XX. *Governor Robinson.*—The Earl of Belmore was succeeded by Sir Hercules George Robert Robinson, K.G.C.M.G., who arrived in the colony and was sworn in on 3rd June, 1872. He had been previously Governor of Ceylon, and this fact, coupled with the circumstance that most of his official experience had been gained in Crown colonies where the system of government is far less free and popular than that which is enjoyed by the people of N.S.W., gave rise to some doubts respecting the success with which he was likely to preside over the destinies of a vigorous and democratic community. But all doubt in this regard was soon set at rest; and although in one or two instances when it was necessary for him to express an opinion on some matter connected with the action of Parliament it was thought he had gone somewhat beyond the duty of a Governor in a colony with a free constitution, yet it may truly be said no Governor ever enjoyed more popularity, no one ever was more successful in the performance of the general duties of his position, and even his mistakes appear to have been characterised by an earnest desire to do what he believed was for the good of the country. No better evidence could be obtained of the success with which he filled the vice-regal position, than the fact that the people from one end of the colony to the other would have gladly hailed his re-appointment. Sir Hercules Robinson is a man of considerable

ability, of careful judgment, prompt and vigorous action and unflinching courage. On several occasions he brought his energetic mind to bear upon questions which vitally affected the interests of the colony, and by the use of his happy talent for public speaking just at the right moment and in the right way accomplished a large amount of good. His speeches on railway progress, on Australian federation, on the position and duties of a Governor of an Australian colony, and at the Sydney University on mental and physical training, were remarkable instances of a penetrating intellect, a thoughtful expression of liberal views, and a clear understanding of what is necessary for the vigour and prosperity of a community like that of Australia. His thoughtfulness and tact in this direction were instanced in connection with the project for holding an International Exhibition (in 1879,) when, coming to the front and urging upon the Agricultural Society and the public the absolute necessity for carrying out the intended Exhibition in order to save the colony from disgrace, he influenced public opinion to such an extent that new life was infused into the movement at once. Even the youth of the colony were not passed over in silence, and his speech at the Sydney Grammar School examination at Christmas 1877 will long be remembered. His period of office was conspicuous for political crises. In consequence of the state of parties in Parliament for some years past it had been impossible for any Government to remain in office for any length of time, and in fulfilling the duties of his position as a representative of the Crown seeking new advisers the Governor had many difficulties to contend with. Generally he exercised a wise discretion on these occasions; but he was responsible for introducing a practice which met with some condemnation, known as that of "conditional dissolutions," or the promise of the Governor to grant a dissolution of Parliament on condition that the outgoing Ministers are able to obtain supply. In two instances, the Gardiner and Rossi cases, Robinson came into collision with the Legislative Assembly; but if Ministers had been more attentive to their responsibility as the advisers of the Crown, and Parliament more alive to the great principle of responsible government, there need not have been any unpleasantness between the Parliament and the Governor. In the early part of his government he was called on to proceed to Levuka and effect the annexation of Fiji. Accompanied by Sir J. G. L. Innes, Attorney-General in the first Parkes Ministry, the Governor visited Fiji and completed the annexation of the Islands to Great Britain, on terms advantageous to England and satisfactory to Thakombau, the reputed King of Fiji, and to the great chiefs of the country. For his services upon this occasion he received the Grand Cross of the Order of St. Michael and St. George, and Innes was knighted. Out of the mission to Fiji arose a sharp correspondence between the Governor and the Chief Justice

(Sir James Martin) on the non-appointment of an administrator of the Government during the absence of His Excellency from the colony, and the subsequent appointment of Sir Alfred Stephen as Lieutenant-Governor. Robinson made several tours into the interior, becoming personally acquainted with most of the evidences of progress amongst the people and with the vast resources of the colony; and on more than one occasion he visited V. His fondness for field sports gave an impetus to this kind of amusement which it never before possessed in the colony; but while he gave countenance and support to horse-racing, he always endeavoured by counsel and example to purify the turf from the vicious practices which surround it, and to make it a means of pleasure that may be enjoyed with safety and benefit by the most respectable and the most innocent in the land. The history of the colony from the time he landed on its shores was marked by several important events, and on the whole by general prosperity and progress. The year of his arrival was conspicuous for the enthusiasm and speculation among all classes of the people, which produced an extraordinary revival of mining enterprise, and raised sanguine expectations that N.S.W. would more than ever prove to the world that she was immensely rich in mineral treasures, and capable of maintaining a great mining population. The discovery of wonderfully rich veins of gold at Hawkins Hill was followed by discoveries of extensive and valuable deposits of tin and copper in various parts of the colony, and many claims being taken up, numbers of mining companies were started, and everybody was in a fever of excitement to secure shares. But, as at previous times when a mania to become rapidly rich has seized the people, the unhealthy mining excitement was followed within a few months by depression and a general collapse. Legitimate enterprise gave way to share-jobbing and dishonest speculation; and while a few persons by these practices acquired large amounts of money, hundreds lost the savings of years, and many were completely ruined. Nothing however occurred to show that the country is not very rich in mineral deposits, and since the period of the mining mania a judicious application of capital and steady continuous industry have produced results on the gold-fields which have furnished in many cases very satisfactory dividends. Not only for the excitement produced by the discoveries of valuable minerals is the year 1872 remarkable. In that year the spread of knowledge through the length and breadth of the land was assisted by the receipt and despatch, for the first time, of direct telegrams between N.S.W. and England, across the continent of Australia, and by a movement in the Legislative Assembly to abolish the postage rates on newspapers. But the year did not close without a serious Parliamentary mistake; for a majority of the House, led by the Government of the day, objecting to the existence of

the Permanent Infantry Force, a body of men as fine and well trained as a regiment of British regulars, the force was disbanded at the end of the year, Parliament voting a sum of money to compensate the men and their officers for loss of service. In January of the following year an Intercolonial Conference was held, the principal result of its deliberations being the reorganisation of the ocean mail services; and the month of December witnessed the arrival of the first steamer by the Torres Straits mail route, the departure of the first steamer by the reorganised San Francisco route, and the departure of the last steamer belonging to the P. and O. Company, under the old Suez contract. Not only did the colony exhibit a highly commendable spirit of enterprise with regard to ocean mail services, but circumstances being favourable for a reconstruction of the fiscal system, the *ad valorem* duties were repealed and the tariff was further amended by the abolition of several specific duties which were but slightly productive of revenue. The flourishing state of the revenue enabled the Colonial Treasurer not only to clear off the deficit that had so long hampered his accounts, but to get rid of some of the taxation that had been imposed for the purpose of putting the public accounts in a healthy condition. In 1873 a public funeral was given to the remains of William Charles Wentworth; Sir James Martin retired from public life and was appointed Chief Justice; the abolition of postage on newspapers was completed; and a series of resolutions were moved in the Assembly providing for a Department of Justice and Public Instruction, with a responsible Minister at its head; for the abolition of the office of Solicitor-General; and for a change in the status of the Attorney-General, by which that Minister of the Crown ceased to be a member of the Executive Council. The year is noticeable also because it witnessed a decided rise in the rate of wages and a shortening of the hours of labour. The collapse of the mining mania of 1872-3 led capitalists to invest considerable sums of money in the purchase of land; and in 1874 the land revenue had increased so considerably that the Treasurer in making his financial statement was able to show a large surplus, and to announce that the Government were in a position to clear off the last remnant of the old deficiency debt, and to put the finances of the colony on a perfectly sound basis. One important measure of the session of Parliament was the Mining Act, which provided for a Minister for Mines and a Mining Board. But the chief political event of the year was the trouble over the release of the bushranger Gardiner, and the consequent fall of the Government. Some objectionable proceedings in Denominational schools raised an outcry in favour of secular, free, and compulsory education, and led to the formation of the Public Schools League, which was soon afterwards met by an organisation formed under the name of the Defence Association and in the interests of the

Denominational schools. But beyond an agitation which lasted for a considerable time and aroused a good deal of bitter feeling between the supporters of the rival school systems, nothing resulted from the movement until 1875, when the Assembly agreed to resolutions repealing the regulation which required one-third of the cost of public schools to be raised by the inhabitants of the locality where the schools were wanted. While these matters were transpiring preparations were being made for carefully watching an expected transit of Venus, and the arrangements of the Government Astronomer were so complete that he was able to make very satisfactory observations of the transit, and convey to England a valuable contribution to the information collected from all parts of the world respecting this important astronomical event. The year 1875 had not closed when the colony learned with profound regret the death of Commodore Goodenough from the effects of an arrow wound received from the natives of Santa Cruz Island; and a few days after he had breathed his last the citizens of Sydney witnessed the burial of his remains in a quiet and secluded cemetery at North Shore. During the following year the colony passed through such a trying period of drought that at one time it was threatened with a water famine, and a day of humiliation and prayer for rain was fixed; but before the appointed day came round the drought broke up, and the day of prayer for rain was changed into one of thanksgiving. The appointment of a Board under the name of the City and Suburban Sewage and Health Board, led to a lengthy inquiry into the sanitary condition of Sydney and its suburbs, to important recommendations for the improvement of our sewerage system, and to the formation of a Health Society. The year is notable also for the opening of a public exhibition in connection with the Academy of Art, which may be considered the nucleus of an Art Gallery for N.S.W.; for important discoveries in New Guinea by the Rev. Mr. Macfarlane and by Signor D'Albertis; the laying of the foundation-stone of the Prince Alfred Hospital; the opening of the Kiama Basin; the opening of the Lending Branch of the Free Public Library; and for the visit of a team of N.S.W. riflemen to Philadelphia, where they secured a good position among the competing national teams. But the two great events of the year were the highly successful representation of N.S.W. at the Philadelphia Centennial Exhibition, and the victory of Edward Trickett on the Thames, which secured for him and for the colony the rowing championship of the world. These two important matters did more than anything had done for many years to bring the colony into notice in the Mother Country and in America; and its success in athletic contests on the water was accompanied by a victory in the cricket field over an eleven from England, the N.S.W. team playing with a smaller number of men than had ever before been placed as opponents to English cricketers. The

defeat of the "Third Party" in the Assembly brought about a coalition of Sir Henry Parkes and Sir John Robertson, and the formation of the present Government. Immigration has been carried on from America as well as from England; efforts have been made to extend the advantages of education by providing for the establishment of Grammar schools in connection with the Public schools, and for the higher education of girls. On the 25th February 1879 the ceremony of unveiling the statue erected in honour of Cook in Sydney took place. The day was proclaimed a public holiday. It was estimated that about 100,000 persons were present to witness the ceremony. The Governor delivered an extremely eloquent address on the occasion, setting forth the chief incidents in the life and career of the immortal navigator. The concluding passages of this oration are worthy of permanent record. "And now," said His Excellency, "although but little more than a century has passed away since the great navigator sailed on an autumn day in May past the Sydney Heads in the little *Endeavour*, what a marvellous change has since then taken place! The condition of the whole world has in that period been transformed mainly through the increased application of science to social life; but in no part of the globe has this transformation been more complete and striking than it has in Australia. Cook found this land a desolate waste inhabited only by a few naked and hostile savages, and what is the prospect which meets the eye to-day? A country covered with flocks and herds—dotted over with cornfields and vineyards—with busy cities and peaceful hamlets—with churches and schools—with railways and telegraphs—the harbours and coasts alive with steam vessels and other craft—and the land the happy home of over two millions of our own race, who are in the enjoyment of civil and religious liberty to as full an extent as any people upon the face of the earth, and who under these invigorating influences have already so far advanced in all the outward and visible signs of civilisation as to be about to collect this year examples of the products of labour, art and wealth from every known country in the world into an International Exhibition! But great as has been the progress of Australia in the last hundred years, it is I believe as nothing compared to what we may look for in the future. The resources of the country are almost boundless—its capacity for expansion practically unlimited—and at the next centenary of Cook's discovery the population will probably not be less than forty millions. Such a prospect is almost dazzling but at the same time it gives rise to reflections which are not altogether free from anxiety; for it is impossible for any thoughtful mind to contemplate the future of this land without perceiving that there are difficulties to be encountered which it will tax all your wisdom and prudence and fairness to surmount. You have the problem before you—how to provide for the homestead settlement of this vast country without giving rise to class

animosities and without stimulating unduly the isolation of individual families, which would result in the deterioration of the rising generation. You will have to adjust too the relations between capital and labour with fairness to each, both being essential factors in the continued development and prosperity of the country. You will some day, unless one-half of this great continent is to remain for ever a waste, have to face the question of the colonisation and cultivation of tropical Australia, which can, I believe, only be accomplished by tropical labour of some kind under European supervision. You have yet to establish that Parliamentary Government—a machine of the most exquisite delicacy—can be made a permanent success with a Legislature formed upon the strict principles of popular representation, and that the checks and safeguards of our mixed and nicely-balanced constitution can withstand the predominating influence and encroaching tendency of universal suffrage. You will have some day, and I hope before long, to provide for the federation of the Australian Provinces into one Dominion, and above all to arrange eventually for that closer political association with the Mother Country which will admit of many millions of self-governing Anglo-Saxons at the antipodes advancing in national life, while still remaining an integral portion of the Empire of which it is now their pride and privilege to form a part. These and other problems of a similar character will have to be worked out in the future, and I can only repeat the conviction which I have before expressed that the key to their successful solution depends entirely upon the intellectual clearness and moral worth of the individual citizen. One of the greatest of living constitutional authorities has observed that 'it is a great truth which cannot be too constantly borne in mind that the success of all free constitutions depends far less on their particular form than on the spirit and public virtue of the people to be governed by them. When a strong sense of public duty, respect for the constituted authorities and for the law, and a high standard of political right and wrong, prevail in a nation, even very defective institutions will produce the fruits of good government; while with a people of an opposite character the best constitution which the wit of man could devise would fail to prevent the worst abuses, and to guard against the ultimate establishment of tyranny in the hands of a mob, of an oligarchy, or of a single despot.' It becomes therefore of the utmost importance that the rising generation here should be brought up to admire and imitate true nobility of character, and it would I believe be impossible to set before them as an example a higher human standard than that of the earnest, modest, brave, self-denying, just, humane and God-fearing man to whose enterprise we owe the discovery of this land, and to whose memory a statue is this day about to be unveiled in our midst. It is, I think, peculiarly

fitting, having regard to Cook's identity with the masses of the English nation, that the idea of a statue of the great navigator should have originated not with the Government or any scientific society, but with the people of this colony themselves. A monument of the kind cannot in any degree enhance the reputation of Captain Cook, whose name and fame will be remembered so long as the English language and history shall continue in the earth. But such a statue is creditable to ourselves as marking our admiration of the character and services of the man, and our gratitude for the benefits which his discoveries have conferred not only on Australia but also on the world at large. It will serve also to bring home to all the lesson that great deeds and a great reputation can be achieved by those in the humblest station and with the slenderest opportunities. There is scarcely a lad born in this country who has not within his reach educational advantages superior to those which were available to the poor Yorkshire peasant boy, and I hope that the history of his early life may not be thrown away upon the young but that many a child in the future will learn at the foot of this statue how a faithful, patient, cheerful attention to the details of daily duty, however monotonous and commonplace, will bring its own reward, and may perchance, as in the case of James Cook, leave behind a noble and imperishable memory." On 13th March 1879 Robinson took his departure for his new Government in N.Z. amidst the respectful farewells of an immense throng of colonists. No Governor that N.S.W. has ever had was more personally liked by all classes of the population. During the interval accruing until the arrival of Lord Loftus, his successor, the Government was administered by Sir Alfred Stephen.

XXI. Governor Lord Loftus.—Lord Loftus arrived in August 1879. The period of his administration has not yet passed into the domain of history, and at this point therefore the general record concludes for the present. But special mention must be made of the first public ceremonial in which the new Governor took part—the opening of the Great International Exhibition. This event was celebrated on 17th September 1879. The Governors of V., S.A. and T. were present, and the ceremony was one of unprecedented splendour. The address presented to the Governor on this occasion, and His Excellency's reply may fitly form the last paragraphs in the eventful story of the Colony of N.S.W. Sir Patrick Jennings, Director-General of the Exhibition, read as follows:—"I have the honour, on behalf of the gentlemen commissioned in the Government of New South Wales, to ask your Excellency to declare the Sydney International Exhibition of 1879 open to the public in the name of Her Most Gracious Majesty Queen Victoria. The original commission which I have the honour to lay before your Excellency was issued on the 3rd day of January of this present year, and is signed by your

lordship's distinguished predecessor, Sir Hercules Robinson. In virtue of its provisions, the commissioners who assemble here to greet your Excellency and your distinguished guests, undertook the duty of bringing to a practical issue the great project of an international exhibition in Australia. Two hundred and fifty-seven days have elapsed since the issue of this commission, and during that time the members of the commission and its officers have endeavoured to the best of their ability to carry out the high trust committed to their charge. Many circumstances have contributed to enhance the importance of this great project, which growing from small beginnings has attained a magnitude unforeseen by its most sanguine supporters. The generous response and active sympathy accorded by the great nations of Europe, by the United States of America, by the Empire of Japan, by the Indian Empire, and our own colonies, has largely contributed to add to the importance of the Exhibition; and it is our pleasing duty to-day to assist your Excellency in welcoming the distinguished representatives of the participating countries and colonies who honour us by their presence on this important occasion. Since the Exhibition of 1851 in London, held under the presidency of the illustrious Prince Consort, whose memory is nowhere more deeply revered than in this colony, universal expositions or world's fairs have been held in Paris, in London, in Vienna and in Philadelphia, and the beneficial consequences of these 'festivals of peace' become more apparent the more their effects are studied. It has remained for the City of Sydney, the metropolis of the parent colony of Australia, to sustain its position by inviting all flags of the world to range themselves in peaceful concord to-day, and we cannot but feel that we are largely indebted to His Royal Highness the Prince of Wales, not only for giving us the great prestige of his Royal name, but also for the lively interest that His Royal Highness has manifested in this great undertaking. The liberality of the Legislature has permitted the structure which your Lordship is about to throw open to the public to be erected in full accordance with the noble design of the colonial architect, and the generous surrender of the private park of the Governors of New South Wales has provided a site unequalled in beauty and convenience of position. The energy and skill of the contractors for the works of the garden palace, and the valued assistance of the director of the public parks and gardens, have further contributed to bring to a successful issue the Exhibition which we are assembled to-day to inaugurate. It will be the duty of judges, hereafter to be appointed, to examine and report upon the exhibits submitted for competition, which will remain open for the inspection of the public for the next six months. The art collection brought together is on a scale heretofore unknown in Australasia. The Queen's and Prince of Wales' valuable paintings, and the South Kensington collection, will further give an

opportunity to study specimens of all that is best in the arts and sciences of the old country, and tend to elevate and refine the tastes and educate the minds of our fellow-colonists. I have now the honour, on behalf of the Commissioners of the Sydney International Exhibition of 1879, to ask of your Excellency to duly declare the Exhibition opened to the public." Lord Loftus delivered his speech in reply :—"Mr. Jennings and Gentlemen,—I receive your congratulations with deep gratification, and on behalf of the gracious Sovereign whom I represent I congratulate the colony of New South Wales on the success of her efforts to gather in her capital a fair representation of the art achievements and the industrial forces of the globe. The event which we assemble to celebrate is an era in Australian progress, the influence of which like the dews of heaven will hereafter gladden with its forms of beauty the hearts of thousands whose thoughts will never trace the delicate and subtle processes between cause and effect. The source of the teaching may not be recognised, but the lessons will not be less abiding and precious in their value. Here in Australia, as in other parts of the world where invention and skill apply the principles of nature to the mechanical creations of man, it will be found that 'emulation hath a thousand sons.' In this fair building which has arisen within a few months as by the wand of an enchanter the most renowned and enlightened nations of Europe, the great English-speaking republic of America, and those countries of Asia which are the abodes of an immemorial civilisation unite in the radiant bonds of brotherhood in laying at our feet the rich and ever-varying stores of their conceptive genius and creative power. With them are associated the young and aspiring sister colonies of Australasia, each upturned gaze fixed upon the sun, and forming a glorious purpose to achieve in the highest walks of civilisation. In the name of New South Wales the elder colony of the Australian group, and once despised, and may I not say the now honoured, I welcome the representatives of the bright daughter lands of England. I welcome all of human brotherhood to our newly-raised temple of industry and peace in a new world. It is not my purpose to detain the brilliant company around me by any review of the progress of this colony. The occasion is too auspicious for its triumphs. The pride I feel, in common with all classes of the people, in New South Wales being the seat of this international assemblage, is a pride unmingled with any local or self-congratulatory feeling; and in contemplating the great work we are met to inaugurate and the noble display of material treasures before us, I hope we shall be led in a spirit of thankfulness to discern the merciful hand of a higher power. It is to the Almighty Giver of all Goodness that the wonderful progress of human industry and art in our age is to be ascribed. To His illimitable power and all-searching wisdom, and only to the marvellous

ingenuity of man as overruled by His beneficent attributes, is due the completion of the beautiful structure we have so successfully raised. With humble and thankful hearts let us on this solemn occasion reverently recognise the hand of our Maker, and while we invoke His all-powerful blessing, to Him alone give praise and thanks, giving, in the holy words of the angels, 'Glory to God in the highest, and on earth peace and goodwill towards men.' In the name of Her Majesty the Queen I declare the Sydney International Exhibition of 1879 opened to the public."

NEW ZEALAND.—GEOGRAPHICAL POSITION.

—The Colony of N.Z. consists of two islands called the North and South Islands, and a small island at the southern extremity called Stewart Island. There are also several small islets such as the Chatham and Auckland Isles that are dependents of the colony. The entire group lies between 34° and 48° S. lat. and 165° and 179° E. long. The two principal islands, with Stewart Island, extend in length 1100 miles, but their breadth is extremely variable, ranging from 46 miles to 250 miles, the average being about 140 miles, but no part is anywhere more distant than 75 miles from the coast.

The total area of—	Sq. miles	Acres.
New Zealand is about ...	100,000	64,640,000
the North Island being ...	44,000	28,000,000
the South Island being ...	55,000	36,000,000
Stewart's Island being ...	1000	640,000

It will thus be seen that the total area is somewhat less than that of Great Britain and Ireland. The North and South Islands are separated by a strait only thirteen miles across at the narrowest part, presenting a feature of the greatest importance to the colony, from its facilitating intercommunication between the different coasts without the necessity of sailing right round the colony. The North Island was, up to the year 1876, divided into four provinces, viz., Auckland, Taranaki, Hawke's Bay and Wellington; Taranaki and Hawke's Bay lie on the W. and E. coasts respectively, between the two more important provinces of Auckland on the N. and Wellington on the S. The South Island was divided into five provinces, viz., Nelson, Marlborough, Canterbury, Otago and Westland (Southland was for a short time an independent province;) Nelson and Marlborough are in the N., Canterbury in the centre, Otago in the S. and Westland to the W. of Canterbury. These provinces however in 1877 were abolished and divided into sixty-three counties—thirty-two in the North Island and thirty-one in the South Island—and Provincial Government ceased to exist. But besides these and the few islands near the coasts, there are several outlying groups and islands, which though situated at a considerable distance in the ocean, yet both by their natural productions and geographical position, may most conveniently be classed as forming part of the N.Z. group of islands. To the S. are the Auckland, Campbell

and Macquarie Islands; to the E. Chatham and the small Bounty and Antipodes Islands; to the N. the Kermadec group and Norfolk with Phillip Islands; and to the N.W. Lord Howe's Island.

PHYSICAL FEATURES AND SCENERY.—The two large islands of N.Z. are marked by striking physical differences which cannot fail to react upon their economical and social relations. North Island, with its varied outlines, consists of two sections—the already mentioned North-western Peninsula, abounding in fertile and well-watered valleys, and the main body of the island, characterised by gently-sloping hilly ranges and low-lying table-lands, varied here and there by volcanic peaks. The country is everywhere covered with a luxuriant growth of timber, except in the heart of the island, which is full of lakes, hot springs and geysers, depositing silica and sulphur, like those of the Yellowstone Park in the United States. South of this point and not far from the centre of North Island is situated Lake Taupo, whose secluded and romantic waters are furrowed only by the canoes of the natives, here more numerous than elsewhere. Still farther to the S. is a very wild highland region but little visited by Europeans. Here are Mount Ruapehu and the extinct volcano of Tongariro, rising to a height of 9195 and 7000 feet respectively. In this district lie the sources of the river Waikato, which flows northwards through Lake Taupo, watering one of the finest regions in the country. Here also are the sources of many other streams, flowing some eastwards to Hawke Bay, others in a south-westerly course to Cook Strait. Besides Mount Tongariro, N.Z. possesses a second active volcano in Mount Wakari, in White Island, a small rock in the Bay of Plenty; besides a large number of extinct craters, tufa and lava cones, beds of slag and scoria, of which as many as sixty-three are found in the isthmus of Auckland alone. At the western entrance of Cook Strait rises in solitary grandeur the snowy Taranaki, or Mount Egmont, 8270 feet high. South Island which is the longer and more extensive of the two presents a very different physical aspect. Its western side is traversed in its entire length by the so-called Southern Alps, a massive range from 10,000 to 13,000 feet high, whose slopes up to the snow-line are densely wooded. Towards the west they contain vast snow-fields and glaciers, extensive tracts filled with stony detritus, moraines, clefts and fissures of enormous depth, whence flow icy streams to the lakes of the table-land. Parallel with the upland plateau and about the centre of the island runs a low range intersected by many mountain streams, which make their way over a series of terraces down to the south-east coast. The lower terraces from the elevation of about 1500 feet down to and inclusive of the narrow coast strip, form the so-called Canterbury Plains. This province of Canterbury is separated from Otago, its southern neighbour, by the broad-flowing Waitaki, which is

fed by three lakes lying at the foot of the central group of hills. The outlines of the coast are very remarkable. The south-western corner of the island is indented, doubtless through glacier action, by deep fiords, similar to those of Norway; the north-eastern sea-board, on Cook Strait, is diversified by countless little inlets and bights; while the east coast forms, with two exceptions, a low and perfectly straight shingly beach. The exceptions are Port Littleton and Port Chalmers, the two narrow channels at Dunedin and Christchurch whose peculiar formation is due to masses of volcanic rock disposed in crescent form and encircling small water basins.

LAKES, HOT SPRINGS, AND GLACIERS.—The lakes of N.Z. deserve especial notice as they present many interesting features. They may be generally classed as due either to volcanic or to glacial action, the former being the case in the North, the latter in the South Island. Taupo, the largest lake in the North Island, is a veritable inland sea, twenty-five miles long and twenty wide, and of an enormous depth, which has not yet been ascertained. It is situated 1250 feet above the level of the sea, and is surrounded by volcanic deposits forming a table-land 1000 feet above its surface. From this rise numerous volcanic cones, while the active volcano Tongariro is only a few miles to the south. On the western side the lake is bounded by vertical precipices 1000 feet high, and here the water is believed to be deepest. Its colour is a dark blue, like that of the deep ocean, and from its centre rises a single small but very beautiful island. This lake has evidently been formed by a great subsidence of the volcanic plateau. Nine miles south of Taupo, behind a group of volcanic cones, is the small lake Roto-aira, at an elevation of more than 1700 feet. The Waikato, about twenty-five miles from its exit from the lake, passes through a remarkable group of hot springs, extending for more than a mile along its banks. The river here plunges through a deep valley, and its floods whirling and foaming around rocky islets dash with a loud uproar through the defile. Along its banks white clouds of steam ascend from hot cascades falling into the river, and from basins full of boiling water shut in by white masses of stone. Steaming fountains rise at short intervals, sometimes two or more playing simultaneously, and producing endless changes, as though experiments were being made with a grand system of waterworks. Dr. Hochstetter counted seventy-six separate clouds of steam visible from a single station, and among them were numerous intermittent geyser-like fountains, with periodical water eruptions. About forty miles N.N.E. from Lake Taupo, and nearly the same distance from the shores of the Bay of Plenty, is the lake district—a cluster of more than sixteen lakes of various sizes, occupying a tract of country about twenty miles long by twelve wide, and covering about the same area as the large lake itself. The district around all these lakes, and extending

between the volcano of Tongariro and the sea, is a zone of hot springs, solfataras, fumeroles and mud volcanoes, more than a thousand in number, which according to Dr. Hochstetter far exceeds all others in the world in variety and extent. The largest as well as the most irregular and picturesque of the group of lakes is Tarawera, surrounded by rugged rocky bluffs, shaded by fine woods, and bounded on the E. by the rock-crowned Tarawera mountain. Next in size is the Rotorua lake, six miles across and nearly circular, with a conical island almost exactly in its centre. Clouds of steam ascend from the numerous hot springs about the shores of this lake, and with its circular form and the conical peak in its centre give it all the appearance of a large volcanic crater; but its depth is but small, and Dr. Hochstetter is of opinion that, like all the other lakes in this district, its origin is due to the sinking of part of the volcanic table-land in which they are situated. But the most wonderful part of the lake region is the small Rotomahana, or Warm Lake, with its boiling springs and siliceous terraces. The first appearance of the lake itself is disappointing, as it wants all the elements of beautiful scenery possessed by the other lakes; but the clouds of steam ascending everywhere around it show that there is something else to be seen. Almost everywhere around the lake there is a seething, hissing and boiling sound from the numerous escapes of steam, boiling water or hot mud, while in the lake itself hot springs are so numerous that the whole body of water is kept at a temperature of 90° or upwards. The chief sight however is the Te Tarata, at the N.E. end of the lake. At eighty feet above its surface, on the fern-clad slope of a hill, there lies an immense boiling cauldron in a crater-like excavation with steep sides, thirty or forty feet high, and only open on the side towards the lake. The basin itself is about eighty feet long by sixty wide, full to the brim of perfectly transparent water, which in the snow-white incrustated basin appears of a beautiful turquoise-blue. Even at the margin it has a temperature of 180° Fahr., but towards the centre, where it is in a state of constant ebullition to the height of several feet, it is probably at the boiling point. The surplus water flowing down the hill-side into the lake has formed a pure white siliceous deposit in a series of ridges or steps covering a surface of about three acres. At the bottom the terraces are low, but further up they are two, three, or even four and six feet high, each with a raised rim from which slender stalactites hang down, and enclosing on its platform one or more basins resplendent with the most beautiful blue water. These basins are of every size and depth, the upper ones warmer and the lower cooler; and they form a series of exquisite baths such as the most refined luxury could not surpass. The pure white of the siliceous deposit, in contrast with the blue of the water and the green of the surrounding vegetation; the intense red of the bare earth-walls

of the water-crater; the whirling clouds of steam—together present a scene unequalled of its kind in any other part of the globe. Passing by numerous mud-springs, fiercely boiling fountains, acid lakes and spouting geysers, we come, on the S.W. side of the lake, to another terrace-fountain called Otukapuarangi, not quite so large and grand as Te Tarata, but surpassing it in the finish and regularity of the terraces, their delicate pinky hue contrasting with the transparent sky-blue water, while the water-crater is shut in by bare walls variously tinged with red, white, and yellow. If now we transfer our view from the Northern to the Southern island, we find, in the magnificent range of the southern mountains, a series of true alpine lakes, fed by huge glaciers, and dependent for their very existence on ancient glaciers of still greater extent. These glacier lakes commence about lat. 42½° S., but they become larger and more numerous as we approach Mount Cook, the giant of N.Z. mountains, 13,200 feet high, where we find Lake Tekapo, fifteen miles long and three wide, and two others, Lakes Tukaki and Oahau, forming the sources of the Waitaki river. The great Godley glacier, which extends above Lake Tekapo, is very extensive, and the view from its middle moraine over the snow-fields of Mount Tyndall, Mount Petermann, and the Keith Johnston range, is said by Dr. Haast to form the grandest scenery he ever beheld in the Alps. Lake Pukaki is ten miles long and four wide, and is shut in by an old terminal moraine, which attains a height of 186 feet above the lake. The view from the outlet towards the Southern Alps, with Mount Cook in the centre, and a wooded islet in the foreground, is described as sublime in the extreme, and, if we imagine villas and parks around its shores, the Lago di Como or Lago Maggiore would not bear comparison with it. It is supplied by the Tasman river, which has its source in the great Tasman glacier, eighteen miles long, and the largest in N.Z. Farther S. the glaciers descend lower, and the lakes increase in size. Lake Wanaku is thirty-five miles long, and Lake Wakatipu fifty miles, while Lake Te Anau, still farther S. is forty miles long, and has numerous extensive branches. The bottoms of many of these lakes are far below the sea-level, though they must have been filling up for ages by the sediment carried into them, a proof either that the entire land was once much higher, or that the lakes have been ground out by glaciers, as supposed by Professor Ramsay. The fact that the lakes increase in size and depth as we go S., while on the W. side of the island it is only towards the S. that the coast is indented by long and winding fiords, whose inner waters are deeper than near their mouths, is strongly in favour of the glacial theory of their origin. On the western side of the mountains there are also numerous glaciers, and one of these, descending from Mount Cook, terminates within 705 feet of the sea-level, and for a long distance is bordered by a magnificent

vegetation of *metrosideros*, tree-ferns, and fuchsias. This is in lat. $43^{\circ} 35' S.$, corresponding to Montpellier and Marseilles in France, and Leghorn in Italy. The general character of the N.Z. scenery, as contrasted with that of A., is well expressed by Anthony Trollope. He says: "In N.Z. everything is English. The scenery, the colour and general appearance of the waters, and the shape of the hills, are altogether un-Australian, and very like that with which we are familiar in the west of Ireland and the Highlands of Scotland. The mountains are brown, and sharp, and serrated, the rivers are bright and rapid, and the lakes are deep and blue, and bosomed among the mountains. If a long-sleeping Briton could be set down among the Otago hills, and on awaking be told he was travelling in Galway or the west of Scotland, he might be easily deceived, though he knew those countries well; but he would feel at once that he was being hoaxed, if he were told in any part of A. that he was travelling among Irish or British scenery."

CLIMATE.—N.Z. has of course a very varied climate, extending as it does through fourteen degrees of latitude. No part of the islands suffer from hot winds, and the temperature is generally equable, especially in the North Island, where frost and snow are almost unknown, except on elevated plateaus, and where, towards the extreme north, the climate becomes semi-tropical. The western shores are moister and more agreeable than the eastern, and the Canterbury Plains on the east side of the South Island experience the greatest vicissitudes of temperature, the annual range of the thermometer being 62° , while at Wellington it is 45° , and at Hokotika, on the west coast of South Island, 48° . The climate of the Canterbury Plains has been said to be a mixture of the climates of the south of France and the Shetland Islands. The rainfall varies between 28 inches at Christchurch and 122 at Hokotika. The coasts of N.Z. are very windy, especially in the straits between the islands; thus Invercargill on Foveaux Straits, and Nelson and Wellington on Cook Straits, have hardly a calm day in the year. Dunedin seems the least windy place on the coast, having had 98 calm days in 1873, while Queenstown, on the Wakatipu Lake, had 142. On the whole the climate is at once mild and bracing; combining a large amount of variety with comparatively few extremes; and it is well fitted for the average English constitution, though less adapted to those in delicate health or with unsound lungs than the brighter skies of A.

GEOLOGY.—The geological formation of the two islands of N.Z. differs remarkably. The North Island is essentially volcanic, the South sedimentary. The North is full of volcanic cones, extinct and active craters, boiling springs, lava fields, sulphur, and lakes formed by subsidence. The South has lofty ranges of slate and granite, with Silurian sandstones and limestones, and the valuable green jade, so much prized by the natives for

making their choicest weapons; snowy ranges, enormous glaciers, deep alpine lakes, and wide glacial deposits. Of course these distinctions are not absolute; there are some primary rocks in the North, and some volcanic formations in the South. Gold and coal are found in both islands, but far more abundantly in the South, while deposits of secondary age cover but a small area in both islands. Volcanic formations occupy fully one-third of the area of the North Island. Within a dozen miles of Auckland City there are more than sixty cones and craters, from 300 to 900 feet high. For hundreds of miles volcanic conglomerates, cinder-heaps, and lava-streams spread over the country; the thousands of hot springs, solfataras, and mud-volcanoes, have already been referred to, while the three lofty volcanoes—Tongariro active, Ruapahu and Mount Egmont quiescent, vie in grandeur with those of most of the great continents. Coal, both palæozoic and tertiary, covers a wide area in the South Island. Good coal is also worked at the Bay of Islands, and near Auckland in the North. Gold has been found to occur almost as abundantly as in V., and in many different localities. Till 1860 little was found, when rich fields were discovered in Otago, and subsequently in Westland, Nelson, and Marlborough, while the Thames-Valley gold-field, in the North Island, surpassed all in richness. Much of the gold is found under glacial drifts, and on the west coast the sands of the sea-shore produce it in paying quantities, especially when a gale of wind brings down fresh deposits from farther north. The same wonderfully lucky finds occurred here as in A. At the Havelock diggings in Marlborough, three men in felling a tree at the edge of a river, found a pocket under it from which in a few hours they washed thirty ounces of gold. In the Tanpeka diggings in Otago one party obtained thirty-eight ounces in a day, and it was said that any who could stand the work could gather from one to two ounces a day. In a few months 16,000 persons were collected at these diggings among wild mountain gullies, and all the phenomena of the Australian "gold-fever" were reproduced. At one time the emigrants arriving at Dunedin from Melbourne amounted to a thousand a day. Besides gold, other metals are worked more or less successfully. Silver is abundant at Mount Rangitoto; copper occurs at Barrier Island, and tin at the Buller. Chrome iron-ore and iron-sand are also abundant, and will no doubt one day be largely worked. Fossil remains are rather scarce in N.Z., and throw little light on its past history. No fossil mammals have been found, and no birds or reptiles except such as are allied to forms still living on the island. The few tertiary shells are closely allied to living species; while the cretaceous and jurassic marine deposits contain ammonites, belemnites, and allied groups bearing a striking resemblance to European forms of the same period; and in the jurassic beds of the Waiparu species of plesiosaurus and ichthyosaurus have been

discovered, showing that these ancient saurians had an almost world-wide distribution.

NATURAL HISTORY.—N.Z. is the largest truly oceanic group of islands in the temperate zone, and, as might be expected, presents a large amount of speciality in all its natural productions. Its flora, when compared with that of other islands of equal extent, is poor in species, since it possesses only about half as many flowering plants as Great Britain. It is, however, wonderfully peculiar, about two-thirds of the species being entirely confined to the group, and even twenty-six of the genera are found nowhere else. The relations of the flora are with A. and with the Antarctic lands, including temperate South America. A large number of species and genera are common to N.Z. and A., but in many cases it is the N.Z. forms which have migrated to A. and not *vice versa*. There is also the extraordinary fact of the total absence of some of the most common and widespread of the Australian groups of plants; for not a single species of *Eucalyptus* or *Acacia* is found in N.Z., a fact which absolutely negatives the idea of any former union or even any recent near approach of the two lands as the cause of the similarities of their floras. No less than eighty-nine species and seventy-six genera are common to N.Z. and South America, but the larger part of these are also found on the Alps of T. and A. There are also fifty species common to N.Z. and the Antarctic islands, and only a few of these are found on the mountains of T. The great characteristics of N.Z. scenery as dependent on vegetation are the forests, the ferns and the grassy plains. The forests chiefly clothe the mountain ranges; the lower hills are covered with fern; while extensive tracts, chiefly on the west in the North Island and on the east in the South, are covered with grass and bushes. In the forests there are scarcely any gay flowers and few herbaceous plants—nothing but shrubs and trees, mostly with obscure green flowers and as destitute of scent as of beauty. Pines belonging to the genera *Podocarpus*, *Dacrydium*, *Phyllocladus*, and *Dammara* abound; but generally the forests are much intermixed, and their chief distinctive feature is the abundance and variety of the ferns that grow beneath their shade. Here are splendid tree-ferns thirty or forty feet high, equalling those of the tropics; exquisitely beautiful filmy ferns growing on trunks of trees; while rocks and shady banks and often the whole surface of the ground are covered with them in great variety. There are about 130 different kinds of ferns and *Lycopods*, while the mosses and *Hepaticæ* are also wonderfully luxuriant, amounting to nearly 900 different species. A few of the trees bear handsome flowers, such as the *Edwardsia microphylla*, with its magnificent yellow pea-like blossoms; the *Metrosideros robusta*, crowned with scarlet flowers; and the large crimson blossoms of the shrubby *Clianthus puniceus*. But these and the few other showy plants are not enough to compensate for the general poverty of

the flora which has led one writer to remark that "there is no indigenous flower equal to England's dog-rose, no indigenous fruit equal to Scotland's cranberry," a statement which though not literally exact well serves to show the poverty in fruits and flowers of the N.Z. vegetation. Sir Joseph Hooker, in the introduction to his "New Zealand Flora," speaks of its monotonous and uninteresting aspect in comparison with that of T., where "*Orchideæ* of many kinds carpet the ground in spring with their beautiful blossoms; the heaths are gay with *Epacrideæ*; herbs, trees and shrubs of *Compositæ* meet the eye in every direction; whilst the *Myrtaceæ* and *Leguminosæ* are characteristics both of the arboreous and shrubby vegetation." And he adds: "The difference is so marked that I retain the most vivid recollection of the physiognomy of Tasmanian mountains and valleys, but a very indifferent one of the New Zealand forest, where all is comparatively speaking blended into one green mass, relieved at the Bay of Islands by the symmetrical crown of the tree-fern, the pale green fountain of foliage of the *Dacrydium cupressinum* and the poplar-like *Knightia* overtopping all." One of the most valuable and abundant of the forest trees of N.Z. is the Kauri pine (*Dammara Australis*), which grows to the height of 180 or 200 feet and furnishes splendid timber. Whole towns have been built of it; it is largely exported, and has been recklessly destroyed by settlers. Dr. Hochstetter so long ago as 1867 stated his belief that the extermination of the Kauri pine is as certain as that of the Maori race. Amongst the smaller plants the Phormium tenax or N.Z. flax is of especial value. When the colonists first arrived the valuable qualities of the phormium fibre were well known as it was in constant use by the natives, and a very considerable trade in the article existed as early as 1828, when the islands were only visited by whalers and Sydney traders. £50,000 worth of the fibre was sold in Sydney alone between 1828 and 1832. At Grimsby, in Lincolnshire, a manufactory was also established in the latter year for the production of articles from the fibre, which failed from some unexplained cause notwithstanding that the results were not considered at the time unsatisfactory. From 1853 to 1860 the average annual value of the fibre exported was nearly £2500 reaching as high as £5500 in 1855, but up to this time the only fibre exported was that prepared by native labour, no machinery of any kind being employed in producing the exported article. In 1860 therefore when the native disturbances affected the Waikato and other interior districts in the North Island, the preparation was confined to the native tribes N. of Auckland, so that the average export value was only £150 per annum. Attention was then directed towards the contrivance of machinery with the aid of which the fibre could be profitably extracted by European labour. In 1861 the increasing demand for white rope and the limited quantity of manilla, which fibre depends for its production on native

manual labour in the Philippine Islands, led to a rise in its value from £21 to £56 per ton and even to £76 per ton in America during the civil war. These high prices stimulated the endeavour to introduce phernium fibre to compete with manilla, and several machines were invented for rapidly producing the fibre from the green leaf. With these machines the export trade again increased, so that from 1866 to 1871 the yearly average was valued at £56,000. [The further descriptive details of the Natural History of N.Z. will be found under the articles "Flora" and "Fauna" of N.Z.]

PAST GEOLOGICAL HISTORY.—"Taking into consideration the peculiarities of the flora and fauna of these islands, and the entire absence of any fossil remains indicating a former connection with other continents, we are justified in concluding that during the whole tertiary period at least, if not for much longer, N.Z. has maintained its isolation from all other extensive tracts of land. We know that A. was formerly richer in mammals than it is now, and we may be sure that it possessed an abundance of species and individuals during the entire range of the tertiary period. If therefore there had been any land connection between the two countries during this lapse of time, it is incredible that no mammals should be found in N.Z., a country so well adapted to support them. The very existence and development of the huge wingless moas is also an indirect proof that no extensive mammalian fauna ever inhabited the country; for such birds take the place of mammals, and they are never abundant except where the latter are absent, as in the case of the dodo and other flightless birds of the Mascarene Islands. But though N.Z. may never have been directly connected with Australia or South America, it has probably been much more extensive than it is now, and has included the Auckland and Chatham Islands, and perhaps even at some remote period the Kermadec group and Norfolk Island. At a much more recent epoch the two large islands have certainly been connected, since an elevation of only 1000 feet would change the submarine bank on which they stand into dry land and form a single island more than double the area of the existing group. This greater extent and greater elevation would have added enormously to the area of the snow-fields of the Southern Alps, and to this was no doubt due that great extension of the glaciers, the effects of which are visible far below their present range in huge moraines and excavated lake-basins. Our conclusion is therefore that N.Z. is the remains of one of the most ancient, if not the most ancient, of the islands of the globe; that it has undergone many fluctuations in area; that the two islands have been quite recently united, and that at some remote epoch it was many times more extensive than it is now; but that through all these changes it has never, during the tertiary epoch at least, been united to any other extensive land." (WALLACE.)

NATIVE RACE.—The physiological and ethnological peculiarities of the Maori race are detailed under the article "Maories."

STEWART ISLAND.—Stewart Island (formerly called South Island) is the third island of the N.Z. group, but is of insignificant size, being only about forty miles in extreme length, and of such an irregular form that its area is less than 500 square miles. It is mountainous and well-wooded with valuable timber-trees. It has also several good harbours, and there are many fertile valleys. It was originally uninhabited, but is now occupied by a few whalers and sealers, with some natives and their half-breed descendants. The seas around swarm with fish, and there are said to be large deposits of iron-sand equal to that of Taranaki.

AGRICULTURE.—The climate of N.Z. is throughout favourable to agriculture and there is everywhere a fair proportion of rich land, although this is more abundant in the North Island owing to the greater extent of decomposed volcanic rocks. In the whole colony there are about 12,000,000 acres of land fitted for agriculture wherein the form of surface is suitable, and about 50,000,000 which are better adapted for pasturage; but from these estimates allowance must be made for about 20,000,000 acres of surface at present covered by forest. In the N. of Auckland including the lower portion of the Waikato valley light volcanic soils prevail, interspersed with areas of clay marl, which in the natural state is cold and uninviting to the agriculturist, but which under proper drainage and cultivation can be brought to a high state of productiveness. The latter are however almost universally neglected at the present time by the settlers, who prefer the more easily worked and more rapidly remunerative soils derived from the volcanic rocks. In the western district which extends round Taranaki and Wanganni the soil is all that can be desired, and is probably one of the richest areas in the southern hemisphere. The surface soil is formed by the decomposition of calcareous marls which underlie the whole country, intermixed with the debris from the lava-streams and tufaceous rocks of the extinct volcanic mountains. The noble character of the forest growth which generally covers the area proves the productiveness of its soil, although at the same time it greatly impedes the progress of settlement. In the central district of the North Island from Taupo towards the Bay of Plenty, the surface soil is derived from rocks of a highly siliceous character, and large areas are covered with little else than loose friable pumice-stone. Towards the coast and in some limited areas near the larger valleys, such as the Waikato and the Thames, and also when volcanic rocks of a less arid description appear at the surface great fertility prevails, and any deficiencies in the character of the soil are amply compensated for by the magnificence of the climate of this part of N.Z. On the eastern side of the slate range, which extends through the North Island, the surface of the country is generally formed of clay marl and

calcareous rocks, the valleys being occupied by shingle deposits derived from the slate and sandstone rocks of the back ranges, with occasional areas of fertile alluvium of considerable extent. It is only the latter portions of this district which can be considered as adapted for agriculture, while the remainder affords some of the finest pastoral land to be met with in any part of the colony. In the South Island the chief agricultural areas are in the vicinity of the sea coast, but there are also small areas in the interior in the vicinity of the Lake districts where agriculture can be profitably followed. The alluvial soil of the lower part of the Canterbury Plains and of Southland are the most remarkable for their fertility; but scarcely less important are the low rolling downs, formed by the calcareous rocks of the tertiary formation, which skirt the higher mountain masses, and frequently have their quality improved by the disintegration of interspersed basaltic rocks. On the western side of the island the rapid fall of the rivers carries the material derived from the mountain ranges almost to the sea coast, so that comparatively small areas are occupied by good alluvial soil; but these, favoured by the humidity of the climate, possess a remarkable degree of fertility. By the proper selection of soil, and with a system of agriculture modified to suit the great variety of climate which necessarily prevails in a country extending over 12° of temperate latitude, every variety of cereal and root crop may be successfully raised; and with due care in these respects N.Z. will not fail to become a great producing and exporting country of all the chief food staples. The progress made in agriculture has been very rapid, and the number of persons engaged in this pursuit is, as compared with other countries, very large, about one in every five of the adult male population being in this way possessed of a permanent stake in the country. The exports of agriculture and farm produce increased from £262,930 in 1875 to £763,635 in 1879. The pursuit of farming has, at any rate in the South Island, been one of the most steadily prosperous industries of the colony; and although in the course of time the value of first-class land has naturally much increased, it is a question whether such enhancement of price is not more than counterbalanced by the improved and cheaper facilities of access to market now offered. Compared with the published accounts of the condition of agricultural affairs in Britain, the prospect offered by N.Z. farming presents a tempting aspect to those engaged in struggling along in the same pursuit in the old country. The average yield of wheat for the year 1878-9 was 22·91 bushels per acre for the whole colony, the average for the last five years being 27·62 bushels per acre.

	Per acre.
For Otago the average yield was	28·18 bushels.
„ Canterbury	20·83 „
„ Wellington	24·47 „

The average yield of other produce for the same year (1878-9) for the whole colony was—

	Per acre.
Oats	30·11 bushels.
Barley	24·76 „
Potatoes	4·98 tons.

The agricultural returns for the year ending 31st March 1879 were 23,129 holdings, of which 15,326 were freehold, 5363 rented, part freehold and part rented 2440. The extent of land broken up but not under crop 251,826 acres. Land under crop 213,764 acres. Wheat 270,198 acres, produce 7,610,012 bushels; oats 330,208 acres, produce 12,062,607 bushels; barley 57,484 acres, produce 1,751,432 bushels; potatoes 21,260 acres, produce 119,523 tons; other crops 186,030 acres; hay 71,911 acres, produce 108,833 tons. The average yield per acre was wheat 28·1 bushels, oats 36·5 bushels, barley 30·4 bushels. The area of the whole colony is estimated approximately at 67,419,107 acres; of this superficies there have been sold or otherwise disposed of from the foundation of the colony to 31st December 1878 (including confiscated lands sold prior to 1877, 1,371,470 acres) 15,241,639 acres; leaving an area of 52,177,468 acres for disposal; a considerable portion of this, particularly in the provisional districts of Auckland, Taranaki, Hawkes Bay and Wellington, is in the hands of native proprietors. In the other districts the native title has become extinct. Of the area of the islands 12,000,000 acres are fitted for agriculture and 50,000,000 for pasturage, but of this area upwards of two-thirds is at present covered by forest. The total area still open for selection was 13,483,679 acres, with 20,828,885 acres held by Land Boards or under lease, and 16,500,000 acres of native territory or of lands sold to Europeans by natives. On 1st January 1880 the number of runs in the colony was 997 of the aggregate area of 12,025,013 acres; the yearly assessment at from a half-penny to twopence per acre rent amounted to £102,215 7s. 3d. There are held under agricultural lease 125,813 acres 2r. 31p., the yearly rents being £10,772 5s. 3d. The land held for mineral and other purposes was 111,287 acres 1r. 33p., the yearly rent being £5517 13s. 9d. The stock returns were 137,768 horses, 578,430 horned cattle, 13,069,338 sheep, 12,243 goats, 207,337 pigs, and 1,323,542 poultry. The agricultural machinery was 985 thrashing machines, 4829 reaping machines, 34 steam ploughs and 32 steam harrows, besides many minor implements.

PASTORAL OCCUPATION.—The mildness of the winter season, which does not require that any special provision for the keep of stock during that period should be made, and the general suitability of the country for grazing purposes and the growth of a superior class of wool, caused the attention of the early settlers to be much given to pastoral pursuits; grass lands were looked up as sheep or cattle runs. The success attending the pursuit enabled the runholders to a large extent

to purchase the freehold of their runs or the best portions of them ; and by improvements in fencing and sowing with English grasses, which thrive remarkably well in the colony, the bearing capabilities of the land were increased many fold. While for the North Island there are considerable tracts of grazing ground with natural herbage, a large extent of the country consists of hill land of varying quality covered with forest or bush, as it is called in the colony. This land, after the bush has been cut down and set fire to, if grass seed be sown upon the ashes is converted in a few weeks into good grazing land. Much forest has already been destroyed in this manner and the land supports large flocks and herds, and the same system will doubtless be extensively followed, as a large portion of country that would be so used is not available for agricultural pursuits. In the Middle Island the bush is chiefly confined to the western slopes of the dividing range ; the open hills, plains and downs to the east of the range being available for grazing purposes. Wool is the most important product of the colony, the annual export being more than double in value that of gold. The merino is the most valuable and important breed cultivated in N.Z., and of sheep of this class the flocks of the colony are chiefly composed ; they are of the Australian merino variety, improved through the importation of pure Saxon merino rams from Germany. The merinos adapt themselves to every change of climate, and thrive and retain, with common care, all their fineness of wool under a burning tropical sun, and in cold mountain regions. In N.Z. the length of staple and weight of fleeces have been increased, without any deterioration in the quality of the wool. Up to the present time the weaving industry in N.Z. has been confined to tweeds, plaiding, and blankets, and various woollen underclothing. The value of wool exported in 1878 amounted to £3,292,807.

FISHERIES.—N.Z. is the chief centre of the southern whale fisheries, and at certain seasons the less frequented harbours are visited by whalers for the purpose of refitting and carrying on shore-fishing and barrelling their oil. These are generally American ships, but Otago and Auckland whaling ships are also equipped by N.Z. owners. The sperm whale abounds in the region of the ocean lying to the N.E., but stragglers are found all round the coast. In the open sea and to the S. the most prized whale next to the sperm is the black whale, or tohoro, which is like the right whale of the North Sea, but with baleen of less value. Along the shores the chief whales captured are the humpback and Rorquals, which become very abundant when not disturbed for a few years. In 1875 20,845 gallons of black oil were exported, valued at £4100, and 7775 gallons of sperm, valued at £2894. In 1877 15,047 gallons of sperm whale oil were exported, valued at £4032. The sea bear, or fur seal, is found in the remote parts of the coasts, about a thousand skins being taken every year by boating parties. In 1875 there were

exported 2767 seal skins, valued at £4050 ; and in 1877 there were exported 1503 seal skins, valued at £1652. The fishes which are found in the N.Z. seas, on the whole, represent the characteristic forms of the southern or Lusitanian province of the Mediterranean coasts ; or, in other words, they resemble those found on the coast between Madeira and the Bay of Biscay more than those caught about the N. of Scotland. Of thirty-three sea fish used as food, the constant residents on all parts of the coast, are the Hapuku, Tarakihi, Trevally, Moki, Aua, Rock Cod, Wrasse, and Patiki ; and while the Snapper, Mullet, and Gurnet are only met with in the N., the Trumpeter, Butter Fish, and Red Cod are confined to the S. But, with the exception of the Patiki, or Flounder, and the Red Cod, none of these are representatives of fishes common even in the S. of Britain, while from the more northern seas similar fishes are altogether absent. In addition to those which remain throughout the year a very large number of the fishes on the N.Z. coast, owing to its geographical position, are pelagic in their habits, and roam over a wide range of ocean, visiting our shores only irregularly in pursuit of food. Of the edible fishes of this class, by far the largest number are visitors from warmer latitudes, such as the Frost Fish, Barracoota, Horse Mackerel, King Fish, Dory, Warehou, Mackerel, and Gar Fish, while only the Ling, Hake, Haddock, and a few other fishes, which are rare and worthless as food, are among those of more southern types which reach the N.Z. coast in their migrations.

METALS AND MINERALS.—Gold was discovered in 1842, less than three years from the foundation of the colony, but it was not practically worked until 1852, when the mines of Coromandel first attracted attention to the district of Cape Colville peninsula, which at the present time forms the chief seat of true mining operations in N.Z. The yield from those mines has up to the present time been over four and a half millions sterling, but is small when compared with the quantity of alluvial gold obtained in the South Island subsequent to 1861, at which date the gold-fields of Otago became prominently known. The principal quartz mines in the North are in Coromandel and in the Thames districts, about thirty miles apart. In these localities the reefs have been "proved" to a depth of over 600 feet below sea level ; but the best mines have as yet been principally confined to the decomposed and comparatively superficial rock. Veins have been discovered and gold obtained at all levels on the ranges, from the sea level to an altitude of 2000 feet. The quantity of gold that has been obtained from some of these quartz reefs is very great ; and for considerable distances the quartz has yielded very uniformly at the rate of 600 ounces to the ton. Such reefs are however very exceptional in N.Z., as elsewhere. Auriferous reefs are also extensively worked in the schistose rocks of Otago, and occur at all altitudes, from sea level to a height of 7400 feet ; the

most elevated gold mine in the Australasian colonies being that opened during 1878 on the summit of Advance Peak, near the Wakatipu Lake. Several promising reefs have also been found in the Westland gold-fields, amongst which may be mentioned a reef of auriferous *Stibnite* at Langdon's Creek, near Greymouth, which yields from a few ounces to ninety-nine ounces of gold per ton; but up to the present time these reefs have not received the attention they deserve, except at Reefton and a few other localities. Reefton is a well-established mining district, and nine mining companies, during the year ending 31st March 1878, divided as profit, the sum of £63,508 among the shareholders. Alluvial gold is chiefly found in the South Island, in the districts of Otago, Westland and Nelson, in which mining operations are carried on over an area of almost 20,000 square miles. The auriferous sand, or gold drift as it is usually termed, is of three distinct kinds:— (1.) That found in the beds of rivers and worked by small parties of miners, the process requiring no large expenditure of capital to effect the separation of the gold. (2.) Immensely thick deposits of gravel of more ancient date occupying the wider valleys and the flat country, from which the gold can only be obtained by means of considerable expenditure and large engineering works for the purpose of bringing a supply of water for undermining and working the auriferous deposits. This description of mining is of a more permanent character than the former, and provision has been made by the Government for assisting the miners by the construction of water races, which will supply the means of profitable employment to a much larger number of persons. Some of these deposits are of considerable age, the cements of Tuapeka being certainly not younger than the lowest tertiary deposits of the colony. They occur in beds from 300 feet to 500 feet thick and cover a considerable area of country. These cements are treated in a different way from ordinary alluvial deposits, being crushed and washed in the same manner that a quartz reef is worked; about 150 tons of stone is thus put through the batteries in one day. They consist of coarse gravels and silts cemented together and carrying variable quantities of gold, and were first found at the Blue Spur in Otago, and subsequently at a number of other places in the same district; at Charleston and elsewhere on the West Coast auriferous cements are also worked, but the localities first cited are those which to the present time have received the greatest attention. The yield of gold from the cement claims is small, but in consequence of the large amount of material which can be operated upon, the value of the deposits is considerable, and their extent guarantees that they will afford remunerative returns for some time to come. (3.) Along the sea coast the continued wash of the waves produces a shifting action on the sands brought down by the rivers and drifted along the shore, thus producing fine deposits of gold, which

by the aid of simple mechanical contrivances afford employment to a large number of diggers, who can labour without incurring the hardships attending the occupation of the miner in the more inland districts. The alluvial diggings at Collingwood were discovered in 1858; those of Otago in 1861; and in 1864 the gold-fields near Hokitika proved a great attraction to the mining population. In Otago the gold drifts rest on the denuded surface of their parent rocks. The auriferous gravels in the western district, on the other hand, as a general rule, rest on the surface of tertiary rocks of marine origin, and they have a general distribution parallel to whatever was the western shore of the island at the time of their deposit. The richest alluvial diggings in Westland usually occur in places inaccessible for water supply, the streams having cut their channels much below the surface of the country, so that an organised system of irrigation is necessary to obtain the required amount of water for the gold washing. The total quantity of gold entered for exportation up to 31st December 1879 amounted to 9,246,946 ounces, valued at £36,110,490. The silver exported from the colony has been chiefly extracted from the gold obtained at the Thames, which is alloyed with about 30 per cent. of the less valuable metal. Within the last two years several mines have been opened where the ore is argentiferous galena that yields twenty to fifty ounces of silver to the ton. In some cases the galena is mixed with iron pyrites that yields a fair percentage of gold. A mine has recently been opened in Nelson, at Richmond Hill, where the ore is a form of tetrahedrite, a mixed ore, containing silver, antimony, zinc, bismuth and copper, the silver being at the rate of from twenty ounces to 1792 ounces per ton. The total quantity of silver entered for exportation from the year 1869, when it was first exported, up to the 31st December 1879, amounted to 338,581 ounces, valued at £90,457. No iron mines are at present worked, though almost every known variety of iron ore has been discovered in the colony, the workings being limited to the black sands which occur plentifully on the coasts. There are also few soils or stream gravels that will not yield a considerable quantity when washed; the chief deposits are however on the sea shore of the W. coast of both islands, the best known being that at Taranaki. Several companies have been formed both in England and the colony to manufacture steel direct from this iron sand; they have not however succeeded, but a partial success has been attained lately by a new company by smelting in furnaces bricks formed of the ore with calcareous clay and carbonaceous matter. It remains to be proved however if it can be treated in large quantities by this process. At Parapara, Nelson, immense quantities of brown hematite ore occurs on the surface of the ground. Some of this was converted into iron at Melbourne in 1873, and gave on analysis 97·7 per cent. of iron. Deposits of a similar kind have been found in other localities.

Copper mines have been worked in Auckland on Great Barrier Island and in Kawau Island, and to a small extent in Doubtless Bay. It has been found associated with the metamorphic rocks in Otago and at Waipori, where a four-foot sulphide of copper (pyrites) lode exists. An attempt to trace this lode was made for a short time and then abandoned. A carbonate of copper is found in the same locality, but only in rolled fragments. Copper has also been found in the form of cuprite and copper glance in the Dun Mountain, Nelson, and on D'Urville Island, at which latter place the ore has been traced to a depth of 100 feet; some of the better samples from this place yielding as much as forty-five per cent. of copper. A lode of copper pyrites mixed with pyrrhotine has also been discovered in Dusky Sound, Otago, and a mine is being opened up at that place. Deposits of lead ore, zinc, chrome, antimony and manganese have been found in small quantities in various localities. Coal mines are being worked in the districts of Auckland, Nelson, Canterbury, Otago and Southland. Bituminous coal is worked chiefly in Nelson Province. At Mount Rochfort or Buller mines the seams are on a high plateau and are ten to forty feet thick, and from 900 to 3000 feet above the sea level; accurate surveys of this coal field show it to contain 140,000,000 tons of bituminous coal of the best quality and easily accessible. A railway seventeen miles in length is completed along the level country at the base of the ranges in which the coal occurs. At the Brunner coal mine on the Grey River, Nelson, the working face of the seam is eighteen feet, and it has been proved to extend one-third of a mile on the strike without disturbance, and to be available for working in an area of thirty acres; the estimated amount of coal being 4,000,000 tons, most of which can be worked above the water level. The coal from the Brunner Mine has been worked for twelve years; it yields vitreous coke, with brilliant metallic lustre. A railway has been constructed by Government to connect the mine with the port, and harbour improvements are in progress, whereby a larger class of vessels will be enabled to enter the river. The small quantity of this coal hitherto obtainable in N.Z. and Australian markets has been eagerly bought up for gas works and iron foundries. Engineers of local steamers esteem it 20 per cent. better than the best N.S.W. coal for steam purposes. Coke made from it is valued at £3 per ton. The first export of coal from N.Z. was made in 1866, amounting to 261 tons. At Kawa Kawa the average output is now 3500 tons per month. The Taupiri Company's monthly output is upwards of 2000 tons. Mining of brown coal or lignite, deposits of which are scattered over all parts of the colony, though not likely, except in a few instances, to support such large mining communities as the black coal, will afford in time extensive employment. As a natural product derived from the decomposition of coal seams, there occur petroleum or rock-oil springs in various parts of

the colony, particularly at Taranaki, on the W. coast, and in the vicinity of Poverty Bay, near the East Cape, in the North Island. The quality of the petroleum in the latter place is said to be equal to that obtained in Canada and the United States, as it yields, by a simple refining process, 60 to 75 per cent. of commercial kerosene. Sulphur is found in several parts of the North Island.—Building stone of superior character, also marble and granite, are regularly quarried in several localities. Marble is said to be in unlimited quantities at Caswell Sound. Graphite or blacklead has been found in large quantities at Wellington, and antimony near Greymouth. From the 1st April 1857 to 31st December 1879 the quantities of gold exported from the following districts were:—From Auckland, 1,249,104 ozs., valued £4,567,915; Wellington, 30 ozs., valued at £120; Marlborough, 46,840 ozs., valued at £181,730; Nelson, 1,622,587 ozs., valued at £6,442,709; West Coast, 2,423,166 ozs., valued at £9,599,663; Otago and Southland, 3,905,219 ozs., valued at £15,361,243; making a total of 9,246,946 ozs., valued at £36,153,380. To 31st March 1880 the total exports of gold were 9,326,248 ozs., valued at £36,471,588. The number of miners on 31st March 1879 was 14,297; the average earning of each miner for the year was £75 10s. Of the miners 3000 are Chinese, of whom about three-fourths are in Otago. During the year ending 31st March 1879 there were crushed 79,005 tons of stone; the yield being 98,052 ounces; beside which 20,000 ozs. were obtained from cement at Lawrence; making a total of 118,052 ozs. On 31st March 1880 the number of miners was 14,409; the average earnings of each miner was £81 2s. During the previous year 75,713 tons of quartz were crushed, yielding 92,344 ozs., which with 23,000 ozs. from cement at Lawrence made a total result of 115,344 ozs.

POPULATION.—By the census taken 3rd March 1880 the population was 230,998 males and 183,414 females; total 414,412. Of these 4438 were Chinese, 9 being females. The number of native-born whites was 174,126. The estimated population on 31st March 1880 was 470,000. In March 1878 there were 79.40 females to every 100 males; but exclusive of Chinese the proportion would be 100 males to 80.98 females. There were 82,588 inhabited dwellings, 5296 unoccupied dwellings, and 497 houses being built. Of the total 85,450 dwellings 3001 were built of brick or stone; 68,771 of wood and iron; 2748 of sod or similar material; 453 of raupo (a framework thatched with raupo or bulrush;) 2202 were described as huts of sod clay, wood or stone, and 2931 were tents or dwellings with canvas roofs. 4401 buildings were returned as stores, warehouses, workshops, business premises, and buildings used for offices only. The population was most dense in the Province of Canterbury, amounting there to 6.769 persons to a square mile; and least dense in the Province of Marlborough, where it only amounted to 1.778 persons to a square mile. Of the population 69.52

per cent. could read and write; 676 could read only; and 2372 could not read. The number of births in 1878 was 17,770; of marriages 3377; and of deaths 4645. *Maori Population.*—The total number of Maoris and of half-castes living as Maoris was in 1878 estimated at 42,819, the greater part being in the North Island, only a few living in the South and its adjacent Islands. The number of the principal tribes is 19. Of the Maoris 24,363 were stated to be males and 20,335 to be females. The sex of 772 was not given. Much difference of opinion exists as to whether the decline of the Maori race has not been, at any rate in certain districts, arrested, and it may be interesting to compare, so far as they are given, the ages of the Maoris with the ages of the settled and steadily increasing population of England. The numbers and sexes of some of the Maori tribes have been imperfectly given. It is therefore necessary to deal only with those tribes for which full information as to numbers, ages, and sexes is given. This was the case in respect of 13 of the principal tribes, amounting in the whole to 31,645, according to an account taken in 1874. Of these 6079 were males under 15 and 5225 females under 15. The males over 15 amounted to 11,209 and the females over 15 to 9132. There was a total excess of males over females of 2931, or to every 100 males there were 83.05 females. In England in 1871 the males under 15 amounted to 37.15 per cent. of the whole male population; the Maori males under the age of 15 amounted to 35.16 per cent. of the male population. The females of similar ages were respectively in England 35.12 per cent. of the whole female population, and among the Maoris 36.39 per cent. The existence among the Maoris of a higher proportion of females under 15 to the total female population than obtains in England might at first lead to the belief that the decline in the numbers of the race had been arrested, and that even an increase might be expected. It will however be manifest that if there are causes in operation which increase the mortality of the adult Maoris without increasing the mortality of the children the actual proportion of children to the whole population would be thereby much greater, and an appearance of productiveness shown which did not really exist. Do such causes exist? Does the fact of the partial adoption by the adult Maori of civilised habits and costume, and the continual reversion to the habits and costume of barbarism, with a system rendered more susceptible to external influences, especially those of a humid and changeable climate, tend to promote the spread of disease, notably of tubercular diseases, and consequent mortality? Does the spread of drinking habits tend to shorten the life of the adult Maori? These and other similar questions have an important bearing on the subject. The examination of the numbers of some of the tribes points rather to the conclusion that some such causes of mortality among the adults do exist.

The Ngatikahungunu show 41.91 per cent. of the males and 41.21 per cent. of the females as being under 15 years of age. The Rarawa show 40.58 per cent. of the males and 48.30 per cent. of the females as being under 15. It is hardly conceivable that the women of these tribes should have been so exceedingly prolific, and that, as in the case of the Rawa, nearly one half of the female population should have been under 15, unless a large number of adult women had died before reaching middle age, thereby increasing the proportion of younger females by reducing the proportion of the adults. It is to be noticed in connection with this subject that in 1871 the Maoris were estimated at 37,502, and in 1867 at 38,540, while in 1874 they were estimated at 45,470, and in 1878 at 42,819. The estimates formerly made were, however, from the then state of feeling in the Maori population, necessarily much more imperfect and unreliable than those recently made.

EDUCATION.—The system of education is now regulated by the Education Act which came into operation on 1st January 1878. The whole colony has been divided into twelve education districts, not corresponding with the former educational divisions, nor with the Provincial Districts. The present districts are subdivided into school districts each being under an Education Board. The teaching is entirely secular and free: the subjects embraced being reading, writing, arithmetic, English grammar and composition, geography, history, elementary science, drawing, object lessons, vocal music, needlework, domestic economy and drill. Religious teaching during prescribed hours is entirely forbidden, but may be given after school hours under certain conditions. There is a statutory grant to the Education Boards of £3 15s. per annum for every child in average attendance at the Public Schools, and in addition a grant at the rate of 10s. per annum for every child in average daily attendance, for distribution among the School Committees for local educational purposes, and a further sum of 1s. 6d. per child for the support of scholarships; and there are also additional grants for the training of teachers and school inspection. During 1879 the number of schools open was 817, as compared with 748 in the previous year. In the number are included 47 half-time, and 39 aided or subsidised schools. The average number of scholars in attendance at all the schools was 58,738, as against 50,639 in the previous year, showing an increase of 8099 scholars; the attendance having risen from an average of 67.7 per cent., to an average of 71.9 for each school. The number of teachers employed was, 1773, classified thus:—Head masters 659, male assistants 113, male pupil teachers 113, head mistresses 278, assistant mistresses 265, female pupil teachers 345. In addition to the literary staff may be added 110 work mistresses or teachers of sewing. The total expenditure on public schools was £417,849 7s. 5d., the cost per scholar including management, school inspection, and

maintenance was £3 3s. 2d.; if the cost of new school buildings be included the average per scholar would be £7 10s. 10d., against £6 3s. 9d. for 1878. The expenditure on school buildings in 1879 was £172,867 14s. 3d. In connection with the school system are Public Libraries and Savings Banks for the use of the children. In 1879 the sum of £6074 0s. 7d. was expended on the former. The Savings Banks have not proved a success. Excluding the Universities and the Theological Colleges the average daily attendance at the Secondary Schools was 679 boys and 483 girls, who were taught by 21 male, and 23 female teachers there being also 29 visiting teachers. 96 scholarships were held from one to three years tenure, varying in value from £20 to £40, the total cost amounting to £2834 14s. 4d. On 1st January 1879 there were 236 private schools, with 526 teachers, and an average attendance of 8138 scholars. For Higher and Secondary Education there are the University of N.Z., the University of Otago and Canterbury College; and Auckland College and Grammar School, Auckland Girls' High School, Wellington College, Canterbury Girls' High School, Otago Boys' High School and Otago Girls' High School, Nelson College, and Christ College and Grammar School, Christchurch, with some other institutions of a less public character. The University of N.Z. is empowered to confer the same degrees as the Universities of Oxford and Cambridge. According to a recent return the number of undergraduates was 158. The income for the year 1879, including the Government grant of £3000, was £3551 8s. 3d., the expenditure was £2885 12s. 5d. At the Otago University for the year ending 31st March 1880 there were 111 students, of whom 15 matriculated. The total number attending the classes was 188. The income for the year was £12,704 5s. 11d.; the expenditure was £13,759 2s. 11d.

NATIVE SCHOOLS.—The number of schools established for the education of the Maori race was during 1877, 56. The number of pupils was 1088 males and 711 females, an increase as compared with the previous year of 94 males and 135 females. The number of instructors was 103, of whom 55 were males and 48 were females; of these four males and three females were of the Native race. The grants by the Government on account of these schools amounted to £10,740. Thirty-six European schools also received subsidies from the Government for the support of Maori pupils. 436 Maoris—viz., 231 males and 205 females, attended these schools, an increase on the previous year of 71 males and 85 females. The total number of Maori children thus receiving education in 1877 amounted to 2235.

PUBLIC WORKS.—The rugged character of the country generally, and the natural difficulties appertaining to many of the sites on which the chief towns were built, very early necessitated a large outlay on roads and public works. This necessity was fully recognised, and to some extent

met by most of the Provincial Governments, who have justly received great credit for their far-seeing and liberal exertions in that direction. A great deal of road-making, often of a very costly character, was accomplished; harbour and other improvements were begun, and immigration was encouraged. Something was also done in the way of making railways, notably in Canterbury, where a line unusually difficult and expensive in construction, involving some heavy tunnelling, was successfully carried through by the Provincial Government in order to provide easy means of communication between Christchurch and the Port of Lyttleton. Some advance towards the construction of a main trunk line had also been made in the same province. In Otago the City of Dunedin had been connected with Port Chalmers by a railway, constructed under the guarantee of the Otago Provincial Government, and some miles of railway had been made in Southland. But the work to be done in the colony generally was too vast to be grappled with by the exertions of local governments. It was therefore proposed that the General Government should take in hand the execution of all public works of a colonial character on an extensive and well-defined system, and a loan of ten millions raised to provide funds for that purpose. The objects to be accomplished were defined to be:—(1) Systematic immigration on a large scale. (2) Construction of a main trunk railway throughout each Island. (3) Construction of roads through the interior of the North Island. (4) The purchase of native land in the North Island. (5) The supply of water on gold-fields. (6) The extension of telegraph works. In accordance with the plan thus laid down, the Immigration and Public Works Act of 1870 was passed by the Legislature, and many who were greatly alarmed when the scheme was first propounded to the country by Sir Julius Vogel, and thought it wild and extravagant, have since admitted that the step taken was as wise as it was bold. A considerable extent of country has been opened up and settled by a large and thriving population in a surprisingly short space of time. As facilities were offered for the conveyance of the products of agriculture the value of land greatly increased—not its nominal value merely, but its actual value. Hundreds of thousands of acres worth, before the advent of railways, from £1 to £3 an acre, were afterwards sold at prices ranging from £10 to £20 per acre, and for the most part were bought by experienced farmers who had made their money in the colony and knew the real capability and value of the land so purchased. It may also be said that in addition to the reproductive indirect results of the public works policy, the outlay incurred, at least in the case of the railways constructed, is likely to prove a capital investment, and so be directly reproductive, many of the principal lines already yielding a fair interest on the money expended in their construction. The total amount expended on public

works by the General Government from the date of the Immigration and Public Works Act of 1870, and similar subsequent Acts, and under their authority up to 31st March 1880, was £15,286,621, which with the addition of the advances in the hands of officers of the Government (£315,763) and an estimated sum of £200,000 for discount and charges of raising the last loan, makes together £15,802,384, leaving a balance of £3,262,410 out of loans raised under the authority of the Act, amounting in the aggregate to £19,000,000 sterling.

IMMIGRATION AND EMIGRATION.—Up to the end of the year 1870 the conduct of immigration was entirely in the hands of the different Provincial Governments. The Public works and Immigration Act of 1870 provided a sum of £1,000,000 out of the loan then authorised, to be expended upon the introduction of immigrants into the colony. The liberal system under which immigration had been conducted, and which allowed residents in the colony to nominate suitable persons for free passages, has been modified for a time owing to the presence of a superabundance of labour coupled with the fact that more than the average number of the most desirable class of immigrants—small farmers and others with means—were coming forward and paying their own passages to the colony. The immigrants who have arrived, taken as a whole, may be said to be of a superior class. The total arrivals during 1879-80 amounted to 7413 persons. The number of immigrants brought to the colony at the public expense up till the 30th June 1880 was 84,499 statute adults.

REVENUE.—The total ordinary revenue for the colony in 1878 was:—Ordinary Revenue, raised by taxation, £1,533,393; Territorial Revenue, not raised by taxation, £2,634,496; Total revenue, £4,167,889. According to the Treasurer's statement the deficit on 30th June 1879 was £133,790; the expenditure for the nine months ending 31st March was £2,772,276; the liabilities on the same date £272,774; making a total of £3,178,840. The receipts for the same period were £2,133,758; land tax due 1st April £50,000; assets £5000; total revenue £2,188,758. Taking the total revenue from the total expenditure, there was a deficit of £990,081 for the period ended 31st March 1880, to meet which Treasury and deficiency bills were issued to the amount of £1,000,000. To equalise expenditure and revenue in the future it was proposed to reduce the salaries of ministers twenty per cent., to make expensive curtailments in the Civil Service, to reduce all salaries ten per cent., to impose an excise tax of three-pence per gallon on beer, and to increase the Succession Duties.

PUBLIC DEBT.—The public debt amounted on 31st March 1880 to £27,422,611; or, deducting the accrued sinking funds, £25,617,112 16s. 4d. This amount is exclusive of Treasury and deficiency bills for £992,000 held by the Public Works Fund and the £800,000 unsold debentures of the loan of 1870 guaranteed by the Imperial Government.

When these are disposed of the gross debt will amount to £29,214,611; or, deducting the accumulated sinking fund, £27,409,113, subject to an annual charge of about £1,535,000 for interest.

IMPORTS AND EXPORTS.—The exports for the year 1878 (excluding imported goods exported) were £6,015,700. The imports were £8,755,663. The export of wool was 59,270,256lbs., valued at £3,392,807; tallow 100,380 cwt., value £178,502; hides 10,203, value £9,571; sheepskins 184,123, value £16,239; gold 311,437 ozs., value £1,244,190; coal 6362 tons, value £5139; flour 4031 tons, wheat 1,701,011 bushels, barley 102,476 bushels, oats 302,776 bushels, the whole valued at £555,071; preserved meats 28,188 cwt., value £74,225; Kauri gum 3,445 tons, value £132,975; hemp 622 tons, value £10,666; timber £183,618; sealskins £1245; sperm oil £5041. The imports comprised all kinds of manufactures and articles in daily use and consumption, £5,333,170 being from the United Kingdom. For 1879 the exports were £5,473,126; the imports £8,374,585. Between 1860 and 1865 the imports rose from £1,188,000 to £5,352,000, and the exports from £438,000 to £2,718,000. This advance was due to the gold discoveries.

BANKS.—On 30th June 1880 the aggregate average assets of the six banks doing business in the colony were £14,310,636 12s. 9d.; the average liabilities £9,424,825 15s. 2d. The dividends ranged from 6 per cent. (National) to 17½ per cent. (New South Wales,) the average being 12½ per cent., and the aggregate £382,514 5s. 5d. The total amount of reserved funds when the dividends were declared was £2,679,341 13s. 11d. The note circulation amounted to £907,084 1s. 7d. The deposits bearing interest were £4,457,230 18s.; not bearing interest, £3,140,522 10s. 11d. The total paid-up capital was £5,450,000.

GOVERNMENT INSURANCE.—An extensive system of life-assurance is carried on by the Government. During the nine and a half years it has been in existence the policies issued number 12,896, assuring the sum of £4,533,733. The accumulated funds on 30th June 1880 amounted to £372,654 14s. 5d.

MILLS AND MANUFACTORIES.—In 1879 there were 102 flour mills, 87 breweries, 31 flax mills. In addition to these there are 657 manufactories, works, &c., employing 7999 male hands and 195 female hands, and machinery of the aggregate of 4203 horse-power. The principal of these factories are 8 agricultural implement, 6 biscuit, 32 boiling down and meat preserving, 124 potteries, 13 candle and soap works, 49 coach building, 2 distilleries, 100 fellmongeries and tanneries, 11 furniture, 2 glue, 28 iron and brass foundries, 19 rope, cordage, and mat, 204 saw mills, sash and door, 43 ship and boat building, 3 woollen cloth. Railway trucks are made in the colony both at Government and private works.

PUBLIC LIBRARIES.—There are 161 institutions variously denominated as public libraries, mechanics' institutes, and literary institutes:

these had, on 1st January 1879, 98,039 volumes and 9411 members.

CROWN LANDS.—Prior to the abolition of Provincial Government the control and management of the Crown lands in each province was vested in the respective Provincial Governments, and the laws and regulations relating thereto were very various. In 1877 a general Land Act applicable to the whole colony was passed. Under this Act the supreme administration of all Crown lands was vested in the Minister of Lands; the colony being divided into ten land districts, each having a Crown Lands Commissioner, one or more Receivers of Land Revenue, and a Board of Commissioners. Land not sold by auction may, by special proclamation of the Governor, remain open for selection, at the upset price, on a system of deferred payments extending over a period of ten years. Although the Act applies generally to the whole colony, the Commissioners have authority to modify some of its provisions so as to meet certain exceptional cases. The Amendment Act which came into operation on 1st January 1880 contains some important provisions, not the least being the repeal of the Act of 1877. It gives power to the Governor to declare residence optional on bush land taken up on deferred payments; also to fix the price at which any allotments of rural or suburban land open for sale on deferred payment may be disposed of, the price being not less in any case than twenty shillings per acre for rural land and ninety shillings per acre for suburban lands. The Governor may increase the price of any allotments which he may consider to be of special value. The Act also provides that several small sections contiguous to one another may be grouped into one allotment. The total area of Crown land sold or otherwise disposed of from the first return in 1856 to 30th June 1879 amounted to 14,014,632 acres; of which 11,672,651 acres were sold for cash, realising the sum of £11,210,412. A total estimated area of 34,304,550 acres (exclusive of Native lands) still remains open for settlement. The total area of Crown lands held for depasturing purposes on 30th June 1879 was 12,253,876 acres, in the hands of 918 holders, the rents and assessments of which amounted to £111,000.

RAILWAYS AND ROADS.—Soon after the passing of the Immigration and Public Works Act in 1870 the construction of railways on a large and systematic scale was commenced, and has proceeded vigorously since that time. The total length of lines open for traffic on the 30th June 1879 was 1140 miles; and there were under construction 142 miles. The total amount expended in the construction of railways to that date was £8,057,188. The district roads are undertaken by the various Road Boards. The total number of these boards in 1877 was 320, and their expenditure for the year amounted to £387,534. Much road making has also been done by the General Government, especially in the North Island. During the period from June 1869 to June 1879 the General

Government expenditure in this department amounted to the sum of £975,552, the roads constructed being about 3000 miles.

ADMINISTRATION OF JUSTICE.—This is under the care of a Chief Justice and four puisne Judges of the Supreme Court, besides Judges of the district courts and Resident or Stipendiary Magistrates. A Court of Appeal, at which all the Judges sit, is held annually at Wellington.

CONSTITUTION.—In 1853 Constitutional Government was conferred on N.Z. (Act 15 and 16 Vict. cap. 72.) It is represented by a Governor appointed by the Crown, a Ministry who form the executive, and a Parliament of two chambers. The Legislative Council consists of forty-five members appointed by the Crown for life, of whom two are Maoris. The House of Representatives consists of eighty-eight members, thirty-two for the North Island, fifty-two for the South Island, and four Maori members, whose term of office is limited to three years. The members of both Houses receive £157 10s. each for every session, to cover travelling and other expenses, less a reduction of ten per cent. Every man twenty-one years of age, who has been resident in the colony one year, and six months in one electoral district, or any person who has for six months preceding the day of registration owned a property of £25 value, is qualified both to vote for, or to be a member of, the House of Representatives. The Maori qualification is possession of a freehold of the value of £25, or being a ratepayer within an electoral district. In 1879, 6686 Maoris were on the electoral roll. Each province till recently had its own separate local government, being in this respect similar to each State in the United States; the governing power was vested in a Provincial Council consisting of twenty to forty councillors, presided over by a Superintendent; both Council and Superintendent being chosen for four years; the provincial system was abolished by an Act of the General Assembly (39 Vict. No. xxi.) passed in 1875, the powers previously exercised by the Superintendents and other provincial officers being delegated to local boards, called County Councils, or vested in the Governor. A detailed description of each Provincial District is given under the several heads.

HISTORY.—I. *First Settlement.*—N.Z. appears to have been discovered and first peopled by the Maori race, a remnant of which still inhabits parts of the Islands. At what time the discovery was made or from what place the discoverers came are matters which are lost in the obscurity which envelopes the history of a people without letters. Little more can now be gathered from their traditions than that they were immigrants, not indigenous; and that when they came there were probably no other inhabitants of the country. Similarity of language indicates a northern origin, probably Malay, and proves that they advanced to N.Z. through various groups of the Pacific Islands in which they left deposits of the same race, who

to this day speak the same or nearly the same tongue. When Cook first visited the country he availed himself of the assistance of a native from Tahiti, whose language proved to be almost identical with that of the New Zealanders, and through the medium of whose interpretation a large amount of information respecting the country and its inhabitants was obtained, which could not have been had without it. The first European who made the existence of N.Z. known to the civilised world, and who gave it the name it bears was Tasman, the Dutch navigator, who visited it in 1642. Claims to earlier discovery by other European explorers have been raised, but they are unsupported by any sufficient evidence. Tasman did not land on any part of the islands, but having had a boat's crew cut off by the natives in the bay now known as Massacre Bay, he contented himself with sailing along the western coast of the North Island and quitted its shores without taking possession of the country in the name of the Government he served; a formality which, according to the law of nations (which regards the occupation of savages as a thing of small account,) would have entitled the Dutch to call N.Z. theirs—at least so far as to exclude other civilised nations from colonising it and conferring on themselves the right to do so. From the date of Tasman's flying visit to 1769 no stranger is known to have visited the islands. In the latter year Cook reached them in the course of the first of those voyages of great enterprise which have made his name illustrious.

II. *Cook's Discoveries.*—The first of Cook's voyages of discovery began in August 1768 when he was sent to Tahiti to observe the transit of Venus. Having performed this duty his instructions directed him to visit N.Z., of which nothing more was known than the little that Tasman had told. After a run of eighty-six days from Tahiti, having touched at some other places, he sighted the coast of N.Z. on 6th October 1769. On the 8th he landed in Poverty Bay on the east coast of the North Island. It is interesting to know what appearance it presented at the time of Cook's arrival. The aspect of most countries from the sea is less prepossessing than their internal features, and this holds good of the greater part of the east coast of both islands of N.Z. Portions of the west coast of both, however, present views from the deck of a ship unsurpassed in any part of the world. For instance, the hundred miles of Southern Alps whose snowy peaks pierce the sky at a height of nearly 14,000 feet, their sides clothed with dense evergreen forests in the very bosom of which lie gigantic glaciers, and their base chafed by the resounding surf of the Pacific Ocean. Then there is the stately cone of Mount Egmont, rising near 10,000 feet in solitary grandeur from an undulating wooded plateau almost on the margin of the sea. There are also the stupendous precipices of Milford Sound shooting up sheer many hundreds of feet from an almost fathomless depth of ocean frowned

down upon by the snowy summits of the great Alpine range, while cascades of nearly 1000 feet fall headlong down their sides. These great features remain to this day as they were at the period of Cook's arrival. Nor has the general character of the country as a whole been much changed in its principal features by the progress of colonisation. More of it no doubt was then in a state of nature; but much of it is so still. Dense forests exhibiting new and beautiful forms of vegetation, including the gigantic scarlet flowering myrtle (one of the largest forest trees,) the graceful tree-fern, and the bright eastern-like Nikau palm, clothed the mountain slopes and much of the undulating lower country. Elsewhere vast plains of brown fern, or coarse yellow and hay-coloured grasses, or big swamps bearing the farinaceous raupo and the native flax of the country, the well-known *Phormium* of commerce. Then there was the feature with which the voyagers from their long visits to Queen Charlotte's Sound would be so familiar—the little retiring cove with its sandy or pebbly beach, its few acres of level green backed up by steep hills covered with lofty trees, and an underbrush of velvety shrubs arranged by the hand of nature far more tastefully than could have been done by the Londons or Paxtons of the civilised world. Ship Cove, Cook's favourite rendezvous, was one of these beautiful nooks—a spot where as he observed if a man could live without friends, he might make a model home of perfect isolated happiness. To every Englishman, whose colonising taste has been inspired by his boyish reading of Robinson Crusoe, these charming little bays seem to realise the exact idea of his imagination. While there are large tracts of country in N.Z. which present no pleasant feature except to the mind of the sheep-farmer or agriculturist, there are others which combine all the grandeur and beauty that can delight the eye of the most fastidious lover of nature, the painter or the poet. And much of this must have lain under Cook's eye during his visits to the country. The spot where Cook landed, however, though by no means repulsive, was not one of the most inviting portions to look at. Hills of no great height or grandeur, backing a moderate-sized flat at the head of a bay, whose horns were two not very commanding white cliffs did not afford a prospect either very imposing or very inviting. At the present time it is the site of a prosperous and flourishing European settlement; but at the time of Cook's visit it was barren and unoccupied, except by a few natives of unfriendly character. No fields of waving corn, no cattle luxuriating on meadows of the now celebrated Poverty Bay rye-grass, no hamlet, no church spire, no cottages with children running in and out, no sign of civilisation, of material plenty or social life. It required an eye of faith to see it as it now is, and to believe that in a hundred years it would exhibit the picture it does. The circumstances of Cook's first landing were unfortunate. "We landed," he says, "abreast

of the ship on the east side of the river, which was here about forty yards broad; but seeing some natives on the west side with whom I wished to speak, and finding the river not fordable, I ordered the yawl to carry us over, and left the pinnace at the entrance. When we came near the place where the people were assembled they all ran away; however we landed, and leaving some boys to take care of the yawl we walked up to some huts which were about 200 or 300 yards from the waterside. When we had got some distance from the boat four men armed with long lances rushed out of the woods, and running up to attack the boat, would certainly have cut her off if the people in the pinnace had not discovered them and called to the boys to drop down the stream. The boys instantly obeyed, but being closely pursued, the coxswain of the pinnace, who had charge of the boats, fired a musket over their heads. At this they stopped and looked round them, but in a few minutes renewed the pursuit, brandishing their lances in a threatening manner. The coxswain then fired a second musket over their heads, but of this they took no notice, and one of them lifting up his spear to dart it at the boat, another piece was fired, which shot him dead. When he fell the other three stood motionless, as if petrified with astonishment. As soon as they recovered they went back, dragging the dead body, which however they soon left that it might not encumber their flight. At the report of the musket we drew together, having straggled to a little distance from each other, and made the best of our way back to the boat, and crossing the river we soon saw the native lying dead on the ground." The account which the natives themselves gave of their impressions on Cook's arrival is recorded by Polack, who had it from the mouths of their children in 1836:—"They took the ship at first for a gigantic bird, and were struck with the beauty and size of its wings, as they supposed the sails to be. But on seeing a smaller bird, unfledged, descending into the water, and a number of parti-coloured beings, apparently in human shape, the bird was regarded as a houseful of divinities. Nothing could exceed their astonishment. The sudden death of their chief (it proved to be their great fighting general) was regarded as a thunderbolt of these new gods, and the noise made by the muskets was represented as thunder. To revenge themselves was the dearest wish of the tribe, but how to accomplish it with divinities who could kill them at a distance was difficult to determine. Many of them observed that they felt themselves ill by being only looked upon by these atua (gods,) and it was therefore agreed that as the new comers could bewitch with a look the sooner their society was dismissed the better for their general welfare." It was not much to be wondered at that any further intercourse with the natives at this point should become impossible. Other collisions attended with similar fatal results followed on succeeding days; and on the 11th, three days after his first landing, Cook

weighed anchor and stood away from this "unfortunate and inhospitable place," as he calls it, and on which he bestowed the name of Poverty Bay, as it did not afford a single article they wanted, except a little firewood. Had his subsequent experiences been as unpropitious he would probably not have reported to his countrymen at home so favourably of N.Z. There is no doubt that the problem of initiating intercourse with a people of the temper exhibited by the Maoris, and so little civilised as they were, was one difficult of solution. As strangers had never but once before visited the country in the hasty manner in which Tasman came and departed, and at a place remote from that at which Cook arrived, the Maoris could hardly be expected to appreciate the relations which ought to exist between themselves and their visitors. It must have been a new sensation to most of them to know that there were such things as strangers; still more strangers resembling themselves so little and differing of themselves so much. It is not surprising that the first impulse of the Maoris of Poverty Bay should be to hurl their spears at the strangers. Cook's idea of meeting such a hostile greeting was, as he tells, first by the use of firearms to convince the savage of the superior power of the white man, and then to conciliate him by kindness and liberal dealing. Whether any other method were possible he does not seem to have been allowed by the natives time to consider, the first collision being in a manner forced upon him within five minutes of his arrival, though the challenge was perhaps too hastily accepted. He soon however discovered that the country was not all made up of "Poverty Bays," nor were the natives, when wooed with a less rough courtship, altogether incapable of access or entirely obnoxious to strangers. In Tolago Bay, Mercury Bay, Hawke's Bay, the Bay of Plenty, the estuary of the Thames, the harbour of Waitemata, in Whangarei, and at the Bay of Islands, and lastly at his favourite rendezvous of Queen Charlotte's Sound, he was able to procure the refreshments which Poverty Bay had failed to supply, and he established a footing with the natives which, if it had in it more of the spirit of barter than of hospitality, was less deterrent than the attitude taken up by those who greeted him on his first arrival, and which ended in the unfortunate events to which we have before referred. There was no object of greater interest to him than the newly-discovered Maori race, with whose habits and character he was specially instructed to make himself acquainted. He found them savages in the fullest sense of the word. Some writers who have given the reins to their imagination have pictured savage life as a state of Arcadian simplicity, and savage character as a field on which are displayed all the virtues which adorned humanity before civilisation brought vice, confusion, and trouble into the world. More truly has it been observed that "the peaceful life and gentle disposition, the freedom from oppression, the

exemption from selfishness and from evil passions, and the simplicity of character of savages have no existence except in the fictions of poets and the fancies of vain speculators, nor can their mode of life be called with propriety the natural state of man." Cook's experience fully verified these views. He found the Maoris almost entirely unacquainted with mechanic arts, their skill limited to the ability to scoop a canoe out of a tree, to weave coarse clothing out of the fibres of the native flax, to fabricate fishing nets, to make spears, clubs, and other rude weapons of war, or still ruder ornaments for the adornment of their persons, their huts, or their canoes. Beasts of burden they had none—the women supplied their place. Stone hatchets were the substitute for axes and all cutting tools. The country is full of iron ore, but the use of the metal was entirely unknown. They had no wheeled carriages. Their agriculture was limited to the cultivation apparently of two roots—the kumera or sweet potato, and the taro, another esculent plant. Their food consisted of those plants, of eels and sea-fish, rats, occasional dogs, wild fowl and human flesh; and their nearest approach to bread was the root of the wild edible fern, a not very wholesome or palatable substitute. Cereals they were without. Their religious notions were of a confused order, involving good and evil demons, but without any idea of worship or prayer. Their priests wielded a sort of half moral and half political power in the institution of the taboo, to which they subjected whom they pleased, and the infringement of which involved punishments of the severest sorts. But the one absorbing idea of the race was war. Every tribe and almost every family was at war with every other. Their time was almost wholly spent in planning or awaiting invasions of their neighbours, or in the bloody struggles which resulted; the consequence being, as Cook observes, a habit of personal watchfulness which was never for a moment relaxed. Female infanticide was a common and established practice, which appears to have reduced the proportion of females to males to something like seven to ten. Female virtue was entirely disregarded before marriage and not much valued afterwards; while to crown the whole, cannibalism was the universal practice of the race. Cook had been specially instructed to institute inquiries on this point. There were many persons at home who were sceptical on the existence of cannibalism among any people. The result of his daily observations was to leave no doubt of its existence, and to establish the fact that it was not merely an occasional excess to which those who practised it were impelled by fury and the spirit of revenge against an enemy, but that human flesh was their almost daily habitual food. A provision-basket was seldom seen without having in it a human head or other evidence of the fact. It is true that they told him that they ate only their enemies; but so incessant were their invasions of each other that enemies were never wanting, or if the supply

failed, slaves taken in former raids were substitutes at hand, and constantly killed in cold blood for the purpose. Much has been said and written of the deplorable fact that the foot of civilised man treads out the life of the savage; and there are not wanting those who impute to colonisation the extinction of the Maori race. A moment's reflection on their habits of life as described by Cook, and still more what we have since learned, must convince anyone that their decadence had set in long before his arrival; for it was impossible that any people whose habits of life were such as theirs, and who lived within a circumscribed area, could long continue to exist. Cook did what little was possible towards improving the condition of the New Zealanders. He tried, but failed, to acclimatise the sheep and goat; neither long survived the attempt. He was more successful with the pig, which rapidly increased, till at the time of arrival of the colonists nearly the whole Islands were found thickly stocked with wild herds, the descendants of his original importation. He also left the potato behind him, which succeeded well, and to a great extent supplemented the kumera, taro, and fern root. He also planted and gave to the natives the seeds of other vegetables and garden plants; but though their remains may be seen in the wild cabbage or turnip, and some other degenerated plants, the natives appear not to have succeeded in their cultivation. He also scattered among them a good many English tools and implements, and some articles of clothing, which, though no doubt soon wore out, gave the Maori a taste for European luxuries and necessities of life. Cook visited N.Z. several times during his three voyages of discovery, and altogether spent 327 days in the country or circumnavigating its coasts. He quitted it for the last time in February 1777, just two years before his melancholy death at Hawaii in the Sandwich Islands. Within a few years afterwards, N.Z. began to be occasionally visited by whaling ships; but, with the solitary exception of a shipwrecked sailor, who records his adventures in the two volumes entitled "The New Zealanders," published in "Knight's Library of Entertaining Knowledge," there is no English account of the state of the island from the time of Cook's departure until the arrival of the first missionaries. Soon after Cook's first visit the French Navigator De Surville, of the ship *St. Jean Baptiste*, anchored at Mongonui (in December 1769) while searching for an island of gold which it was believed the English had just discovered in the Pacific Ocean. He held friendly relations with the natives at first, but in the belief that they had stolen one of his boats he burned a village and carried away a chief. Three years later, on 11th May 1772 his countryman Marion du Fresne, with Crozet second in command, in the ships the *Mascarin* and the *Marquis de Castres*, anchored near the same spot. Friendly intercourse was maintained with the natives till the thirty-fourth day, when Marion and fourteen of his company were enticed on

land and murdered; a terrible retaliation followed, many natives were shot down and their villages burned.

III. *The First European Settlers.*—The first rough pioneers of civilisation among the Maoris were undoubtedly the English whalers and sealers from N.S.W. Others of the same craft but of different nations followed, who locating themselves on the coast of Cook Straits gradually improved their communications with the natives, and pursued a rude but lucrative trade in what is called shore-whaling, in contradistinction from deep sea-fishing—the whalers merely following the fishing boats from their settlements, where the buildings and implements for “cutting in” and “trying out” were established. The Sydney merchants gave employment to these land whalers, their vessels carrying away the oil and leaving money, clothes, arms and rum in payment. These rough-and-ready settlers amalgamated in some degree with the Maoris—half warriors, half fishermen—of the coasts. Some of them married the daughters and sisters of native chiefs, thereby securing the powerful protection of the latter; others contracted alliances of a less formal nature with native women, and a half-caste breed sprang up to cement the alliance between the races. In the numerous conflicts between native tribes the Englishmen sometimes sided with that which had shown them favour or was connected with them by marriage or traffic; and their furious bravery, their firearms—then rare in the country—and the formidable weapons of their trade, the harpoon, the axe, the lance and the whale-spade, caused the fortunes of the party against which they fought to kick the beam. They themselves sometimes suffered no trifling reverses. When absent in their boats in pursuit of fish some foraging party of hostile Maoris would rush upon the settlements, burn down the huts and whaling stages and carry off property, women and children, not perhaps so much out of enmity to the whites as in blind retaliation on the tribe among which they resided. The utter want, or rather absence of law or of any superior example of conduct, and the periodical plenty of strong waters, gave rise to and perpetuated scenes of drunken riot such as, knowing the actors, one can easily conceive, but which to describe would be impossible. Such being the European actors in the first scene of N.Z. civilised, there follows a straggling host of runaway sailors, military deserters, escaped convicts from N.S.W. and V.D.L., sawyers and lumberers, adventurers and evasives of every sort. The Maori's impressions of the European scale of morals and polite arts as furnished by these specimens could not by possibility rise high. Indeed the drunkenness and reckless debauchery of the Pakehas (foreigners) actually revolted the natives; for they are sober by nature and by practice even now. Moreover on those especial points on which the New Zealander was supposed to excel, namely merciless onslaughts on the unarmed and

unsuspecting adversary where neither sex nor age was a shield, there were not wanting instances in which Englishmen distinguished themselves above the savage, lending their vessels, boats, arms and personal aid through every stage of enormity. A certain master of a vessel named Stewart has been convicted by notoriety of furnishing means of transport, arms, ammunition, and his own countenance and assistance in the most truculent and destructive descent of one tribe upon another that ever was heard of—even to cooking the bodies of the slain, to which purpose he devoted his ship's coppers. This man met with a mockery of a trial at Sydney, and escaped through some flaw in the proceedings. But if the natives were not impressed with exalted notions of the white man's purity of conduct, nor of the code that ruled his morals, there was no mistake about the respect they entertained for the thews and sinews, the powers of endurance, the pluck and spirit, as well as the skill and perseverance of their foreign visitors. These rough denizens of the coast and wave were a race of men bronzed and bloated by sun, wind, sea, and rum, to a shade of red-brown that, were it not for the wicked blue eyes and wickeder oath, and for the rolling gait acquired on the sea and retained on land by seamen, a traveller might easily mistake one of them for an untattooed Maori. In some of their whale-chases the Englishmen were assisted by young natives, not only in pulling the boats, but occasionally in “fastening” to a fish; and oftentimes, when one of these giants of the deep got embayed on a lee shore near the native settlements, a boat entirely manned by them would harpoon him, and make signals for the English fishermen to come up and do the most difficult and dangerous part of the business; for which good service they were liberally rewarded with cash or goods to the amount sometimes of £20 or £25. With all their personal strength, courage, and desire of gain, it is affirmed that in no instance were the native fisherman known to have performed the feat of killing the whale with the lance,—the exclusive duty, and a most onerous and riskful one, of the “headsman” of the boat. Whaling, like all other sports, has its season; and during the intervals of idleness forced upon the rough society of Queen Charlotte's Sound and its neighbouring fishing bays, its pursuits and pastimes were not of an orderly or intellectual character. The most turbulent of the natives, many of them chiefs of rank and note, tolerated however, and associated familiarly with the whites for the sake of the traffic of fire-arms, ammunition, and other coveted European goods,—each race, with the natural proneness of humanity to evil, picking up the most prominent and peculiar vices of the other. If ever there was an earthly Pandemonium, it existed at that time and place. To complete this fortuitous aggregation of the wildest elements of society, nothing was wanting but to engraft upon it a convict penal settlement; and from this fate N.Z. was saved only by the character of ferocity

and treachery attributed generally to the natives. Among the numerous schemes of the English Government for the disposal and punishment of their criminals, that of exposing them in this lion's den of cannibalism either never occurred to them, or was considered too severe as a secondary punishment even in those times. This doom, happily, the land of the Maori escaped.

IV. *The First Missionaries.*—During a visit to England in 1808, the Rev. Samuel Marsden, Colonial Chaplain of N.S.W., laid the foundation of the Church of England Mission to N.Z. This was the great enterprise of his life; he will be for ever remembered as the Apostle of N.Z. Not that he had the exclusive honour of being the only one, although he was in point of time the first who began, about this period, to project the mission. The Wesleyans were early in the same field. The Rev. Samuel Leigh, a man whose history and natural character bore a marked resemblance to those of Marsden, was the pioneer of Methodism, and proved himself a worthy herald of the Cross amongst the New Zealanders. A warm friendship existed between the two. On his passage homewards he was a guest at Parramatta; and no tinge of jealousy ever appears to have shaded their intercourse, each rejoicing in the triumphs of the other. Marsden's position afforded him peculiar facilities, and having once undertaken it, the superintendence of the N.Z. mission became, without design on his part, the great business of his life. He had formed a high estimate of the Maori tribes. "They are a noble race," he writes to his friend John Terry of Hull, "vastly superior in understanding to anything you can imagine in a savage nation." This was before the mission was begun. But he did not speak merely from hearsay; several of their chieftains and enterprising warriors had visited Australia, and they ever found a welcome at the hospitable parsonage at Parramatta. Sometimes, it is true, they were but awkward guests, as the following anecdote will show, furnished by one of Marsden's daughters:—"My father had sometimes as many as thirty New Zealanders staying at the parsonage. He possessed extraordinary influence over them. On one occasion a young lad, the nephew of a chief, died, and his uncle immediately made preparations to sacrifice a slave to attend his spirit into the other world. Mr. Marsden was from home at the moment, and his family were only able to preserve the life of the young New Zealander by hiding him in one of the rooms. Mr. Marsden no sooner returned and reasoned with the chief, than he consented to spare his life. No further attempt was made upon it, though the uncle frequently deplored that his nephew had no attendant in the next world, and seemed afraid to return to New Zealand lest the father of the young man should reproach him for having given up this, to them, important point." The Church Missionary Society, which had been established about seven years, seemed fully disposed to co-operate with him; and at their

request he drew up a memorial on the subject of a mission. He lays great stress on the necessity of civilisation going first as the pioneer of the Gospel; "commerce and the arts having a natural tendency to inculcate industrious and moral habits, open a way for the introduction of the Gospel, and lay the foundation for its continuance when once received." Again, "Nothing, in my opinion, can pave the way for the introduction of the Gospel but civilisation." The missionaries he thought "might employ a certain portion of their time in manual labour, and that this neither would nor ought to prevent them from constantly endeavouring to instruct the natives in the great doctrines of the Gospel." He adds, "The arts and religion should go together. I do not mean a native should learn to build a hut or make an axe before he should be told anything of man's fall and redemption, but that these grand subjects should be introduced at every favourable opportunity, while the natives are learning any of the simple arts." The founders of the Church Missionary Society listened gratefully and with respect to the opinion of one so well entitled to advise; they determined on the mission, and they gave a high proof of their confidence in the wisdom and piety of their friend by consulting him in the choice of their first agents. But they did not adopt his views with regard to the importance of civilisation as the necessary pioneer to the Gospel. "It has been stated," they subsequently wrote, "that the mission was originally established, and for a long time systematically conducted on the principle of first civilising and then christianising the natives. This is wholly a mistake. The agents employed in establishing the mission were laymen because clergymen could not be had; and the instructions given to them necessarily correspond with their lay character. The foremost object of the mission has from the first been to bring the natives by the use of all suitable means under the saving influences of the grace of the Gospel, adding indeed the communication to them of such useful arts and knowledge as might improve their social condition." The committee's instructions to their first agents in the mission sustain these assertions. William Hall and John King were the two single-hearted laymen to whom the honour was committed of first making known the Gospel in N.Z. They bore with them these instructions ere they embarked in the same vessel in which their friend and guide Marsden himself returned to Australia:—"Ever bear in mind that the only object of the Society in sending you to N.Z. is to introduce the knowledge of Christ among the natives, and in order to this, the arts of civilised life." Thomas Kendall followed; a third layman, for no ordained clergyman of the Church of England could yet be found. The same instructions were repeated, and in December 1815 when the Rev. John Butler, their first clerical missionary, entered on his labours, he and his companions were exhorted thus: "The committee would observe that they wish in all the missions of the Society that the

missionaries should give their time as much as possible, and wholly if practicable, first to the acquisition of the native language and then to the constant and faithful preaching to the natives." Before he left England Marsden formed or renewed an acquaintance with Wilberforce, Sir George Grey, Rev. Daniel Wilson (late Bishop of Calcutta,) Rev. Charles Simeon, Rev. Josiah Pratt, Dr. Olinthus Gregory and Dr. Mason Good. The latter's introduction to Marsden much impressed him. He saw and wondered at his self-denial; he admired the true sublimity of his humble, unassuming, but unquestionable and active piety. "The first time I saw Mr. Marsden," says his biographer, "was in January 1808. He had just returned from Hull and had travelled nearly the whole journey on the outside of a coach in a heavy fall of snow, being unable to secure an inside place. He seemed scarcely conscious of the inclemency of the season, and declared that he felt no inconvenience from the journey. He had accomplished his object and that was enough. And what was that object, which could raise him above the exhaustion of fatigue and the sense of severe cold? He had engaged a ropemaker who was willing at his (Mr. Marsden's) own expense to go and teach his art to the New Zealanders." Marsden left England in August 1809. The ship *Ann*, in which he sailed, carried with her one who subsequently played a part only less important than his own in the conversion of N.Z. The ship had been some time at sea before Marsden observed on the fore-castle amongst the common sailors a man whose darker skin and wretched appearance awakened his sympathy. He was wrapped in an old great coat, very sick and weak, had a violent cough accompanied with profuse bleeding. He was much dejected and appeared as though a few days would close his life. This was Duaterra, a N.Z. chieftain, whose story as related by Marsden himself is almost too strange for fiction. And as this young chief became, as he tells, "one of the principal instruments in preparing the way for the introduction of the arts of civilisation and the knowledge of Christianity into his native country," a brief sketch of his marvellous adventures will not be out of place: When the existence of N.Z. was yet scarcely known to Europeans, it was occasionally visited by a South Sea whaler distressed for provisions, or in want of water. One of these, the *Argo*, put into the Bay of Islands in 1805, and Duaterra, fired with the spirit of adventure, embarked on board with two of his companions. The *Argo* remained on the coast for above five months, and then sailed for Port Jackson, Duaterra sailing with her. She then went to fish on the coast of New Holland for six months, again returning to Port Jackson. Duaterra had been six months on board, working in general as a common sailor, and passionately fond of this roving life. He then experienced that unkindness and foul play of which the New Zealander has always had sad reason to complain.

He was left on shore without a friend and without the slightest remuneration. He now shipped himself on board the *Albion* whaler, Captain Richardson, whose name deserves honourable mention; he behaved very kindly to Duaterra, repaid him for his services in various European articles, and after six months cruising on the fisheries, put him on shore in the Bay of Islands, where his tribe dwelt. Here he remained six months, when the *Santa Anna* anchored in the bay, on her way to Norfolk Island and other islets of the South Sea in quest of seal skins. Duaterra again embarked; he was put on shore on Norfolk Island at the head of a party of fourteen sailors, provided with a very scanty supply of water, bread, and salt provisions, to kill seals, while the ship sailed, intending to be absent but a short time, to procure potatoes and pork in N.Z. On her return she was blown off the coast in a storm, and did not make the land for a month. The sealing party were now in the greatest distress, and accustomed as he was to hardship, Duaterra often spoke of the extreme suffering which he and his party had endured, while, for upwards of three months, they existed on a desert island with no other food than seals and sea fowls, and no water except when a shower of rain happened to fall. Three of his companions, two Europeans and one Tahitian, died under these distresses. At length the *Santa Anna* returned, having procured a valuable cargo of seal skins, and prepared to take her departure homewards. Duaterra had now an opportunity of gratifying a desire he had for some time entertained of visiting that remote country from which so many vast ships were sent, and to see with his own eyes the great chief of so wonderful a people. He willingly risked the voyage, as a common sailor, to visit England and see King George. The *Santa Anna* arrived in the Thames in July 1809, and Duaterra requested that the captain would make good his promise, and indulge him with a sight of the King. Again he had proof of the perfidiousness of Europeans. Sometimes he was told that no one was allowed to see King George; sometimes that his house could not be found. This distressed him exceedingly; he saw little of London, was ill-used, and seldom permitted to go on shore. In about fifteen days, the vessel had discharged her cargo, when the captain told him that he should be put on board the *Ann*, which had been taken up by the Government to convey convicts to N.S.W. The *Ann* had already dropped down to Gravesend, and Duaterra asked the master of the *Santa Anna* for some wages and clothing. He refused to give him any, telling him that the owners at Port Jackson would pay him in two muskets for his services on his arrival there; but even these he never received. Marsden was at this time in London, ignorant of the fact that the son of a N.Z. chief in circumstances so pitiable lay on board a South Sea whaler near London Bridge. Their first meeting was on board the *Ann* when she had been some days at sea. His

sympathies were roused and also his indignation. He inquired of the master where he met with him, and also of Duaterra what had brought him to England and how he came to be so wretched and miserable. He answered that the hardships and wrongs he had endured on board the *Santa Anna* were exceedingly great and that the English sailors had beaten him very much, which was the cause of his spitting blood, and that the master had defrauded him of all his wages and prevented his seeing the King. Marsden soothed his afflictions and assured him that he should be protected from insults and that his wants should be supplied. By the kindness of those on board Duaterra recovered, and was ever after truly grateful for the attention shown him. On their arrival at Sydney Marsden took him into his house for six months, during which time he applied himself to agriculture; he then wished to return home, and embarked for N.Z. The two laymen, Hall and King, sailed from England with Marsden in 1810 and were soon after followed by Kendall; and the three assembled at N.S.W. intending to sail thence without delay for the scene of their future work. But fresh difficulties arose. Marsden's intention was to accompany them and in person to meet the first dangers, and lay as it were the first stone. But this the Governor absolutely forbade. To him the whole scheme seemed utterly preposterous. The idea of converting the savages of N.Z. was the chimera of a pious enthusiast—a good and useful man in his way, but one who was not to be allowed thus idly to squander the lives of others, to say nothing of his own. Nor were the Governor's objections altogether without foundation. The last news from N.Z. was that an English ship, the *Boyd*, had been seized and burned by the cannibals in the Bay of Islands, and every soul on board, seventy in all, killed and eaten. The report was true, save only that out of the whole of the ship's company, two women and a boy had been spared to live in slavery with the savages. A N.Z. chief had sailed on board and had been treated with brutal indignities similar to those which Duaterra suffered from the captain of the *Santa Anna*. He smothered his resentment, and waiting the return of the *Boyd* to the Bay of Islands summoned his tribe, who on various pretences crowded the deck of the ship, and at a given signal rushed upon the crew, dispatched them with their clubs and hatchets, and then gorged themselves and their followers on the horrible repast. All that Marsden could obtain at present was permission to charter a vessel if a captain could be found sufficiently courageous to risk his life and ship in such an enterprise, and to send out the three missionaries as pioneers; with a reluctant promise from the Governor that if on the ship's return all had turned out well, he should not be hindered from following. For some time no such adventurous captain could be found. At length for the sum of £600 for a single voyage an offer was made, but Marsden looked upon the sum as too much; and this with

other considerations induced him to purchase his own missionary brig the *Active*, in which Hall and Kendall finally set sail for the Bay of Islands. They carried a message to Duaterra entreating him to receive them kindly, and inviting him to return with them to Parramatta, bringing along with him two or three friendly chiefs. Duaterra after his visit to Marsden had again suffered great hardships from the perfidy of the master of the *Frederick*, with whom he had embarked from N.S.W. under an agreement to be set on shore at the Bay of Islands where his tribe dwelt. He was carried to Norfolk Island and there left; and to aggravate his wrongs and sorrows the vessel passed within two miles of his own shores and in sight of his home. He was defrauded too of his share of the oil he had procured with his companions, worth £100. A whaler found him on Norfolk Island almost naked and in the last stage of want, and brought him once more to Australia and to his friend and patron Marsden. A short stay sufficed; he sailed again from Sydney and soon found himself to his great joy amongst his friends in N.Z. On the arrival of the *Active* with its missionaries he was there to greet them and to repay the kindness of his friend in the welcome he secured for these defenceless strangers. They carried with them a present which, trifling as it may seem, was not without its share of influence in the great work. Duaterra had been provided by Marsden with a supply of wheat for sowing on his return to N.Z. To this accomplished savage the honour belongs of first introducing agriculture into an island destined, within forty years, to rival the best farms of England in the value of its crops and the variety of its produce. The neighbouring chiefs and their tribes viewed with wonder first the green ears and then the growing corn. The wild potato, the fern, and a few other roots were the only produce of the earth they were yet acquainted with, and when Duaterra assured them that his field of wheat was to yield the flour out of which the bread and biscuits they had tasted on board English ships were made, they tore up several plants, expecting to find something resembling their own potato at the root. That the ears themselves should furnish the materials for a loaf was not to be believed. Duaterra meant to impose upon them, or else he had been duped, but they were not to be cajoled with the tales of a traveller. The field was reaped and the corn threshed out, when Duaterra was mortified with the discovery that he was not provided with a mill. He made several attempts to grind his corn with the help of a coffee-mill borrowed from a trading ship, but without success; and he was laughed at for his simplicity. At length the *Active* brought the important present of a hand-mill for grinding corn. Duaterra's friends assembled to watch the experiment, still incredulous of the promised result; but when the meal began to stream out beneath the machine their astonishment was unbounded; and when a

cake was produced, hastily baked in a frying-pan, they shouted and danced for joy. Duaterra was now to be trusted when he told them that the missionaries were good men. And thus the first favourable impression was made upon the Maoris, whose race was in the next generation to become a civilised and Christian people. Hall and Kendall having introduced themselves and their mission in N.Z. returned to Sydney, accompanied by Duaterra and six other chiefs, amongst whom was Duaterra's uncle the famous Shunghie, or Hongi, the most powerful of N.Z. Chieftains; such was the confidence Marsden's name and the good conduct of the missionaries had inspired. The *Active* reached Sydney on 22nd August 1814. Marsden experienced great joy on the successful termination of the voyage, and having obtained the Governor's permission, he determined to accompany the missionaries on their return to the Bay of Islands. He wrote just before he sailed:—"It is my intention to visit N.Z. and see what can be done to promote the eternal welfare of the inhabitants of that island. I have now several of the chiefs living with me at Parramatta. They are as noble a race of men as are to be met with in any part of the world. I trust I shall be able, in some measure, to put a stop to those dreadful murders which have been committed upon the island for some years past, both by the Europeans and the natives. They are a much injured people, notwithstanding all that has been advanced against them." On 19th November 1814 he embarked on his mission with a motley crew of savages and Christian teachers and enterprising mechanics, their wives and children, besides cattle and horses. Of this strangely assorted company he gives the following description:—"The number of persons on board the *Active*, including women and children was thirty-five; the master, his wife and son, Messrs. Kendall, Hall and King, with their wives and children, eight New Zealanders, (including Duaterra and his uncle the great warrior Shunghie or Hongi) two Otaheitans, and four Europeans belonging to the vessel, besides Mr. John Lydiard Nicholas and myself; there were also two sawyers, one smith and a runaway convict whom we afterwards found on board, a horse and two mares, one bull and two cows, with a few sheep and poultry. The bull and cows have been presented by Governor Macquarie from his Majesty's herd." On 15th December, they were in sight of land; the next day the chiefs were sent on shore, and a friendly communication was at once opened with the natives. But even before they had landed a canoe came alongside the *Active* with plenty of fish, and shortly afterwards a chief followed from the shore, who immediately came on board. Marsden's fame, as the friend of the New Zealanders, had arrived before him. "I told them my name with which they were all well acquainted. We were now quite free from all fear, as the natives seemed desirous to show us attention by every possible means in their power." The

Active dropped her anchor a few days after at Wangaroa, near the Bay of Islands, the scene of the massacre of the *Boyd's* crew, and there amongst the very cannibals by whose hands their countrymen had fallen so recently the first Christian mission to N. Z. was opened. A fierce and unholy revenge had been taken in the murder of Tippahee, a native chieftain, and all his family by an English crew who had visited Wangaroa after the *Boyd's* destruction, and Tippahee as Marsden always maintained suffered unjustly, having had no share in the dreadful massacre. Amongst a people so exasperated did these first missionaries venture forth as the heralds of the Gospel. Marsden's journal of his first visit to N.Z. is a document of singular interest, and when published at the time in England made a deep impression. It is written in plain and forcible language and is characterised by that vein of good sense and practical wisdom which distinguished him. Duaterra and Shunghie had often told of the war arising out of the affair of the *Boyd* that was raging while they were at Parramatta between the people of Wangaroa (the tribe of Tippahee) and the inhabitants of the Bay of Islands, who were their own friends and followers; the Wangaroans accusing the people of the Bay of Islands of having conspired with the English in the murder of Tippahee. When the *Active* arrived several desperate battles had been fought, and the war was likely to continue. Marsden determined to establish peace amongst the contending tribes. He was known already as the friend of Duaterra and Shunghie; he felt that he must convince the other party of his good intentions. He did not come amongst them as an ally of either, but as the friend of both; he resolved therefore to pass some time with the Wangaroans; and with a degree of intrepidity astonishing even in him, not only ventured on shore but passed the night accompanied by his friend Nicholas alone with the savages who had killed and eaten his countrymen. After a supper of fish and potatoes in the camp of Shunghie, they walked over to the hostile camp distant about a mile. They received the two white strangers very cordially. He sat down amongst them and the chiefs surrounded them. Marsden introduced the subject of his embassy, explained the object of the missionaries in coming to live amongst them, and showed how much peace would conduce in every way to the welfare of all parties. A chief to whom the Europeans gave the name of George acted as interpreter; he had sailed on board an English ship and spoke English well. Marsden tells us how the first night was passed: "As the evening advanced the people began to retire to rest in different groups. About eleven o'clock Mr. Nicholas and I wrapped ourselves in our great coats and prepared for rest. George directed me to lie by his side. His wife and child lay on the right hand and Mr. Nicholas close by. The night was clear, the stars shone bright and the sea in our front was smooth, around us were innumerable spears stuck

upright in the ground, and groups of natives lying in all directions, like a flock of sheep upon the grass, as there were neither tents nor huts to cover them. I viewed our present situation with sensations and feelings that I cannot express, surrounded by cannibals who had massacred and devoured our countrymen. I wondered much at the mysteries of Providence, and how these things could be. Never did I behold the blessed advantage of civilisation in a more grateful light than now. I did not sleep much during the night. My mind was too seriously occupied by the present scene, and the new and strange ideas it naturally excited. About three in the morning I rose and walked about the camp, surveying the different groups of natives. When the morning light returned we beheld men, women and children asleep in all directions like the beasts of the field. I had ordered the boat to come on shore for us at daylight; and soon after Duaterra arrived in the camp." In the morning he gave an invitation to the chiefs to breakfast on board the *Active*, which they readily accepted. "At first I entertained doubts whether the chiefs would trust themselves with us or not, on account of the *Boyd*, lest we should detain them when we had them in our power; but they showed no signs of fear, and went on board with apparent confidence. The axes, billhooks, prints, &c., I intended to give them were all got ready after breakfast; the chiefs were seated in the cabin in great form to receive the presents, I sat on the one side, and they on the other side of the table; Duaterra stood and handed me each article separately that I was to give them. Messrs. Kendall, Hall, and King, with the master of the *Active* and his son, were all one after the other introduced to the chiefs. The chiefs were at the same time informed what duty each of the three persons were appointed to do. Kendall to instruct their children, Hall to build houses, boats, &c., King to make fishing lines, and Hanson to command the *Active*, which would be employed in bringing axes and such things as were wanted from Sydney, to enable them to cultivate their lands and improve their country. When these ceremonies were over, I expressed my hope that they would have no more wars, but from that time would be reconciled to each other. Duaterra, Shunghie, and Koro Koro shook hands with the chiefs of Wangaroa, and saluted each other as a token of reconciliation by joining their noses together. I was much gratified to see these men at amity once more." The chiefs then took their leave, much pleased with the attention of Marsden, and still more with his presents; and they promised for the future to protect the missionaries and never to injure the European traders. Some of the presents excited no little wonder; no New Zealander, except the few who like Duaterra had been on foreign travel, had ever seen either cows or horses, for the largest quadruped yet naturalised in the island was the pig, and even that had been introduced but recently. Duaterra had often told his wondering countrymen of the horse and its

rider, and in return was always laughed at; but when the horses were now landed and Marsden actually mounted one of them, they stood in crowds and gazed in mute astonishment. The first Sunday on which Christian worship was held in N.Z. was Christmas Day 1815. Marsden thus describes it:—"Duaterra passed the remaining part of the previous day in preparing for the Sabbath. He enclosed about half an acre of land with a fence, erected a pulpit and reading-desk in the centre, and covered the whole either with black native cloth or with some duck which he had brought with him from Port Jackson. He also procured some bottoms of old canoes and fixed them up as seats on each side of the pulpit for the Europeans to sit upon, intending to have Divine worship performed there the next day. These preparations he made of his own accord, and in the evening informed me that everything was ready for Divine service. I was much pleased with this singular mark of his attention. The reading-desk was about three feet from the ground and the pulpit about six feet. The black cloth covered the top of the pulpit and hung over the sides; the bottom of the pulpit, as well as the reading-desk, was part of a canoe. The whole was becoming and had a solemn appearance. He had also erected a flagstaff on the highest hill in the village, which had a very commanding view. On Sunday morning when I was upon deck I saw the English flag flying, which was a pleasing sight in N.Z. I considered it as the signal and the dawn of civilisation, liberty, and religion in that dark and benighted land. I never viewed the British colours with more gratification, and flattered myself they would never be removed till the natives of that island enjoyed all the happiness of British subjects. About ten o'clock we prepared to go ashore to publish for the first time the glad tidings of the Gospel. I was under no apprehension for the safety of the vessel, and therefore ordered all on board to go on shore to attend Divine service, except the master and one man. When we landed we found Koro Koro, Duaterra and Shunghie, dressed in regimentals which Governor Macquarie had given them, with their men drawn up ready to be marched into the enclosure to attend Divine service. They had their swords by their sides and switches in their hands. We entered the enclosure and were placed on the seats on each side of the pulpit. Koro Koro marched his men and placed them on my right hand in the rear of the Europeans, and Duaterra placed his men on the left. The inhabitants of the town, with the women and children and a number of other chiefs, formed a circle round the whole. A very solemn silence prevailed—the sight was truly impressive. I rose up and began the service with singing the Old Hundredth Psalm, and felt my very soul melt within me when I viewed my congregation and considered the state they were in. After reading the service, during which the natives stood up and

sat down at the signals given by Koro Koro's switch, which was regulated by the movements of the Europeans, it being Christmas Day, I preached from the second chapter of St. Luke's Gospel and tenth verse, 'Behold, I bring you glad tidings of great joy,' &c. The natives told Duaterra that they could not understand what I meant. He replied that they were not to mind that now, for they would understand by-and-by, and that he would explain my meaning as far as he could. When I had done preaching he informed them what I had been talking about. Duaterra was very much pleased that he had been able to make all the necessary preparations for the performance of divine worship in so short a time, and we felt much obliged to him for his attention. He was extremely anxious to convince us that he would do everything in his power, and that the good of his country was his principal consideration. In this manner the Gospel has been introduced into N.Z.; and I fervently pray that the glory of it may never depart from its inhabitants till time shall be no more." The confidence of the natives in Marsden was now unbounded and scarcely less was the confidence he reposed in them; and he resolved upon a short coasting voyage with the view of exploring their different harbours and making arrangements for the future extension of the mission. Many of the chiefs and warriors, led by Duaterra, wished to sail with him, and without the slightest misgiving twenty-eight savages fully armed after the fashion of their country were invited on board the *Active*, manned as she was by only seven Europeans. Their leave of absence having nearly expired Marsden and his companions were obliged to prepare for their voyage homeward. They had laid the foundations of a great work—how great none of them could tell. As patriots they exulted in the prospect of extending the renown of England. Marsden, in his conversations with the natives, explained to them the nature of the English government and the form of trial by jury; he discoursed with them upon the evils of polygamy and showed his marked abhorrence of their darling vices—*theft and lying*. A chisel being lost from the *Active* a boat was sent on shore, manned by Duaterra and other chiefs, to demand restitution; the culprit was not found nor the implement restored; but a whole village was aroused from its slumbers at midnight, and the inhabitants literally trembled with fear of the consequences when they saw the angry chiefs, though no harm was permitted to ensue. An example of high integrity was always set. Marsden might have obtained land or timber or whatever he required in exchange for ammunition and muskets; but he interdicted the sale or barter of these articles upon any terms whatever, and to this resolution he always adhered. And he took an opportunity upon all occasions to impress upon their minds the horrors their cannibalism excited; how much their nation was disgraced by it and dreaded on this account. One thing still remained to be done. The missionaries

possessed no land, and were liable after his departure to be removed or driven out at the mere caprice of the tribes amongst whom they settled. He therefore determined if possible to purchase for them a small estate. It consisted of about 200 acres; and the first plot of ground to which England can lay claim in N.Z. was formerly made over in a deed of which Nicholas preserved a transcript. It was executed in the presence of a number of chiefs who were assembled to take leave of the *Active* on the day before she sailed, and ran as follows:—"Know all men to whom these presents shall come that I, Anodee O Gunna, king of Rangheehoo, in the island of N.Z., have in consideration of twelve axes to me in hand now paid and delivered by the Reverend Samuel Marsden of Parramatta, in the territory of N.S.W. given, granted, bargained and sold; and by this present instrument do give, grant, bargain, and sell, unto the committee of the Church Missionary Society for Africa and the East, instituted in London in the kingdom of Great Britain, and to their heirs and successors, all that piece and parcel of land situate in the district of Hoshee in the island of N.Z., bounded on the south side by the bay of Lippouna and the town of Rangheehoo, on the north side by a creek of fresh water, and on the west by a public road into the interior, together with all the rights, members, privileges and appurtenances thereto belonging; to have and to hold to the aforesaid committee of the Church Missionary Society for Africa and the East, instituted in London in the kingdom of Great Britain, their heirs, successors, and assigns for ever, clear and freed from all taxes, charges, impositions and contributions whatsoever, as and for their own absolute and proper estate for ever.

"In testimony whereof I have to these presents thus done and given, set my hand at Hoshee in the island of N.Z., this twenty-fourth day of February, in the year of Christ, one thousand eight hundred and fifteen.

(Signatures to the grant.) "THOMAS KENDALL.
"J. L. NICHOLAS."

To this was affixed a complete drawing of the "amoco" or tattooing of Gunna's face, done by Shunghie, on one side of which he set his mark. Marsden returned from his first voyage to N.Z. accompanied by ten chiefs, landing at Sydney on 23rd March 1815. He and Nicholas immediately presented themselves to the Governor who congratulated them on their safe return from what he regarded as a most perilous and rash adventure. Duaterra had been left sick, and four days after Marsden's departure he died. He was a noble specimen of human nature in its savage state. His character was cast in the mould of heroes. At the very period of his death after ten years of as much privation, danger, and hardship as nature could well bear, his courage was unsubdued and his patriotism and enterprise unabated. He told Marsden with an air of triumph, "I have now

introduced the cultivation of wheat into New Zealand; New Zealand will become a great country; in two years more I shall be able to export wheat to Port Jackson in exchange for hoes, axes, spades, tea and sugar." He had made arrangements for farming on a large scale and had formed his plan for building a new town with regular streets after the European mode, on a beautiful situation which commanded a view of the harbour and the adjacent country. "I accompanied him to the spot," says Marsden; "we examined the ground fixed on for the town and the situation where the church was to stand." Other trials followed the death of Duaterra. Fresh wars broke out. One hostile tribe encamped in sight of the mission premises, and, no longer restrained by Marsden's presence, threatened, not indeed to expel the missionaries, but to kill and eat them. For months together the affrighted band kept watch night and day; their children were laid to sleep in their cots dressed, to be ready for instant flight, and the boat was always kept afloat, with its oars and sail in readiness. The storm blew over, and they remained steadfast at their posts. Soon afterwards the Wesleyan Methodists established their mission in the island, and the missionaries gained strength from each other in society and mutual counsel. The first Wesleyan missionary, Samuel Leigh, was well known at Parramatta, and Marsden viewed his labours with thankfulness and hope; but the reports which reached him from time to time of the difficulties to which the missions were exposed still added much to his anxieties. His thoughts seem to have been always alert, turning every hint to account, seizing every occasion and employing every likely instrument to promote the grand design. The excellent quality of the N.Z. flax had not escaped him. He induced two young natives whom he had brought with him to Parramatta, to visit England, which they did in H.M. ship *Kangaroo*, and were placed under the care of his friends in London. "I wish on no account," he writes, "that they should be idle; if they cannot be useful in forming a vocabulary (of the Maori language of which he was now anxious that a grammar should be prepared) let them be put into a rope walk, and be kept close to labour while they remain in England. They were both chieftains, Tooï and Teterree. When their English education was completed the young chieftains returned to Parramatta, and Marsden embarked a second time for N.Z. taking them with him, with several missionaries, three mechanics and their families. They landed in the Bay of Islands on 12th August 1819. The rival chiefs Shunghie and Koro-Koro now contended for the site of the new missionary settlement which Marsden contemplated, each being anxious that his own domain should be preferred, and offering a grant of land. The spot was selected at Kiddee Kiddee (or Keri-Keri) a district in the territory of Shunghie, at the head of a fine harbour; but such

was the distress of the disappointed chieftain that Marsden almost relented:—"He made strong appeals to our feelings and urged his request by every argument that he could advance, so that we were obliged to promise to accompany him on the next day to Parroa, and that we would build him and Tooï a house if the situation pleased us, and send one or two Europeans to reside amongst them." The stores were landed, and all the beach exhibited "a scene of busy civilisation; fourteen natives sawing timber, others cutting knees, &c." "A sight more grateful to a benevolent mind could not possibly have been seen; our hearts overflowed with gratitude. We viewed the various operations with delight, and considered them the dawn of civil and religious liberty to this land of darkness, superstition, and cruelty." On the next Sabbath day the work was consecrated with prayer and praise. Marsden's language best describes the scene:—"We assembled on the beach for public worship, as there was no place sufficiently spacious to hold the people. We were surrounded with natives and a number of chiefs from different districts. It was gratifying to be able to perform worship to the true God in the open air without fear or danger when surrounded by cannibals with their spears stuck in the ground, and their pattoo-pattoos and daggers concealed under their mats." During a three months sojourn, besides the attention which Marsden gave to the missions in the Bay of Islands, he made a circuitous journey of 700 miles, exploring the country with a view to more extensive operations. His arrival overland and in health at the Bay of Islands on his return relieved the minds of the missionaries. "There is not one in ten thousand, I think," writes Hall, "who could or would have borne the privations, difficulties and dangers which he has undergone." He landed during a coasting voyage, with young Tooï, on the small island of Motooroa. The first object that struck his eye was a man's head stuck on a pole near the hut where they were to sleep; the face appeared beautifully tattooed; it was the head of a chief who was killed by Shunghie's people. Shunghie, the greatest of the N.Z. warriors, was a striking instance of that union of gentleness and ferocity which characterised this people. To the missionaries his kindness was always great, and his respect for Marsden knew no bounds. An instance of his good feeling may be noticed. In the beginning of 1817 a naval expedition under his command sailed from the Bay of Islands. It consisted of thirty canoes and about eight hundred men. Its object was to obtain peace with his enemies at the North Cape. The chief took an affectionate leave of the settlers and told them that if he fell they must be kind to his children, and if he survived he would take care of their families when they should die. The expedition returned however in about a fortnight, his people having quarrelled with those of Wangaroa, into which place they had put for refreshment; and being afraid, he said, that the Wangaroa

people would attack the settlers in his absence, he for the present abandoned the expedition. Shunghie was again preparing for war when Marsden paid his second visit to N.Z.; his army, to the number of several thousand men, were already assembled; his war-canoes were ready, and all his preparations complete; yet in deference to the remonstrances of Marsden he again abandoned his scheme of conquest or revenge and dismissed his followers. Shunghie paid a visit to England about the year 1820. His majestic person, graceful manners and gentle yet manly disposition were much admired. He was one of Nature's nobles; what might not be expected from such a man when he returned home again? George the Fourth invited him to Carlton Palace and received him with marked attention, presenting him with some military accoutrements and costly fire-arms. Yet the heart of a savage never ceased to beat beneath this polished exterior, while his pride was fanned to madness by the consideration he received in England. "There is," he exclaimed, "but one king in England; there shall be only one king in New Zealand." Returning by way of Sydney he there happened to meet with Inacki, another chief, with whom he had an ancient feud. He told him that when they got back to N.Z. he would fight him. Inacki accepted the challenge and Shunghie accordingly assembled on his return no fewer than two thousand men to attack Inacki. The latter was prepared to receive him, and for some time the event of the battle that ensued was doubtful. At length Shunghie, who had the greatest number of muskets and who had arranged his men in the form called in Roman tactics the cuneus or wedge, placing himself at the apex and directing those behind him to wheel round the enemy from the right and left, or to fall back into their original position as opportunity offered, shot Inacki. The savage Shunghie immediately sprang forward, scooped out the eye of the dying man with his knife and swallowed it; and then holding his hands to his throat into which he had plunged his knife, and from which the blood flowed copiously, drank as much of the horrid beverage as the two hands could hold. Amongst the horrible superstitions of the Maoris, one was that the eye of a victim thus devoured became a star in the firmament, and thus the ferocious Shunghie sought for honour and immortality. With the sword which he had received as a present from King George in England, he immediately cut off the heads of sixteen of his captives in cold blood; this was done to appease the spirit of his son-in-law who had fallen in battle. In this battle Shunghie and his tribe were armed with muskets, his opponents only with the native weapons, the club and spear. His victory therefore was an easy one, but his revenge was cruel. Amongst the few who escaped the general slaughter was Koromona, a chief who became blind soon afterwards, but hearing Archdeacon Williams preach at Matamata, was

converted. Amidst such scenes the missionaries dwelt in peace. War and cannibalism showed themselves at their gates but were not allowed to hurt them. Under God, their security was owing in a great measure to the prudence and courage with which Marsden planned and carried out his projects. Himself a stranger to fear he infused courage into those around him. He arrived at home after this second visit in November 1819. In February 1820 he was once more on his way back to N.Z. The Governor had consented to his recent visit with reluctance, and had limited the period of his absence with military precision, threatening at the same time to deprive him of his chaplaincy unless he returned within the given time. The last day arrived, and the expected vessel was not in sight. The Governor repeated his determination to those around him, and Marsden's friends were filled with anxiety, and his wife and family at length gave up all hope. Towards evening the long-wished-for sail appeared in the offing, and at eight o'clock in the evening Marsden quietly walked into the Governor's drawing room with the laconic and yet respectful address, "Sir, I am here to report myself." H.M.S. *Dromedary*, Captain Skinner, was directed by the Government to proceed from Sydney to the Bay of Islands to receive a cargo of N.Z. timber for trial in the dockyards of England; and Sir Byam Martin, controller of the navy, knowing something of the energy of Marsden's character, and his great acquaintance with the islands, requested that he would accompany the *Dromedary*, which was joined by the *Coromandel*, in order to facilitate the object of their visit. With this request he felt it his duty to comply. He arrived in N.Z. on 20th February, and embarked on board the *Dromedary* to return on 25th of November. Thus nearly the whole year was given to the service of N.Z., travelling amongst the natives teaching them the first elements of civilisation. In July 1823 Marsden again embarked for N.Z.; his intention being to visit the stations of the Church Missionary Society and to arrange its affairs. Since his previous visit fresh causes for anxiety had appeared. In consequence of Shunghie's misconduct, the natives were now alienated from the missionaries; they had become indifferent to education and agricultural improvements; and the gospel it was too evident had made little progress hitherto. Shunghie declared that as to himself "he wanted his children to learn to fight and not to read." The Maoris about the settlement insisted upon being paid for their services in fire-arms and ammunition. "Since Shunghie's return" writes one of the missionaries, "the natives, one and all have treated us with contempt. They are almost past bearing; coming into our houses when they please, demanding food, thieving whatever they can lay their hands on, breaking down our garden fences, stripping the ship's boats of everything they can. They seem in fact ripe for any mischief; had Mr. Marsden himself been

amongst us, much as he deserves their esteem, I believe he would not escape without insult; but the Lord is a very present help in time of trouble." Amongst the missionaries themselves certain evils had appeared, the growth of a secular and commercial spirit which had injured their cause and threatened to frustrate the end for which the mission was projected. Marsden heard of these untoward events, and hastened his departure full of anxiety but not abating one jot of his confidence in the final triumph of the cause. He was accompanied on his voyage by the Rev. Henry Williams and his family, who went to strengthen the mission, of which he soon became one of the most effective leaders. One of Bishop Selwyn's first steps when he was appointed bishop of N.Z., was to make Williams one of his archdeacons, and he was subsequently designated to a bishopric in a district inhabited exclusively by Christianised Maoris. This was his fourth visit, and though in some respects it was painful, yet in others there was ground for joy. At length, after nine years toil, hopeful symptoms appeared amongst the Maoris. Their visitor observed with much pleasure, he says, that since his last visit the natives in general were much improved in their appearance and manners; and now for the first time he heard them sing hymns and repeat prayers in their own language. This convinced him that, notwithstanding the misconduct of a few of the Europeans the work was gradually going on, and the way preparing for the Gospel. Yet he had a painful duty to discharge. He had to rebuke some of the missionaries, and even to dismiss one of them. Several chiefs, among whom was Tooi, warmly took up the cause of the missionary who had been dismissed. Marsden writes:—"Tooi, addressing me, said a missionary had informed him that day that he was going to leave N.Z., and the chiefs wished to know whether this person had been dismissed for selling muskets and powder to the natives. To this I replied that he was directed, by the gentlemen in England who had sent him out as a missionary, not to sell muskets and powder; that it was not the custom in England for clergymen to sell muskets and powder; and that no missionary could be allowed to sell them. As several of the chiefs present had been at Port Jackson, I observed that they knew that the clergymen there did not sell muskets and powder. They knew that I had not one musket in my house, and that they had never seen any when they were with me. They replied, they knew what I said was true. I further added we did not interfere with the Government of N.Z., they did what they pleased, and the missionaries should be allowed to do what they pleased. Tooi said that this was but just, and observed, 'We are at present in the same state as the Otaheitans were some time back. The Otaheitans wanted only muskets and powder, and would have nothing else, and now as they knew better they wanted none; and the New Zealanders would care nothing about muskets when they knew better, which they

would in time.' All the chiefs acquiesced in the observations Tooi made. I said, Tooi's remarks on the conduct of the Otaheitans were very just, and told them that the *Queen Charlotte* brig, which had sailed from the bay the preceding day, belonged to the young king Pomare; that the Otaheitans had sent oil and various other articles to Port Jackson, and that they had received in return tea, sugar, and flour, and clothing, as they wanted these articles, and that the New Zealanders might in time have a ship of their own to procure sperm oil, spars, &c., which they might sell at Port Jackson, and many of them were able to kill the whales, having been employed on board the whalers. When they got a vessel of their own, they would soon be equal to the Otaheitans, and give over their cruel wars. They expressed much pleasure at having a vessel of their own. After some further explanation the chiefs were satisfied that Mr. — had violated our laws and had brought all his distress upon himself." The conduct of the natives confirmed the impression which Marsden had previously formed, that they are a race of men of considerable mental capacity, of great perseverance and enterprise, who never lose sight of an object upon which they have once set their minds; powerful reasoners on any subject within their knowledge; possessed of quick perception and natural sagacity, which enables them to form a just acquaintance with human nature as it presents itself before them. Marsden paid a visit at Wangaroa to the Wesleyan missionary station. He found Leigh, founder of their mission, very ill, and invited him to return with him on a voyage of health and recreation to Port Jackson; and having taken leave of the Church Missionary brethren he re-embarked on the 6th of September 1823. Like the first and greatest of missionaries, it was ordained that he, too, should suffer shipwreck and be cast upon a desert island. His journal gives us the story of his danger and deliverance:—"Sunday 7th.—This morning we weighed anchor. The weather was very threatening and stormy; the wind from the eastward and strong, blowing directly into the mouth of the harbour. We lay in Kororarika Bay, on the S. side of the harbour, and had to sail along a lee rocky shore. In working out with the wind dead on the land, the ship being light and high out of the water she would not answer her helm, and twice missed stays. The lead was kept continually sounding, and we soon found ourselves in little more than three fathoms of water, with a rocky bottom and a shoal of rocks on our lee, and it was then high water. When the captain found the situation we were in, he immediately ordered to let go the anchor, which was done. When the tide turned the ship struck, the gale increased, and the sea with it; a shipwreck was now more than probable; there appeared no possible way to prevent it. Mr. Leigh was very ill, and felt the disturbance much, Mrs. Leigh also being very ill. I requested the captain to lend me the boat to take Mr. and Mrs. Leigh to the nearest island, where

we arrived very safely, the island being but two miles distant. The natives expressed much concern for us, made a fire, prepared the best hut they could, which was made of bulrushes, for our reception. I requested them to send a canoe to Rungheeche, to inform Mr. and Mrs. Hall of the loss of the ship, and to bring their boat to assist in bringing the people to land. At the same time, I desired they would tell the natives to bring a large war canoe. The natives for some time alleged that their canoe would be dashed to pieces by the waves, but at length I prevailed upon them. They had between five and six miles to go through a very rough sea. About three o'clock Messrs. Hall, King, and Hanson arrived in Mr. Hall's boat, and a large war canoe with natives; they immediately proceeded to the ship, and we had the satisfaction to see them arrive safe, and waited until dark with the greatest anxiety for their return. The rain fell in torrents, the gale increased, and they had not returned; we lay down in our little hut full of fear for the safety of all on board. The night appeared very long, dark, and dreary. As we could not rest we most anxiously wished for the morning light to learn some account of them. When the day arrived we had the happiness to see the vessel still upright, but driven nearer the shore. No boat or canoe from her; the gale still increased; about mid-day we saw the mainmast go overboard. The natives on the island screamed aloud when the mast fell. I concluded they had cut away the mast to relieve the vessel. We spent the rest of this day in great suspense as we could not conjecture why all the passengers should remain on board in the state the ship was in. At dark in the evening Mr. Hall returned and informed us that the bottom of the vessel was beaten out, and that both her chain and best bower cable were parted, and that she beat with such violence upon the rocks when the tide was in that it was impossible to stand upon the deck; at the same time he said there was no danger of any lives being lost as he did not think the vessel would go to pieces, as she stood firm upon the rock when the tide was out. He said the passengers on board had not determined what they would do or where they would land as yet; they wished to wait till the gale was abated. Mr. Hall's information relieved us much; as it was now dark, the wind high, and the sea rough, we could not leave the island, and therefore took up our lodgings in our little hut. The natives supplied us with a few potatoes and some fish. My pleasing prospect of returning to Port Jackson was at an end, for some time at least. I was exceedingly concerned for the loss of so fine a vessel on many accounts, as individuals who are interested in her must suffer as well as the passengers on board, and spent the night in reflections on the difficulties with which I was surrounded; while the raging of the storm continued without intermission. At the return of day we discovered the ship still upright, but she appeared to be higher on the reef. I now determined

to return to Kiddee-Kiddee in Mr. Hall's boat with Mr. and Mrs. Leigh. We left the island for the missionary settlement where we arrived about nine o'clock. Our friends had not heard of the loss of the ship until our arrival as there had not been any communication between the different settlements in consequence of the severe weather. We were very kindly received by the brethren; I informed them in what situation we had left the ship and requested that every assistance might be given to land the passengers and luggage. The wreck was about twelve or fourteen miles from the settlement. Four boats were immediately sent off; Mr. Hall's boat took the women and children to Rungheeche, and two of the boats returned with part of our luggage, and we went to the station of the Rev. Henry Williams. All the brethren rendered every aid in their power. The boats on their return brought the welcome news that all was well on board, and Mr. Leigh did not appear to have suffered much injury from the wet and cold he endured on the island, though in so weak a state." The shipwreck of the *Brampton*—which was the vessel's name—occurred on 7th September, and in consequence Marsden was detained in N.Z. until the 14th November, when he returned home in the *Dragon* and arrived at Sydney in the beginning of December 1823. He drew up rules for the guidance of the missionaries and Christian settlers in their intercourse with the shipping which now began to visit the Bay of Islands. He encouraged the erection of a school-house for the natives. "The foundation," he says, "must be laid in the education of the rising generation. The children possess strong minds, are well-behaved and teachable. They are capable of learning anything we wish to teach them." During his detention he also addressed a circular letter to the missionaries respecting a grammar in the Maori language, pointing out the necessity of adopting some more systematic method for its arrangement and pronunciation. This led to a new vocabulary of the native language, and in a short time to a new method of spelling. Shunghie became E'Hongi; Kiddee Kiddee, Keri Keri; and so in other instances. A political object also occupied Marsden's thoughts. The incessant and desolating wars which the native tribes waged against each other were he saw the great obstacle to the progress of N.Z. The missions were always insecure, for the country was always more or less disturbed. Add the ferocity of N.Z. warfare, its cannibalism and its undying spirit of revenge, and nothing more was wanted to degrade the country into a very pit of darkness. Marsden conceived that if he could succeed in establishing some one chief as supreme, a plan of government might be drawn up securing life and property throughout the island. He consulted Shunghie, Wyatto, Riva, and other powerful chiefs. Shunghie's ambitious spirit would have embraced the proposal, the condition being, of course, that he should

be the sovereign; but the jealousy of the rest prevented anything like unanimity. Riva justly remarked that to have any superior would degrade them; yet all the chiefs appeared tired of war and the unsettled state consequent upon it. So the project failed. At length he returned home, accompanied by six N.Z. youths, whose eagerness was such that they gladly promised to sleep upon the deck rather than miss the opportunity. Mr. Leigh was also his fellow voyager. Leigh writes:—"The shipwreck which we have experienced will, I have no doubt, prove favourable to the reputation of the New Zealanders. For several days we were in their power, and they might have taken all that we had with the greatest ease; but instead of oppressing and robbing us, they actually sympathised with us in our trials and afflictions. Mr. Marsden, myself, and Mrs. Leigh were at a native village for several days and nights without any food but what the natives brought us; what they had they gave us willingly, and said, 'Poor creatures! you have nothing to eat, and you are not accustomed to our kind of food.' I shall never forget the sympathy and kindness of these poor heathens. I do hope that the Rev. S. Marsden will be successful in his endeavours to put an end to the frequent wars in N.Z. I have heard many natives and chiefs say, 'It is no good to go to fight and eat men; we wish to cease from war and retire to some peaceful place.' I pray that this object may soon be effected among this people. The Christian world, and especially the Church Missionary Society, will never be able fully to appreciate the valuable labours of the Rev. Samuel Marsden. His fervent zeal, his abundant toil and extensive charity in the cause of missions are beyond estimation." In 1826 Marsden made his fifth voyage to N.Z. A great change had just taken place in the conduct of several chiefs towards the missionaries in consequence of their fierce intestine wars. At Wangaroa the whole of the Wesleyan missionary premises had been destroyed; the property of all the missionaries was frequently plundered and their lives were exposed to the greatest danger. The worst consequences were apprehended, and the missionaries, warned of their danger by the friendly natives, were in daily expectation of being at least stripped of everything they possessed, according to the N.Z. custom. For a time the Wesleyan mission was suspended, and their pious and zealous missionary, Turner, took refuge at Sydney, and found a home at the parsonage of Parramatta. The clergy of the Church mission deeply sympathised with him. Williams writes:—"The return of Mr. Turner will be a convincing proof of our feelings on this point. In the present unsettled state of things we consider ourselves merely as tenants for the time being, who may receive our discharge at any hour." As soon as the painful intelligence reached him Marsden determined to proceed to the Bay of Islands and use his utmost exertions to prevent the abandonment of the

mission. He was under no apprehension of suffering injury from the natives, and his long acquaintance with their character and habits led him to anticipate that the storm would soon pass away. He sailed in H.M.S. *Rainbow* and arrived in the Bay of Islands on 5th April 1827. He found the state of things improved, peace had been restored, and the missionaries were once more out of danger. He conferred with them and gave them counsel; reasoned with the chiefs on the baneful consequences of the late war, and at the end of five days from his arrival he was again upon the ocean on his way back to Sydney. Brief as the visit was, it confirmed his confidence in the speedy conversion of N.Z. In consequence of his co-operation with the missionaries, the labours of the press now for the first time reached the Maori tribes. During a visit to Sydney Mr. Davis had carried through the press a translation of parts of Genesis and Exodus and parts of St. Matthew and St. John, and some hymns. These prepared the way for the translation of the New Testament into Maori, which was printed a few years afterwards at the expense of the British and Foreign Bible Society. In 1830 Marsden perceived that N.Z. was about to undergo a great change. His efforts to induce the chiefs to unite under one head or sovereign elected by themselves had totally failed. Shunghie had been slain in battle and his ambitious projects of gaining a N.Z. throne by conquest were at an end. War was the natural condition of all the Maori tribes, and this, rendered more deadly, though possibly less ferocious by the introduction of fire-arms, was fearfully thinning their numbers from year to year. They were subject also to periodical returns of a terrible scourge, a disease resembling the influenza, which cut off multitudes. On the whole it was calculated that not more than a hundred thousand Maoris now survived; while twenty years before, when the island was first visited, the numbers were at least two hundred thousand. It was evident that they could not long maintain their independence as a nation. European ships began to crowd the Bay of Islands. English settlers were already making their way into their choice and fertile lands. To minds less sagacious than Marsden's the result could be no longer doubtful—N.Z. must become an English colony. He foresaw the necessity, and though at first with reluctance, cordially acquiesced in it even for the sake of the Maoris themselves. His concern now was to prepare them for a measure which must sooner or later take place. Everything was in a lawless state; the progress of the missions was greatly interrupted, and his presence was once more highly necessary. His own anxiety was great, first on behalf of the missions which had so long been the especial objects of his care, and then for N.Z. at large that the policy of Great Britain should respect the rights of the native tribes and pledge itself to their protection. On his arrival in March 1830 he was greeted before the ship had cast anchor by

Williams and others of the missionary band, who hastened on board and expressed their joy at his unexpected appearance among them. It was a critical moment, for they were in greater anxiety and difficulty than they had experienced at any former period of the mission. The natives were at open war, and but a day or two before a great battle had been fought on the opposite beach of the Bay of Islands, in which about 1400 had been engaged. The alleged cause of the war was the misconduct of an English captain who had offered indignities to some native women on board his vessel. One tribe espoused his cause, while another came forward to avenge the insult. Six chiefs had fallen in the battle, and 100 lives were lost; several whaling vessels were lying in the Bay, and their crews as well as the missionary stations were in the utmost peril from the revenge of the victorious tribe, which now lay encamped at Keri-Keri. There was not an hour to be lost. Marsden crossed the bay with Henry Williams early the next morning to visit the camp as a mediator. The chiefs, many of whom from different parts of the island had formerly been acquainted with Marsden, all expressed their gratification at meeting him again. After conversing with them on different points connected with proposals of peace, the two friendly mediators crossed over to the camp of their opponents, and entered at once on the subject of their mission. They spoke to them of the evils of war, and more particularly of the civil war in which they were engaged. "They heard all we had to say," he writes, "with great attention, and several of them replied to the different arguments we had used. They contended that we were answerable for the lives of those who had fallen in the battle, as the war had been occasioned by the misconduct of the captain of a vessel, one of our own countrymen; they wished to know what satisfaction we would give them for the loss of their friends who had been slain. We replied that we would give them no satisfaction, that we condemned his conduct, and were sorry that any of our countrymen had behaved so badly, and that we would write to England and prevent his return." This the savages requested that Marsden would not do; they longed for his return that they might take their own revenge. Marsden then proceeded to inform them that he had had an interview with the chiefs on the other side who were willing to come to terms of peace, and wished him to assist in settling their quarrel. This information was received in a friendly way by the greater part; one or two still wished to fight. The mediators returned to the beach which they found covered with war canoes and armed men. A war council was held, and Henry Williams stated the business upon which they had come amongst them. The natives listened attentively. Many of the chiefs gave their opinion in turn, with much force and dignity of address. These orations continued from an early hour in the morning till the shades of evening were closing. It was finally agreed

that the mediating party should proceed next morning to the opposite camp and repeat what had taken place. After a long discussion it was concluded that two commissioners from each party should be appointed along with Marsden and Williams to conclude terms of peace. Having urged all that was in their power to bring about a reconciliation they walked over the ground where the battle had been fought; a dreadful scene under any circumstances, unutterably loathsome where cannibals were the contending parties. The remains of some of the bodies that had been slain were lying unconsumed on the fires; the air was extremely offensive and the scene most disgusting. The next day (Sunday) was spent by Williams at the camp, for it was not considered safe to leave the savage warriors whose angry passions smouldered. Marsden proceeded to the station and preached to the infant church. He thus describes the scene as he sketched it upon the spot:—"The contrast between the state of the east and west side of the bay was very striking. Though only two miles distant the east shore was crowded with different tribes of fighting men in a wild savage state, many of them nearly naked and when exercising entirely naked; nothing was to be heard but the firing of muskets, the noise, din, and commotion of a savage military camp; some mourning the death of their friends, others suffering from their wounds, and not one but whose mind was involved in heathen darkness without one ray of divine knowledge. On the other side was the pleasant sound of the church-going bell; the natives assembling together for divine worship, clean, orderly and decently dressed, most of them in European clothing; they were carrying the litany and the greatest part of the church service, written in their own language, in their hands with their hymns. The church service, as far as it has been translated, they can write and read. Their conduct and the general appearance of the whole settlement reminded me of a well-regulated English country parish. In the chapel the natives behaved with the greatest propriety and joined in the church service. Here might be viewed at one glance the blessings of the Christian religion, and the miseries of heathenism with respect to the present life; but when we extend one thought over the eternal world how infinite is the difference!" These were trying times. The missions had existed fifteen years, and yet paganism raged in all the horrors of cannibal warfare close to the doors of the missionary premises. On the following Tuesday Marsden was aroused from his bed by a chief calling at his window to tell him that the army was in motion and that a battle seemed to be at hand. He arose immediately and was informed that thirty-six canoes had been counted passing between the mainland and the island. He immediately launched the missionary boat and proceeded to meet them. When he came up to them he found they had left their women and children on the island, and that they were all fighting men well armed and ready

for action in a moment's notice. He counted more than forty men in one war canoe. Yet amongst these infuriated savages the missionaries felt no alarm:—"We were under no apprehension of danger; both parties placed the utmost confidence in us, and we were fully persuaded the commissioners would be cordially received." If the event had turned out otherwise Marsden and his friends had notice given them by the native commissioners that they would be seen alive no more. The missionaries' confidence was not misplaced. "The whole day was spent in deliberation; at night, after a long oration, the great chief on one side clove a stick in two to signify that his anger was broken. The terms of peace were ratified, and both sides joined in a hideous war-dance together, repeatedly firing their muskets. The missionaries then took their departure from these savage scenes with much satisfaction, as they had attained the object they were labouring for." Even then the "Day-spring from on high" had visited this savage race. In no part of the world was the Sabbath-day more sacredly observed than by the converts in the missionary settlements; their lives gave evidence that their hearts were changed. Marsden was waited on one evening by several native young men and women who wished to converse on religious subjects; when they came in their anxious countenances explained the inward working of their minds. "When I had addressed them at some length," he adds, "a young native woman begun to pray. I never heard any address offered up to heaven with such feelings of reverence and piety, so much sweetness and freedom of expression, with such humility and heavenly mindedness." Amongst the audience in the room were the widow and two daughters of Shunghie. When they rose from their knees the ex-queen exclaimed, "Astonishing, astonishing!" and then retired; "and I confess," adds Marsden, "I was not less astonished than she was." A few days after Marsden married an Englishman to a native Christian woman, who repeated the responses very correctly in English which she well understood; she conducted herself with the greatest propriety and appeared neatly dressed in European clothing of her own making, for she was a good sempstress. Marsden considered this marriage to be of the first importance, and the New Zealanders appear to have been of the same mind and to have done due honour to the occasion, for the company came in a war canoe and brought their provisions with them, a pig and plenty of potatoes. Shortly afterwards he united a young native man and woman in marriage; they were both Christians, domestic servants to one of the missionaries, and seemed to have a great affection for each other. The young man was free and of a good family; the young woman was a slave, having become such by capture; for all their prisoners of war if not massacred were reduced to slavery. Clarke therefore redeemed her from her

master for five blankets, an axe and an iron pot. So confident was Marsden in the good feeling of the natives towards himself that he had taken one of his daughters with him, and she accompanied him in his visits to the chiefs, one of whom, known by the title of King George, demanded her in marriage for his son, "an honour," writes her father, "which I begged permission to decline." Fearful indeed had been the condition of females hitherto amongst these savages, as the following extract attests. He is describing the great change which Christianity had effected among the New Zealanders:—"On one of my former visits, sitting in the room I am at present in, the natives killed and ate a poor young woman just behind the house. In this little spot, where so late hellish songs were sung and heathen rites performed, I now hear the songs of Zion, and the voice of prayer offered up." Marsden's seventh and last visit to N.Z. was made in February 1837. He sailed in the *Pyramus* and landed on the southern side of the island at the river Hokianga. He remained amongst the Wesleyan missionaries for about a fortnight; after which he crossed over to the Bay of Islands, carried all the way in a litter by the natives. In this way he visited the whole of the missionary stations in the neighbourhood of the Bay of Islands, as well as Kaitia, a station at the North Cape. On the arrival of H.M.S. *Rattlesnake* he accompanied Captain Hobson (afterwards Governor of N.Z.) to the river Thames and the East Cape, returning at length to Sydney in that ship, where he arrived on 27th July, after an absence of five months. When entering the heads of Port Jackson one of the officers of the ship observed, "I think Mr. Marsden you may look upon this as your last visit to N.Z." He replied, "No I don't, for I intend to be off again in about six weeks. The people in this colony are becoming too fine for me. I am too old to preach to them, but I can talk to the New Zealanders." An English barque had lately been wrecked on the coast, but fortunately Guard the captain, his wife, two children and the crew, twenty-eight in all, escaped to land. At first the natives treated them with kindness, which they soon exchanged, in consequence of what provocations on either side it would be useless to ask, for open hostilities. A quarrel was got up between two tribes and an engagement followed in which twelve Europeans and about forty Maoris fell. Guard and his party were taken prisoners. On condition of returning with a cask of powder as a ransom for himself and the rest, Guard and five of his men were allowed to proceed to Sydney, where he laid the matter before Sir Richard Bourke. Relying on the accuracy of Guard's narrative, the Governor requested Captain Lambert to proceed with H.M.S. *Alligator*, which happened to be lying in Port Jackson, to obtain the restoration of the British subjects then in the hands of the New Zealanders. He was instructed to abstain from any act of retaliation and to obtain the restoration of the captives by

amicable means, and Guard and his five men returned in the same ship. Soon after the arrival of the party Guard recognised the chief who was now the proprietor of the shipwrecked women and children, and the unsuspicious native rubbed noses with him in token of amity, at the same time expressing his readiness to give up his prisoners on receiving the "payment" guaranteed to him. This however was not the way in which the affair was to be settled; Guard and his sailors seized him as a prisoner and dragged him into the whale boat in which the party had gone ashore. Great cruelty was practised towards this unfortunate man and fearful havoc committed by the English. The British subjects were restored, as indeed they might have been without the loss of a single life, through the intervention of the missionaries and of the British resident at the Bay of Islands, and the expedition having gained its object by force and stratagem, returned to Sydney with the troops and the liberated captives. The native tribes were still at war with each other and with the European settlers—the miserable effect of Guard's conduct. From the missionary station at Pahia, Marsden's daughter counted one morning twenty-one canoes passing up the bay. A battle followed, which she witnessed at a distance, and the Europeans all around fled to the missionary station. In the engagement three chiefs fell; a second fight occurred soon afterwards. "We have heard firing all day," she writes; "many have been killed: we saw the canoes pass down the river containing the bodies of the slain." Marsden himself was absent on a visit to the southward, or his presence might possibly have prevented these scenes of blood. Wherever he appeared he was received by the converted natives with salutations and tears of joy; the heathen population welcomed him with the firing of muskets and their rude war dances. Wherever he went he was greeted with acclamations as the friend and father of the New Zealanders. One chieftain sat down upon the ground before him gazing upon him in silence, without moving a limb or uttering a single word, for several hours. He was gently reproved by Williams for what seemed a rudeness. "Let me alone," said he, "let me take a last look; I shall never see him again." "One principal chief," writes Marsden, "who had embraced the Gospel and been baptised, accompanied us all the way. We had to travel about forty miles by land and water. He told me he was so unhappy at Hokianga that he could not get to converse with me from the crowds that attended, and that he had come to Waimate to speak with me. I found him to be a very intelligent man and anxious to know the way to heaven." While at Kaitai he held a constant levée, sitting in an arm chair in an open field before the mission house; it was attended by upwards of a thousand Maoris, who poured in from every quarter; many coming a distance of twenty or thirty miles, contented to sit

down and gaze on his venerable features; and so they continued to come and go until his departure. He presented each with a pipe and fig of tobacco; and when he was to embark at last, they carried him to the ship, a distance of six miles. The state of things in those parts of the islands where depraved Europeans had settled is graphically described by Marsden. Contrasting the happy state of the mission settlement at Waimate, he proceeds:—"On the opposite side of the harbour a number of Europeans have settled along with the natives. Several keep public-houses and encourage every kind of crime. Here drunkenness, adultery, murder, &c., are committed. There are no laws, judges, nor magistrates; so that Satan maintains his dominion without molestation. Some civilised Government must take New Zealand under its protection or the most dreadful evils will be committed by runaway convicts, sailors and publicans. There are no laws here to punish crimes. When I return to N.S.W. I purpose to lay the state of N.Z. before the Colonial Government to see if anything can be done to remedy these public evils. I hope in time the chiefs will get a Governor. I shall inform the Europeans in authority how much they are distressed for want of a Governor with power to punish crime. The Bay of Islands is now in a dreadful state." The venerable founder of the missions—advocate of its native population and friend of all that concerned its welfare—took his last leave of the shores of N.Z. in H.M.S. *Rattlesnake*. The signal gun was fired and all the friends from Waimate and Keri-Keri arrived to accompany their revered father to the beach.

V. *The New Zealand Company*.—For a period of more than fifty years after its discovery by Cook N.Z. continued to be the scene of unceasing savage warfare; and it was left in the occupation of its aboriginal native race. It was not until the great natural advantages of the country and its political importance were prominently brought before the public by the N.Z. Association that the true value of the islands was fully understood. Believing that the occupation of the country would prove injurious to the natives and a hindrance to the mission, the Committee of the Church Missionary Society opposed the project put forward by the N.Z. Company for planting settlements in the islands; and the Government, averse to new projects, refused to sanction the scheme. In vain was it represented by the promoters of the undertaking that the French were contemplating the establishment of a settlement in the country, and that unless British right to the sovereignty was openly maintained and immediately acted on, the French would gain a footing in the country and the sovereign rights of Great Britain would be lost. It was maintained by the Government that any right of sovereignty obtained from Cook's discoveries had already been abandoned; that it had in various legislative enactments admitted that N.Z. was no part of the

British dominions, and that His Majesty King William the Fourth had made the most solemn declaration that it was a substantive and independent State. While this controversy was in progress adventurers from the neighbouring colonies were flocking to N.Z. to purchase land from the natives, and a joint stock company was formed in England for colonising the country; and while the Government were demonstrating the theoretical difficulties which prevented the occupation of the country English adventurers were engaged in practically effecting its colonisation. The company formed for colonising N.Z. had Lord Durham at its head and consisted of political economists, colonial reformers, influential shipowners, bankers and merchants connected with London; and in political influence it was one of the most powerful joint stock associations of the day. Amongst the directors were men of high character who were influenced in becoming members of the association solely by patriotic and disinterested motives; but there were also some who had a stronger interest in their individual advantage than in the success of an undertaking formed to promote a great national object; and although men of rank and high character were made to appear before the public as taking an influential part in their proceedings, those gentlemen were frequently but the instruments of more able but less disinterested colleagues. Gibbon Wakefield wrote: "I was the principal founder of the Company and its principal managing director from the time of its formation till the summer of 1846, allowing for intervals of absence occasioned by illness and other occupation at a distance from England. My incapacity changed the whole character of the direction of the Company's affairs, which then fell into the hands of a few persons in whose minds sound principles of colonisation and colonial government were as nothing compared with pounds, shillings and pence." Referring to the Company in his speech on the second reading of the New Zealand Bill, Earl Grey said: "They did not display that judgment that might have been expected from them in conducting the great enterprise into which they had somewhat rashly entered." According to Sir William Molesworth who was for some time connected with them, "the Company was founded for two objects: the one was to put in practice certain views with regard to colonisation; the other was to make money. Some of these views proved correct; others erroneous. The pecuniary speculation utterly failed; partly in consequence of the obstacles put in the way by the Colonial Office, in defiance of whom it had been undertaken; but it had chiefly failed in consequence of great mismanagement." The first object of the Company was to induce the Government to erect the islands into a British colony; but disappointed in their endeavours they themselves fitted out and dispatched a preliminary expedition for the purpose of making purchases of land from the natives, for selecting suitable localities

for the sites of settlements, and to prepare for the reception of emigrants on their arrival in the country. And calculating on the success of their agent they proceeded at once to offer for sale by lottery in England the right of selection amongst the lands thus anticipated to be acquired by them; and though the country was at that time almost a byword for barbarism—without law or government and inhabited by a wild and warlike native race—and though officially warned that their proceedings could not be sanctioned by the Government, the Company found purchasers in England to the amount of more than £100,000. Without waiting to hear what locality had been procured by their agent for the site of a settlement, or whether he had succeeded in making the purchase of a single acre of land, they sent out several ships filled with emigrants to be located on that spot, wherever it might be, which on their arrival in the country they might find to have been procured for that purpose. Yet at that time and for several years after N.Z. became a dependency of the Crown, little was known of the common law of real property in force amongst the native owners of the soil; few were aware of the accurate knowledge they have of boundaries; of the use they make and the value they attach to tracts of country which appear waste and worthless; of the tenacity with which they defend their territorial rights; of the number of individuals who on different grounds have various degrees of interest in the same piece of land; of the necessity in order to make a safe purchase of any particular tract of country of ascertaining who have individual rights to particular portions as well as who are the chiefs and others who have general rights on the whole; and particularly of having well ascertained and clearly defined the sacred places, eel-fisheries, and other favourite localities which the owners may desire to have reserved for themselves. It was not then known in fact that to complete a safe and satisfactory purchase of land from the natives is a work of as much difficulty, requires as much time, careful investigation, and knowledge of native law and custom as to complete the purchase of an English baronial estate. The majority of the Select Committee of the House of Commons appointed in 1844 to inquire into the proceedings of the Company had assuredly no desire to deal hardly with that body; but they were compelled to report—"That the conduct of the Company in sending out emigrants, not only without the sanction, but in direct defiance of the authority of the Crown, was highly irregular and improper." In most of the localities best adapted for the sites of settlements, purchases of land from the natives had already been made by the old residents, by absentee Sydney speculators, and by a host of land-jobbing adventurers. Thus limited in his range of choice, and daily expecting the arrival of some hundreds of the Company's emigrants from England, their agent, Wakefield, had little time or opportunity for a

careful examination of the country. Meeting with natives asserting themselves to be the sole owners of the land in the neighbourhood of Cook Straits, and but imperfectly acquainted with the native law of real property, Wakefield proceeded to deal with them as if they were its sole and rightful owners; and within a short time after his arrival, he reported to the Company that he had completed the purchase of the harbour of Port Nicholson and a large tract of the surrounding country, together with a considerable portion of the northern part of the Southern Island. The colonisation of N.Z. was thus forced on the British Government; and to protect the natives, to avert a war of races, and to rescue the emigrants themselves from the evils of a lawless state of society, it was now resolved "to adopt the most effectual measures for establishing amongst them a settled form of civil government." Captain Hobson, who had recently visited N.Z. for the purpose of affording protection to English subjects there, and who had shown great ability and judgment in his report on the state of the country and its people, was selected to conduct the undertaking. All claim to sovereignty on the ground of discovery having been abandoned, Hobson was instructed to urge upon the native chiefs the impossibility of extending to them any effectual protection, unless the Queen were acknowledged as the Sovereign of their country; and he was commissioned to enter into a treaty with them for the formal cession of the sovereignty to the Crown.

VI. *Governor Hobson*.—On his arrival in the country in the character of British consul, N.Z. was an independent State; its native inhabitants were a wild and lawless race; its European occupants were unrestrained by any law and amenable to no tribunal, and had been alternately the authors and victims of every species of crime and outrage. Before a British colony could be founded, everything was yet to be done. The sovereignty over the country had to be obtained by treaty from the natives; territory for the occupation of British settlers had to be acquired; and the machinery of civil government was to be organised and set in motion. Nor was the establishment of British authority an easy or popular task. Its native inhabitants were a high-spirited, well-armed, warlike race. A large portion of the European population had long been living in a state of utter lawlessness. To curb and restrain, where all restraint had been unknown—where every man had been a law unto himself—and to put a stop to all private dealings with the natives for the purchase of their lands could be no popular duty for the Minister of the Crown. His first great object was to obtain the concurrence of the principal chiefs to a treaty ceding to the Crown all their rights and powers of sovereignty; yet no inconsiderable difficulty was experienced by him in prevailing on them to become parties to the treaty from a jealous fear lest by ceding the sovereignty they might be deemed to have parted

with the property in the soil; and at the outset of his proceedings the project had nearly been defeated. After announcing to the chiefs assembled at Waitangi the object of his mission, he carefully explained to them that it was the sovereignty and not the land that would pass to Her Majesty by virtue of the proposed treaty; that, to use their own figure, "the shadow would go to the Queen, but that the substance would remain;" and he assured them that they might rely implicitly on the good faith of Her Majesty's Government in the transaction. Many of the assembled chiefs addressed the meeting on the subject, and a protracted and stormy discussion ensued. Several of them, having been instigated into opposition by disaffected Europeans, opposed the cession of the sovereignty with so much skill and ability that apprehensions were for a time entertained as to the result of the negotiation. "Send the man away" said one of the opposing chiefs turning to Hobson. "Don't sign the paper. If you do you will be reduced to the condition of slaves and be obliged to break stones for the roads and your lands will be taken from you." And but for the timely interference of one of the most influential of the northern chiefs it is probable that the project would have been completely defeated; but the eloquence of this faithful ally ultimately turned the scale. "You must be our father" said Tamati Waka, turning to Hobson in concluding his address. "You must not allow us to become slaves; you must preserve our customs and never permit our lands to be wrested from us." With this touching confidence in British honour did the native inhabitants of the islands consent to place themselves under the dominion of the British Crown. The example of Tamati Waka decided the waverers, and a large number of the most influential chiefs of the north became parties to the treaty of Waitangi; the adherence of many powerful chiefs in other parts of the Northern Island was afterwards secured. Many however steadily refused, believing that if they put their signatures to the treaty their land would be taken from them. They had heard, they said, of the history of America, of New South Wales, and of many countries taken possession of by the English, and they could not but be jealous of the intentions of the British Government. In some instances those who signed the treaty refused to accept any present lest it might be construed as a payment for their land; and many influential chiefs in various parts of the country, though strongly urged to give in their adherence, to the last continued steadily to refuse. Before the negotiations were brought to a conclusion, and while agents were still engaged in various parts of the country in endeavouring to obtain signatures, intelligence reached Hobson that the settlers sent out by the Company had organised a system of government under the authority of the Port Nicholson chiefs; and deeming the proceeding to be of a reasonable character he at once (February 1840,) and without

waiting for the completion of the cession, proclaimed the Queen's sovereignty over both islands. For a few months they were annexed as a dependency to N.S.W.; but on the 16th November following, by a Charter under the Great Seal of the United Kingdom, the islands of N.Z. were erected into a separate and independent colony. One of the earliest duties which devolved on Hobson was to select a suitable site for the seat of Government. Having migrated from a warmer climate, the Maori race had settled themselves for the most part in the more congenial latitudes of the N.Z. group; and they were chiefly to be found congregated in the northern part of the Northern Island, nineteen-twentieths of the whole native population being settled in that island alone. And as the principal object of the Government in establishing British authority in the country was to promote their civilisation and advancement, other considerations besides the natural advantages of the locality had to be taken into consideration in deciding upon the most suitable situation for establishing the capitals of the colony. When the Company sent out their exploring expedition they explained to Wakefield that there was probably some one part of N.Z. better suited than any other to become the centre of its trade. The shores of safe and commodious harbours, the sheltered embouchures of extensive rivers communicating with a fertile country, were the situations to which his attention was directed; and he was especially instructed to make purchases of land on the shores of that harbour which should appear to offer the greatest facilities as a general trading depôt and port of export and import for all parts of the islands. But closely followed unfortunately by several hundred intending settlers, Wakefield had no time to spare in selecting a site for their location. Many harbours, in other respects suitable for extensive settlement, were already occupied by claimants still earlier in the field; and in the selection of a site for their first and principal settlement the Company were confined to unoccupied localities; while Hobson, as the representative of the Crown, had all before him where to choose. There are many good harbours in N.Z., and many districts abounding in rich and fertile land, and not a few where the facilities of internal water communication are considerable; but the difficulty was to find these natural advantages in combination. The Bay of Islands as a harbour is second to none; but the country in the immediate neighbourhood is hilly and broken with but a limited extent of open country available for agricultural purposes. Taranaki has a large extent of excellent land, well watered and beautifully wooded; but it has no harbour and abuts upon an open roadstead. Wellington has a spacious harbour surrounded by beautiful scenery, but owing to the broken and hilly character of the neighbouring country there is little available land within a radius of eight or ten miles of the port. The harbour of Nelson is

of second-rate character; and there also the available land in the neighbourhood is of limited extent; and both at Wellington and Nelson the facilities of internal water-communication are inconsiderable. At Canterbury the harbour is not of first-rate character, but the district possesses a vast extent of open available fertile land, covered throughout its whole extent with fine natural grass; though the plains are separated from the harbour by a lofty ridge. The Otago district comprises a large extent of fine open grassy country; but its harbour, although sufficiently good for the purposes of the settlement, is not by any means of a first-rate character. The district of Auckland, however, in addition to its excellent harbour, with a second port within six miles on the opposite coast and extensive natural facilities of internal communication, has its town, suburban, and country lands in a compact and convenient area; and all impartial testimony is united in favour of the wisdom of Hobson's choice. Without the aid of a map it is difficult to convey a clear impression of the position selected for the capital of N.Z.; begirt as it is by harbours, and forming a centre from which water-communication radiates inland in every direction. It is the centre of the great bulk of the native population; it possesses unusual facilities for internal water-communication; it has a safe and commodious harbour and several smaller ports in its immediate neighbourhood abounding with valuable timber; and it is surrounded by a considerable extent of available land. "With my present knowledge of N.Z.," wrote Hobson, addressing the Secretary of State, "having for some time resided at the Bay Islands; having visited Cook Straits and Banks Peninsula; and after seeing the Company's settlement formed at Port Nicholson, I do not hesitate to state my opinion that the neighbourhood of Auckland combines advantages for a very extensive and prosperous settlement not to be found in any other part of this colony." "There can be no question," also wrote Dieffenbach, the naturalist who accompanied the Company's preliminary expedition and who had a personal knowledge of the locality, "that the place has been judiciously chosen for the site of a town; as commanding a great extent of cultivable land in its neighbourhood, great facility of communication with the coast and the interior of the Northern Island, and as being a central point for the most powerful native tribes—the Nga-Puhi to the northward, the Waikato to the southward, and the Nga-te-haua to the eastward;—separating them in a military point of view, but uniting them for the purposes of civilisation and commerce." It was not until some weeks after Hobson's death that the intelligence reached the colony that his choice had been confirmed. "In reference to your selection of Auckland in preference to Port Nicholson as the site of the capital of N.Z., I am happy to acknowledge," wrote the Secretary of State, "that the grounds on which you proceeded

appear to me satisfactory. On a subject so peculiarly local and to the right understanding of which so much topographical knowledge is essential, my opinion must of course be guided by the comparison of the statements transmitted to me and by balancing the weight of conflicting authorities. Approaching the question in that manner, and unaided by any personal acquaintance with the localities, I have thought there is such a clear prepared course of motives in favour of your choice as to justify me in advising the Queen to decide that Auckland should be the seat of Government of the new colony, and I have received Her Majesty's commands to acquaint you that such is Her Majesty's pleasure." In fixing the seat of Government amidst the great bulk of the native population in the north Hobson drew on himself the hostility both of the Company and their settlers, who were disappointed that the settlement planted by the Company at Wellington was not selected by Hobson for the capital, overlooking the fact that Auckland was chosen with reference to the permanent interests of the country, while Wellington was selected by a private company with reference to the private interests, limited means and present views of a trading association whose proceedings had not then received either the sanction or recognition of the Crown; their intending emigrants having in fact, before leaving England, been officially informed that the Government had no connection with the Company nor any knowledge of their proceedings, and could hold out no expectation that her Majesty would be advised to recognise or sanction them. Knowing the great natural advantages of the northern portion of the islands as a field for colonisation, and foreseeing the prestige which would attach to the locality fixed upon as the capital, the Company from the first regarded the settlement founded at Auckland by Hobson with undisguised jealousy, and at the outset of his proceedings the first Governor drew on himself and upon his government their bitter and increasing hostility. Seeing that the country was already inhabited by a powerful native race it was especially desirable that the Government should have the power of directing the course of colonisation, determining the localities to be from time to time occupied by settlers, and prescribing the limits within which their colonising operations should in the first instance be confined. But systematic colonisation had been rendered almost impossible by the delay which had taken place in commencing the undertaking. Without the sanction and in direct defiance of the authority of the Crown, the Company had sent out a large body of emigrants from England; and while the controversy between the Government and the Company was still pending, and during the two years immediately preceding Hobson's arrival in the country, large numbers of speculators and adventurers had flocked over from N.S.W. with ready-made deeds in English common form, in the expectation that they would be able speedily

to make valid purchases of land from the natives for little more than a nominal consideration. And by the time British authority was proclaimed in the country, the claims to land were so numerous and extensive as to make it at once obvious how essential it was to the systematic colonisation of the country, not only that no land should in future be ceded by the natives except to the Crown, but that the purchases alleged to have been already made from them should be subjected to investigation; the basis of the enquiry being the assertion on the part of the Crown of a title to all lands in N.Z. which had been granted by the chiefs in accordance with the customs of the country, and in return for some adequate consideration. Accordingly during the short period that N.Z. continued in the relation of a dependency of the neighbouring colony, the Legislature of N.S.W. in accordance with instruction from the British Government, passed an Act providing that all claims to land alleged to have been purchased from the natives before the establishment of British authority, should be submitted to the investigation of a commission of enquiry; that in case it should be proved by the claimant that he had made a purchase, that the quantity of land to be granted to him should be regulated by the sum expended in the purchase; and that as a general rule no claimant should have granted to him more than 2560 acres. At that time nearly the whole European population of the North Island were claimants of land alleged to have been purchased from the natives before the proclamation of the Queen's authority: the number of claims, in addition to the gigantic claims of the Company, amounted to upwards of twelve hundred; and in extent they varied from a single rood to more than a million and a quarter of acres. Three of these claims exceeded a million of acres each; three of them comprised more than half a million of acres each, three others exceeded a quarter of a million of acres, and upwards of thirty of the claims comprised more than twenty thousand acres each. For some of these claims, the claimants had nothing to show but the ornamental scrawl or signature of one or more chiefs to a deed which in its terms and phraseology must have been utterly unintelligible to those who signed it; comprising a description of the boundaries purporting to be conveyed by it so vague and indefinite as to render it void for uncertainty. Some of the most extravagant of the claims were never actually prosecuted before the Commissioners; many were ultimately commuted for scrip credit at the sale of land by the Government; and for several hundreds of them Crown grants were issued, after a lengthened but unavoidable period of delay. In carrying out a measure almost universally regarded by the claimants as an act of general confiscation, the Local Government, though but the instruments of superior authority, was involved in the most unfriendly relations with the whole of the European population of the north; and for many

years the country was kept in a state of unprofitable agitation by their angry and determined opposition. After a lapse of eighteen years a few of these old claims remained unsettled; and the question which so long and so vexatiously agitated the country had hardly been entirely set at rest. Having large families growing up around them, and having no reasonable expectation that N.Z. would shortly become a regularly settled English colony affording a profitable field for the industry and enterprise of their children, it is hardly surprising that some of the missionaries and catechists stationed in the country availed themselves of the permission given them by the Church Missionary Society to purchase land from the natives for the use and benefit of their families; but these missionary claims eventually proved to the parent society a source of painful interest. The Roman Catholic and Wesleyan missionary bodies prohibited the purchase of land by their missionaries from the people they are commissioned to convert. The Church missionary body were placed in a false position when it could be said, with but the slightest appearance of the truth, that unlike the self-denying members of other denominations their missionaries had taken advantage of their position to secure their own aggrandisement. A few only of the members of the Church missionary body had made purchases exceeding what might fairly be considered a reasonable provision for their families; and some were not purchasers of so much as a single acre. The real evil indeed was not so much in the extent of the land purchased as in the fact of the purchase itself: the error of the society consisted in giving any sanction to the purchase of land from the natives by their missionaries even to a moderate extent. The prejudice however which in the first instance was studiously excited amongst the colonists against the members of the missionary body was soon seen by them to be unfounded and unjust; and whatever difference of opinion were entertained by the settlers of the extent of missionary influence amongst the natives, all agreed that the missionaries had rendered important services to both races, and that but for their labours a British colony would not have been established in the country. For the few months during which N.Z. continued to be a dependency of N.S.W. the newly-founded colony was subject to a code of laws enacted for a penal settlement; and even after it had been erected into a separate and independent colony, in November 1840, N.Z. continued for a while to be subject to the laws of the convict colony; for by an early Act of the Legislature it was provided that, until the laws necessary for its government could be specially framed with that object by the local Legislature, all such laws of N.S.W. as were applicable to the colony should continue to be in force. Happily the period of bondage was of short duration. Soon came English lawyers, imbued with English spirit, and eager to relieve the colony from the baneful influence of a convict

code; and measures were speedily enacted for establishing courts of judicature and for providing for the administration of justice, for the establishment of municipalities, for the transfer of real property, for the regulation of marriages and a variety of other important subjects. In the structure of the laws themselves the precedent was established of framing them in simple, concise and intelligible language; of confining the matter of each clause to a single subject; of arranging the clauses methodically under appropriate heads, and of avoiding the prolixity and tautology by which English legislative enactments are usually distinguished. And not being hampered by any complicated pre-existing system, nor impeded by the opposing influence of a powerful profession, the lawgivers of the colony were also enabled to effect amendments in the law which the British Legislature has hardly yet succeeded in accomplishing. A simple system of oral pleading suited to the primitive condition of the community was established for eliciting the issue in civil actions; and the form and language of indictments in criminal proceedings were materially amended. Of enactments of a more permanent character, that relating to real property is perhaps the most conspicuous for the boldness of its alterations. Many useless forms and subtleties in this abstruse branch of the law were abolished; not a few of its rules were amended. Many doubtful points not even yet well settled in England were set at rest by declaratory enactment, and to reduce the length of purchase-deeds, mortgages and other conveyances it was provided that a single, short and simple deed should be sufficient; and the more certainly to provide against unnecessary prolixity, that professional men should be remunerated according to a prescribed scale of charges irrespective of the length of the instrument itself. By this means and by the further enactment that they shall imply the lengthy covenants and provisions in common use, instruments for mortgaging and conveying land in N.Z. have in practice been kept within a moderate compass. These alterations in the law of real property, complemented by a system of registration affording to an intending purchaser or mortgagee an easy means of ascertaining the true state of the title, have done much to render the dealing with real property a comparatively simple and easy transaction. The changes effected in this important branch of the law were of so sweeping a character as even to attract the attention of the authorities at home. "Her Majesty would have been advised to confirm and allow the ordinance for facilitating the transfer of real property and simplifying the law relating thereto," wrote the Colonial Minister, Lord Stanley, "had it not been that this enactment introduces innovations of such magnitude and importance that no opinion of its probable effects antecedently to the actual trial of the experiment would seem entitled to much weight. I am gratified in observing how large a range of knowledge and

how much diligence have been brought to bear in the structure of this Ordinance; nor do I dissent from the learned framer of it in the general opinion that it is an object of inestimable importance to relieve a new society in its infancy, when alone it can be relieved, from thralldom to that complex and artificial system of law regarding the acquisition and transfer of real property which has grown up in this country. I therefore do not object to this experiment, venturous as it is. But neither am I willing to advise the Queen to sanction it until I shall be able to lay before Her Majesty some surer proof than I can at present command of the real wisdom of the fundamental changes." Although the seat of Government was established in the centre of the great bulk of the native race and of the European population settled in the north, it soon became obvious that one general central authority could not satisfactorily legislate in detail for the several settlements almost contemporaneously planted in the country. In addition to the settlement founded by the Crown at Auckland, three settlements were planted by the Company at Wellington, Nelson, and New Plymouth; all widely separated from each other, and some of them at that time distant from the capital a four weeks journey or a fortnight's sail; and one of the earliest enactments of the Colonial Legislature was a comprehensive measure of a Municipal character, empowering the colonists to manage their own local affairs and to provide for the good order, health, and convenience of the public. The measure was based upon the principle that the people themselves are best qualified to provide for the management of their own local affairs. It was so framed as to entitle any then existing or future settlement, whenever its population should amount to 2000 souls, to be erected into a separate Municipality; and if cordially accepted by the colonists it was expected that it would relieve the general Government from a duty which it could but ill perform, and that the progress of the colony generally would be promoted by the honourable rivalry which might be expected to spring up amongst the various settlements when entrusted to their own local management. The duties which devolved on the local Government in founding the colony, arduous as they would have been under any circumstances, had to be performed amidst the angry opposition of an irritated community; and the most strenuous efforts were made, not only by land claimants in the north and by the disappointed settlers in the south, but by a powerful English Joint-stock Association, to effect Hobson's recall. Almost alone—looking in vain for despatches from home, failing in health, surrounded by angry opponents and assailed by the bitterest abuse, uncertain whether his proceedings would be approved by the Ministers of the Crown—the last few months of Hobson's life were passed in a state of painful and harassing suspense. Had he lived but a few weeks longer he would have been cheered by the

knowledge that his general administration of the affairs of N.Z. was approved by Her Majesty's Government; that his selection of the site of the capital had received the sanction of the Crown; and that in all his transactions with the Company he might rely upon the support of Her Majesty's Government against the "exaggerated pretensions" of that Company and their agents. Hobson had a novel and arduous duty to perform; he laboured honestly and assiduously to discharge it, and his services entitled him to the favourable consideration of his country. "Mother Victoria," wrote one of their greatest chiefs, addressing Her Majesty after Hobson's death, "my subject is a Governor for us and for the strangers of this island. Let him be good man. Look out for a good man: a man of judgment. Let not a troubler come here. Let not a boy come here, or one puffed up. Let him be a good man as the Governor who has just died." Brief as it was Hobson's career as the first Governor and founder of the colony will always deserve a prominent place in the history of N.Z. Between January 1840 and September 1842, during his administration of affairs in the several characters of Consul, Lieutenant-Governor, and Governor, the sovereignty over the country was obtained by treaty from the native chiefs; considerable tracts of land became by purchase the demesne land of the Crown; the machinery of Government was organised and put in motion; the purchase of land from the natives by private individuals was put down; the seat of Government was established on a well-chosen site; an important body of laws was devised and enacted for the peace, order, and good government of the colony; and almost for the first time colonising operations excited the interest and attention of the British public. It was now seen however that an experiment was about to be tried deeply affecting the interests of humanity; that a pledge was given by the Ministers of the Crown that the natives of the islands should if possible be saved from that process of extermination under which uncivilised tribes had hitherto disappeared when brought into contact with civilisation; and that the British Government was for the first time in earnest about to try the experiment whether a fragment of the great human family, long sunk in heathen darkness, could be raised from its state of social degradation and maintained and preserved as a civilised people: whether it were possible to bring two distinct portions of the human race in the opposite conditions of civilisation and barbarism into immediate contact without the destruction of the uncivilised race; and whether in rendering the colonisation of a barbarous country possible by his religious teaching the Christian missionary is not also at the same time the pioneer of the destruction of its heathen people. Such were the grave issues involved in the proceedings taken by Great Britain for the colonisation of the country.

VII. *The Wairau Massacre.*—Early in the year 1840, and before British authority was established

in the country, the N.Z. Company's first fleet reached Wellington; and no sooner had the emigrants disembarked than the want of authority for the preservation of order amongst them began to be felt. Ignorant of the difficulties of the enterprise into which they had hastily engaged, the Company had made it their boast that they had undertaken the colonisation of the country in defiance of the authority of the Crown; but their first body of colonists soon found that, whatever may be its form, some governing power is the first necessity of the social state. Before leaving England the emigrants had entered into a compact amongst themselves that, when they reached their adopted country, every offender should be punished in the same manner as if the offence had been committed against the law and within the realm of England; that certain members of the colonising body should constitute a council of government; and that in all criminal proceedings, an umpire, assisted by assessors, should decide on the guilt or innocence of the party accused. Hardly had their first body of settlers reached the country, when they were officially warned from England, not only that any act of coercion or authority done by them under the agreement would be illegal, but that they would be liable to a prosecution for usurping the functions of the Crown and Parliament in setting up an independent jurisdiction, and that it was the intention of the Government to enforce the strict letter of the law. A serious difficulty was thus experienced at a critical period of their adventurous undertaking; and without some controlling power the community must soon have been broken up. A prompt and efficient remedy was essential to its very existence. The colonists, however, were Englishmen, practised in the exercise of political functions: not a few of them equal to any emergency; able, energetic, and determined. Self-preservation was the paramount consideration. They could not carry British law into effect, even by mutual consent; but there was no law to prevent them living in an independent State, enjoying its protection and subject to its laws. A constitution and laws adapted to the habits of an enterprising body of Englishmen were not, it is true, at that time to be found amongst the wild tribes of N.Z.; this, however, was a small difficulty; for the country had at all events long since been officially declared by the Government to be an independent State. Some years previously, the British residents, for the purpose of providing some means of regulating their increasing commerce, had collected together a number of the northern chiefs who agreed to meet in congress at Waitangi, in the autumn of each year, for the purpose of framing laws for the dispensation of justice, the preservation of peace and good order, and the regulation of trade. Although this attempted confederation failed to effect the object of its author, it served as a useful hint to the newly-arrived settlers at Port Nicholson; and they at once perceived a means of

obtaining the protection of laws of their own framing, without any violation of the laws of their own country. Following the example of the British residents, the Port Nicholson settlers called together the "sovereign chiefs" of the district, and went through the form of obtaining from them the adoption and ratification of the Contract of Government entered into by themselves before leaving England. Besides ratifying the agreement, these sovereign chiefs conferred upon the council of government which had been established by the settlers all such powers of legislation as they might themselves exercise and perform. In resorting to these proceedings the southern colonists had no intention of establishing a permanent independent Republic: it was simply an act of self-preservation, to enable them to maintain order amongst themselves without violating the law of their own parent State. And this ephemeral constitution answered the object of its founders: it gave them the appearance at least of legitimate authority; and it had the effect of hastening the establishment of British rule. But the Wellington settlers had yet no conception of the helpless position in which they had been placed by the precipitate proceedings of the Company by whom they had been sent out. For a short time after their arrival they continued to live on the most friendly terms with the natives, and anticipated no opposition to their peaceful occupation of the country. But the defects in the Company's title soon became apparent. When their surveying parties began to cut the boundary lines, or when their purchasers proceeded to take actual possession of the land, natives from various parts of the country who had not been parties to the sale came forward to assert their rights, and regarding the Company's settlers as unauthorised intruders actively opposed their occupation of the land; while the colonists, ignorant of the native law of property, naturally viewed the claims put forward by the natives as but a pretext for acts of violence and for making extortionate demands. And thus, prevented from occupying the soil, the intending settlers were confined in a state of complete inactivity to the strip of land forming the site of the projected town of Wellington. From an early period of the settlement angry relations sprung up between the Company's settlers and the natives, and during a long period of unprofitable inaction capital remained idle or was unprofitably expended, labour remained unemployed and the best energies of a numerous body of enterprising colonists were wasted on the Wellington beach. No long time elapsed however before the settlers had reason to believe that the Company had sold land to them which they had never in fact purchased from the natives, and the question arose, What were the rights, the claims and the obligations of the several parties? As to land which they had not sold to the Company, it was clear that the natives not only continued to have an undoubted right to it, but that they had also a claim upon the British Government to be

supported in the peaceable possession of it. Before the country was colonised repeated disclaimers were made by the Queen and Her Majesty's predecessor of every pretension to seize upon it. By the treaty of Waitangi too, "Her Majesty the Queen of England confirmed and guaranteed to the chiefs and tribes of N.Z. the exclusive and undisturbed possession of their lands." By the Royal instructions the Governor was directed especially to protect them in their persons and in the free enjoyment of their possessions, and the Secretary of State declared that "Her Majesty had distinctly established the general principle that the territorial rights of the natives as owners of the soil must be recognised and respected." Thus the rights of the natives and their claims on the British Government did not admit of a question. If the Company had been even tacitly allowed to colonise N.Z. they might have had some claims upon the Government for consideration, but they were informed by Lord Normanby before the sailing of their preliminary expedition, that "Her Majesty could not recognise the authority of the agents whom the Company might employ," and that "no pledge could be given for the future recognition by Her Majesty of any proprietary titles to land within N.Z. which the Company or any other persons might obtain by grant or purchase from the natives." So far from the Company's operations having been conducted under the sanction or with the permission of the Government it was made a boast by the Company that they colonised N.Z. in spite of the Government. Neither against the natives nor against the Government therefore could the Company have any claims to land which they had not purchased. But the settlers themselves, it was urged, had claims either against the Government or against the natives, because "upon the faith of an Agreement between the Company and the English Government which seemingly recognised and adopted the Company's title many of the settlers had expended sums of money." Unfortunately for the Port Nicholson settlers this agreement contained an express declaration on the part of the Government that "the Company having sold or contracted to sell land to various persons, Her Majesty's Government disclaim all liability for making good any such sales or contracts;" and to make the case stronger, in answer to an enquiry made on behalf of a number of purchasers of land in the Company's first or principal settlement, and before the first body of settlers sailed from England, the Colonial Minister replied that Her Majesty's Government had no connection with that Society and that he "could not hold out any expectation that Her Majesty would be advised to recognise or sanction them." To a similar enquiry made on behalf of a small community of intending emigrants, it was replied that Her Majesty's Government had not in any manner recognised the proceedings of the Association, and could enter into no engagement as to the validity of any titles to land which might

be derived from that body. On the British Government therefore it was clear that the Company's settlers had no claim. Neither had they any equitable claim against the natives. It is true that according to English notions of equity, if the owner permits a stranger without warning or interruption to erect buildings or to expend money on his land, the stranger acquires a right to some consideration; but in the present instance the natives by no means acquiesced; they constantly protested; they did more; they in some cases pulled down the buildings erected on the land, and drove off the intruder by force. The first really serious collision between the two races occurred not where many hundreds had settled in the vicinity of a populous native settlement, but in the thinly peopled Southern Island, and in a district not permanently occupied by the natives. About the middle of July 1843 the startling intelligence reached the seat of Government that a party of colonists belonging to the settlement founded by the Company at Nelson had come into collision with the natives, and had been cut off almost to a man; and that upwards of twenty of them, including nearly all the leading members of the Nelson Settlement had been tomahawked or shot. The claims of the Company to land amounted to some millions of acres; partly in the Northern Island and partly in the northern part of the Southern Island: in many instances these claims had been denied, and in some cases openly resisted by the natives, on the ground that the land had never in fact been sold by them to the agents of the Company. In order to carry out the plan on which the Nelson settlement was founded, it became necessary, for want of land in the neighbourhood, after putting the settlers into the possession of their town and suburban sections, to resort to the Wairau valley, a fine district in Cloudy Bay, about seventy miles from Nelson, for the purpose of finding land to supply the original purchasers with their 150 acre sections of country land; and in April preceding, several surveying parties were despatched on the part of the Company to survey the district. Almost immediately on their commencing work, the natives who disputed the sale of that district ordered off the surveyors, pulled up their ranging rods and stakes and did everything in their power to prevent the survey from proceeding. Whilst this was being done by some of their people, Rauparaha and Rangiaiaata, two of the most powerful and least civilised chiefs of that part of N.Z., who were the original native owners of the district, were at Porirua, on the other side of Cook Straits, urging the Land Claims Commissioner, Spain, to hasten over to settle the land claims at Wairau, as they wished the surveyors to be withdrawn; and the commissioner agreed to hear these claims towards the end of June. In the meantime both the chiefs crossed the Straits to Cloudy Bay, went up the Wairau with their party, found the surveyors still there, collected a number of them

together, their tents and provisions, and told them that they intended to send them all off the land together. Previous to this they had set fire to Cotterell's (one of the surveyors) hut, having first assisted him to move all property of value to prevent its destruction. Early in June, Cotterell proceeded to Nelson to inform Captain Arthur Wakefield, the Company's agent there, of what had taken place: Tuckett, the Company's chief surveyor attempting, but in vain, during Cotterell's absence to obtain permission of the chiefs for the survey to proceed. On arriving at Nelson, Cotterell (on 12th June) laid an information before the police magistrate, Thompson, who issued a warrant against Rauparaha and Rangiaiaata for burning Cotterell's hut; and accompanied by Wakefield and several other officers and men in their employment, shortly afterwards started for the Wairau, with the intention of executing it. Distinguished for his high character, humanity and courage, Wakefield, the leader of the Nelson settlement, was esteemed and respected by all who knew him; and the last lines he ever wrote record his belief that in engaging in the ill-fated undertaking he was acting for the benefit of all. "We heard on Sunday," he wrote to his brother, "that Te Rauparaha and Rangi have commenced operations on the Wairau, and have burned one of the surveyors' houses. The magistrates have granted a warrant on the information, and Thompson accompanied by myself, England, and a lot of constables are off immediately in the Government brig to execute it. We shall muster about sixty, so I think we shall overcome these travelling bullies. I never felt more convinced of being about to act right for the benefit of all, and not less especially so for the native race." On the 13th June Thompson, the police magistrate, Wakefield, Richardson, Captain England (late of H.M. 12th Foot,) Howard, the Company's storekeeper, Patchett, merchant, Cotterell, Company's surveyor, Brooke, who acted as interpreter, the Chief Constable of Nelson, three constables, and about twenty-five other persons, mostly labourers and others connected with the Company's survey department, started on the expedition. Before reaching the Wairau they were joined by one of the Company's boats having on board Tuckett and ten or twelve men who joined the party. On Thursday evening they anchored at the mouth of the Wairau, and remained there; and at a Pah at the entrance of the river Howard served out arms to the men (about thirty-five in number) consisting of muskets, bayonets, pistols, swords, cutlasses, and several rounds of ball-cartridge; the constables were also armed with guns, muskets and pistols. One or two of the men were sworn in as special constables; some were told they were going to take Rauparaha and Rangiaiaata on a warrant; few knew that they were on a hostile service, and many of the party expressed their intention not to use their arms. In the course of their progress they were joined by Barnicoat,

another of the Company's surveyors, and his man. Early on Saturday morning the party who had left their boats when the river became shallow and marched up the banks, came up to the place where they expected to find Rauparaha and Rangiaiaata and their party; and found them encamped on the opposite bank of a narrow creek. By the directions of Thompson and Wakefield the European party was now formed into two bodies under England and Howard, who gave orders to their men not to interfere until directed. As a means of communication with the other side of the creek where the chiefs were encamped a canoe was placed across the water to serve as a bridge. Thompson, Wakefield, Chief Constable Brooke, and some others then crossed over. Thompson, Wakefield and Cotterell walked backwards and forwards for nearly half an hour with the natives, and apparently in a friendly manner. Three women, the wives of Rauparaha, Rangiaiaata, and Puaha, sat in the centre; the party of resident natives on one side and the armed natives of the northern island on the other side of the group. Puaha stood in the centre with a Testament in his hand reading to the natives and exhorting both parties to peace. Rangiaiaata was in the back-ground out of sight. Thompson then showed his warrant, directed the constable to execute it on Rauparaha, and instructed Brooke to explain the meaning of it. Thompson also stated that he was the Queen's representative and *that* (pointing to the warrant) was the Queen's book; that Rauparaha must go on board the brig with the constable and that it was for burning Cotterell's house, and had nothing to do with the land question. Rauparaha told them to sit down and talk and not make a fight, and to wait till Spain and Clarke came and hear what they would say. Thompson then inquired of Rauparaha whether he would come or not? to which he replied he would not; but that if Clarke or Spain was there he would. Thompson then said if he would not go he would make him. Rauparaha still refusing, Thompson, pointing to the Europeans, said: "There is the armed force and they shall fire upon you all if you won't go." Thompson it appears then became "exasperated" and the discussion violent. Rangiaiaata called on him not to fire. "For God's sake, Thompson, mind what you are about!" also shouted Richardson from the other side. Thompson however called to the armed party to fix bayonets and advance, Wakefield placing the canoe across the stream for a bridge gave the word, "Englishmen, forward!" A few of them had entered the canoe when a shot was fired—whether by accident or design is not quite clear—on the side of the Europeans. Upon this the firing immediately became general on both sides and several fell. Three of their party having fallen, the Maoris hesitated whether they should run away, but Rauparaha urged them to pursue. When the firing commenced Thompson, Wakefield and the rest of the party who had been in communication with the chiefs re-crossed the creek to

join their own party, who were now retreating up the hill pursued by the natives. At each step in the ascent Wakefield again and again attempted to rally the men and entreated them to make a stand, to fix bayonets and charge. An irregular firing was still kept up, but the European party continued retreating. "For God's sake, come back, men!" cried Thompson, "the Maoris are coming upon us." But the greater number made good their retreat, and there was running in all directions. Wakefield finding it impossible to rally the men ordered those who remained to lay down their arms and surrender. Brooke, the interpreter, called to the Maoris: "Leave off, enough!" But after this some shots were fired by those in retreat who had reached the top of the hill and were too far distant to know what was going on below. When signals of surrender had been made one or two Maoris also threw down their arms, and advanced with their arms stretched out in token of reconciliation. It seems that while the surrender was taking place by the gentlemen below, and the firing by the stragglers above, Rangiaia came up enraged. He had discovered that his wife had been shot. "Rauparaha," said he, "remember your daughter!" The dreadful carnage then commenced, and Rangiaia alone with his own hand, it is said, destroyed the greater number. "Puaha, Puaha!" cried out the wife of a chief from a distance, "save some of the chiefs (gentlemen) that you may have it to say that you have saved some." But it was then too late. On the European side the number of armed men was forty-five men; on the Maori side about forty were engaged: their loss was four killed and five wounded. On the Wednesday following Mr. Ironsides, Wesleyan missionary, having heard of the fatal conflict hastened to the spot, where he found nineteen European bodies, including those of Wakefield and Thompson. On Thursday they were buried: Ironsides reading at the grave the funeral service of the Church of England. On his way to the fatal spot Ironsides met Rauparaha and Rangiaia and obtained permission to go and bury the dead. They told him that they had no intention to fight: that it was the wrath of the Europeans that made them fight; that the Europeans had fired upon them and one or two of their number had fallen before they began to fight; and that it was not until the wife of Rangiaia was shot that "they began to seek for payment." In addition to the nineteen bodies found dead on the field five of the party were severely wounded and four were missing. In defence of the survivors who fled early in the conflict it was urged that many of them were common labourers on the Survey-staff of the Company, not hired to risk their lives in fighting with the natives; that they had no interest in the contest; and that they had wives and families depending on them for support. But in answer, it was said that they ought in the first instance to have refused to take up arms; or, having taken them up, to have manfully used

them; but that they took up arms, advanced, and fired, and entered into the conflict under the direction of leaders, and thus undertook to support and obey them; and that if they had done so, the most revolting features of the case would have been spared, and many valuable lives; but that, as far as it was possible for them to do so, they damaged the British character in the estimation of the Maoris; and having entered so far into the conflict as to fire upon a body of people guilty of no offence as far as they were concerned, they then, heedless of the rallying cry of Wakefield, and deaf to the entreaties of Thompson for support, left their comrades in the hour of need to the savage fury of those whom they had themselves provoked. Before the affray commenced the prestige of the English stood high; and if they had shown a steady front and made a determined stand the natives would probably have given way. Immediately after the fatal conflict Rauparaha and Rangiaia crossed over Cook Straits, and with a strong party took up their position at Waikanae and Otaki, about fifty miles from Wellington. Anticipating retaliation from the English they were meditating an attack on the town; and the Wellington people, not without reason, became seriously alarmed. At that time no troops were stationed there: the whole military force in the colony, stationed at Auckland nearly five hundred miles distant, did not exceed one hundred men; and they could not be brought down to Wellington in less than a month. As a precautionary measure it was resolved, at a meeting of the magistrates in Wellington, that Spain, Commissioner of Land Claims, should be requested to go and communicate to the native chiefs their determination not to make or sanction any attempt to take vengeance for the death of the white men at the Wairau, but to leave the whole matter to the decision of the Queen's Government. Few men at that moment would have sought the commission; but Spain was not the man to shrink from the honour thus conferred upon him by his brother magistrates; and he at once proceeded up the coast, when he met Rauparaha himself, and addressed a large assemblage of the natives, informing them that it was not the policy of the English law to punish the innocent for the guilty; that the statements both of the Maoris and the white men engaged in the conflict had been sent to Auckland to the Governor who would decide upon the steps to be taken; and that in the meantime, no act of aggression would be committed upon them by the English. At the conclusion of his address, Spain was asked by Rauparaha if his object in coming amongst them was not, first to quiet them, in order that the English might have time to get troops, and when they came, if the English did not intend to attack them? "Rauparaha," says Spain, "seemed to feel the difficulty of my situation. 'I hope, at all events,' said he, 'you will act as gentlemen, and that if the Governor should decide upon sending soldiers to take me and Rangiaia that you will

send and let us know when they arrive : you need not take the trouble to send up here for us. If you will only send, I will come down to Wellington with 1000 Maoris, and have a fight with the white men ; if they beat us they shall have N.Z., and we will be their slaves ; but if we beat them, then they must stand clear.'” Rauparaha, whose name had for many years been a terror to the country, was a most powerful speaker, and a crafty, able man. He told the natives that the English in retaliation would certainly make an attempt to kill all the Maoris ; that they had already sent for soldiers, and were preparing at Port Nicholson ; and that now was the time to attack the white people before they were prepared. Happily for the peace of the country, the people of the district had for some time been living under the ministration of one of the most devoted and influential missionaries in N.Z. ; and it is hardly too much to affirm that Wellington owed its safety at that moment to a single individual, the Rev. Octavius Hadfield. He had arrived in December 1838 with the Bishop of Australia, by whom he had recently been admitted to deacon's orders. Five years afterwards, he was appointed, by the Bishop of N.Z., Rural Dean of the district of Wellington and Taranaki ; then Archdeacon of Kapiti ; and he was subsequently nominated first Bishop of the See of Wellington ; an office which, from ill health, he was unable to accept. Yet a single false step on the part of the Government would have been fatal. If the natives had then attacked Wellington in force, probably not even the patrimony of God would have been spared ; but “the smoke of the town would have gone up like the smoke of a furnace,” and like Kororarika, the Company's “first and principal settlement,” would have been totally destroyed. On the side of the Maoris it was complained by Rauparaha that the attack made on them was unjust ; that the English first took away his land and then wanted to take himself and Rangiaiaata into custody, for having destroyed a hut built on his own land of toe-toe and wood grown upon it : and “is this,” he asked, “the justice the Queen of England promised to the Maoris ?” The Nelson people on the other hand sent a deputation to wait on the Government to express their views of the catastrophe. “We have no hesitation in stating,” said the deputation, “that it is the general opinion of the settlers at Nelson that our countrymen who were killed at the Wairau plain lost their lives in endeavouring to discharge their duties as magistrates and British subjects, obedient to British law ; and that the persons by whom they were killed are murderers in the eyes of common sense and justice.” On the part of the Colonial Government it was replied that for the recent bloodshed an awful responsibility had been incurred ; but what was the degree of criminality of those concerned in the fatal conflict, and on whom that criminality chiefly rested, were questions on which no opinion could then be given, as the transaction might

become the subject of judicial enquiry ; but whatever might be the crime and whoever might be the criminals, it was clear that the event had arisen in consequence of some of the Company's surveyors, without the knowledge or concurrence of the Government, proceeding to take possession of and to survey a tract of land in opposition to the original native owners, who had uniformly denied the sale of it. Fortunately for the safety of the country, the Government were so far removed from the scene of action as to be able to form a dispassionate judgment. After careful consideration of the evidence before them they arrived at the conclusion that the proceeding, so far as Thompson the police magistrate was concerned, was illegal in its inception, and in every step in its execution, up to the moment of the attack itself ; that it was unjustifiable in the magistrate and the four constables, and that it was criminal on the part of the rest of the attacking party. The British Government, still further removed from all disturbing influences, arrived at the same conclusion. “So manifestly illegal,” wrote the Secretary of State, “unjust and unwise were the martial array and the command to advance, that I fear the authors of that order must be held responsible for all that followed in natural and immediate sequence upon it . . . Whether I try the proceedings of Mr. Thompson and his followers by general principles, or the narrow rules of the law of England, I am compelled to adopt the same conclusion : I adopt and I record it with that serious concern with which alone we can contemplate the errors of our fellow-countrymen, when expiated by the most lamentable sufferings, and even, as unhappily in this case, by death. But my regard for the memory of the deceased (among whom were several gallant and meritorious men, and eminent benefactors of the colony,) does not acquit me of the obligation of stating explicitly my judgment of their proceedings. It is a painful duty : but that judgment is that they needlessly violated the rules of the law of England, the maxims of prudence, and the principles of justice.” The attempt was made by the Company to fix on the local Government “the massacre of the Wairau, and the crime of having, by unjust and ill-judged proceedings, involved first the Northern and then the Southern districts in insurrection and bloodshed.” But ten years after the fatal event, when all excitement had entirely passed away, a committee of the House of Representatives, composed of the leading members from every province, and having certainly no leaning in favour of the executive authorities by whom the colony had been governed, thus recorded their judgment on the subject :—“It is with great pain and reluctance that your Committee refer to the melancholy affair at Wairau in 1843 ; nor is it with the smallest intention of casting any reflection upon the memories of the men who fell there : whom they believe to have been men of high and generous character, and actuated by honest motives ; although, from their ignorance

of the native character, almost necessarily mistaken. But your committee cannot admit that the responsibility of the massacre of the Wairau rests with the local Government, or that it has any necessary connection with the selection of the site of the Nelson settlement. There can be no doubt of the fact that the Massacre of the Wairau was caused by the agents of the Company attempting to take possession of a district with regard to which the natives always denied that they had sold it; and although the local Government may seem to be implicated in the matter, inasmuch as its representative, the Police Magistrate, headed the expedition, it is nevertheless perfectly notorious that the Company's agent was the real instigator of that expedition which led to such lamentable results. The native war in the North there is every reason to believe was occasioned by the success of the natives in the conflict with the white men at the Wairau. In consequence of that success, the superstitious feeling with which the natives had previously regarded the power and the law of the white man was destroyed; the jealousy of the natives on the subject of their territorial possessions was indefinitely stimulated, and a feeling was created which prompted the restless and turbulent among a race of savages fond of the excitement of war to seek to emulate in another field what they considered to be the triumph of their countrymen. In fact instead of deducing the native wars from the proceedings of the Local Government as their sole or principal cause (the position assumed by the Company) there appears to your committee greater reason to say that the first conflict between the settlers and the natives was precipitated by the conduct of the Company and its agents." This first collision between the natives and the colonists is commemorated as "The Wairau Massacre," and a column to the memory of the victims has been erected on the spot where they fell.

VIII. *Joint Stock Colonisation.*—Having in the first instance been taught to regard the natives and the Colonial Government as the cause of their misfortunes, the Wellington settlers for some time made common cause with the Company; but the proceedings in the Court of Commissioners of Land Claims brought to light the fact that the Company had received from their settlers money for land which the Company had never purchased and of which the native title had never been extinguished, and the southern settlers now directed their complaints against the Company themselves. "It is distressing," said Charles Buller, a leading member of the directors of the Company, writing to the Secretary of State, "to hear the tales of individual disappointments and woe which reach us every day. All emigration to N.Z. is stopped; the first colonists are quitting it as fast as they can." "These returned colonists," said the directors themselves addressing their shareholders, "come straight to us and afflict us with their complaints of disappointment and ruin.

We tell you," they add, "that it is our deliberate conviction that unless a great change takes place immediately, your settlements will not be worth preserving. We come here to fritter away borrowed money, to consider claims we have no means of satisfying, and to hear the most distressing complaints without being able to assist the sufferers." Such was the account given by the Company themselves of the result of their colonising operations as regards their first and principal settlement. Having discovered the real authors of their misfortunes, the whole body of resident landholders in the settlement of Wellington and Wanganui claimed compensation from the Company who had sent them out from England. "We address you," said they, "not as supplicants for your bounty—not as men suing for favour at your hands—but as parties deeply and grievously injured; as men protesting against great wrongs inflicted by you; and as such demanding redress. And to what causes are the disasters which have befallen us attributable? You cannot and dare not deny that the immediate and proximate cause of our ruin has been the non-fulfilment by you of the contract formed with us seven years ago." No great length of time elapsed before the unhappy situation of the Company's settlers became known in England; with what result may be readily imagined. "The accounts which have reached home," wrote their chairman addressing the Secretary of State, "have produced a like cessation of income from land sales here; for the Commissioners Court has rendered them unmarketable, and the Company has altogether ceased to obtain any return from its lands. These difficulties must we think be ascribed to one cause; namely, the dispute respecting the Company's titles to land. This is the one thing which appears to have led to all the bad blood between the natives and the settlers. It was the direct cause of the unhappy business at Cloudy Bay (the Wairau,) and of the subsequent disastrous state of feeling." Although the attempt was made by the Company to impute the misfortunes of themselves and their settlers to the bad faith of the natives, the Report of the Land Claims Commissioner, soon afterwards made public, showed that they had sent out settlers to occupy land which they had never purchased, and had sold to them land to which they never had a claim. "I am of opinion," reported the Commissioner of Land Claims, "that the greater portion of the land claimed by the Company in the Port Nicholson district, and also in the district between Port Nicholson and Wanganui, including the latter place, has not been alienated by the natives to the Company; and that other portions of the same district have been only partially alienated by the natives to that body; and it appears to me so far as the evidence has gone that all the Company's purchases were made in a very loose and careless manner." To the precipitate proceedings of the Company, in a second time sending out a body of emigrants before it was known that a suitable

locality had been secured for their reception, is to be attributed the catastrophe at the Wairau. However plausible it might have been in theory, their scheme of the Nelson settlement failed also in bringing together the three necessary elements of land, capital and labour, in the prescribed ratios. Formed in England, upon paper, the plan was attempted to be carried out in a locality unsuited to the purpose. A sufficient price had been paid for the land by the settlers before leaving England; but on arriving on the site of the settlement, the land itself was not to be found; and in the attempt to obtain the greater portion of the quantity required, and that at a distance of seventy miles, more than twenty valuable lives were thrown away. Labour, it is true, was carried out; but no adequate amount of capital was sent out to employ it; and failing to find employment amongst the settlers, a large number of labourers fell back upon the Company who had sent them out, and for a time about three hundred were employed by them upon public works. Disappointed in the expectations they had been led to entertain, finding themselves employed almost out of charity by the Company, at what they believed to be an inadequate rate of wages, the labouring class broke out into open mutiny, and threatened to plunder the Company's stores. Nor were the land-purchasers themselves better satisfied with their lot: the failure of the Company to put them in possession of land, naturally occasioned them much disappointment and loss; and, like the Wellington settlers, they also claimed compensation from the Company, for breach of their agreement. For some time these claims were strenuously resisted by the Company: eventually, however, they announced to the Nelson land-purchasers that they had submitted to counsel a case for a legal opinion as to the respective rights and liabilities of themselves and their settlers; that they had authorised their agent at Nelson to act in behalf of the Company, taking the opinion which might be given on the case as the basis of the arrangement; and promising that the opinion itself should be sent out by the earliest opportunity. Shortly after a legal opinion to the effect that the Company were *not* liable to their settlers, either for breach of contract or for the losses sustained by them, was sent out and made known to its Nelson settlers by the Nelson agent: and believing this to be the legal opinion referred to, having no knowledge of any second or different opinion, and finding that they had no legal rights against the Company, the Nelson land-purchasers agreed to a compromise on the most favourable terms they could procure. It was publicly charged against the Company that the "opinion" sent out by them for the guidance of the settlers at Nelson was a changeling: that the opinion of their own counsel (a member of their own body and a man of character and standing) was that the Company were not only liable to return to the Nelson land-purchasers their original purchase-money with interest, but to make compensation also for their

losses; and that suppressing this opinion they submitted a case to another counsel, little known in the profession, from whom they obtained an opinion that the land-purchasers had no claims against them, and had sent out this second opinion as the one to which they had originally referred as the basis of the proposed arrangement, thereby entrapping the settlers into making a compromise disadvantageous to themselves. It must have been mortifying to many honourable men who joined the association with no other object than to aid and take part in what they believed to be a laudable undertaking, to find its governing body afterwards charged before Parliament with deceiving their own colonists by means of a deliberate suppression of the truth. With reference to the settlement of Nelson itself, the Chairman of the Company, in his place in Parliament, made the candid admission that it did not fulfil the strict letter of the law; that the scheme of it was not well advised; and that it had not answered the expectations either of the Company or of the settlers. "In so far as that field of settlement extended," said the Report of the Committee of the House of Representatives, "the Company was entirely unobstructed in its operations, and its failure there, and the misery of its settlers are mainly chargeable upon its own mismanagement and the utter unfitness of the scheme of colonisation attempted to be carried out as applicable to the peculiar features of the colony. So long as the Company attempted to carry out that scheme and actively interfered in the affairs of the settlement money was squandered, labour was misapplied, there was no production and no vitality; and the dawn of progress, healthfulness and production dates from the day when the Company's works were suspended, the Company's system of colonisation was abandoned and working men placed upon allotments of land." With respect to the class of labouring emigrants sent out by them, it would be unjust to the Company not to acknowledge that eventually, and as a body, their emigrants bettered their condition by going out. But in their case, as well as in that of the land purchasers, it would not be difficult to point to instances of promises unfulfilled or sought to be evaded. The case of the labourers at Taranaki on any other evidence than the admission of the parties implicated would be incredible; but that case rests on the written statement of the Company's agent, published in the Appendix to their 12th Report. "You are aware," he writes, "that the emigrants in this settlement hold what they call embarkation orders, being a sort of handbill in which it is distinctly stated that the Company's agent will at all times give them employment in the service of the Company, if from any cause they should be unable to obtain it elsewhere. Being unable to give any other interpretation to this promise than the words quoted seemed to imply, and yet bearing in mind that the court of

directors view their engagement in a different light, I endeavoured to evade it by sending the applicants for employment a long distance from home, making no allowance for time spent in the journey or for time lost in bad weather. The necessities of the men and their families were such as compelled them to submit for several weeks to these conditions; but many came home sick and claimed the promised medical aid, and others commenced the trade of pig and sheep stealing, not having yet had time to raise potatoes for themselves." Nor were the Company more successful in establishing for themselves a high character for straightforward honesty of purpose in the conduct of their proceedings in England. When N.Z. first became a British Colony the Chatham Islands, lying about 500 miles to the eastward of the group, were not included in the Governor's commission. In the year 1841 but little was known of the Company beyond the fact that they were an influential association, comprising amongst their directors men of name and reputation, and it was thought inexplicable that the Under-Secretary of State for the Colonial Department should have sought and obtained permission from Lord John Russell (then Colonial Minister) to be relieved from the duty of ever again receiving any of the directors at any interview relating to their affairs. Sir James Stephen must have had good reasons for resorting to so significant a proceeding. The correspondence which soon afterwards took place between the Company and the Government on the subject of the Chatham Islands makes it probable that his apprehensions of the danger of transacting business with them, in the absence of documentary evidence, were not without foundation. After entering into negotiations with a German Colonisation Company for the sale of the Chatham Islands, they commenced a correspondence with the Government on the subject; and the governor of the Company wrote to the Secretary of State (Lord Stanley) informing him that the directors being in treaty for the sale of the Chatham Islands to a German Company, they considered it right to inform his lordship of the circumstance. To give useful neighbours to the settlement which they had founded in N.Z. was, they affirmed, the motive which principally induced them to dispose of their property in these islands. In reply, Mr. G. W. Hope was directed to state that Lord Stanley could not discover on what grounds the Company could claim a right to enter into negotiations with the diplomatic agents of a foreign State for creating a foreign colony in the neighbourhood of the British settlements and the protection of the commerce and navigation of Great Britain with the proposed colony; and that the opinions of the Attorney and Solicitor-General would be taken as to the consequences in point of law of the assumption and exercise by the Company of such powers. To escape this dilemma, it was stated by Somes (governor of the Company) that the Company had not entered into any contract in their capacity of

directors; that in fact the Chatham Islands were not claimed by them at all, but belonged to the old Company; and they trusted that the circumstance of their having, perhaps rather unguardedly, stated that the directors were in treaty, would not prejudice them in his lordship's judgment. Lord Stanley then informed them that as it appeared from their own statement that they had no property in the Chatham Islands, he thought it unnecessary to pursue any correspondence with them on the subject. Three weeks later Hope was directed to inform the directors that the law officers had reported their opinion that the purchase of the Chatham Islands and the proposed sale of them by the directors were unauthorised by their Charter; that their proceedings in the transaction were an interference with the Royal prerogative and therefore unlawful; and that an abuse of their powers might be the forfeiture of their Charter. The Company in reply stated that no act had been done between them and the parties with reference to the projected arrangements. But three months later they were informed that Lord Stanley had received the copy of a despatch from Her Majesty's Chargé d'Affaires at Hamburgh, enclosing the copy of an agreement for the sale of the Chatham Islands, purporting to be made between Mr. Sieveking of the one part, and John Ward Esq., acting on behalf of the N.Z. Company of London incorporated by Royal Charter, of the other part. The Company were informed that thenceforward the Chatham Islands would form part of the colony of N.Z., and that no claimant would be allowed a greater quantity of land than 2500 acres. Nothing now remained for the directors but to disavow Ward's proceedings; and Lord Stanley was assured that the steps taken by Ward in his communication with Sieveking were not taken in pursuance of instructions from the Company! The proceedings of the Company as a colonising body had now come to a dead lock. They had expended a considerable amount of capital in fitting out their preliminary expedition in sending out emigrants and in payments to natives for land. But they hardly succeeded in a single instance in making a really valid purchase; on the contrary, the proceedings in the Land Commission Court proved that in almost every instance their claims were either defective or wholly without foundation. This discovery led to a lengthened and angry discussion between them and the Government. The Company having represented themselves to be the purchasers of large tracts of land from the natives, the Government had agreed to grant to them, not the whole quantity claimed to have been purchased, but four times as many acres as they had expended pounds in the work of colonisation. According to the terms of this agreement they would have been entitled to a grant of upwards of a million acres. The agreement however was based throughout on the assertion of the Company that they really had made large purchases of land. Failing however to prove a valid purchase of the land claimed by

them, the Company nevertheless maintained that it was immaterial to them whether or not they had in fact extinguished the native title to the land, as the Government were bound under any circumstances to put them in possession, if not of the particular land itself, at least of the stipulated quantity. As this claim could only be satisfied by making a purchase of upwards of a million acres from the native owners of the soil out of the public funds and at the expense of the British nation, it was strongly resisted, so long as Lord Stanley continued to administer the government of the colonies. The affairs of the Company were now in an utterly hopeless condition. They had not only sold land to their settlers to which they had no title, but they were unable to put them in possession. On all sides they were beset with claims for compensation and redress; their capital was expended, and the native owners of the soil, exasperated by their attempts to take possession of the land by force, were now unwilling to deal with them for the sale of it on reasonable terms. In bringing before the public their project for colonising the islands, they in the first instance expressed the most considerate regard for the rights of the native race, and avowed their desire to promote their permanent interests; but their colonising operations were beset with difficulties, and there appeared to them to be but one mode of surmounting them, and that was by urging the British Government to set aside the treaty with the natives by which the sovereignty over N.Z. had been gained. "We have always had very serious doubts," urged the Company, addressing the minister, "whether the treaty of Waitangi, made with naked savages by a consul invested with no plenipotentiary powers, without ratification by the Crown, could be treated by lawyers as anything but a praiseworthy device for amusing and pacifying savages for the moment." Happily the honour of the Crown and of the country was in honourable keeping, and the suggestion to set aside the treaty was met by a reply which cannot be more fitly characterised than as being worthy of a Minister of the British Crown. "Lord Stanley is not prepared, as Her Majesty's Secretary of State, to join with the N.Z. Company in setting aside the treaty of Waitangi, after obtaining the advantages guaranteed by it; even though it might be made with 'naked savages,' or though 'it might be treated by lawyers as a praiseworthy device for amusing and pacifying savages for the moment.' Lord Stanley entertains a different view of the respect due to the obligations contracted by the Crown of England; and his final answer to the demands of the N.Z. Company must be that, so long as he has the honour of serving the Crown, he will not admit that any person, or any Government acting in the name of Her Majesty, can contract a legal, moral, or honorary obligation to despoil others of their lawful or equitable rights." Failing in the attempt to induce the Government to break faith with the natives the Company as a last resource claimed compensation from the

Government, and a Committee of the House of Commons was appointed to examine into the complaints made by them of losses sustained by them in consequence, as they alleged, of the proceedings of the Colonial Office and of the local Government. Lord Howick, who had taken an active part in supporting the case of the Company before the House, was appointed chairman; and the Committee reported their opinion that the Company had sustained injury from the Government and were entitled to redress. But the Committee appointed some years afterwards by the House of Representatives itself, to inquire into the subject of the Company's debt, arrived at a different conclusion. When Lord Grey came into office as Colonial Minister he was appealed to by the Company for that redress which his predecessor had steadily refused. Nor was the appeal in vain. Lord Grey not only reversed the policy of his predecessor, and admitted to be valid claims which Lord Stanley had resisted as unjust, but notwithstanding the antecedents of the Company he passed a measure through Parliament vesting in that body the whole of the demesne lands of the Crown in the province of New Munster; granting to them, in addition to a previous loan of £100,000, a further loan of £136,000; and finally, providing that if they should find themselves unable to continue their proceedings with profit to themselves and benefit to the colony, they might wind up their affairs, freed from all liability to repay the loan of £236,000, and with a charge in their own favour of the sum of £268,370 15s. on all future sales of the demesne lands of the Crown throughout N.Z.: the Government agreeing to accept as an equivalent the lands which the Company merely claimed to have acquired or to have become entitled to. Of the terms of the agreement entered into between the Government and the Company there is but one opinion. It is only just to Lord Grey to believe that in being a party to such an agreement he was himself mistaken and deceived; and that, notwithstanding their antecedents and the ill success which had attended the colonising operations of the Company, he still believed they might be turned to useful account, as instruments in promoting a great scheme of emigration for the benefit not only of N.Z., but of the kingdom at large. If such were Lord Grey's expectations, no one could be more grievously disappointed than himself. Out of the large sums of public money placed at their disposal for the purpose of restoring the prosperity of the existing settlements of the Company, and to promote efficient colonisation, less than £30,000 was expended in emigration; and instead of being applied to its legitimate objects a considerable sum was lent by the Company to its own shareholders, and lost. Other large sums were laid out, ostensibly in the purchase of private estates, but really to buy up troublesome claims for compensation; and further sums of considerable magnitude were appropriated by the directors of the Company amongst themselves on

account of past fees. Notwithstanding the ample means which had been placed at their disposal by Earl Grey they still found themselves unable to continue their proceedings either with profit to themselves or with benefit to the colony; and, taking advantage of the very favourable arrangement obtained from Parliament on their behalf, they surrendered their Charter, and as a colonizing association ended their career without having given a single legal title to a single individual of a single piece of land; leaving the whole of their engagements in respect of the disposal of land, during a period of twelve years unfulfilled and uncompleted, and leaving the whole colony burdened with a debt of £268,000. Despairing of obtaining the active interference either of the Government or of Parliament, the Colonial Legislature ultimately authorised a compromise to be made. It was agreed that the colony should pay to the Company the sum of £200,000 in full of all demands; and in order to raise the amount application was made to Parliament to guarantee a loan to be raised by the colony for the liquidation of the debt. "This proposed loan," said Sir J. Trelawny in the course of the debate, "is in fact nothing but hush-money in order that all discussion about past transactions may be put an end to." "It has been my misfortune," said Sir James Graham, "to see the commencement of the proceedings connected with this subject, to watch them and to resist them; but I do not think it expedient now to revive the discussion of those proceedings. Much light was thrown upon the transactions to which I refer in 1852, when the late Sir William Molesworth called the attention of the House to the subject. The House then obtained from the Colonial Office detailed information with respect to the occurrences that had taken place; and although I do not think they will bear very close investigation, I cannot but regard the Act of 1852 as a condonation of them." Without re-opening the discussion Parliament agreed to guarantee the loan. So far as the company are concerned the debt is now but a matter of curious history.

IX. NATIVE INSURRECTION.—Having neither money nor men—charged with the duty of governing a semi-barbarous race, who as a body had not even professed submission to British rule—and responsible for the safety of several isolated English settlements, the local authorities were placed in a painful and anomalous position. Some time however elapsed after British authority had been formally proclaimed, before the natives had any conception of the consequences of ceding to us the sovereignty of the country. Before the colonists came into actual collision with them, the prestige of British power stood high and they were disposed to regard the Government with respect; but from the want of firmness displayed on the occasion of the conflict at the Wairau, they soon conceived a low estimate of the warlike prowess of the British: and in their first conflict with regular

troops they were unfortunately victorious. From time immemorial land had been the principal cause of quarrel amongst them; and with their independent spirit and sensitive jealousy as to their territorial rights they soon began to regard with mistrust the introduction of British rule. Their territorial claims were not confined to the land they had brought into actual cultivation but they claimed and exercised ownership over the whole surface of the country, and there is no part of it however lonely of which they did not know the owners. Forests in the wildest part of the country had their claimants. Land apparently waste was highly valued by them. Forests were preserved for birds; swamps and streams for eel-weirs and fisheries. Trees, rocks and stones were used to define the well-known boundaries. Land was held by them either by the whole tribe or by some family of it, or sometimes by an individual member of a tribe. Over the uncultivated portions of territory held by a tribe in common every individual member had the right of fishing and shooting. When any member of a tribe cultivated a portion of the common waste he acquired an individual right to what he had subdued by his labour; and in case of a sale he was recognised by the tribe as the sole proprietor. If undisposed of by sale it generally descended from father to son. And even the power of disposing of land by will orally expressed at the point of death was recognised amongst them. A certain man had a male child born to him; then another male child; and then a third male child. He also had daughters. At last the father of this family being at the point of death the sons and daughters and all his relations assembled to hear his last words and to see him die. And the sons said to their father: "Let thy mouth speak O father that we may hear your will, for you have not long to live." Then the old man turned towards his younger brothers and spoke thus: "Hereafter O my brothers be kind to my children. My cultivations are for my sons. Such or such a piece of land is for such or such a nephew. My eel-weirs, my potato-gardens, my potatoes, my pigs, my male slaves, and my female are all for my sons only. My wives are for my younger brother." Such was the disposition of a man's property; it related only to the male children. The custom as to the female children was not to give them any land; for their father bore in mind that they would not abide on the land. They might marry husbands belonging to another tribe not at all connected with their parent's family; therefore no portion of land was given to them. Not so the male children; they stand fast always on the land. Such was the account given by an intelligent New Zealander of the custom amongst them as to the disposal of landed property. The natives who were parties to the treaty of Waitangi were by no means aware of the important consequences to themselves of ceding Sovereign authority to a foreign power; but the practical effect of the proceeding soon began to be

experienced by them. As early as the year 1843 an attempt was made by a party of settlers in the south to gain forcible possession of their land. For some time previously immigrants had been rapidly flocking into the country; and seeing their independence threatened, and fearing that when the European population became sufficiently powerful the attempt would be made to ignore their title to the soil, some of the Northern tribes only arrayed themselves against the Queen's authority. The New Zealanders were in the zenith of their power—independent of all other nations—the uncontrolled masters of the country—and looked up to and conciliated by the strangers whom they had permitted to reside amongst them. Early in 1840 Captain Hobson arrived in the character of British Consul, commissioned to treat with the chiefs for the cession to Her Majesty of the sovereignty over the whole or any part of the country which they might be willing to place under the dominion of the British Crown. The treaty of Waitangi which formed the basis of his negotiations, provided that the chiefs should still continue to exercise their "chieftainship" with its incidents; the chiefs on their part giving to the Crown the exclusive right of pre-emption over such lands as they might be disposed to alienate. The terms made use of in the native language were such as would clearly convey to the natives who signed the treaty, the idea that their chieftainship with whatever might be incident to it was to remain unaltered; but the terms did not and could not convey to them a distinct understanding of what was understood and intended to be understood by the language made use of to cede to the Crown of England the sovereignty over the country; there being no word in the native language by which that term could be clearly expressed. Thus they had but a very imperfect knowledge of the force and effect of the terms of the agreement; and throughout the whole of the negotiations it was held out to them by the agents of the Crown that their cession of the sovereignty would at all events be productive of signal and substantial advantages to themselves: indeed, the only clear idea which they formed of the consequences of ceding the sovereignty over the country was, that they should be the immediate gainers. Those who became parties to the treaty looked forward with eager expectation for the promised fruits; but they were doomed to speedy disappointment. Instead of receiving immediate advantage from the change, the natives—especially those of the northern district who were the first and principal parties to the treaty—found their condition suddenly and in almost every respect altered for the worse. For no sooner were the negotiations concluded and the Queen's Sovereignty proclaimed in the north, than Hobson having now assumed the office of Lieutenant-Governor removed his head-quarters from the Bay of Islands and fixed the seat of Government at Auckland. This proceeding had the effect of withdrawing a large

portion of the European population from the northern district; and the immediate consequence was the very reverse of that expected by the natives in the north in becoming parties to the treaty. The influx of immigrants to the Bay of Islands immediately ceased; the greater part of those who had originally settled there, while N.Z. was acknowledged as an independent State, followed the Lieutenant-Governor to the newly-chosen site of the capital. The trade with the natives at the Bay gradually decreased; many of the whalers which had frequented the harbour ceased to do so, now that law and authority was established there and customs regulations brought into force. The free intercourse with the shipping, which the natives had enjoyed while in their state of independence, was restrained by custom-house regulations; the prices of their favourite articles of consumption were increased by the duties levied on imported goods. The natives themselves were now no longer regarded by the settlers as the all-powerful chiefs of former times, but were sometimes addressed with curses, foul language and abuse. A large portion of their land they now saw in the possession of strangers, greatly increased in value, while the consideration they had received in exchange for it had been long since expended. And in consequence of the treaty, they found they could no longer dispose of their land as heretofore to the European settlers; neither did the Crown become the purchaser of a single acre in that part of the country. So many unexpected results, following so closely upon the establishment of British authority, could scarcely fail to excite in the minds of the natives serious misgivings; and there were not wanting amongst the European settlers men mischievous enough, for the sake of gratifying their own disappointed hopes, to endeavour to stir up in the minds of the natives feelings of hatred and distrust of British rule. They were told that by-and-by all their lands would be seized by the Government, and that they would themselves be made slaves; that N.Z. was not the first country which had been taken from its native inhabitants; that in other countries, as in N.Z., Englishmen had first arrived in small numbers with missionaries among them, then in greater numbers, then a Governor and soldiers were sent, and at last the natives were hunted like wild beasts and driven off their lands. Such being the circumstances under which N.Z. was colonised, it is not remarkable that Heki, the first to sign, should be the first to break the treaty; and that after the lapse of a few years, some unruly spirits should have risen into rebellion against the authority of the Crown; but it is remarkable that the natives of the north did not immediately rise to a man, to throw off what to them would naturally appear to be the baneful dominion of a treacherous foreign sway. Nor were their jealous apprehensions altogether without foundation. The Company had already urged the British Government to set aside the Treaty of Waitangi; and a Committee of the British

Parliament—ignorant probably of the territorial rights of the natives, and of their power to defend them; ignorant also it may be hoped, of the extent to which the honour of the Crown and of the nation had been pledged to them that their rights should be recognised and respected—agreed to a resolution that “means ought to be forthwith adopted for establishing the exclusive title of the Crown to land not actually occupied and enjoyed by the natives;” overlooking the fact that in undertaking the colonisation of the country the Government expressly disclaimed all intention to acquire any right to the soil in acquiring the sovereignty, and especially instructed Hobson “to obtain by fair and equal contracts with the natives such waste lands as may be progressively required for the occupation of settlers resorting to N.Z.” But almost at the moment the Committee were urging the propriety of the measure, the natives were demonstrating its impracticability. When the two races first came into collision the settlers were the aggressors; but the natives, emboldened by their success at the Wairau, and utterly disabused of the opinion they had previously entertained of the prowess of the British, now boldly ventured to try their strength in the open field against disciplined English troops. And as if to give a decisive illustration of the practical unsoundness of the theory, that the uncivilised inhabitants of any country have but a qualified dominion or a right of occupancy only; and as if practically to establish the opposite axiom, that the civilised inhabitants of a country can have but a qualified dominion over any other country, or a right of occupancy over so much of it only as they can take and keep by force of arms, the oldest settlement in the country, under the protection of a sloop of war and a small detachment of troops, was openly attacked. Despite the efforts of the soldiers, seamen, and armed settlers, the royal flag-staff was cut down—the military blockhouse was taken—the soldiers, seamen, and the whole population of the settlement abandoned it and took refuge on board ship; the habitations of the people, with scarcely an exception, were sacked, plundered, and destroyed; and, to increase the humiliation, the whole of this painful and disastrous scene was enacted within range of the silent guns, and in the unmoved presence of a foreign ship of war. The destruction of Kororarika, and the threat of Heki to march his victorious forces to the south, spread alarm throughout the country. The northern district of the colony was declared by proclamation to be subject to martial law; and as soon as the troops were reinforced a series of military operations was undertaken, but with little effect in restoring the prestige of the British power: instead of being put down, the disaffection spread from north to south. Hardly had the troops taken the field when they were three times attacked by the insurgents; and though they always gallantly repulsed them at the point of the bayonet, the officer in command had to report that the attempt made by the troops to carry

Heki's fortified pah had failed; that they had been repulsed with heavy loss; and that one-third of the men actually engaged had fallen in the attack. And when he again took the field with a force of more than 1000 men (soldiers, seamen, and marines,) together with an auxiliary body of several hundred native allies, he with difficulty gained possession of the fortified pah at Ruapeka-pekapa, occupied by less than half the number of the attacking force. In the south, too, the settlers were driven from the valley of the Hutt; in the town of Wellington the colonists were in arms for weeks together, keeping watch and ward in daily expectation of attack; at Whanganui, the out-settlers were driven in, houses in the settlement itself and within gunshot of a strongly fortified military post were plundered and destroyed; and the Queen's troops during a period of several weeks could only show themselves outside of their own stockade at the hazard of being shot. The loss sustained by the natives during the insurrectionary struggle was never correctly ascertained, but there is reason to believe that it was less considerable than that of the British. In their various encounters with the insurgents, the loss of the troops between March 1845 and July 1847 was 65 killed and 165 wounded. During the same period martial law was six times proclaimed; of the five natives executed under its authority, four were the murderers of an unoffending woman and her children: one was condemned to execution as a rebel; and the few who were transported under the authority of martial law were soon afterwards sent back from V.D.L. and shortly set at liberty. A more unprovoked and cold-blooded murder than that for which the four natives suffered death was never committed in a civilised country; and as their guilt was clearly proved and afterwards confessed, there could be no hesitation as to what should be their fate, and they promptly met with the punishment they deserved. But on another occasion when some natives had been taken and tried as rebels by court-martial, the military authorities found themselves in an embarrassing position. An example had already been made, and a native had been put to death under martial law for rebellion against the Queen's authority; and considering the circumstances under which the sovereignty had been acquired, and that the natives for the most part had not undertaken any special allegiance to the Crown, the court were naturally unwilling to condemn them to an ignominious death; so not knowing that the punishment could not be carried into effect they sentenced them to transportation, and they were accordingly sent out of the country: but the authorities in V.D.L. having no legal warrant to receive or detain them they were soon afterwards returned to N.Z. and restored to their friends. In this particular instance it is not improbable that several lives were saved in consequence of the ignorance of the military tribunal of the nature and extent of their powers: but it is to be regretted that no

work of authority was ever published, showing the circumstances under which it is held justifiable to bring martial law into operation; by whom it may be proclaimed; how it is to be administered; and what are the powers and jurisdiction of those who carry it into effect. For some time after the British authority had been proclaimed, the difficulty of carrying it into practical effect was not fully comprehended even by the Colonists themselves; and the anomalous position of the Local Government at that time has hardly been fully understood. With an inadequate military force and an empty treasury; surrounded by powerful native tribes suddenly conscious of their strength and responsible for the safety of several distant and isolated settlements; the local authorities were for some time left unaided, to contend as best they might with the difficulties of their perilous position. Governor FitzRoy, than whom no man has ever come to N.Z. with a more ardent desire to benefit its native people, was hastily condemned and suddenly re-called; but as the difficulties he had to contend with have become known, Governor FitzRoy's proceedings have been more justly appreciated. Whether the proceedings taken by the Government for establishing British authority in N.Z. were the most judicious that could have been adopted is a point on which opinions may differ. It may even be good international law, according to the law of the strongest, and as maintained by the Parliamentary Committee, "that the uncivilised inhabitants of any country have but a qualified dominion or a right of occupancy only." But seeing that whether wisely or not the acknowledgment of their right to the soil of the country had been repeatedly made to its native inhabitants; that the honour of the Crown and of the nation had repeatedly been pledged to them by the Queen's representative by the officers of the New Zealand Government, and by various missionaries and ministers of religion, that Great Britain would not and did not intend to acquire territorial rights by the acquisition of the sovereignty; seeing too that it was on the faith of these solemn assurances alone that the New Zealanders were induced to cede to Great Britain the sovereignty over their country, it is difficult to understand on what principle it was suggested that England should afterwards set up a claim on the part of the Crown to the whole of the unoccupied soil of the country. The attempted encroachments of the Company and the suggestions of the Parliamentary Committee no doubt tended to awaken the jealousy of the natives; yet so far as the local authorities were concerned, no occasion was ever given to them to lead them to doubt that their territorial rights, as guaranteed by the treaty of Waitangi, would be faithfully respected. Formidable as it was the disaffection was by no means general; seeing however that an insignificant minority of the native population kept the country for upwards of two years in a constant state of disturbance—putting a stop to emigration, driving the settlers from their

homesteads and affording inadequate, harassing and unprofitable occupation to Her Majesty's troops—it is not easy to exaggerate the catastrophe which would have followed any attempt on the part of those in authority to violate the treaty and rob them of their lands. Happily the errors of the Parliamentary Committee were neither shared in nor acted upon by the Minister of the Crown. Lord Stanley simply forwarded to the Government of N.Z. a copy of their proceedings, accompanied by an expression of his apprehension that their views thus publicly put forward, might add to the difficulties of the Governor's already embarrassing position. Nor was the apprehension without foundation, for a copy of the Parliamentary report reached N.Z. at the moment when the insurrection first broke out in the northern part of the colony; and the recommendation contained in it was communicated to the natives, already ripe for mischief, with an effect that may be readily imagined. If the attempt had been made to carry into effect the recommendation of the Parliamentary Committee of 1844, it would hardly have been recorded in 1853 that "actively engaged as are its inhabitants in productive industry—raising already a large excess of food, with a ready market close at hand for all their surplus produce—with no rivalry between the races but the pursuit of peaceful industry—with an improving revenue and rapidly increasing trade, it may be doubted whether any portion of Her Majesty's subjects enjoy in more abundant measure the blessings of peace and plenty, or have before them a more certain prospect of a prosperous career." Fortunately no attempt has ever been made to establish without purchase the title of the Crown to the waste lands of N.Z. Cognisant of the extent to which the credit of the nation had been pledged to the natives, and not unmindful of the respect due to the obligations contracted by the Crown of England, the local Government have uniformly acted on the instructions originally addressed to its first Governor, and have always been able to obtain on reasonable terms, by fair and equal contract with the natives, such waste lands as have been required for the occupation of the settlers resorting to the country. And the Sovereign and Her Majesty's representatives in N.Z. have continued to enjoy the respect and confidence of the native race.

X. *The Rebellion of Honi Heke*.—The interregnum of Mr. Shortland, the Colonial Secretary, who administered the government for a year and a-half after Captain Hobson's death, was no bed of roses; and in the midst of it (June 1843) occurred the Massacre of the Wairau. The passions of the two races, roused by this frightful event and by the measures which occasioned it, had lost little of their exasperation when Captain FitzRoy in the latter end of 1843 assumed the reins of government. The disaffected natives, indeed, had evidently gained encouragement for

further outbreak from the easy victory of their brethren over an equal number of armed white men. The celebrated Honi Heki had about this time commenced his crusade against the British flag, which certain foreigners, hostile to English supremacy, and certain English scoundrels adverse to the establishment of law and order, persuaded him to consider as the symbol of the slavery and degradation of his countrymen. Governor FitzRoy had stepped into a hornet's nest. No attempt at creating fortified posts had been made, such as with any nation but Englishmen would have been the first care after gaining possession of an acre of land amongst a people of such doubtful friendship. The Governor had no power to draw on the Home treasury. There was an empty exchequer in the colony, with unpaid public servants, and a standing army of some 150 soldiers. This poverty in money, troops, and other resources requisite for vigorous retaliatory measures, compelled him to temporise with the rebels when wholesome correction was most necessary. In March 1845 a seasonable reinforcement, consisting of 250 soldiers, arrived at Auckland; and, pressed on all hands by bellicose advisers, the Governor was induced to send against Heki a force which, utterly destitute of equipment for the siege of a strong stockade, was unsuccessful. The following month a second expedition, with augmented numbers, and a poor supply of munitions of war, once more beleaguered the rebel chief. Attack by assault failed; but, after a short blockade, the garrison evacuated the pah, which was entered and destroyed,—an advantage gained at a sadly disproportionate expense of life on the British side. Heki, severely wounded, was quieted for a time, and his adherents dispersed. His fierce old ally, Kawiti, retired to a distant post, where he occupied himself in fortifying the most formidable pah ever erected in N.Z. The Governor's anxious and unrelenting efforts, with insufficient means to control and amalgamate the discordant elements with which he found himself surrounded, were but partially successful; and certain of the measures which he was impelled by dire necessity to adopt meeting with the disapproval of the Home Government, he was recalled; and in November 1845 was succeeded by Captain Grey, late of the 83rd Regiment. Happier had it been perhaps for FitzRoy's comfort if, preferring ease to an honourable but "a laborious, responsible and ill-remunerated office in a very distant colony," he had declined the post, with its adjuncts of a few hundreds a-year salary, an empty Home treasury, and a company of infantry to enforce the law amongst a mixed and hitherto lawless white population, and 30,000 or 40,000 proud, suspicious, sanguinary, and well-armed natives. Colonel Mundy's spirited narrative of these first Maori wars is mainly followed in the ensuing narrative:—An apt instrument in the hands of the enemies of order and the British Government was found in Honi Heki. This turbulent warrior was not a chief by descent, and had never been liked or

much respected by the majority of the real chiefs. He lived as a boy in the capacity of servant at the Church of England missionary station at Pahia. Accompanying Marsden to N.S.W. and residing in his service at Parramatta, he was continually found absent from his duties and was as constantly discovered in the barrack-yard looking on at the drill. His missionary education so far profited him that he had read as well as heard of battles, and had longed "to follow to the field some warlike lord,"—but to be himself that lord. The exterminator E'Hongi gave him his first lessons in war and his daughter in marriage. At length his longings took the peculiar form of cutting down the British flag-staff which designing persons had taught him to regard as the symbol of Maori subjugation and slavery. This desire seems to have amounted to a kind of monomania. Heki commenced operations by depredations on the white settlers—carrying off horses, cattle, boats, &c.; and in July 1844, on a trivial plea of having been insulted by a native woman married to an Englishman of Kororarika, he made his appearance at that settlement with a strong armed party of wild young men, who remained there for two days bullying and plundering the men and brutally insulting the women. After performing prayers with arms in their hands, they proceeded in a body to the signal-hill and cut down the flag-staff with great ceremony. The police magistrate on this occasion dissuaded the male inhabitants from armed resistance to this savage inroad, although there were it is said a hundred men ready and willing to turn out under his orders. It was evidently Heki's main object to excite the whites to hostilities, in order to afford him and his associates some show of pretext for the commission of every horror whereof a savage is capable. This first crusade against the standard of England by Heki was in fact a deliberate declaration of war; for it was undertaken by previous and open arrangement, and in spite of the remonstrances of the missionaries, the Protector of Aborigines, and the Police Magistrate. "Is Te Raupehaha to have all the honour of killing the Pakihas?" exclaimed the pseudo-Christian chief, adverting to the massacre of the Wairau which occurred some ten months before—a tolerably plain avowal of his intentions and furnishing a motive for the evidently premeditated insults inflicted on the settlers of Kororarika. The flag-staff of Russell, on which the Government chose to hoist the red cross of England, was situated on the top of a high and rugged hill surrounded by tangled ravines half a-mile from the town; and was in fact so placed as a signal-mast for telegraphing shipping outside the bay. The proper place for the standard would have been within the town stockade; and on the first occupation of a country where welcome was so doubtful and partial obstruction absolutely certain, no settlement ought to have been left without such a place of refuge for the inhabitants in case of need, and where a few soldiers might have defied any Maori

attempt. A few such temporary strongholds with some vigilant ships of war would have given a sense of security which was in fact far from being enjoyed at this time by the European settlers. At the time of the first fall of the flag at Kororarika the military force at Auckland, the new seat of Government, amounted to about 180 soldiers of all ranks belonging to the 80th and 96th regiments. Governor FitzRoy on hearing of Heki's outrages immediately detached a small party—one officer and thirty men—to the scene of riot, and wrote a pressing requisition for a strong reinforcement to the Governor of N.S.W., who so promptly acted on it that on the 14th of the following month a detachment of 150 men of the 99th regiment, with two light guns, field equipage, stores and provisions, were disembarked at Kororarika and encamped there. The Governor himself soon afterwards arrived at the Bay of Islands in Her Majesty's ship *Hazard* and instantly caused to be put on board this ship and some other vessels a party of 210 soldiers, with which force, together with a body of armed seamen, he proposed to follow Heki into his fastnesses on the opposite shore of the bay and to punish him for his misdeeds. The expedition accordingly arrived off the Kiri-Kiri River, where the Governor received a message from a number of chiefs, many of them being of Heki's tribe, praying that the troops might not be landed in their district, and offering to make atonement, and to be responsible for the future good behaviour of the rebel. The force therefore returned to Kororarika, and the reinforcement from N.S.W. was in the following September sent back to Sydney pursuant to the desire of Governor Gipps. This sudden demonstration of force, its encampment at Kororarika, and its rapid descent on the enemy's coast, had a good effect upon the wiser and less warlike native leaders, whose consequent mediation between the Governor and Heki prevented a collision which, considering the weakness of the English force, and the determined character of the natives—not then fully appreciated,—with the strong and difficult country through which the invasion was to be carried might have proved disastrous for the British. Prior to sending back the troops to N.S.W. the Governor called a convocation of the neighbouring chiefs, and met them at Waimate, the church missionary settlement in the bay. The conference between the Governor and his officials, civil and military, the missionary clergy, the Maori leaders and their adherents, must have been a singular and interesting spectacle. His Excellency addressed the assembly in a speech full of indignation. He reminded them of the benefits wrought among them by the missionaries, and explained to them that the Queen of England assumed the government of their islands for their own good, and to protect them from aggression by other nations; that the flag was the sacred symbol of that protection. He laboured, in short, to prove that, in cutting down the flag-staff they were felling the

tree of liberty rather than the emblem of slavery, as it suited Heki's plans to consider it. His Excellency closed his speech by a demand for a number of fire-arms to be given up by the assembled natives as an atonement of Heki's misconduct. Thereupon several chiefs sprung up, and, bringing about twenty guns, laid them at the Governor's feet. These he accepted in acknowledgment of Heki's errors, and immediately restored them to the Maoris. In return, His Excellency had to listen, through his interpreter, to some very long speeches (not devoid of wild eloquence and even of good feeling,) from the native chiefs, among whom the passion for oratory is very strong. No fewer than twenty-four men of note got upon their legs on this occasion. Moses Tawhai, a brave warrior, and staunch ally of the British afterwards, said—"Welcome Governor! your kindness is great. My heart has been roasted and cooked on account of this circumstance of Heki's. Don't imagine that evil will entirely cease. It will not. You must expect more troubles from us; but when they come settle them in this way and not with guns and soldiers. Governor, I give you my first welcome fully acknowledging you as Governor of this country." Hihiatoto then sprang up and said, "I am the man who cut the staff down. Do not look after that man, Heki. Take me as payment. Who is Heki?—who is Heki? Take me!" The self-sacrifice does not appear to have been accepted. Before leaving Waimate His Excellency received the following characteristic letter from Heki:—"Friend Governor,—This is my speech to you. My disobedience and my rudeness is no new thing. I inherit it from my parents, from my ancestors. Do not imagine that it is a new feature in my character. But I am thinking of leaving off my rude conduct towards the Europeans. Now I say that I will prepare a new pole inland at Waimate, and I will erect it in its proper place at Kororarika in order to put an end to our present quarrel. Let your soldiers remain beyond sea and at Auckland. Do not send them here. The pole that was cut down belonged to me. I made it for the Maori flag and it was never paid for by the English.—From your friend, (signed) Honi Heki Pokai." The hollow truce effected by this conference was of short duration. Enemies of England and order were active in perverting the minds of the Maoris by every means—among which the practice of translating according to their views and garbling passages from the local and English newspapers was very effective. In January 1845 accordingly, Hicky (as the soldiers called him) made another gathering of the wild young men at his beck for any deed of mischief, and paid a nocturnal visit to the old object of his antipathy the flag-staff which had been duly re-erected and was guarded by friendly natives. These recreant guardians being connected with Heki's tribe, and unwilling as they afterwards said to shed blood for a bit of wood, made but a faint resistance. The axe was once more laid to the

root of the staff; the red cross kissed the dust; and the rebel chief sent his compliments to the resident magistrate to say that he would return in a couple of months or so to burn the Government buildings and eject the Government officers from the settlement. The Governor, now convinced that the disaffected party had gained strength and were bent on coming into actual collision with the authorities, again applied to N.S.W. for an accession of force. Owing to the difficulty of obtaining tonnage for its transport, and stress of weather, the force did not leave Sydney until 11th March, the very day on which the third visitation of Heki to the doomed settlement of Kororarika occurred, when it was effectually surprised, taken, sacked and burnt! In the previous month H.M.S. *Hazard* had conveyed to that place from Auckland a detachment of fifty men of the 96th Regiment with two subaltern officers—all that could be spared from the weak garrison of the capital; and they carried with them the materials for a musket-proof block-house to protect the already twice dishonoured flagstaff. "The settlers," relates Captain FitzRoy, "were armed and drilled, although very reluctantly on their part. A strong stockade was erected as a place of safety for the women and children, and some light guns were mounted. No anxiety as to the result of any attack was entertained, but on the contrary, there was rather over-confidence and far too low an opinion of the native enterprise and valour." During the first days of March armed parties of natives collected in the neighbourhood of Russell carrying off horses and destroying property. An armed boat followed the plunderers and was fired upon by them. This was the first shot of the war. It was returned from the boat carronade. Another foray was attempted close to the village, but was prevented by a few shots from a party from the *Hazard*. These preliminaries prepared the English, or ought to have prepared them, for further troubles; but no one expected, no Englishman had a right to expect, the disastrous and disgraceful results of 11th March 1845. On the night of 10th March, Heki and his veteran associate in arms, Kawiti, with a force variously computed at from 1200 to 500 men (the former chief afterwards declared that not more than 200 were in the attack, although 1000 joined in the sacking,) landed their respective parties in the two coves of Onoroa and Matavia. The former disposed his men in close ambush among the ferny ravines in rear of the Signal Hill; and so favourable is the ground for such an operation that the chief and his foremost men lay undiscovered and unsuspected within a few yards of the block-house, biding their time with all the patience and motionless silence of the savage. So well matured were their plans to make the surprise complete, that they were not tempted to deviate from them by killing or capturing the junior of the two officers, who late that night passed close to one of their bands little thinking of the fierce eyes that were

glaring on him through the underwood skirting his path. Kawiti placed his followers in concealment close to the opposite flank of the settlement. Although Heki in accordance with Maori custom had given the authorities of Kororarika a blustering promise of attack, and various preparations to meet it had been made on the night in question, no person, civil, naval or military, dreamed of the cordon of lurking savages by which they were compassed round. Instead of lynx-eyed vigilance, careless carousing was the order of the day in many of the houses of the town. The soldiers were perfectly on the alert—the little detachment disposed in the upper block-house and the barrack sleeping with their loaded arms by their sides, and an armed body of seamen and marines under the command of the acting commander of the *Hazard* being stationed on shore for the night. The lower block-house was occupied by some twenty of the towns-folk, with three small guns mounted on a platform in front of it. The weather favoured the assailants, for the morning of 11th March broke in clouds and haze. At the first gleam of day the young ensign in charge of the block-house started with a few men, with more zeal than prudence, to finish a breast-work on a height looking into Onoroa Bay, where a picquet had been posted during the day at a distance and separated by rugged ground from his post. This working party carried with them their entrenching tools and arms. Fifteen men were left under a corporal in the signal block-house. The lieutenant in command had repaired to the barrack to turn out his detachment, and the commander of the *Hazard* had proceeded with an armed party to complete a little field work for a gun on the spur of a hill commanding the road to Matavia Bay. The ensign had just broken ground when several shots from the side of Matavia attracted his notice, and he immediately fell back towards the block-house. Instead of re-entering it he remained on a brow of the declivity overlooking the town about 200 yards distant from the flagstaff. The same shots which had drawn the attention of the officer towards Matavia Bay, shots probably agreed upon as a signal of readiness for co-operation from Kawiti to Heki, attracted also the notice of the men at the upper or flagstaff block-house. Under the impression that his officer had been attacked, the corporal got his men under arms, and with as little forethought as his superior had shown, advanced towards the brow of the hill, leaving only three or four men at the post. But finding that the firing was from the further side of the town, he was in the act of returning to his little fortress when suddenly and as if from the bowels of the earth a strong body of well-armed Maoris sprung with loud yells out of the gullies on its flanks and rear, one party of them rushing into the block-house and instantly destroying its few defenders, another opening on the soldiers a heavy fire which as the corporal reported "repelled them back." Firing and retiring, he retreated on the officer's

party, who re-forming the whole of his men attempted to retake the lost block-house. In this he was frustrated by the fire of a cloud of native sharpshooters spread unseen among the brushwood, as well as from the captors of the post, when finding that these were striving to throw a force between him and the lower block-house, his only rallying point, he retreated on and took possession and command of it. And lucky it was he did so, for there were only a few civilians within it, and it was Heki himself with a chosen body that was about to attempt to take it by a rush. Indeed he made more than one effort to do so after it was thus reinforced. Meanwhile the Lieutenant of the 96th and the Naval Commander had barely reached their posts when the latter was attacked by about 200 men, who taking advantage of the darkness, their knowledge of the ground, and the cover afforded by the brushwood and flax tussocks, out-flanking and outnumbering the English, gradually drove them, fighting hand to hand, back upon the town, killing and wounding several, but suffering severely themselves. Near an angle of the churchyard-fence was the spot where the gallant Captain Robertson cut down a stalwart chief, and received five desperate wounds while dealing sturdy blows right and left among the swarthy foes by whom he was encompassed. Advancing at double pace from the barrack across the flat to the succour of the marine force, Lieutenant Barclay with his detachment was so briskly attacked from the front and from his left flank as to bring him to a check, and finally to compel him to retire, with the naval party, whose ammunition had failed them, through the town and along the beach to the stockaded house, where he left a few men, and thence to the lower block-house into which he threw his people just as its beleaguers, becoming more audacious, had pressed close up to its walls. Indeed the junior officer had to call out from the top of the work to his friends on the gun-platform below, that some of the savages had crawled through the brushwood to within fifteen paces of the guns. Meanwhile a considerable reinforcement of Maoris came pouring over the hills, a large party rushing down a gully seized the barracks of which, always indefensible and now deserted, they took possession. A gun on the platform opened on the barrack to dislodge them, while the two others blazed away among the thickets in front filled with skirmishing natives; and their missiles were distributed so indiscriminately as to endanger friend and foe equally. The gallant Philpotts, an officer of the *Hazard*, who fell afterwards at Ohaiowai, proposed to "rush the hills" if supported by the soldiers and drive off these daring savages; and although this measure was not acceded to by the lieutenant in command a few soldiers and sailors dashed out without orders, and cleared the front of the block-house. An attempt to retake the upper block-house was also proposed by a civilian, but his proposal was not seconded. Nor could it possibly have

succeeded, the fern being filled with outlying savages close upon the work and ready to cross their fire with their friends within it. It was now mid-day. The women and children had been removed from the crowded rooms and cellars of the stockade to the shipping; and this fortunate migration had barely been completed when, to put a climax to the confusion, the magazine within this building exploded, wounding several persons and entirely destroying the place, the last refuge of the non-combatants. In consequence of this mishap, whereby the greater part of the spare ammunition was lost, a council of war was held on board the *Hazard*, and the resolution to evacuate and abandon at sundown the settlement of Kororarika was passed and adopted. Accordingly during a truce which had been demanded by the chiefs to carry off their killed and wounded, the military and civilians were embarked on board H.M.S. *Hazard*, the United States corvette *St. Louis* (which was present during the conflict but remained neutral) the whale-ship *Matilda*, and the *Dolphin* schooner. The party of military in the block-house were the last to embark. During the embarkation the natives surrounded the heights commanding the town but without making any movement. A random shot was occasionally fired by them. During the evening a few of the townspeople who were most popular with the natives were employed in bringing off portions of their property. Astonished at their own success the Maoris performed the usual rites over the dead, danced war-dances, indulged in long-winded koriros (or boasting speeches) over their pipes, and then came down from the hills in a body, and plundered the stores and dwelling-houses ceded to them. On the afternoon of the following day they burnt the town to the ground; "and a settlement of very early days, but of great iniquity," reported Colonel Hulme, "is now a mass of ruins." The 96th's loss was four men killed and five wounded. The *Hazard* lost six men killed and eight wounded; and Captain Robertson's hurts were so severe that his life was for some time despaired of. The signal man, Tupper, was severely wounded while gallantly fighting for his flag; and two old discharged soldiers distinguished themselves in working the guns. The loss of the natives was put down at about eighty killed and wounded, but they acknowledged to no such amount. It is a matter of surprise that the casualties were not more numerous, considering that the affair lasted some eight hours, and that a vast quantity of ammunition on both sides was fired away. The officers lost the greater part of their baggage and about £40 of public money; and the soldiers the whole of their great-coats and kits, barrack-bedding and utensils. On the 13th the shipping got under weigh from the Cove on its way to Auckland, and Kororarika ceased to exist as a British settlement. Two Christian Bishops (Dr. Selwyn and M. Pompalier, head of the Jesuit mission) were present at this

unblessed conflict. The former, who had arrived in his yacht, employed himself with the greatest assiduity in assisting the wounded and helpless in embarking. "Was it not a terrible scene?" the good prelate was asked by some one striving to elicit his opinion of the affair. "It was a painful, a very painful, sight!" was the grave reply. He added that the plundering was conducted with the utmost moderation, the savages pillaging from one door of a house whilst the owners were removing goods by the other. Both Bishops did their duty. There were not wanting those who read in the destruction of Kororarika a judgment on its crimes. On the arrival of the ships in Auckland great was the tumult and panic, for Honi had boasted that he would attack the capital next. The late inhabitants of Kororarika, who had lost all their property, were loud in their reproaches against the military and the Government officials, making such gross imputations against the two young officers as compelled the Lieutenant-Colonel commanding in N.Z. to convene a court-martial for the investigation of the charges. The Lieutenant was "most fully and most honourably acquitted" by the court. The Ensign was arraigned "for that he did heedlessly and carelessly guard the block-house committed to his charge, and evacuate the same without sufficient cause and without orders from his superior officer." He was found guilty, with the exception of the word "evacuating," and sentenced to be severely reprimanded. His were merely the errors of inexperience. The destitute refugees were so hospitably received at Auckland that, as Captain FitzRoy writes, "all the most necessitous were placed in comparative comfort before they had been two days in the town." A sentence of outlawry was passed against Heki and his ally Kawiti; and the Governor was assailed by writers in the papers, burning for vengeance and blind to all risk from its hasty indulgence, who urged him to fit out a retributive expedition against the rebel chiefs. Sorely against his own judgment and expressed opinion, he therefore gave directions for the ill-fated expedition under Lieut.-Colonel Hulme. A rumour was rife in Auckland that Heki, elated with his success, intended to attack the capital with 2000 men at the next full moon. Fortunately however a considerable accession of force reached that station towards the end of March in H.M.S. *North Star*, which, together with a small transport, brought six officers and 200 men of the 58th Regiment to restore confidence to the desponding colonists, many of whom were leaving N.Z. for more tranquil quarters. Civil warfare moreover operated pretty strenuously to divert Heki's attention from his object; for the brave and loyal chief of Hokianga, Tomati Waka, with his brother, raised his tribe, and true to his promise at the Waimate convention attacked the conqueror of Kororarika and enemy of the British flag on his own territory. Finding himself however unable to cope with superior numbers, Waka

urged the Governor to hasten to his assistance; and accordingly his Excellency, conceiving that the case admitted of no delay, despatched all the force he could muster to the Bay of Islands, with discretionary orders to its leaders, Lieut.-Colonel Hulme and Captain Sir E. Home, to attack Heki in conjunction with Waka, whenever fit occasion might occur.

XI. *The Second Expedition against Heki*.—The expedition embarking at Auckland reached Kororarika on 28th April, and found the *North Star* in the bay. The gallant captain and colonel, in order to re-establish the authority of the Queen at that place, landed immediately with a guard of honour, and once more with every ceremony hoisted the British flag. The first hostile movement was undertaken against a disaffected chief named Pomare, whose pah was situated a few miles up the harbour. His garrison consisting of not more than sixty armed men, no resistance was made by them. As for the chief himself, he was outdone in craft by the military commander, who getting possession of his person sent him on board the *North Star* as a prisoner—acting thus under superior orders. His myrmidons escaped into the bush. As was expected, much of the property plundered from Kororarika was found in the stockade, which was fired by the troops and destroyed. The expedition anchored off the missionary station of Pahia, across the bay, where Tomati Waka and suite came on board and held a conference with the British commanders, urging instant action against Heki, whose force he rated at 1200 men. This sagacious and loyal chief indicated the best route for the march, and promised to co-operate with 800 of his tribe. H.M.S. *Hazard* having meanwhile joined the expedition, at daylight on the 3rd of May the force, consisting of the small-armed seamen, the marines and the military, in all about 400 men, disembarked at a point about thirty miles distant from Waka's pah, which they hoped to reach in two days, carrying five days' biscuit and two days' cooked meat. There was no means of transport for spare ammunition, camp equipage, cooking utensils, or the spirit ration. So dreadful was the weather and the state of the roads that the colonel was driven two miles out of his road to seek shelter for his men in the church and missionary buildings on the Kiri Kiri River, where they were rain-bound for two days. Nearly the whole of the extra ammunition which the men were compelled to carry in their haversacks was saturated with wet. On the 5th they reached Waka's pah, once more well drenched, and found but wretched shelter there. The following morning the colonel as he reported "had a koriro with Waka; and when he found that I intended to assault Heki's pah, and force an entrance by pulling down the palisades, he smiled, and said we were all madmen, and that every man would be sacrificed in the attempt; and to impress his opinions more forcibly he declared that we could not easily take his pah, which was not

half so strong as Heki's." At noon the colonel from the top of a hill about a mile distant reconnoitred Heki's position, and became aware of its great strength. White persons who had been there informed him, "that it had three rows of palisades all round it; that there was a deep ditch inside; that large stones had been piled up against the inner palisades; and that traverses had been cut from side to side, and deep holes dug, in which the rebels would shelter themselves from our fire and destroy the troops as they advanced. From what I had seen and heard, I returned to camp quite convinced that it was impracticable to take Heki's pah without first breaching it." He had no artillery, but he possessed a few rockets, the effect of which he was resolved to try; and feeling "that the chances of war are many," the gallant officer placed his force in position near that of the enemy, formed in three parties of assault and a reserve, prepared to seize an opportunity for storming it should accident offer one. On the morning of the 8th May, the English force, accompanied by about 300 of Waka's tribe, marched from that chief's stockade towards Heki's camp—the friendly natives wearing a white head-band to distinguish them from the foe. The reserve halted in rear of a ridge about 300 paces from the rebel pah; while the three assaulting parties—one composed of armed seamen, another of the 58th Light Company, and the third of detachments of the marines and 96th Regiment—advanced and occupied under a heavy fire the positions previously arranged, within two hundred yards of the work, driving some natives from a small breast-work. "And now," wrote the colonel in his despatch, "more closely examining Heki's pah, I was convinced that it was impossible to take it by assault, until it was first breached, without a great sacrifice of life and with uncertain success, for the pah had been unusually strengthened, the flax leaf having been forced into the interstices of the outer palisades to turn the musket balls. The rocket party, under command of Lieutenant Egerton, of H.M.S. *North Star*, took up a position, and fired several rockets, but in consequence of Heki having covered the roofs of the huts with flax leaf, they did not set them on fire. A few of the rebels left the pah on the first rockets exploding, but they afterwards returned to it—the affair of Kororarika having accustomed Heki and his main body to the operation of shells." Meanwhile the besieged were not idle, nor did they show themselves ignorant of that very effective method of protracting defence—the sortie; for a strong body under Kawiti, stealing through the bush, were in the act of falling upon the unprotected flank of the advanced posts—when the ambush was detected by the sharp and practised eye of a friendly native. Warned of the impending danger these parties, directing a heavy fire upon the spot, made a spirited charge, driving the enemy in confusion before them, and killing many at close quarters—the British bayonet did its work

in its usual style when fairly brought to bear on its object. Soon afterwards some signalling by means of flags took place between Heki within the fortress and Kawiti without. The result was a combined attack by these leaders on the advanced position. The reserve opened a smart though distant fire, from which they recoiled; yet many of the boldest reached the entrenchment previously taken and were there killed. Kawiti was again repulsed by the bayonet with some loss. Yet this was not the last effort of the hoary warrior, who was much more liberal of his person than his younger and stronger associate—a tall and athletic man, while Kawiti was small and decrepit—for when the advanced posts were ordered to retire on the reserve and were bringing off their wounded, unsupported by Heki he made a third and fierce attack upon the British, which was checked and finally repulsed by the skirmishers. The British loss was fourteen soldiers, seamen and marines, killed; two officers, four sergeants, thirty-two soldiers, seamen and marines, and one private servant, wounded. The loss of the rebels could not be correctly ascertained. Several chiefs were slain. Kawiti was rendered childless, two of his sons being killed. Besides which several near relatives, and nearly the whole of his tribe that were present, fell in the skirmishes. Having collected the wounded the English leader commenced a retrograde movement, and reached on the evening of the 8th Waka's stockade, where he was detained twenty-four hours by heavy rain; but on the 10th he fell back to the settlement at Kiri Kiri, the effective men carrying the litters with their wounded comrades, natives in sufficient numbers for that purpose not being procurable. In this manner half the force was employed from eleven a.m. until nine at night; but all, seamen and soldiers, performed this unusual duty with a cheerfulness that can never be surpassed. The distance was not less than eighteen miles. Rumours having reached the English camp that Heki had disappeared from his pah, the Colonel thought it probable that his aim was to harass the line of retreat, passing as it did through a hilly country covered with fern and brushwood. He therefore continued his march to Tariai's river, where the *Hazard* lay at anchor, and before night the troops were on board of that ship. On the 12th they were transhipped to the hired vessels and returned to Pahiā, where the Colonel awaited further orders from the Governor. During the absence of the land expedition the naval Commander amused himself by destroying some half-dozen small villages on the coast belonging to Heki's tribe, in breaking up their war-canoes, and retrieving several boats the property of Englishmen. The wounded men were sent to Auckland in one of the men-of-war. Thus ended the first series of operations undertaken against Honi Heki in his fortress of Okaehau. The unsuccessful issue of this expedition is attributable to the want of battering

artillery. The troops suffered under a multitude of minor difficulties, most of them rendered unavoidable by the public indigence ; among which were the absence of carriages or beasts of burthen, of camp equipment, and of hospital, commissariat, and store departments. The weather was most inclement. Moreover, by some means or other, the enemy were well informed of every movement and intended movement of the British. A few days after the affair of Okaehau Archdeacon Williams had an interview with Heki—once his mission servant, now a great rebel chieftain, successful in two battles in both attack and defence against English disciplined forces ; and the missionary proposed terms of peace to him. Certain places were to be vacated by the natives and ceded to the English ; horses, boats, and other property belonging to Europeans to be restored ; the flag-staff to be paid for, “staff for staff ;” the rebel leader himself to retire to Wangaroa for two years ; after which, if he remained quiet, the Governor would receive him. On the subject of this proposal Honi addressed a letter to the Governor, of which the following are characteristic passages:—“May 21st 1845. Friend the Governor: I have no opinion to offer in this affair, because a death's door has been opened. Where is the correctness of the protection offered in the Treaty? Where is the correctness of the good-will of England? Is it in her great guns? Is it in her Congreve rockets? Is the good-will of England shown in the curses of Englishmen and in their adulteries? Is it shown in their calling us slaves? or is it shown in their regard for our sacred places? The Europeans taunt us. They say, ‘Look at Port Jackson, look at China, and all the islands ; they are but a precedent for this country. That flag of England which takes your country is the commencement.’ After this the French, and after them the Americans, told us the same. Well, I assented to these speeches, and in the fifth year (of these speeches) we interfered with the flag-staff for the first time. We cut it down and it fell. It was re-erected ; and then we said, ‘All this we have heard is true, because they persist in having the flag-staff up. And we said, We will die for our country which God has given us.’ If you demand our land where are we to go to? To Port Jackson? to England? If you will consider about giving us a vessel it will be very good. Many people—(here he enumerates tribes)—took a part in the plunder of Kororarika. There were but 200 at the fight, but there were 1000 at the plundering of the town. Waka's fighting is nothing at all. He is coaxing you, his friend, for property, that you may say he is faithful. I shall not act so. He did not consider that some of his people were at the plunder of the town. It was through me alone that the missionaries and other Europeans were not molested. Were anything to happen to me all would be confusion. The natives would not consider them harmless Europeans, but would kill in all directions. It is I alone who

restrain them. If you say we are to fight, I am quite agreeable ; if you say you will make peace with your enemy, I am equally agreeable. I now say to you, leave Waka and myself to fight. We are both Maoris. You turn and fight with your own colour. It was Waka who called the soldiers to Okaehau, and therefore they were killed ; that is all. Peace must be determined by you the Governor.—From me, JOHN WILLIAM POKAI (HEKI).” A few days after writing the above letter Heki in making an attack upon the pah of his old foe Waka, who nothing daunted by the retreat of the British held his ground, received a bad wound from a musket shot in the thigh, from the effects of which he never entirely recovered, and which partly caused his death in the year 1850. Heki was more of a diplomatist than a *sabreur*—not possessing much personal courage. His person and features were fine, with a small cunning eye and a massive obstinate chin.

XII. *Third Expedition against Heki*.—The expedition under Colonel Hulme—a most intrepid and experienced soldier—although in the main unsuccessful, caused the dispersion of the rebels for a time at least as well as the loss of some of their bravest men. But scarcely had the ships and troops returned to Auckland when information was received that Heki was again collecting men, and was actively engaged in building a new pah which would be stronger than any yet constructed in N.Z. Reinforcements continued to arrive from Sydney where Sir George Gipps and the Commander of the Forces were making every exertion in their power to assist the local government of N.Z. It was of the utmost importance to prevent the rebels from making head, and collecting the disaffected from other parts of the island ; therefore without delay another expedition was prepared on a larger scale. Lieut.-General Sir M. O'Connell sent to N.Z. in the course of April and May in augmentation of the former force a detachment of 530 men of all ranks of the 58th regiment under Major Bridge, followed by Colonel Despard of the 99th regiment, the flank companies of the 99th regiment, and a company of the 96th ; also Major Marlow of the Royal Engineers, and some light guns and ordnance stores from Sydney and Hobart Town. The gallant fellows engaged in the first expedition expected to carry all before them, and failed. The second expedition, prepared with greater foresight and with the experience afforded by past disaster, was more sanguine, and had better cause to be so ; yet the attempt to storm Heki's new stronghold was frustrated with a deplorable loss of life on the British side. Colonel Despard having heard on the 13th June from an Englishman who had seen Heki that his wound was very severe, and that the ball had only been cut out the day before, resolved to hasten his movements. The vessels accordingly got under weigh from Kororarika at daybreak on the 16th, crossed the Bay of Islands quickly, and the troops being landed reached the Station at Waimate the

following morning early. By a return dated 15th June the force (not including the armed seamen and marines) consisted in round numbers of twenty-four officers and 510 men of all ranks of the 58th, 96th and 99th regiments; one officer of engineers, one of artillery, two of the commissariat; volunteers from the Auckland Militia for the service of the Royal Artillery and Engineers, two officers and seventy-five men. The ordnance was two 12-lb. howitzers and two six-pounders. Nearly the same difficulties which harassed the former expedition beset the present one—rainy weather and almost impassable roads; paucity of means of transport, and consequent short supply of military and commissariat stores; a difficult country, covered in some parts with brushwood seven or eight feet high, with only a footpath traversing it, and intersected with high-banked and swampy streams; guns without tumbrils or limbers, having ship carriages with wheels fifteen inches high, little suited to N.Z. mud, famous for depth and tenacity. Such were a few of the impediments in the way of the troops on the road to Waimate. Detained by scarcity of provisions and bad weather until 23rd June, the force was at an early hour put in motion towards Heki's pah of Ohaiowai, distant six miles; and so great were the difficulties on the road that ten hours were consumed in performing that short distance. Arriving within a mile of the pah firing was heard and seen, and the advanced guard pushing on was met by Tomati Waka, who had just driven in a picquet of the enemy. The day being by this time far spent, the commandant employed what remained of it in encamping his force about 350 yards from the stockade, covered by an eminence. From Waka's position he obtained a bird's-eye view of the pah. It was situated in a hollow plain, in form of a parallelogram, about 150 to 200 yards long by 100 broad each face. On two angles there were projecting outworks, but the others had none. There was an outer barricade of timber about ten feet high, and each upright piece from six to eight inches in thickness, and fixed in the ground close to each other. On the outside of this barricade a quantity of native flax was tied, so as to make it more ball proof. Within this barricade there was a ditch from four to five feet deep and about the same broad. Within the ditch there was a second barricade, similar to the outer one; and the whole place was divided into three parts by two other barricades crossing it, of similar height and strength to the outer one. During the night of Monday, a battery of four guns was erected for the purpose of breaching the face opposite where the troops were encamped, which opened at 7 o'clock a.m. on Tuesday, but not with the effect anticipated, as the shot frequently passed between the timbers, without displacing any of them. After firing a short time it was discontinued, and during the night the battery was removed to a better position not more than 250 yards distant. Still little

impression was made, although one gun was taken to the top of the before-mentioned hill, and fired from thence, where it commanded the whole place, and was within musket-shot. The shells plumed right into the midst of the stockade, the six-pounders whistled right through its wooden walls from one side to the other, yet the besieged made no sign. They slipped into their burrows underground when a match was laid to a touch-hole, and kept up a brisk fusillade from their dangerous and well-contrived loopholes *à fleur de terre*. After some time the small brass guns tumbled off their platforms into the soft mud. A battery at closer quarters was next tried, but with no better success, for the breastwork being shaken down, it was soon silenced by musketry, and the guns were withdrawn after the enemy had made an unsuccessful attempt to take them by a rush. On 30th June, with infinite labour and difficulty, a thirty-two-pound gun was brought up to the camp from the *Hazard*—a distance of fifteen miles, and was posted on the hill occupied by Waka's tribe, where a light gun had already been posted under a guard to enfilade the defences. At 10 a.m. on 1st July the great guns opened fire. Great were the expectations raised by this formidable acquisition; and whilst the attention of every one was occupied in observing its effects, Kawiti once more tried his favourite trick of flank attack. Rushing from a thick wood close in rear of the battery, he drove Tomati's force in confusion from the hill, and would undoubtedly have overpowered the guard and taken the two guns but for a timely and spirited charge of a party of the 58th under Major Bridge, who recovered the position and drove away the enemy with loss. Yet they succeeded in carrying off a small union jack, which shortly afterwards was seen flying below the rebel standard in the stockade. This sortie induced Colonel Despard—not having a heavy shot in his locker, for the thirty-two-pound shot brought from the *Hazard* were by this time expended—to resolve on assaulting the place by escalade. He had been prepared since the morning for this bold measure; and the orders issued for the distribution and direction of the storming parties were so detailed and so suitable to circumstances, and the troops under his command so admirable in every way, that had the breaching battery been tolerably effective no reasonable doubt can be entertained of his perfect success. Soon after three o'clock all was prepared; the English soldiers ready to rush on their savage enemy; the Maoris awaiting in grim silence their onset. Not a shot was fired, not a sound heard; when suddenly a bugle-blast, the signal for advance, rang through the forest. Its notes were instantly drowned by a deafening cheer from the British; and the wild yells of the savages joined in the fierce concert, with the shouts of the officers and the rattling of musketry. In ten minutes all was over. One third of the English force had bitten the dust. The remainder recoiled, baffled from the absolutely impregnable stockade! "The troops,"

says the Colonel commanding, "rushed forward in the most gallant and daring manner, and every endeavour was made to pull the stockade down; they partially succeeded in opening the outward one; but the inward one resisted all their efforts, and being lined with men firing through loopholes on a level with the ground, and from others half way up, our men were falling so fast that notwithstanding the most daring acts of bravery and the greatest perseverance, they were obliged to retire. This could not be effected without additional loss of life in the endeavour to bring off the wounded men, in which they were generally successful. The retreat was covered by a party under Lieut.-Colonel Hulme of the 96th Regiment, and too much praise cannot be given to that officer for the coolness and steadiness with which he conducted it under a very heavy fire." Immediately after this disastrous repulse the troops were withdrawn to their original position, not more than 400 yards from the pah, but sheltered from its fire by an intervening height. Then came the melancholy task of counting the killed and wounded; and the following is the list of the British loss before the stockaded den of the savage at Ohaiowai:—"Killed: Officers 2; sergeants 4; rank and file 29; seamen 2. Wounded: Officers 5; sergeants 3; rank and file 75; seamen 3. Names of officers killed: Lieutenant Philpotts, H.M.S. *Hazard*; Captain Grant, 58th Regiment. Names of officers wounded: 99th Regiment, Brevet Major McPherson severely; Lieutenant Beattie, severely; Lieutenant Johnstone, slightly; Ensign O'Reilly, severely; W. Clarke, interpreter, severely. Since dead of their wounds: Lieutenant Beattie and 4 privates." The Commandant states in his despatch of 2nd July, that "one-fourth of the whole strength of the British soldiers under my command have been either killed or wounded." During the night after the assault the shrieks of a tortured prisoner of the 99th, mingling with the yells and roars of the war-dance within the pah, harrowed the souls of his comrades. This unfortunate man was never again heard of! All the shot and shells being expended and no transport for further supplies being available the Colonel contented himself with holding his position, directing his chief attention to the conveyance of the wounded to Waimate. Meanwhile the rain fell in torrents night and day. The men were harassed by rumours of night attacks. The native allies rendered no assistance; for although they admired the determined hardihood of the attempt upon that impregnable stockade, they condemned, even ridiculed it as the act of mere madmen; and appeared to have lost all interest in the business so soon as the British took the lead and the operations lost that stealthy and desultory character which suited their tactics. Yet they were both alarmed and irritated when they heard that the English force was about to retire; and some of the chiefs at a conference with the senior officer delivered themselves of such violent speeches

on the subject, that the gallant Colonel was compelled to silence them by reminding them that they had been but sleeping partners in this bloody affair, and had therefore no right to bluster about the result. Preparations were accordingly in progress for a general retreat to Waimate, there to await fresh supplies and reinforcements; when early on the morning of the 10th July it was discovered that the enemy had evacuated the pah, leaving behind them four iron guns on ship carriages, which do not appear to have been used during the siege, immense quantities of provisions above and under ground, and many Maori valuables, such as muskets, axes, saws and suchlike—intended probably to engage the cupidity and to prevent the pursuit of their countrymen under Waka. They had no fear—could have none of the redcoat in the bush. They had already seen enough of him to know that it was only on open ground he was their superior, and they took very good care not to meet him there. On taking possession of the pah active search was made for the body of the gallant Grant, Grenadier Captain of the 58th, and after disturbing several Maori graves it was found. On stripping in order to wash the corpse, what was the horror of the officers, his comrades, to find that it had been brutally mutilated! There is some consolation in knowing that no tortures could have been inflicted on his living body, for the death-shot had passed through his gallant heart. The deceased it was said had the strongest presentiment of death. In the old church at Parramatta in N.S.W. is a tablet, raised by his brother officers to commemorate the loss "of a good soldier and a warm friend." Philpotts was shot dead whilst bravely but vainly striving to force his way through the palisades, and was scalped by the barbarian enemy. Beattie, a fine young officer, and much beloved by his brethren in arms, died of his wound; and these two lamented officers of the sister professions, buried with military honours, lie side by side in the mission churchyard at Waimate, "The River of Tears." Major McPherson and Ensign O'Reilly were desperately wounded, the former in the act of heading the storming parties, the latter while hacking the flax-withes that bound the palisades with that mockery of a weapon called the "regulation sword." His right arm being shattered the naked sword fell into the enemy's hands, and two years and a half after the battle Colonel Mundy had the pleasure of returning it to him at Sydney, the blade having been redeemed by old Tomate Waka and delivered to the Colonel at the Bay of Islands. On the 11th and 12th the pah of Ohaiowai was burnt. The strength of the place struck every one with astonishment. From Waimate on the 16th a detachment of 200 men were led by the commandant to attack a strong pah of another rebel chief about six miles distant. The garrison deserted the place, putting a burning bridge over a deep creek between themselves and their pursuers. This stockade was then dismantled by the

troops. The enemy was now dispersed in different directions; the winter was fairly set in; there were not seventy effective soldiers at Auckland. No choice therefore remained but to wait for better weather and reinforcements from Sydney before operations could be recommenced. Colonel Despard, in a letter to the Governor, concluded with the remark that "whatever has been the real cause of our want of success, it is not to be attributed to the officers or men under my command, for a braver or more intrepid body never wore the British uniform"—an indisputable truth, for there were present at this disastrous combat portions of three fine regiments and a picked body of man-o'-war's men, all eager for distinction, working well together, and led by zealous, able and dashing officers. They did all that could be done by human strength and courage, unassisted by those appliances and inventions of war which alone give advantage to the civilised over the savage combatant. That Englishman must be a stoic indeed—that English soldier a stock and a stone—whose heart swells not with a mingled feeling of grief and rage as he contemplates scenes where such reverses as those of Kororarika, Okaiehau and Ohaiowai befel the British arms. Nor did the military feeling derive much unction from the fact that Kororarika was resumed as a British settlement almost immediately after its sacking, and that the two paks of the confederate rebel chiefs were evacuated and destroyed ere the troops were withdrawn. The building of the strongest pak, where the materials for stockading are growing on the spot, and where there are plenty of willing hands and sharp axes, is but the work of a month or so. The burning timbers of Ohaiowai accordingly had scarcely ceased to smoke before the veteran Kawiti, now upwards of seventy years of age, was heard of, thirty or forty miles distant, busily engaged in erecting the most formidable work ever attempted in N.Z.,—namely, the Rua Peka Peka, or the Bat's-nest. There is something of the prophetic spirit in the following passage of a letter addressed to Governor Hobson in June 1840, by Major Bunbury of the 80th Regiment, when employed in carrying out the treaty of Waitangi in the Middle Island:—"The military, I conceive, ought rarely to be required to act or to appear, as the slightest check they might receive would be attended with the most disastrous consequences. It is true that the natives are not prepared to cope with the courage and discipline of British troops, but if the former are ever *unadvisedly pent up in their paks or forts*, despair may supply the place of both." How literally did the writer foresee coming events—now passed beyond recall! When the troops were withdrawn shortly afterwards to Kororarika, some uneasiness was felt on the score of Waimate; but the Maoris respected the place for the sake of the "just men" it contained. They warred, as they said, against the soldiers and the flag, not against the missionary and the settler. The operations appeared to

have impressed the natives with a shrewd notion that, although the British soldier was merely human, the eventual success of the British arms was beyond doubt. Accordingly when, in November 1845, Colonel Despard lay encamped at Kororarika on the site of the ruined settlement, several influential chiefs with their adherents came and pitched their warrees close to his camp. Tomati Waka, Nopera (or noble) Macquarie Taunni and Moses Tawai, with other notables and their tribes, amounting to many hundreds, constituted themselves military neighbours and allies of the British force, and were on excellent terms with the soldiers. Whilst encamped at Kororarika, the commandant employed himself and his men in clearing around the town; he selected posts for fortification, to defend the re-nascent settlement; practised his few artillerists in throwing empty shells which were recovered for more serious work; and waited patiently until a better campaigning season and reinforcements in men and munitions should arrive. In the middle of November Governor Grey reached Kororarika, and gave the rebels a few days to consider the terms of peace dictated by his predecessor. Honi Heki, still smarting under his wound and from an attack on the lungs, sued for peace in tolerably humble terms. "Give me a ship and I will leave the country altogether," he cried. However, he held aloof from his old ally Kawiti, whose overtures to the Governor, couched as follows, evinced no great humility:—"Rua Peka Peka, September 24, 1845.—Sir the Governor,—How do you do? I am willing to make peace—that peace should be made. Many Europeans have been killed, and many natives also have been killed. You have said that I must be the first to begin peace-making. Now this is it. Now I agree to it. This is all I have to say. It ends here. From me, Kawiti." The old warrior was only gaining time to strengthen his new fortress, the Bat's-nest. The Governor however put an end to his evasions and to the negotiations of the missionaries by giving orders for the recommencement of hostilities, and no time was lost in carrying them into effect.

XIII. *Expedition against Kawiti.*—It was towards the middle of December that Colonel Despard, with a force and with means infinitely more commensurate with his undertaking than had hitherto been employed in N.Z. advanced from Kororarika towards the rebel stronghold. His route lay about ten miles by water up the Bay and the Kawa-Kawa River to a point on the latter, where stood the pak of a friendly chief named Puku-Tutu, beyond which some twelve or thirteen miles of difficult country lay between him and the Bat's-nest. One half of the force performed the first portion of the distance in boats supplied by the squadron in harbour, while the Colonel himself with the other half forced his way over a rough hilly country, moving on the flank of the water expedition and thus protecting them from attack from the shore. The chief

Puku-Tutu, alive like most Maoris to the main features of war movements, had volunteered to keep the banks of the river clear of enemies; for Kawiti had been foraging among his potato gardens, and he owed him therefore a grudge—a kind of debt that the Maori is always ready to pay without being dunned. In spite of the active co-operation of the naval people two days were expended in getting to the house of this chief. Here was a fine spot for an encampment; and the force accordingly halted, awaiting guns, stores, provisions, and teams, while the staff reconnoitred the country in their front almost up to the embrasures of the Bat's-nest. On the 22nd the Colonel pushed on with the greater part of his little army, and overcoming a thousand difficulties by dint of extraordinary exertion, was soon enabled to take up a fine position about 1200 yards from his enemy, where the rest of the force quickly joined him, and where they had to halt in their bivouacs under heavy rain on the 24th and 25th. On the 29th December the force before Kawiti's pah was, in rough numbers, as follows:—Staff: 1 Acting Colonel, and 1 Acting Major of Brigade. Artillery and Engineers: 1 Captain and 1 Subaltern. Small-armed seamen: 10 officers and 211 seamen. Royal Marines: 3 officers and 79 men of all ranks. Detachments of the 58th and 99th Regiments: 27 officers and 750 men. East India Company's Artillery: 3 officers and 21 men. Volunteers as pioneers: 1 officer and 48 men. Artillery: Two medium 32-pounders; one 18-pounder; two 12-pounders brass howitzers; two 6-pounders; and four 5½-inch mortars, with shot, shell and rockets. The veteran chief must have felt flattered by the armament assembled for his subjugation. On a commanding eminence 1200 yards from the pah, batteries for shells and rockets were thrown up. The insurgent chief had shown no little shrewdness in the choice of his new position. The general aspect of the country between Puku-Tutu's village and the Rua Peka Peka is that of bare and steep downs, intersected by occasional strips of bush, through several of which the troops had to pioneer their way by axe-work. The pah itself was erected on a rising spur of land, about a quarter of a mile within the margin of an extensive tract of the heaviest timber and brushwood, which screened its fronts and flanks, and stretched away interminably in its rear. About 200 yards of cleared glacis surrounded it. The chief strength of the pah lay in its difficulty of approach and the massiveness of its palisading. The commander of the incursion, warned by foregone events, resolved to proceed against the work by regular trench—a method which, if ever contemplated in the affair of Ohaiowai would probably have failed owing to the excessive wetness of the ground. The first batteries were thrown up on the summit of the hill, from whence the enemy were treated to a specimen of shelling and rocketing which must have surprised them not a little, for the very first bomb cut Kawiti's

flag-staff in two—not a bad shot, and, to a superstitious race, no very encouraging omen. A rocket, also, falling short of the pah, set fire to the fern and underwood, laying bare an extensive patch which was afterwards made available for more advanced works. From the position of the first batteries the prospect was very striking. In front a profound, rocky, and thickly wooded gully presented an impassable barrier to the artillery. Beyond this gully a small plain opened to the sight, and was terminated by the dense bush, within whose verge lay the Bat's-nest, almost entirely masked by high trees. The troops were compelled to turn the head of the ravine by carving their way with the utmost difficulty and labour through a thick wood, absolutely laced together with a network of creepers. The old rebel was as hard to get at as the "Sleeping Beauty" in the fairy tale. The English commander had to cut a path through an almost impervious forest to reach the object of his enterprise. About a quarter of a mile through a kind of cloister of foliage—the result of the pioneers' labours—stands the small plain in the centre of which a temporary stockade was erected by the native ally. Moses Tawhai, just before daylight on 29th December, pushed silently through the bush with some picked men of his tribe, and seizing his forward position, quickly ran up some palisades and breast-work, sufficient to cover his party from musketry and from a sudden rush of the enemy. The Colonel promptly joined him with 200 men and a couple of guns; and the position, 600 yards from the pah, was secured before the enemy were aware of the movement. The pah of Rua Peka Peka was solidly constructed; nor was there less ingenuity displayed in the formation of the trenches and covered ways, between a double row of palisades and within both, from whence the defenders could take deadly aim along the glacis at the exposed stormers. Most of the loopholes for musketry were on the ground level, and across the trenches in which the musketeers stood or crouched were erected regular traverses, with narrow passages for one person, to guard against the *ricochet* of the British shot. The interior was subdivided into many compartments, so that the loss of one of them would not necessarily prevent the next from holding out. How these rude savages had contrived in a few weeks, and without mechanical appliances, to prepare the massive materials of their stockade, and to place them in their proper positions, deeply sunk in the earth and firmly bound together, is inconceivable. To be sure the timber and flax grew on the spot, and the labourers engaged in the work were working and preparing to fight for their native land and for liberty—what more need be said? The pah was studded with subterranean cells, into which the more timid or prudent ran when they heard the whizz of a shell or a rocket, or had reason to expect a salvo from the guns. These war-crypts were about eight or nine feet deep and large enough to contain a party of four men. The

mouth was defended by a bomb-proof roof and breastwork of logs and earth. The resolution of the British leader to approach by regular trench and to effect a practicable breach before storming, leaves no doubt as to what would have been the result had the affair proceeded to the length of a regular assault, which it can scarcely be said to have done. It was apparent that the stout wooden walls were no match for the heavy guns. Many of the huge pickets, eighteen or twenty feet high by two feet thick, were knocked into splinters, and more than one of them was regularly bowled out of the ground by the thirty-two-pounders like a wicket stump. A concentrated fire would therefore have soon made a good breach. The actual capture of the Rua Peka Peka occurred somewhat fortuitously on Sunday 11th January 1846. The "Mihonari" or Christian portion of the garrison had assembled for church service on the outside of the rear face of the fortress under cover of some rising ground. A party of loyal natives approached under command of Wiremu Waka, brother of Tomati, and reconnoitred the breaches. Discovering the employment of the defenders a message was sent back to the English reporting the circumstance. It led to the almost instantaneous defeat of the natives; but it also saved them and the English from the tenfold carnage which a more vigilant and disciplined resistance from within their walls would have infallibly caused. An officer or two with a small party of soldiers and seamen stole quietly into the almost deserted pah, and further reinforcements followed quickly from the trenches. The Maoris, too late discovering their error and the movements of their foes, rushed tumultuously back into the work and made a fierce but futile attempt to retake it. Hand to hand and unfavoured by position they had no chance against the British bayonet and cutlass. Baffled and overpowered they fled by the rear of the stockade, and the Bat's-nest was taken. "The enemy," reported Colonel Despard, "was obliged to retreat and shelter himself in a wood opposite the east face of the pah where, the trees being extremely large and forming complete breast-works, many of them having been cut down previously, and evidently purposely placed in a defensive position he was enabled to maintain a heavy fire against us for a considerable time, until a doorway in that face being forced open, the seaman and troops rushed out and dislodged him from his position. He however still continued to keep up a fire from the woods, but more with a view to cover his retreat and enable him to carry away his wounded men than with any expectation of renewing the contest. The attack commenced about ten o'clock a.m., and all firing had ceased at two p.m. The enemy's loss has been severe, and several chiefs on their side have fallen. The numbers I have not been able to ascertain as they invariably carry off both killed and wounded when possible." Thus fell on 11th January 1846 Kawiti's pah of Rua Peka Peka;

and with its fall ended the active resistance of that chief and Heki, and British military operations in the northern district. The brave Maori was not only fairly defeated but fairly outwitted. The lesson was salutary; for this people are sagacious enough to "know when they are beaten," a branch of knowledge which that great preceptor in the art of war, Napoleon, was disgusted to find he could never instil into the English armies. The rebel chieftain must have had a bold heart to hold out against a force of nearly a thousand British seamen and sailors arrayed against him, while H.M.'s ships *Castor*, *Calliope*, *North Star*, and *Racehorse*, with the Honourable East India Company's sloop *Elphinstone*, lay at the mouth of the Kawa Kawa River, within fifteen miles of his wooden fortress. The British loss during the assault was:—Seamen and marines: killed, 9; wounded, 1 midshipman and 17. Soldiers: Killed, 3; wounded, 11; and 2 volunteers wounded. The pah was dismantled by the troops, and the natives deserted and avoided the place as a spot accursed. The paths leading to it are now grown up and nearly obliterated. The Genius of the wilderness, true to her children, is fast erasing every trace of the Maoris' defeat at Rua Peka Peka! Kawiti, who had made his escape on the capture of his fortress, was in the May following received by the Governor on board H.M.S. *Driver* in the Bay of Islands, and there and then gave in his allegiance to the British Government, expressing regret for "the trouble he had given," and gratitude for the treatment he had received. The old warrior, it is said, appeared deeply humiliated in making such concessions in the presence of other chiefs, who had fought on the English side and had eventually triumphed over him after a long and stout resistance. His letter, written a week after his defeat, and expressing a desire for peace, is a rich specimen of Maori diplomacy:—"January 19th 1846. Friend, —Oh my esteemed friend, the Governor, I salute you. Great is my regard for you. Friend Governor, I say, let us have peace between you and me—because I am filled (satisfied, have had enough,) of your riches (cannon balls.) Therefore I say let you and I make peace. Will you not? Yes!—This is the termination of my war against you, Friend Governor. This is the end of mine to you. It is finished.—To my esteemed Friend. To the Governor.—(signed) KAWITI." Heki, it is said, arrived at the Bat's-nest on the day it fell. He seems to have laid aside the name by which he was known as a great warrior—his signature at this time being Honi Wiremu Pokai.

XIV. *Governor Grey*.—On 14th November 1845 Sir George Grey arrived at Auckland as successor to Captain FitzRoy. While a young man, Grey had explored the unknown tract of territory lying betwixt Adelaide and the Swan River settlement, and had written a sketch of his journey, in which he suggested and described a system of policy considered to be well adapted for ameliorating the condition of the aborigines of that country. He

dedicated this book to Lord Glenelg, at that time Colonial Minister. The work was favourably received, and shortly after its publication Grey was appointed Governor of S.A. He was then selected to administer the affairs of N.Z. in a period of difficulty and emergency; and a ship of war was despatched from India in order to take him as early as possible to his destination. Grey was admitted to be a man with abilities of a high order, his capacity for administration was undoubted; and if he had devoted his energies faithfully and fearlessly, with justice and magnanimity, to the adjudication of the conflicting claims and affairs of the two races which he was sent to govern, he would have retired, after his long and eventful service in N.Z., with the character of a great man and the reputation of an enlightened statesman. The measures of his government were in many ways statesmanlike, but shaped and shaded with such strong tendencies to arbitrary power that their practical importance was impaired, and they failed to inspire confidence in either the Maoris or the colonists. When Grey arrived he found that the Maoris had begun to "pale their ineffectual fires" before the power and endurance of British troops, and although they had experienced no defeat of importance, still the loss they had sustained at the storming of Russell and in their encounter with M'Lerie convinced them that they were no match for us in arms. The constant harassment to which they were exposed by the British system of conducting military operations had completely worn out their strength and endurance. From this cause, as well as from that want of discipline and organisation which characterises the warfare of all uncivilised people, the insurrection had in a great measure lost its vigour. The new Governor, after a short stay at Auckland, proceeded to the north in order to quench the expiring embers of the insurrection, but previous to his departure he made arrangements for taking up the debentures in circulation with Imperial funds, as he had received from the Lords of the Treasury authority to obtain from the commissariat any amount of treasure he might require in conducting the Government. Possessed of such authority, and provided with ample funds, he saw the difficulties hitherto experienced in administering the affairs of the colony disappear like winter snows at the approach of summer. The two chiefs, Heki and Kawiti, with their followers, having offered terms of peace and submission, Grey behaved in a generous manner to the Maoris. In the first instance he confiscated their territory, but shortly afterwards restored it to them. This was sound and judicious policy and was not thrown away, for this tribe, the Gnapui, one of the most numerous and warlike in the country, have continued ever since to be distinguished for their loyalty and allegiance to the Government. The Governor remained a short time at Auckland before proceeding to Wellington to quell the spirit

of insurrection which had manifested itself in the south ever since the unfortunate defeat at the Wairau. Before his departure however he abolished the system of direct purchase of lands from the natives by the colonists which had been introduced so successfully in the north by his predecessor. This false step in his policy was no doubt taken with the view of conciliating by a peace-offering to their cupidity the N.Z. Company, whose influence, although on the wane, was still great in England. As they had always denied the claims of the natives to the rights of British subjects, he supported them in this measure in opposition to his judgment; but Grey was an ambitious man, and in order to ingratiate himself with this powerful Company he forsook the right and adopted the expedient in his policy. The Company at that time owned a considerable extent of territory, and the exclusion of the natives from the field of competition in the sale of lands was an important object gained. Governor FitzRoy's aim was to abolish the disgraceful land-jobbing monopoly carried on both by the Company and Government in order to establish a just and sound system of policy, and at the same time to act fairly towards the natives. Grey's object was to re-establish both, and conciliate the natives by a system of gifts and presents out of funds drawn from the Imperial Treasury in the first instance, and subsequently from colonial revenues. This was merely postponing the settlement of the question instead of grappling with it in a statesmanlike manner. The Government then was as completely despotic as can be imagined, and the Governor was in the habit of quoting Carlyle's theory of a pure despotism as the best of all systems of colonial government. He held in his hand for a time, for good or for evil, the destiny of the colony; but he trusted to cleverness and expediency instead of erecting his system of policy on the principle and basis of fair play and justice to both races. His policy laid the foundation for the subsequent wars in N.Z., although during his first tenure of office he made everything pleasant to the Government, the Company and the natives. It was however a policy which could not last, as it was founded solely on expediency and personal influence. The Governor invited the great chief Te Whero Whero to accompany him to the south. This chief had the reputation of being the greatest warrior in N.Z., and some years previously had conquered the tribes which had now risen in rebellion against the Government. The war in the south was however of short duration, as the troops had acquired experience in the field as well as in the mountain and forest warfare peculiar to N.Z. Frequent skirmishes took place, and occasionally the troops suffered rather severely, but their skill and gallantry were irresistible, and the capture by stratagem of Te Rauparaha, the notorious intriguing chief, on 24th July 1846, terminated hostilities and completed the subjugation of the insurgent natives in the south, who

quietly submitted to the British supremacy. Conspicuous for gallantry and indefatigable activity was Captain Stanley, with the officers and crew of H.M.S. *Calliope*, whose services contributed greatly to the success of the British arms. The services of Colonel Henderson, R.A., will likewise be long remembered, as he was on all occasions distinguished for skill and gallantry, while his capacity for command was no less conspicuous. The suppression of the insurrection being accomplished, the Governor went to work vigorously to arrange the various and complicated land claims of the N.Z. Company. This was no easy matter, as the natives in many instances stoutly maintained that they were still the rightful owners of much of the territory claimed by the Company. The Governor, however, lent his aid and influence to the Company in the settlement of these disputes, and even advanced funds on behalf of the Government to buy out the natives in order to give the Company undisputed possession of some valuable lands. At the same time he conducted himself in a hostile manner towards all who had obtained land under Governor FitzRoy's direct purchase proclamations in the north, and although Lord Grey, Secretary of State for the colonies, had instructed him in direct terms that all purchases sanctioned by his predecessor were to be respected, he treated many of them arbitrarily and even with injustice. In the south he permitted the natives to lease their lands direct to the colonists, while in the north he not only prohibited such a system, but inflicted the full penalty of the law on all colonists who transgressed. In this manner Governor FitzRoy's system was practically sanctioned in the south, while the same system was prohibited in the north. The old rivalry between the Company's settlements in the south and the Government settlements in the north still existed, but Grey, instead of acting fairly towards both, cast his weight and influence into one of the scales of the contending parties, and favoured the Company and the south. Many important and useful measures were enacted by the first Legislative Council held under the presidency of Grey in September 1846. No measures of policy could, however, be introduced or discussed except by the Government, which consequently restricted all legislation merely to the will and pleasure of the Governor. This system afforded an opportunity to a clever man to display his abilities for administration, as well as his talents for debate, as he was his own Prime Minister and Colonial Secretary, as well as Governor. One peculiar feature of Grey's character was developed on this occasion, and distinguished him during his whole career. When any sound suggestions or practical observations were made by independent members, either in support of or in opposition to the Government, he never openly at the time accepted them, but on some future occasion he would adopt and embody them as his own, in measures introduced by himself. He displayed

wonderful talent in seizing and appropriating the valuable information, original ideas, and practical views of others. Not possessed of great intellectual powers, nor rich in original conceptions and ideas, in the application to practical purposes of the knowledge and experience of others, as well as in the faculty of observing and waiting the development of events, then attributing their natural operations to his personal interference, and claiming the whole as the result of his own foresight and policy, he was unrivalled. At this period he was eminently successful in conciliating the natives if he did not inspire them with confidence in his measures. He made frequent tours through the country, visiting their paha and villages, as well as receiving them at Government House on all occasions with the greatest hospitality and kindness. In this way he soon acquired a complete knowledge of their language and character, appreciated their display of patriotism, expressed a genuine pleasure in listening to their animated rehearsals of their traditions and legends, and was amused at the troubadour style in which they recited their ballads and poetry; while he stimulated them by every means to educate their young chiefs, and many of them attended the schools and were fairly educated. At this time they could for the most part read and write their own language fluently, and a party consisting of sixty-five Maoris who were employed in building the barrack wall at Auckland, sixty-four could write their own language and sixty-five could read it. They were now, except in a few instances, entirely denuded of arms and munitions of war, and the importation of such articles was prohibited, ruinous penalties being inflicted by legislative enactment on all who violated this law. From this circumstance they had in a great measure abandoned their warlike and predatory habits. But as they were endowed with great energy of character, mental as well as physical, and aware of the great property they possessed in the country, and were ambitious of maintaining that rank and distinction which they formerly held, they preferred a life of occupation to idleness and repose. They were on all occasions anxious to imitate the colonists in their pursuits and amusements, and were animated with the ambition to excel and compete with them and share the prizes of civilised life. Stimulated by a justifiable desire for wealth, they adopted and persevered in peaceful and industrious pursuits, became the possessors of numerous coasting vessels, which they navigated themselves, and cultivated their lands, growing and reaping their crops of grain, as well as planting, hoeing and digging their potatoes. They employed skilled mechanics to erect mills on their property, and were recompensed by the ability not only to supply themselves with food of their own production, but to realise considerable sums by the sale of their surplus stock in the markets; while their self-love was gratified in owning sheep, cattle, and horses. In all parts of

the country, north and south, they often rode in troops well mounted from their villages to the towns and settlements; and at race meetings, would enter their horses and sometimes succeed in winning the race and stakes. These habits and pursuits having been adopted, the country might with advantage have remained a Crown colony, under a Governor observing discretion and exercising prudent forbearance, undisturbed for some length of time. Under any circumstances it would have been only just that, previous to the introduction of constitutional and responsible government, the political condition, rights, and privileges of the natives, as British subjects, should be clearly defined by the Imperial Parliament. In India, as well as in every country where colonies have been founded by England, the aboriginal inhabitants had either been conquered or treated as a conquered race. N.Z. is the only exception to this rule. The Maori chiefs in good faith ceded the sovereignty of their country to the Queen, and in consideration she guaranteed to them all the rights and privileges of British subjects. At this time Lord Grey was Colonial Minister, and with his special views on all colonial questions, confirmed by Lord Durham's famous report on the affairs of Canada, he had introduced a bill into the Imperial Parliament to provide N.Z. with constitutional and representative government. Some of the provisions of this charter were however not only framed expressly to exclude the natives from all political rights, but it contained a clause providing that all their unoccupied lands should be forfeited to the Crown. The measure was consequently received in the colony by influential people of both races with disappointment, dissatisfaction and alarm. Amongst those who were dissatisfied were Bishop Selwyn and the Church of England missionaries, on behalf of the natives. The following protest against the introduction of this charter was therefore sent to the Governor by Bishop Selwyn, with the usual request that it should be forwarded to the Secretary of State for the Colonies:—"St. John's College, Bishop's Auckland, 1st July 1847.—May it please Your Excellency,—I, George Augustus, by Divine permission Bishop of New Zealand, on my own behalf and on behalf of the clergymen of this diocese employed by Captain Hobson to interpret and explain the Treaty of Waitangi to the native chiefs of New Zealand, do hereby record my deliberate and formal protest against the principles expressed in a letter of instructions addressed by the Right Hon. the Earl Grey to your Excellency, bearing date Downing-street, 23rd December 1846, to the effect that the savage inhabitants of New Zealand have no right of property in land which they do not occupy, and which has remained unsubdued to the purposes of man. Against this doctrine I feel myself called upon to protest as the head of the missionary body, by whose influence and representations the native chiefs were induced to sign the Treaty of Waitangi, not one of whom

would have consented to act as an agent of the British Government if the assurances given to them by Captain Hobson had not been directly contrary to the principles now avowed by the Right Hon. the Earl Grey. It is my duty also to inform your Excellency that I am resolved, God being my helper, to use all legal and constitutional measures befitting my station, to inform the natives of New Zealand of their rights and privileges as British subjects, and to assist them in asserting and maintaining them, whether by petition to the Imperial Parliament or other loyal or peaceful methods, but that in so doing I shall not forget the respect which I owe to your Excellency, nor do anything which can be considered likely to add to the difficulties of the colony. I have further to request that this communication may be forwarded to the Right Hon. the Earl Grey, Secretary of State for the Colonies, with whom I am privileged to communicate through your Excellency. I have, &c.,—G. A. New Zealand." When this protest was laid before Parliament some members of the House of Commons viewed several passages in it as very strong, if not insolent, and were disposed to resent them. At the same time Grey not only considered the introduction of such a measure as altogether premature, but condemned in unequivocal terms that portion of it which ignored the claims of the natives to the rights of British subjects, and despoiled them of their lands. He therefore succeeded in prevailing on Lord Grey to suspend for a time the introduction of this charter, if not in convincing him of the prudence of abandoning it altogether. The following extract from Grey's despatches to Earl Grey in reference to this measure convey a lucid and faithful sketch of the condition and character of the natives at that period:—"Before stating the reasons on which these views are founded, I think it proper to mention that Her Majesty's native subjects in this country will certainly be exceedingly indignant at finding that they are placed in a position of inferiority to the European population. They will undoubtedly argue, as they now frequently do, that they not only cheerfully ceded the sovereignty of the country to the Queen, but that when attempts have been made by some discontented tribes to throw off the sovereignty of Great Britain, and that at a period when from the smallness of the British force in the country they had apparently some hopes of success, the principal chiefs came forward, and freely gave the services of themselves and their people, and shed their blood in assisting to maintain for Her Majesty that sovereignty which they had yielded to her. Then it must be borne in mind, that the great majority of the native population can all read and write their own language fluently; that they are a people quite equal in natural sense and ability to the mass of the European population; that they are jealous and suspicious; that they now own many vessels, horses and cattle; that they have

in some instances considerable sums of money at their disposal, and are altogether possessed of a great amount of property in the country, of the value of which they are fully aware; that there is no nation in the world more sensitive upon the subject of money matters, or the disposal of their property, and no people that I am acquainted with less likely to sit down quietly under what they may regard as injustice. At present the natives are quite satisfied with the form of Government now existing, and as the chiefs have always ready access to the Governor, and their representations are carefully heard and considered, they have practically a voice in the Government, and of this they are well aware; but under the proposed Constitution they would lose their power and the Governor would lose his influence over them; in fact the position of the two races would become wholly altered, and the Governor would I fear lose that power which I do not see he could well dispense with in a country circumstanced as this." During this period of tranquility and prosperity among all classes, including the natives, one of those incidental outrages characteristic of their condition as a fierce and semi-barbarous race occurred, and but for the sound judgment and intrepidity of Colonel Laye of the 58th Regiment, it would have involved the country in a formidable insurrection. The disturbance originated in the circumstance of a midshipman of H.M.S. *Calliope* having accidentally shot a native with a pistol. The wound being of a serious description, apprehensions were entertained of its proving fatal. The natives became excited, and it was found impossible to convince them that a deliberate attempt had not been made to murder their relation. In accordance with their former customs, and their thirst for retaliation when exasperated, they demanded that blood should be taken for blood. Whilst in this state of excitement six of them attacked the house of Gilfillan, a settler living about six miles from the township of Wanganui. Gilfillan escaped slightly wounded, but his wife, daughter, and two sons were barbarously murdered by the infuriated natives. Some of the native allies went in pursuit of the murderers and apprehended five of them, who were delivered to the officer in command of the detachment at Wanganui. This officer likewise held the appointment of civil resident magistrate, but as Laye had only a small force under his command, 170 men all told, and was satisfied that the prisoners would be rescued by their friends if he attempted to forward them to Wellington, ninety miles distant, and that it would be impolitic to divide his small force and forward them under an escort altogether insufficient, he resolved on his own responsibility to try them by military law, and make their immediate punishment a striking example of the inexorable justice and supremacy of British law. An inquest was therefore held on the mutilated bodies of the Gilfillans, and the coroner and jury returned a verdict of wilful

murder against the prisoners. A court-martial was assembled immediately, consisting of seven officers; the prisoners, upon the clearest evidence, were found guilty. Four were sentenced to be hanged; but the fifth, a boy, was in consideration of his youthful years sentenced to be transported for life. The finding and sentence of the court were confirmed by Laye, and the murderers were hanged the following morning. In the meantime their friends and a number of dissatisfied natives, relying on the assurance of assistance from Rangahaita, a notorious rebel chief, had assembled in large force in order to rescue the prisoners, and took possession of the hills surrounding the settlement. They attacked the stockade, and for five hours kept up an incessant fire on the place, but eventually were in the most gallant manner repulsed and driven off with considerable loss by the detachment of the 58th Regiment, aided by a few armed settlers. In this manner the sound judgment and intrepid behaviour of Laye dispirited the natives, and impaired the force of the insurrection. In a few weeks, as the natives were really sensible fellows, peace was restored. Laye's behaviour in this crisis evinced the possession of high qualities, valuable in a soldier, a capacity for command as well as intrepidity in action. The Governor, in despatches to Earl Grey respecting this disturbance, wrote—"I should add that the speedy and satisfactory termination of these disturbances must be in a great measure attributed to the firm and vigorous manner in which Captain Laye acted. There is every reason to suppose that, had Captain Laye not acted in the firm and decided manner he did, a much more formidable and lengthened rebellion might have ensued in the southern portion of the island." Lord Grey, in reply to Governor Grey, wrote:—"I have it especially in command to assure you of the sense which Her Majesty entertains of the firmness with which Captain Laye acted upon the occasion of the attack of the natives on the town of Wanganui, and of the gallant conduct of himself and detachment under his orders." The colony in all the settlements now made rapid advance in wealth and population, and the south was distinguished for the enterprise and success of the colonists, and began to take the lead of the northern settlements in the growth of wool and production of grain, which it has maintained ever since. The fine climate and abundant pastures of the Hawke's Bay district had attracted numerous settlers, while the Nelson settlement in the South Island, having recovered from the sad disaster at the Wairau, was making rapid progress, not only in pastoral pursuits but in agriculture. Enterprising colonists even found their way further south, to the remote settlement of Otago, hitherto viewed as the Ultima Thule of the colony, where only a few whalers and sealers had formerly taken up their residence. If the power of the N.Z. Company had been broken in the struggle with the Government, the mantle of their enterprise had fallen on the colonists, who from that day

have never faltered in their colonising spirit, amidst unparalleled disasters and difficulties. In the north, at Auckland, which was still the seat of Government, a greater degree of security was afforded by the introduction from England of a number of military pensioners, with their families, who were located in villages round, on sites selected as salient points of defence, so as to afford complete protection to the settlements. Law and order were established on a firm basis, life and property rendered as secure as in any part of England, and in a short time the country within a radius of ten miles was enclosed, partitioned and cultivated, abounding in parks, cornfields and gardens, as well as studded with villas and hamlets. The head-quarters of the 58th Regiment had likewise returned to N.Z., and there were two regiments stationed in the country, one in the north and the other in the south. In order to complete the military arrangements, N.Z. was erected into a separate command, and Major-General George Dean Pitt, K.H., was sent from England with a head-quarters staff to take command of all the forces in the colony. At this time St. John's College, situated about six miles from Auckland, where Bishop Selwyn resided, was a place of interest and attraction. With private funds the Bishop had purchased many hundred acres of land, and in a rather bleak but conspicuous situation had built the college, where a number of boys of both races, sons of colonists and Maori chiefs, were domiciled and educated. The Bishop's residence, unpretending in appearance, with few comforts—among them his library—was built of stone, but there were erected in an irregular manner numerous detached wooden buildings, for the accommodation of the masters and scholars, as well as for the convenience of all attached to the establishment. These were built in the Gothic style, with traceried windows, and included a small chapel, ecclesiastical in structure and sacerdotal in character, but in good taste, where all assembled every morning at seven o'clock to prayers. The aspect of this cluster of buildings, from the Gothic style of architecture, the traceried windows, gables and pinnacles, cloisters and stiles, was Middle Age and abbey-like, and from its monastic repose highly ecclesiastical and characteristic. Around this collection of dwellings was the college demesne or farm, where cattle, sheep, and poultry were seen grazing undisturbed in profuse and luxuriant pastures. The aspect of an English rural landscape was about the place, indicating primitive comfort and abundance. Situated on an eminence, it looked down on a scene as fair as can well be imagined. On one side the Gulf of Shouraki, studded with islands, was displayed in all its captivating loveliness; and although the college was situated in a secluded spot, not a ship or vessel of any kind could arrive or depart from the Auckland Harbour without being observed. On the other side the view extended over the whole isthmus, to the shores of

the west coast, including the numerous villages and hamlets, volcanic hills, woods, lakes, and streams in the Auckland district, forming a diversified and magnificent landscape. In those primitive times the Bishop was hospitable to all in a simple and cordial style. He was then young, full of life, vigorous and hopeful, and he was animated with the fervour of religion, as well as with a sentiment of chivalry, which united with his indefatigable and self-imposed labours to make him highly esteemed by both races. The Roman Catholic prelate, Bishop Pompallier, a Frenchman, who had been in early life an officer in a dragoon regiment, was courteous and well-bred, after the fashion of his countrymen. Cosmopolitan in manners, sacerdotal in appearance, faithful to his order, and a devoted servant to the Church; he was the first of the bishops who resided in the colony, having been in N.Z. before it became British territory. The Wesleyans had likewise built a college, a little more ambitious in style, and perhaps a shade more practical in its management than the others. In the early times their missionaries had contributed much to that civilisation which led the way to its settlement as a British dependency. Many of them were conspicuous for practical good sense, and some displayed fair abilities. The Rev. Mr. Buller was specially distinguished for his talents and accomplishments. The Scotch Presbyterians at the same time had performed their part in the cause of religion and education. They erected a capacious kirk in the Greek order of architecture. The natives had likewise done their part, and with their own funds had built churches as well as aided in erecting and establishing schools for the education of their children. In this manner the two races were brought to live together in harmony and prosperity—the Englishman and New Zealander, the civilised man of the nineteenth century and the Maori lately emerged from a state of barbarism, who were never viewed or treated nor would submit to be treated as a conquered race, and who during the war in 1845-6 had joined with us in suppressing a formidable insurrection, freely giving their services and sacrificing their lives in maintaining the Queen's authority, and in support of that sovereignty which they had frankly bestowed on condition of receiving the rights of British subjects. Governor Grey, who in the order of things which had sprung from the disturbed condition of N.Z. had become distinguished, was created a Knight of the Bath. Unaided by the advantages of high birth or family influence, he was at this early period of his life rewarded for his meritorious services, and deservedly stood high in public estimation. The ceremony of his installation took place on the lawn in front of Government House in presence of a large party of ladies, a great number of civilians, all the military, and many of the Maori chiefs, who viewed the ceremony with characteristic gravity and dignified demeanour. There were some circumstances connected with

this ceremony which rendered it more than usually attractive. Grey was not only the youngest knight, but the most youthful man of the Order, and had won his spurs by his own merit and personal achievement. He was ambitious and self-reliant, his career successful and brilliant, and he was justly proud of this mark of royal approbation. Among the early colonists there were many accomplished gentlemen, distinguished for intelligence and enterprise, who from having been exposed from time to time to all the perils and vicissitudes of N.Z. colonisation had acquired great experience and knowledge in its State affairs, and the characters of some of the present colonial representative men were formed and developed in those stirring and eventful times. Colonel William Wakefield and Captain Arthur Wakefield, who represented the N.Z. Company, cannot be forgotten for their practical talents and good sense. At that time Sir Charles Clifford, first Speaker of the General Assembly, Mr. Stafford, Mr. Fitzherbert, Dr. Featherston and Mr. Fox had distinguished themselves in colonial politics, and Sir David Munro was remarkable for his intellectual accomplishments, besides the gifted Sir Francis Dillon Bell, and a host of others all famous in the annals of the colony. The name of Dr. Martin, of Auckland, must be added as that of a colonial representative man of great literary attainments.

XV. *The Native Difficulty.*—Long before N.Z. was colonised it was known that the natives were a powerful and warlike race; and some account has been given of the formidable opposition which an insignificant minority of them were able to offer to disciplined English troops. But until they rose into open rebellion it appears to have been thought that British authority might easily be established amongst them by moral influence alone. Hobson's urgent solicitations that an adequate military force should be stationed in N.Z. were met on the part of the Imperial Government by a positive refusal. It was not considered that a few individuals composing the staff of the civil government must be powerless to govern and control not only their own countrymen but nearly a hundred thousand of the most barbarous and warlike people on the face of the earth; and that a single act of injustice, or a single rash step on the part of the colonists, would endanger the life and property of every British-born subject in the country. So for several years the local authorities were placed in an anomalous and humiliating position; and from an imperfect appreciation of the difficulty of the undertaking the attempt to colonise had been followed by most disastrous consequences. The natives were not a conquered people, nor did a majority of them give an intelligent and unqualified submission to British rule; yet the moment the Queen's sovereignty was officially proclaimed, the whole of the inhabitants, native and European, at once became—in theory at least—amenable to British laws; and the authorities were expected

to carry the theory into execution. The settlers not only looked to the Local Government for protection from native aggression; but if an offence against the law of England was committed even amongst the natives themselves, and in the interior of the country, the authorities were expected to apprehend and punish the offenders! And because native offenders went unpunished—because acts of cannibalism were committed, and native warfare was allowed to go on unchecked—the Local Government were reproached with culpable inefficiency, and the Queen's sovereignty was described as a delusion and a snare! In seeking to govern and control a wild and barbarous people, impatient of restraint and accustomed every man to take the law into his own hands in a rude and summary way, the principal difficulty was to induce them to have recourse to the British tribunals and to yield obedience to their decisions. But when these tribunals were found to be unable to carry out their own awards, and when a judicial decision was frequently but an empty name, it was not easy to satisfy them that the mode of administering justice was practically superior to their own. The local authorities were for several years powerless, both in civil and criminal proceedings, effectually to carry out the law. When the British first undertook the colonisation of the country its trade was not confined to the settlers, but for some time previously a considerable amount of commercial intercourse had been carried on between the two races. Nor were dealings with the natives confined to the English settlements and the districts immediately around them, but were extended over the whole country, carried on partly by straggling settlers, by travelling traders, and by persons engaged in occupations in which native labour was found to be available. Many dealings between the two races took place in districts so remote from settlements as to be practically beyond the operations of the courts of law, and the difficulty of administering justice between the settlers and the natives in civil cases alone soon became apparent. Before the establishment of British authority, the contracts and engagements entered into between the two had for the most part been faithfully fulfilled. The English settler, living upon sufferance amongst the natives, was bound to good behaviour; the native, valuing the advantage of trading with the Englishman, had also a direct interest in keeping faith in his transactions. But when the country became a British colony contracts made between the two races were less faithfully observed. The courts of law it is true were open to all, without distinction of race; but what remedy was practically open to the New Zealander? He was unacquainted with the mode of procedure, living it might be at a distance of fifty miles from any settlement, unable probably to procure the attendance of witnesses, and without the means of paying the fees of court. Assuming these difficulties to be overcome, and that a Maori complainant had

recourse to the courts of law and obtained a verdict in his favour, yet the English defendant, living in the bush, might be practically beyond the reach of law for any useful purpose. His property, if he had any, could not be profitably brought to market from a distance and converted into money under legal process, and to imprison the person of the debtor was small satisfaction to the successful native plaintiff. If, on the other hand, the Maori failed in the performance of his contract, what power had the colonial tribunals to compel the native defendant even to appear? Even if the settler succeeded in gaining a verdict, what probability was there of the sheriff being able to levy from the native the amount of damages awarded by the court? Instead of diminishing, the number of cases in dispute between the two races largely increased; for, relying on the Government for redress, the natives, after British authority was proclaimed, more readily than formerly entered into contracts with the settler; and relying on the power of the Government for protection from personal violence, the settler was less careful than before in fulfilling his engagements. The difficulty of carrying English law into operation amongst the natives, so far as it arose from the technical character of the ordinary legal proceedings, was remedied by the appointment of magistrates empowered, by a law specially framed for the purpose, to arbitrate in a summary way between the two races, according to equity and good conscience, and without being bound by the technicalities of ordinary legal tribunals; so that without cost, without legal knowledge or assistance, the complainant, whether native or European, might personally go before the magistrate, state his case, and obtain a judgment in his favour. But the main difficulty still remained: it was easy for the magistrate to give his judgment, but how was he to enforce its execution? Assuming the decision to be against the native, by what means could he compel payment of the damages awarded? The efficient administration of the criminal law presented a still more formidable difficulty. A short experience of the independent character of the natives, and of the difficult nature of the country, soon proved to the local authorities the difficulty of preserving peace, or of securing the person and property of the English settler; and so powerless were the Government to afford protection to the public, that aggression could be committed by the natives almost with impunity. The difficulty of seizing the offender, and the danger of punishing him, if he should happen to be a person of importance belonging to an important tribe, were the principal obstacles to the punishment of crime. To meet the difficulty and to avoid the danger, a temporary enactment was passed, providing that no native offender should be arrested except through the instrumentality of the chiefs of his tribe; and thus in cases when the chief arrested the offender, the danger was avoided. But the

difficulty in most cases still remained, for the sum authorised by law to be paid to the chiefs, to secure their co-operation, was not sufficient to induce them to exert themselves in favour of the law; and the provisions of the law could not, of course, meet the case of the misconduct of the chiefs themselves. Even as between the natives and the colonists, when a native was the offender, his countrymen were not always willing that he should be dealt with in accordance with our law. On one occasion, in the early history of the colony, a native was put on his trial for theft; a "protector of Aborigines" was present watching the proceedings, and counsel was employed by the Government for his defence. On the clearest evidence the jury convicted him, his own counsel was satisfied with the justice of the verdict, and he was sentenced to a term of imprisonment. His native friends who were present at the trial were by no means satisfied that their countryman should be thus ignominiously punished; and before he could be removed from the dock—in the face of the sheriff and gaolers, in spite of the efforts of constables and turnkeys—they started up and brandishing their tomahawks rushed on the prisoner and dragged him out of the court. Thus in the face of day—in the heart of the capital of the colony—was the majesty of the Law branded by the natives, and the administration of justice defeated by brute force. When a native committed an offence against a colonist it was generally admitted by them that he should be punished for the offence; but even amongst those most favourable to the establishment of British rule a strong feeling was entertained against the degradation of imprisonment. They were willing to acquiesce in the Scripture rule that he who stole should restore fourfold; but they were unwilling to lend active aid in the apprehension of a thief so long as he was subject to the degrading punishment of imprisonment. A law was accordingly enacted that any native charged with theft who should plead guilty to the charge might pay into court four times the value of the goods stolen, and so become entitled to his discharge. If the friends of the offender were unwilling that he should undergo imprisonment, they assisted him to comply with the requirement of the law in order to save him from indignity. If on the other hand he was a man of low degree, he was left to suffer the punishment of his offence. Thus by adapting the law to the feelings of the native people, many offenders were allowed to be taken who would otherwise have set all law at defiance and have altogether escaped unpunished. As it was also provided that the property stolen, or the value of it, should be restored to the owner, the settlers were not dissatisfied with the exceptional character of the law. In 1846 the Government was authorised by Parliament to proclaim districts in which the natives might be allowed to continue the exercise of their own laws and customs. But this power was never

carried into practice; the authorities steadily set themselves to obliterate, rather than perpetuate, social and political differences between the two races, and by degrees to extend the laws to the natives, and to govern the country without distinction of race. The efforts of the Government were not altogether without success. An increasing desire was shown by the natives for a more active and efficient power to control them in their relations with each other. In the session of 1858 measures were passed by the Legislative Assembly to extend the operation of English law amongst them, with a view to improve their social condition, and for the administration of justice amongst them by native juries and assessors. The local Government was directed to organise a special department for protecting the natives in their persons and property; and it was not until they had risen in rebellion in the north, and the settlement at Kororarika had been attacked and destroyed, that more than one hundred men were stationed in the country to maintain British supremacy, to afford protection to the settlements, and to vindicate the law. Being hardly pressed for several years to maintain its own existence, the Government was for some time unable to undertake measures of a permanent character for promoting the civilisation of the natives. It soon became evident that the department maintained at considerable expense for the protection of the natives was unnecessary; and when the settlers had been stripped, their houses plundered, their cattle stolen, their enclosures destroyed, it became a mockery, and if it had not been speedily abolished would have proved fatally injurious to the cause it was intended to serve. To the Government however the "native protectors" were invaluable in the character of political agents, and they virtually became the protectors of the colonists themselves. They were employed in negotiating purchases of land from the natives; as interpreters in the Land Commissioners' Court; sometimes as interpreters to Her Majesty's forces when engaged in the field; conducting official correspondence with the natives; in endeavouring to disabuse their minds of unfavourable impressions conveyed to them by disaffected people; keeping the authorities informed of the sentiments and proceedings of the natives in the interior; and generally in the performance of services of a purely political character; useful and essential to the Government, but of no direct advantage to the natives, for whom and at whose expense the department was maintained. It soon became apparent that the "protection" of the natives was unnecessary; that even the name of "native protector" was offensive to the settlers, so that the maintenance of the Protectorate was calculated to create a bad feeling, rather than to promote friendly relations between the two races; and that the cost of the department, if expended in the education and civilisation of the natives, would be productive of unmixed good to the colony. With a view of applying the funds to education, an

ordinance was passed by the Legislature providing that the funds applicable to native purposes should be expended in the establishment of schools for the instruction of the natives in the English language; for a course of industrial training in English usages and arts; and in promoting their advancement in the social and political scale. The Church of England, the Roman Catholics, and the Wesleyans were already engaged in the work of native education, and all had schools in operation capable of extension and requiring aid. There existed amongst them an amount of zeal which no Government could purchase and which no money could procure; and it was decided that instead of establishing new schools under the management of the Government, aid should be afforded to these religious bodies. During Grey's administration an ordinance was passed authorising the appropriation of a portion of the public funds for the encouragement of native education. By the Constitution Act it was afterwards provided that a sum of £7000 a year should be appropriated to "native purposes." Grey proposed that nearly the whole of that sum should be devoted to the consolidation and extension of the system of education prescribed by the local Act; which after the experience of several years had been found to be satisfactory and successful. The course pursued by Grey was cordially accepted by the managers of native schools and approved of by the Government at home, and was attended with considerable success.

XVI. *Incidents of the Maori War.*—Besides more than one cruel murder of settlers, several British soldiers fell under the musket and tomahawk of the Maoris at Boulcott's Farm in the Hutt Valley. This was one of the boldest attacks on an English regular force ever attempted by the Maoris. The farm consisted of a wooden cottage and offices with a barn hard by. This latter building had been partially stockaded by the officer in command thereby making it bullet-proof, which was by no means the case with the other tenements. The garrison consisted of a single officer and fifty men of the 58th—one-half of them occupying the barn. The premises were surrounded by a rough clearing of no great extent shut in by the primeval forest. The River Hutt, fordable in ordinary seasons, but impassable except by boats or canoes during flood, runs at half-musket shot distance from the post. At the time of the attack the opposite shore, covered with thick scrub, was in the hands of the enemy. Just before dawn on 16th May 1846 the sentry in front of the inlying picquet observed a dark object crawling towards him. He fired at it; and in an instant the air was rent with a chorus of yells, as fifty naked savages, springing up from the herbage, rushed on him and overpowered and slew both the men of the picquet and himself before any effectual resistance could be offered; while a general onslaught was made on the post from all parts of the surrounding bush, and a heavy fire was poured on the building in

which the officer and a section of his people were housed. The Lieutenant hurried from his quarters with two men, intent on joining the party in the stockade, but was immediately driven back by a rush from the Maoris. The sergeant got a few men together and checked the furious assailants, and in a second attempt—with only six men carrying three others wounded—the officer succeeded in reaching the barn, whence, leaving a sufficient force to protect it, he sallied against the enemy with the rest, and advancing and firing in extended order soon drove them across the river. There they danced a war dance, showing their numbers to be about two hundred, within view of the British post. "But for the alertness of all in turning out," says the officer in his report, "and the determination of the men, we should all have fallen." The British loss was six killed and four severely wounded. The bugler, quite a lad, was struck by a tomahawk on the right arm, while in the act of sounding the alarm; the brave boy changed the bugle to the other hand and continued to blow, when the savage split his skull with a second stroke of his weapon. It was fortunate that a sergeant had come that morning from Wellington with reports that made the officer suspect some intended enterprise by the rebels. All were prepared, and the soldiers in the stockaded barn were canvassing the probability of an attack, when the sentry's shot, followed by a volley from the enemy, was heard. The Maoris had good right to be satisfied with the havoc they had committed, without pushing their audacity further. As to the loss on their side, if there was any, both killed and wounded were carried off as usual. The affair of Boulcott's Farm was a successful surprise of a British piquet on the part of the natives;—a gallant repulse of a superior force in a night attack, on that of the British. The Maoris did not want the post—they wanted blood, as they afterwards boasted, and they got it. The force in the valley was immediately augmented by Major Last of the 99th, commanding in the southern district, who drove the still hovering rebels from their woodland position on the right bank of the river, with some loss. About a month after the combat at the farm, which had subsequently been reinforced and placed under charge of a captain, that officer, with a view to acquaint himself with the roads in the vicinity of his post, the fords of the river, and the position of the enemy—who were reported to be encamped not far distant—and perhaps with a desire to avenge the loss inflicted by them on 16th May, marched out to his front with forty soldiers, a small party of loyal natives under the chief Waiderapa, and a few militiamen; accompanied also by a young officer of the 58th, a volunteer on the occasion. The main road along which they proceeded was at that time extremely narrow, full of deep holes, and in some places up to the knees in mud, the bush so thick that the view of the advancing party hardly extended

beyond a few paces to their front and flanks. On reaching a piece of cleared land, or rather land with felled timber lying on it, where there was a potato patch, one of Waiderapa's natives, who was acting as a scout, springing on a log to look out a-head saw several men lying close below him, and shouting out "Rangihaieta's Maoris," threw himself flat on his face. A smart volley delivered at fifteen paces from among the logs on the left of the road informed the captain that he had fallen into an ambuscade. The loyal natives threw themselves into cover and returned the fire from the same side of the road as the enemy. The English, in skirmishing order, answered it briskly from among the trees on the opposite side. In about ten minutes some of the Maoris were seen crossing the road so as to obtain a flanking fire on the right of the soldiers, while a strong party were observed to move swiftly towards the road in their rear so as to cut them off from the stockade. This display of tactics induced the officer to sound the retreat, which movement was effected without further loss of time or blood. Indeed the casualties had already been pretty severe; four soldiers were severely wounded, of whom one died, and two were missing; while the young officer of the 58th was severely hurt, maimed perhaps for life, by a shot through the arm. This gentleman was left for some time to the mercy of the savages, who fortunately were too much alarmed themselves to perceive him as he lay concealed in the underwood. The captain, enquiring anxiously for his comrade, was informed that he had gone wounded to the camp in charge of a soldier; nor was he missed by anyone until the party had nearly reached the stockade. Making the best of his way in that direction he came on a party of natives, and thought his last hour had come; but they proved to be friends and assisted him in his retreat. The two missing men also found their way to the stockade in the course of the evening. Meanwhile the subaltern of the stockade hearing the firing promptly armed his men, who were working on the defences, and inviting the co-operation of a friendly tribe encamped hard by, advanced with forty soldiers and a hundred aborigines, under their veteran chief, E Puni, to the support of his superior. Meeting him half way on his retreat he was, after a short consultation, directed to form an advance guard in the direction of the camp, to which the entire British party accordingly retired. The two native chiefs on meeting held a brief koriro, when Waiderapa and E Puni joining their forces determined to return to the scene of action. An English interpreter who accompanied the allied warriors reported that, after throwing forward their scouts, who ascertained that the rebels had made off, they came up just in time to see some of them retreating to the river across the clearing, and dropping blankets, cartridges, and potatoes in their track. The account of the action given by Waiderapa affords an amusing specimen of the vain-glorious bombast of the Maori warrior. He

appears to have behaved with the utmost coolness in the affair; to have particularly requested that none of the soldiers should mix with his men, and that they should not "fire from behind them," as a half-drunken militiaman was seen to do; and he took up his position on the enemy's side of the road, quite independently of his white allies, although his force amounted to but fifteen men. "The reason why we retreated," said the chief in his evidence before a court of enquiry, "was because we were partly composed of soldiers and partly of natives. Had we been all natives we would have driven away Rangihaieta's people. The soldiers retreated because they thought the enemy were dividing into two parties to cut them off. I did not think so because they, the enemy, had seen the position I had taken up!" But the strangest part of this affair remains to be told. About a mile and a half further up the valley, at a part called the Taitai, stands a spot where, at the time of these operations, stood a stockade by the wayside occupied by a party of militia. The ambushed natives had therefore boldly placed themselves between two British posts, with a flooded river between them and their resources. The militia subaltern hearing the musketry proceeded with a sergeant and twelve men towards the spot; was, according to his official report, fired upon by the rebels; was briskly engaged with them for an hour and a half, checking their progress, and did not return to his stockade until night was coming on. By this singular incident the Governor was misled into the belief that these few had not only held their ground against, but had twice repelled the very party from whom the regulars, under a captain of foot, with a strong body of native allies, and a reinforcement under his subaltern, had been compelled to retreat! It proved afterwards that if they did indeed exchange shots with the hostile Maoris, their main efforts were with more gallantry than propriety directed against the friendly natives under E Puni, who advancing towards the Taitai, was fired upon by the militia in mistake until the interpreter approaching the post claimed exemption for his companions. The leader of the reconnaissance having fallen into the snare deliberately laid for him had the choice of two alternatives—to fight his way through it, or extricate himself by retreat. All the evidence collected by the inquiry held to investigate the details agreed that the commander was justified in retiring when he was satisfied that the enemy, whom he supposed to be the whole of Rangihaieta's disposable force, had turned one of his flanks and were menacing to cut him off from his reserve; that the retreat was conducted slowly and with regularity; and that the captain was the last man to retire—himself taking charge of the rear-guard. The officer was acting under superior orders, induced by the numerous murders lately committed by the rebels in the immediate vicinity of the British post to devise—in conjunction with the officers of militia and loyal chiefs—some plan for

discovering the fords by which the murderers were in the habit of crossing the river. But a reconnaissance in so impracticable a country with so small a force could hardly meet with a happy result; and the requisite information could have been better gained by native spies in their stealthy manner than by any operation so ostentatiously conducted. The affair of the 16th June must be classed as a decided defeat, and a very unlucky one at a moment when disaffection was fast spreading among the natives, and when risk of failure should have been avoided with peculiar caution. Within a mile or two of the camp of Porirua is the pah of Taupo belonging to Rauperaha, where he was cleverly captured in the following manner: This old chief, pretending friendship towards the English during the rebellion, was found to be secretly supplying his old ally, Rangihaieta, then in hostility against them, with provisions and intelligence across the rear of the British position at Porirua, from Taupo to Pahatanui, Rangihaieta's stronghold; and suspicions existed that he and other disaffected chiefs were conniving at the movement of a hostile body from the Wanganui tribes down the coast, to form a junction with the latter rebel leader. Preparations had already been made for attacking Rangihaieta in his pah, only three miles from Porirua, but it was judged best to arrest Te Rauperaha, and thus prevent his co-operating with his friend, before Pahatanui was invested. A combined naval and military force was accordingly put on board H.M.S. *Driver*, with the double intent of attacking the rebels moving down the coast, and of seizing the veteran tiger in his lair. Adverse gales prevented the performance of the former service, which however was almost as well accomplished by the missionary natives of Otako, who opposed and stopped the intended inroad of the northern barbarians. On 23rd July 1846 Major Last of the 99th, with Captain Stanley of the *Calliope*, and a party of about 130, landed before daylight with such perfect silence and order, that the stockade of Taupo was surrounded and entered before the inmates caught the alarm. Te Rauperaha was seized in his bed by a band of seamen, and, struggling, biting, and shouting, "Ngatitoo—Ngatitoo—to the rescue!" he was safely carried off to the ship without any casualty. A considerable quantity of muskets and ammunition and a small iron gun were also taken in the stockade. This capture was neatly effected. The "old serpent" (one of his nicknames) was always hatching mischief—his talent lying more in plots than in exploits. His was the treacherous head and Rangihaieta's the bloody hand that together perpetrated against their countrymen in former days, and against the whites more lately, a catalogue of crimes such as would make the Newgate Calendar a record of trifling incidents. The attention of "the fighting Governor"—thus was Grey styled by the Maoris—was now turned to Rangihaieta. A combined movement from Wellington, Porirua, and the Hutt

Valley across the hills, was planned. The arch-rebel's courage failed him, and he fled from Pahatanui with his followers before the force had assembled; and a party of militia, guided by friendly Maoris along a native path from the Hutt, slipped in, and secured the evacuated fortress. Had he remained and fought well, there would unquestionably been severe fighting, for the position and construction of the pah were remarkably strong. Rangihaieta, however, was aware that there were cannon at Porirua that would soon have levelled his wooded walls; and an artillery officer, by a bold nocturnal reconnaissance, had discovered a hill commanding the place, whence some well-directed salvos would have quickly dislodged the enemy. Perhaps his conscience made a coward of the once bold warrior. Hotly pressed, the rebel chief soon turned to bay on a spot which had been previously prepared for a stand—a rough breastwork of horizontal logs pierced for musketry having been drawn across a narrow and steep spur of a thickly-wooded hill—so narrow that but few men could approach abreast, and flanked by steep ravines. On the morning of 6th August 1846 this strong position was attacked, with little effect, and with the loss of a promising officer, Ensign Blackburn of the 99th Regiment, and two privates killed and nine wounded. Blackburn was shot dead by a Maori concealed in a tree, who was instantly brought to the ground by an artilleryman. Two small mortars having meanwhile arrived, the position was again attacked on the 8th. The height and thickness of the trees prevented the efficient practice of the shells; and the inaccessible nature of the country, with the evident intention of the enemy to abandon post after post, firing a few destructive volleys and then flying from their valueless positions with little or no loss to themselves—were considerations which together with the difficulty of subsisting so numerous a force, induced the officer commanding the expedition to desist from further pursuit of his slippery foe. The troops were accordingly withdrawn into the stockades, and the loyal natives in pursuance of their gallant offer were left to watch the enemy, to cut off his supply of provisions and water, and thus eventually to capture or drive him back. Servantes, the military interpreter, who in a short time had rendered himself perfect master of the Maori language, remained with the natives and reported progress. On the 13th the rebels opening a brisk fire on the loyalists, Puaha the leading chief of the latter rushed with his followers to meet them, and finding that the others retreated pressed forward and entered their works by the front as the rebels passed out by the rear. The poor wretches had been fairly starved out—no remains nor signs of provisions having been found in the camp except the mamuka, or edible fern. A day or two later the Christian chief Wiremu Kingi (William King) issuing from Waikanae, a missionary station on the sea coast, fell upon the rear of the discomfited rebels capturing a

few half-famished creatures who had been driven by hunger to approach the coast. Harassed on all sides Rangihaieta thought himself fortunate in making his escape to the mountains, almost totally denuded of his "tail." Had the friendly Maoris stuck with more constancy to the pursuit he must have been caught; for the captain of the *Calliope* who was on the coast near at hand had formed a plan for a joint attack upon him with these allies—which could hardly have failed. The troops returned from the bush-fight with their clothes and accoutrements so shredded by the rough underwood, and their persons so besmirched with rain, mud, and the smoke of bivouac fires, as to be in little better condition than Rangihaieta's hunted and ragged regiment of the Horokiwi. This turbulent chief was much humbled by these events, and never again appeared openly in arms against the British Government. In December 1846, soon after the defeat and dispersion of Rangihaieta and his "Taua" in the Horokiwi valley, in consequence of apprehensions entertained by the Governor for the safety of the settlement, the officer commanding the southern district, Lieut.-Colonel McCleverty, despatched for its protection from Wellington a force consisting of 185 men of all arms, including a few artillery, with nine officers. Sites were quickly selected for stockades and block-houses, officers and men were soon huddled in temporary warrees of reeds, the position was entrenched and surrounded with double palisades bullet-proof, and a few light guns and mortars were mounted. Rangihaieta was not far off, among his relations and friends at Manawatu. He does not appear to have co-operated directly with the revolted party at Wanganui; but he did not fail to divert himself according to his peculiar tastes—now plundering some poor unarmed settler, now levying tolls upon cattle on the coast road and driving them off. In April 1847, with thirty or forty wild hands in a single war-canoe, he made a descent on the island of Kapiti, where he laid under contribution an Englishman residing there—securing among other plunder some fire-arms and fifty pounds of gunpowder, with a supply of lead and bullet-moulds, doubtless the especial objects of his marauding visit. On the same day, and in suspicious connection with this expedition, occurred near Wanganui the appalling and sweeping massacre of the peaceful household of the Giffillan family, already narrated. In forty-eight hours after the receipt at Wellington of the news of the murder of the Giffillan family, the Lieut.-Colonel commanding had hired vessels and embarked for Wanganui a strong reinforcement. Captain Laye, assured that the execution of the murderers would exasperate to the utmost the passions of the ill-disposed natives, set to work to strengthen his position, clearing the glacies of brushwood, stockading two of the strongest houses at the extremities of the village, and levelling after a council of war the residence of a settler in the close vicinity of the camp which the

enemy, now assembled within two miles of the place, showed evident signs of occupying. He enrolled some of the gentlemen of the village as a volunteer corps, formed rallying places for the townsfolk, completed his supplies, and inspired all hands, civil, military, and naval (for from the first there was a gunboat at Wanganui under the orders of a most active officer) with a reliance on his forethought and determination which made them encounter cheerfully the privations inseparable from their position. First blood was drawn by the scouts of the enemy catching and tomahawking a soldier of the 58th, who in breach of orders had strayed away from the camp. The policy of the Maoris was to draw the garrison into a fight on ground chosen by themselves. Posting their forces on a hill about two miles off they tried every manœuvre to lure the British from their works—sometimes pushing skirmishers within one or two hundred yards of the palisades. The commander however, aware of the ambuscading habits of the Maoris, stood fast; and on one occasion, after a small party had played off until they were tired a multiplicity of insulting pranks without any success, he saw a body of about 150 men rise suddenly from among the fern where they were concealed and retire to the camp on the hill. Other parties of the enemy showed themselves on the opposite bank of the river, and the guns of the fort tried their range upon them with some effect. The chief, Mamuka, had about 400 or 500 men encamped; 300 more were reported to be coming down the river; and worse than all, the Christian natives of the district—with the exception of those belonging to the Missionary pah of Putiki, under the spiritual charge of the Rev. Mr. Taylor—arose in a mass and joined the hostile Tāua. On 18th May large bodies of the insurgents were seen approaching the place from all directions. They took possession of the surrounding hills and of several houses on the outskirts of the town, and keeping well under cover opened a harassing fire on the stockades, the village, and the gunboat in the river. Too weak in numbers to move out by daylight to attack the enemy, the captain despatched at night two strong parties to seize the buildings occupied by the foe—a duty which they gallantly performed—the Maoris plundering and evacuating them at the first onset. The troops suffered no loss, but the rebels, in addition to some thirty men wounded, lost a great fighting chief, Maketu by name, who was killed by a musket-shot in a house at a distant extremity of the village. Some hills rising just beyond this point were strongly occupied by the rebels, and a building immediately opposite the house before mentioned was stockaded and held by a captain's detachment—by one of whose men this shot was fired. At 150 paces the ball had passed through five planks, including the garden paling, as well as through the skull of the chief as he crouched on the floor fancying his person quite secure. Another minor chief was also

slain. After the fight their friends retired for a time to bake the bodies of the slain and to vow vengeance. They were seen the following morning sitting disconsolate on the hills lamenting their loss, and soon afterwards all had disappeared. On 4th June Colonel McCleverty arrived at Wanganui in the *Inflexible* with a strong reinforcement—raising the numbers in the camp to about 550 men, and assuming the command. During the week he made reconnaissances three or four miles up each bank of the river, thereby ascertaining that the enemy's camp which was posted on the right bank was covered by a series of entrenched ravines stretching from a swamp to the river; but that there was no regular pah. The Governor, who had repaired to Wanganui, took active interest in these movements as well as others. On the first occasion a naval party co-operating with the troops moving along the shore pushed up the river in boats, and landing in rear of these entrenchments, without any communication with their friends on land, burnt some of the huts of the hostile camp; and their leaders were displeased that the sister service did not turn the reconnaissance into an attack, and storm the breastworks and entrenched gulleys. The Colonel however feeling that a direct assault on so strong a position would be to play his adversary's game, resolved not to throw away his men for the poor result of winning a barren post—only taken up by the rebels to be abandoned after a double volley or two at the exposed soldiers—the utmost probable loss to themselves being a few kumeras and a cluster of raupo huts built in two or three hours. There was no particular end to be gained in precipitating an engagement on the enemy's ground. The lapse of every day would cause starvation, discontent, and the gradual dispersion of adversaries unprovided with stores and greatly in want of ammunition. On 1st July he beat up the quarters of a marauding party who were destroying property and driving away stock beyond the heights of St. John's Wood to the northward of the English camp, and succeeded in recovering some of the settlers' cattle. A few days afterwards the rebel tribes seemed to be gradually closing round the settlement—considerable numbers showing themselves on either side of the river as well as on the heights, distant about a mile and a-half from the town. So insolently bold were some of the native scouts in an attempt to cut off a herdsman and his charge under the very guns of the fortress, that two parties under active subalterns were sent to drive them off. The scouts fled—doubtless according to pre-arrangement—towards the hill of St. John's Wood, and up a steep ravine which had been strongly entrenched, and behind which among the trees a body of the rebels lay concealed. The soldiers dashing after the runaways were received with a heavy fire, which they of course returned, and an action was commenced. The Colonel having come up sent to the camp for reinforcements

the insurgents were strengthened from their supports in rear of the wooded heights; and in a short time about 400 men on either side were briskly engaged. The enemy had the advantage of strong earthen breastworks drawn across the narrow and rough ascent, with flanking entrenchments on the sides of the gully, while the troops were wholly exposed. Indeed no ground could well be more unfavourable for the attacking force. The only approach from the British stockades to the heights of St. John's Wood was along a narrow ridge of dry sand scarcely passable by three abreast, and hemmed in on either hand by deep swampy land, broken, yet affording no cover, for the long reeds were worse than none. A subaltern's party thrown out to the left for the purpose of turning the flank of the rebels, and diverting their attention from the main attack, found themselves suddenly over their knees in water and mud, whilst the tall and strong flags almost overtopped their heads—a helpless predicament in which an equal number of the more active and lighter-armed foe might have easily destroyed them. Had they not been promptly extricated such must have been their fate; for the enemy had marked their vulnerable position and were preparing to take advantage of it. This party reached the *terra firma* of a sand hillock trending into the morass, and were reinforced from the town just as a strong body of Maoris issued against them from the entrenchments. The small party of artillery, with a brass three-pounder and a field howitzer, pushing gallantly along the natural causeway, opened a fire on the fortified ravine, which was answered by a volley of musketry that put two of that corps *hors de combat*. A second subaltern's party, better posted, connected the right flank of the troops with the river, where the gunboat, under a lieutenant of the *Calliope*, confronted and drove back the chief Mamaku himself, who with a numerous band made an attempt to get into the rear of the British by the bank of the stream. In the hope of tempting the enemy from their cover the Colonel now tried the effect of a partial retreat, withdrawing and altering the position of the guns; which movement was no sooner observed by the Maoris than with a deafening shout they rushed boldly down the hill, and musket and tomahawk in hand fell upon the nearest of their white opponents. Then the soldiers, turning upon their savage assailants, charged the foremost at the distance of fifteen paces, overthrowing those who waited for the touch of the bayonet, and driving the others in hot haste back to their breastworks and reserves. On the British side one officer was wounded; and one of the 65th narrowly escaped being tomahawked by a warrior, who sprung on him while stumbling among the fern, but who was shot through the head by a soldier of the 58th, just in time to arrest the stroke. Two privates were killed and eleven wounded, one of whom died subsequently. Nothing but the well-known

awkwardness of the New Zealanders in the use of fire-arms can account for the small execution done by them during this skirmish. After the brisk brush just related, the rebels stuck fast to their works, which were admirably though only temporarily constructed—all approach to them being impossible except under a front and flank fire. The swampy nature of the ground at the foot of the range rendered abortive any attempt to turn the position, except by a long detour from the right—a detour which the Colonel would have seen right to attempt had the Maoris given him another opportunity of attacking them in the same position. The affair of the 19th, brought on by the rebels themselves, commenced too late in the day to admit of any circuitous manœuvring before action. It was difficult to obtain trustworthy information as to the enemy's loss. Three men are known to have been killed and ten wounded, of one clan—the Ngatiruaka—which, being connected with the Christian pah of Putiki, communicated to them the loss of their friends. The chief of this tribe, Paore te Hotite by name, was slain in a single combat, by a soldier of the 58th, who after bayonetting his antagonist, coolly walked off with his double-barrelled fowling-piece. Of the damage sustained by the various tribes headed by Mamaku, Te Hapua, Te Pehe, Ngopera, and others, little was heard; and great care, as usual, was taken by them to conceal its amount. In this action there were but two or three natives fighting on the side of the British; one of whom was wounded. Yet in none of the N.Z. battles would a strong band of native allies under an enterprising leader, acting on the flanks of the enemy in ground impracticable for the heavy soldier, have been more useful. On the side of the rebels there were many hitherto loyal Maoris; and among the wounded and the foremost assailants of the soldiers was a native teacher, one of a party who surprised and wounded Mr. McGregor of Wanganui in an attempt to reconnoitre from the top of Shakespeare's Cliff. He was chased down the hill and severely hurt by a shot; but his life was saved by the intrepidity of Mr. Middleton of the 58th, who, with the master of the schooner *Edward Stanley*, crossed the river, under a sharp fusillade, and picked him out of the water into which he had thrown himself. After the affair of St. John's Wood there occurred a singular scene. The natives of Putiki pah, anxious to know it had fared with their relatives in the enemy's camp, got permission from the colonel to visit them on the hills; and accordingly an animated bout of hand-shaking, nose-rubbing, and kororoing took place according to Maori custom in like cases. Two or three days later the hostile natives who still displayed considerable numbers on the heights and who occasionally exchanged shots with the British picquets returned the greetings of the Putikis. A chief named Te Hapua ran forward towards the English post with a piece of white paper on his ramrod and called for Hori Kingi

(George King) the chief of the Christian natives. A crowd of the Putikis, with the colonel's sanction, rushed into the plain beneath the stockades, and about a hundred of the rebel warriors came down to them and performed a war-dance in a dense body within easy reach of the guns. As a point of honour these were silent for a time; the crowd retired, and shortly afterwards a series of dances took place in succession along the whole crest of the ridge occupied by the enemy, showing that they were still there in considerable force. Their yells and roars resounded through the hills and were distinctly audible in the camp. The Putiki renegades were the first to desert the rebel ranks; and shortly afterwards the Tana broke up altogether from the British front and dispersed into winter quarters—a movement to which their desultory mode of warfare, the scarcity of ammunition and provisions (for these wild warriors had hitherto lived from hand to mouth by plundering the cattle and swine of the settlers and loyal natives,) the severe cold of the season, and perhaps the taste of the bayonet they had received, all contributed to incline them. A long-threatened assault on the British stockades never took effect, though it is said the storming parties for each with the chiefs to lead them had all been regularly “told off.” Their plan was to set fire to the reed huts of the cantonments within the palisades by throwing fire-sticks on them, and to rush to the attack during the confusion occasioned by the conflagration. Had they made this attempt with real determination to do or die, few of them would have escaped the latter fate. The grass roofs of the warrees had been rendered fire-proof by a covering of bread-bags steeped in lime-water, and there were upwards of 500 British soldiers within the forts with artillery, while the enemy, but little more numerous, had no guns. Superstition was one potential cause of the abandonment of the projected onslaught. On the evening of the night fixed for its execution the priests or seers consulted the relative positions of the moon and of a certain star—the former being considered to represent the beleaguering Tana, and the latter the British camp. These diplomatic horoscopists did not fail to discover that the aspect of the two luminaries was unpropitious to Maori success; for the crescent of the half moon had its back turned towards the flashing rays of the star, instead of threatening it with its horns, which would have been the favourable augury. The sustained blockade of the river, and other stringent measures enforced by the English, reduced the natives residing on its banks to the greatest straits; and, under the pressure of famine, a numerous deputation of men of note came down to the camp and tendered their submission to the officer in command. He assured them of the pardon of the Governor on certain conditions. In reviewing the Wanganui campaign there is found much to admire—many individual instances of gallantry, firmness, and self-devotion; much cheerfulness under hardship and privation.

The consummate tact of Governor Grey in the management of the Maoris was of good service subsequently in securing the co-operation of the friendly chiefs and their followers, as well as in deterring from active hostilities against the British the doubtful and wavering. With the skirmishes at Wanganui terminated the first N.Z. war. When Honi Heki first cut down the British standard and unfurled that of revolt in the country, there was no vessel of war on its seas, and only one company of soldiers on its soil. At the close of the Wanganui campaign in August 1847 there were two splendid regiments, full 900 strong each, a powerful naval force, including a steamship of 1200 tons, and a strong band of Pensioner Fencibles, gradually increasing in numbers. The elder chieftains, not ignorant of English tenacity of purpose, well knew that from whence these came more “hippas” and “hoias”—ships and soldiers—would be forthcoming if necessary. With such odds against them, the Maoris discovered that peaceable pursuits were more profitable than warfare. In January 1848 Governor Grey held a conference at Wanganni with the leaders of the Tana from the river districts, who had demanded an audience. Mamaku, the friend of Rangihaieta, and the head chief of the rebels, together with the main body of the tribes implicated in the late outbreak stayed away—perhaps because they were not permitted to treat with arms in their hands. But a fleet of large canoes was seen gliding with prodigious speed down the stream, and was quickly moored under Shakspeare's Cliff. A few of the chiefs then came across and were admitted to the Governor's presence in a room of one of the deserted houses. The Christian native Dawson, dressed in European costume, came forward boldly, though his loyalty was by no means beyond doubt, and spoke in behalf of his rebel brother Te Pehe. This man and Ngopera were at first extremely nervous, striving vainly for many minutes to recover their self-command. At length each spoke to the purpose of the conference, both acknowledging that they had joined in the war party against Wanganui, but averring that Mamaku had originated and was at the head of it. The koro ended by their promising that certain cattle, sheep, &c., the property of settlers which had been “lifted” during the rebellion should be restored, and that a murderer who had taken refuge up the river should be delivered up to British justice if he could be found. The Governor's pardon was guaranteed to them on the performance of their promise.

XVII. *The New Constitution.*—Limited in numbers and occupied with the immediate exigencies of their daily life, it is not easy to find amongst the first body of settlers just landed in a new country a sufficient number of men having the leisure, experience, and public spirit necessary for devising its fundamental laws; and following the course usually pursued on founding an English colony, the Executive and Legislative branches of

the Government of N.Z. were in the first instance composed of persons appointed by and responsible to the Crown. The political tutelage of the colony however was of short duration, and no other British dependency has ever been deemed fit for the enjoyment of free institutions at so early a period in its history. But to devise political institutions suited to the peculiar circumstances was no easy task. If the country had been colonised at only a single point there would have been little difficulty in framing for it a Constitution which, while securing Imperial interest, conferred on the settlers ample powers of representative self-government. But the task of governing N.Z. was complicated by serious practical difficulties. Instead of colonising from a single centre, several settlements were almost simultaneously planted at wide intervals on both the principal islands. These settlements were separated from each other by great distances, and communication even for persons on horseback existed only between three of them. The wide intervals between them were occupied by a native race estimated to consist of 120,000 souls, a very large proportion of whom were males capable of bearing arms. As early as 1842 a measure based on the principle of representative self-government was passed by the Legislature for the local government of the various settlements—a measure declared by the directors of the Company, to whom it was submitted for consideration, to be excellent and “admirably calculated in the main for carrying out the beneficial public objects for which it purports to be framed.” It was well received by the colonists, but on trifling and technical grounds disallowed by the Crown. The attempt thus made to prepare the settlers to take part in the management of public affairs was attended with small success. Nor was the measure subsequently passed with the same object during the administrations of Governors FitzRoy and Grey much more successful. More than once the settlers were again incorporated for purposes of local self-government. By charter conferred on the people of Auckland during Grey’s administration, the various hundreds into which the neighbouring country had been divided were erected into a municipality, and the settlers had conferred on them, not only the ordinary powers of an English town council, but extensive powers of self-government in all matters of local interest. But the opponents of the measure persuaded the settlers that the general revenues of the Province were sufficient, not only for the general Government, but also for purposes of local improvement; the burgesses became indifferent to the retention of the political power conferred on them; and in the course of a little more than a year they allowed it to expire. In all those measures the necessary powers of taxation were granted to the colonists for the purpose of promoting local improvements. For upwards of ten years after it was colonised N.Z. continued to form one undivided colony;

and a Legislative Council composed of Crown nominees, without any admixture of the popular element, was the sole depository of legislative power. In the year 1846 it was believed by the Home authorities that the time had arrived when a representative constitution might safely be granted. The measure devised for that object was framed by men who had paid great attention to colonial affairs, and who had access to all the information on the subject of N.Z. which the records of the Colonial Office could afford. But no sooner were its provisions made known in the colony than it was seen to be unfit for the country and the circumstances, and it was represented by the local authorities that the attempt to give effect to its provisions would endanger the peace of the country by exciting the fears of the native race for the preservation of their territorial rights. The Secretary of State promptly took measures for suspending its operation; and it is but an act of justice to Lord Grey to declare that few men would have had the good sense and the moral courage so readily to abandon a favourite measure in deference to the opinion of the local authorities. When the subject again came under consideration in 1852 the Imperial Government were in possession of Grey’s exposition of the circumstances of the country, and of the condition and character of its native people. The measure introduced by the Colonial Minister, Sir John Pakington, was discussed in both Houses of Parliament at considerable length: leading men of all parties taking part in the debate. The heads of the bill had been prepared while Lord Grey was Colonial Minister, and its general outlines were adopted by his successor. The greater number of its clauses however were taken from an ordinance passed in the colony itself for establishing Provincial Legislatures. In its progress through Parliament it underwent considerable alterations. Under these circumstances it can hardly be surprising that the new Constitution was found to be defective, and evinced on the part of its framers neither certainty of purpose nor unity of design. But whatever were its faults it conferred on the colonists almost unfettered powers of self-government; gave them the power of regulating the sale and disposal of the waste lands, and of moulding their political institutions to the circumstances of the country. By this Act the Islands were divided into six Provinces, and placed under the jurisdiction of one Supreme Legislature, composed of the Governor, a Legislative Council and House of Representatives, who formed the Colonial Parliament. The Governor represented the Queen; the Council, the Lords; and the House of Representatives, the Commons. The Upper House was to consist of twenty Members. No property qualification was prescribed for its Members; they were appointed by the Crown, held their offices for life, and were presided over by a Speaker appointed by the Governor. The House of Representatives consisted of thirty-seven Members elected by the

people for a period of five years, subject to the power of the Governor to dissolve the Assembly. No qualification was required for the Members other than that of being an elector; and the Speaker was chosen by the Members themselves. Thus constituted the General Assembly of New Zealand was authorised to legislate for the peace, order, and good government of the colony at large. But all its acts were liable to disallowance by the Crown. But as, with its numerous and widely-detached settlements, it was obvious that the colony could not be governed in detail by a single central authority, it was provided by the Constitution that for the local government of each of the Provinces there should be a Superintendent and a Provincial Legislative Council. The Superintendent was to be elected by the people of the Province, and his term of office, if not sooner dispossessed, was four years. The Members of the Provincial Councils were also elected by the people for the like period; but any Council was at any time liable to be dissolved by the Governor. The Superintendent and Council of each Province was authorised to make all such laws as might be required for the government of the Province—excepting on matters relating to the customs, courts of judicature, currency, weights and measures, post-office, bankruptcy, lighthouses, shipping dues, marriage, crown lands and native land, inflicting disabilities or restrictions on the native race, criminal law, and the law relating to inheritance. All laws made by the Provincial Legislatures were subject to the veto of the Governor, and might at any time be repealed by the General Assembly. The Elective Franchise was without distinction of race. Every man of the age of twenty-one or upwards who owned land of the value of £50, or a lease of the value of £10 a year, or being a householder occupying a tenement in a town of the annual value of £10, or in the country of the annual value of £5, if duly registered, was qualified to vote at the election of a Member of the House of Representatives and of the Provincial Council, and also of the Superintendent of the Province, and also to be himself eligible for the office of Superintendent, or of Member of the Provincial or General Legislature, or both. The Franchise was virtually equivalent to Universal Suffrage, and was the same as that prescribed by the Local Legislature in providing for the establishment of Provincial Councils. But the Local Legislature had provided that one-third of the members of the proposed councils should be appointed by the Crown. In one important particular the new Constitution was certainly the most liberal ever granted to a British colony; the possession of property not being prescribed as a qualification either for the office of Superintendent or for a seat in the General or Provincial Legislatures. As soon as the several Provincial Councils had met and held a session the General Assembly was convened. It soon became apparent that instead of drawing together and uniting the colonists in

the various and widely separated settlements, the new Constitution rather tended to perpetuate their isolation; and the Government took the earliest opportunity of pointing out the evil. "Seeing," said the Acting-Governor on opening the first session of the Assembly, "that the colony is composed of six detached settlements, each from another more than a hundred miles apart; with no facilities of intercommunication; planted by various founders, on different systems, each independent of the other; with little intercourse between them, either social or commercial; with no common sympathy; and heretofore without the slightest bond of union: seeing too that each of its several Provinces has been invested with larger powers of local legislation, it will rest with the General Assembly of these Islands whether N.Z. shall become one great nation, exercising a commanding influence in the Southern seas, or a collection of insignificant, divided and powerless petty States." But the inhabitants of the various Provinces having already been so long and so completely separated from each other, it soon became evident that the leaning of the majority of the members of the General Assembly itself was altogether provincial; that a provincial rather than a national feeling prevailed amongst them; and that their views and sympathies hardly extended beyond the Province they had been returned to represent. The tendency to provincial independence had shown itself in the whole of the Provincial Councils; and foreseeing that if some controlling check were not promptly interposed there would shortly be as many different kinds of law as there were Provinces in the colony, the Government continued urgently to direct the attention of the Assembly to the subject. It recommended that some guiding principle should be adopted whereby it might be determined on which of the subjects within the common jurisdiction of the General and Provincial Legislatures the superior authority should initiate legislation. This view gradually gained acceptance and was afterwards partially carried into effect; but the first session of the Assembly closed without any attempt to embody it in a substantial Act, and instead of controlling, the Assembly was in fact itself controlled by the Local Councils. At the second General Election the House of Representatives became still more provincial in its character; the superintendents of all the Provinces and many of the members of the Provincial Councils being elected to the House of Representatives. Comprising so many members interested in maintaining the importance of provincial institutions, the General Assembly failed to prove an efficient check on the growth of the mischievous multiplicity and diversity of provincial legislation. The whole of the six Provincial Councils thus left unchecked, passed during the first three years of their existence upwards of 200 provincial ordinances; and it was not until the Upper House in the Session of 1856 appointed a committee to

inquire into the subject that the Assembly appeared to be alive to the growing evil. In 1857 an Act was passed to enlarge the constituent power of the General Assembly, and designed to mould the Constitution in conformity with the wishes of the people.

XVIII. *The First General Assembly.*—The first session of the General Assembly will long be memorable in the constitutional history of N.Z. Liberal as were its provisions, the Constitution made no change in the principles on which the Executive Government of the colony had previously been conducted; nor did it make provision for securing to the Executive any medium of communication with the House of Assembly. By the Royal Letters Patent issued to the Governor subsequently to the passing of the Constitution Act, it was provided as before that the Government should be administered by the Governor himself under instructions from the Crown, with the advice and assistance of the Executive Council, consisting of the Senior Military Officer in command of Her Majesty's forces, the Colonial Secretary, the Attorney-General, and the Colonial Treasurer. The Governor was authorised to add to the Executive Council such other persons as he might deem to be capable and qualified to advise him; but such appointments were to be provisional only, and subject to be confirmed or disallowed by the Crown. Both by the terms of his commission and by the royal instructions the Governor was made directly responsible to the Crown; and no discretion was left him to delegate his authority or to relieve himself from responsibility in the conduct of the duties of his office. By the same instruments the members of the Executive Council were made responsible to Her Majesty; and no provision was made for enabling the Governor to establish the system of Ministerial responsibility. Hardly had the Assembly met, when the absence of any provision for securing that the Executive should be represented in the Legislature was seen to be a serious defect. When the necessary measures for bringing the Constitution into operation had been completed, and after the Provincial Councils had all met for the despatch of business, Governor Grey proceeded to England on leave of absence; and Colonel Wynyard of the 58th Regiment, senior officer in command of the troops, became the temporary administrator of the Government. When he entered on the duties of office, the crowning act for giving effect to the Constitution was still to be performed. Wynyard would gladly have allowed the Assembly to continue in abeyance, and left the responsibility of convening that body to the permanent Governor of the colony. It was uncertain however when Grey would return, or when his successor would be appointed; and acting the bolder part Wynyard promptly summoned the Assembly to meet at Auckland on 24th May 1854. Grey left N.Z. on 31st December 1853, and soon after his arrival in England was promoted by the Duke of Newcastle to the Government

of the Cape of Good Hope. His successor, Colonel Thomas Gore Browne, did not reach the colony until 4th September 1855. If Wynyard had not undertaken the responsibility of convening the Assembly, the supreme legislature of the colony must have remained in abeyance for a period of two years longer. Amongst the members returned to the House of Representatives at the first general election were several experienced and able men. Conspicuous amongst them was Edward Gibbon Wakefield. Possessing acknowledged ability, the chief promoter of the colonisation of N.Z., the founder of the modern school of colonial politicians, and justly described as "one of the shrewdest of mankind," Wakefield naturally filled a large space in the colonial Parliament. Although assembled from all parts of the colony—some of them from a distance of more than seven hundred miles—thirty-three of the thirty-seven members attended the summons, two seats being vacant. The formal preliminaries having been completed, the Acting-Governor proceeded to open the business of the Assembly on 27th May, in an elaborate address, prefaced by a statement of the considerations which had induced him to summon the Assembly:—"Possessing the necessary legal authority, and seeing that Her Majesty's subjects in N.Z. have a right to the exercise of the powers conferred on them by the British Parliament, I felt that I ought not to allow considerations personal to myself to disappoint their expectations, and to delay them indefinitely in the enjoyment of their Constitutional privileges. Trusting that under the circumstances under which the government of the country has devolved upon myself, I may rely on your friendly co-operation and cordial support, I determined to summon, and I have this day been allowed the memorable privilege of opening, the First Parliament of New Zealand." This prompt action was gratefully appreciated by the House of Representatives, who recorded their sense of the benefit which Wynyard conferred on the colony by convening the Assembly at the earliest period after it became his duty to assume the Government of the country. It soon became obvious however that the popular branch of the Legislature was rather intent on increasing its power over the Executive Government than on securing the country from an accumulating mass of conflicting provincial legislation. Immediately after the adoption of the answer to the opening address, a resolution was moved by Wakefield, "That amongst the objects which the House desires to see accomplished without delay, the most important is the establishment of Ministerial Responsibility in the conduct of Legislative and Executive proceedings by the Governor." The subject was discussed in a debate of three days' continuance—if debate it may be called in which no difference of opinion was expressed. By many of the members the subject was imperfectly understood; but the way having been opened by the mover's explanatory speech,

every other member followed the lead and delivered to the House his sentiments on the subject. An amendment for a select committee to report on the time and mode in which the principle of responsible Government should be brought into operation, so as to guard the interests of both races, was negatived by a majority of twenty-nine to one; and the original motion having been carried by acclamation, was followed up by an address to the officer administering the Government, praying him to take the previous resolution into his serious and early consideration. An amendment was moved that the Crown was the only proper and competent authority to be appealed to on the subject; but the delay even of a few months for reference to England was distasteful to the House, and the motion was rejected by twenty-five to two. The proceedings of the House of Representatives, thus united almost to a man, were no doubt calculated, even if not intended, to coerce the Government into compliance with their views. The demand thus made on the Head of the Executive—for the all but unanimous resolutions of the representative body could hardly be regarded in any other light—was that the senior officer in command of the troops, taking advantage of the absence of the Governor, and without waiting for the sanction of the Crown, should alter the fundamental principles on which the Government of the colony was conducted; that he should take on himself the responsibility of accepting the resignations of the advisers appointed by the Crown; that instead of administering the Government under instructions from the Crown, with the advice and assistance of a Council appointed by and responsible to the Crown, he should appoint to the principal offices of the Government members of the General Assembly responsible to the Assembly, and should carry on the Government of the country in obedience to their commands; that he should subject the native race to the dominion of their European fellow-subjects; and virtually surrender the powers of the Crown to the representatives of the people. It was not within the power of the Acting-Governor to carry out these demands; nor had it been so was it in the power of the House to enforce them; for by an oversight in the Constitution Act, the House of Representatives had not at that time the power of “stopping supplies.” On establishing representative institutions it would no doubt have been desirable that the Governor should be in a position to call to his Councils, and to appoint to the principal offices of the Government, persons in whom the colonists would confide to give free scope to the development of the new Constitution. The difficulty in the way of this arrangement arose from the fact that the holders of those offices held virtually permanent appointments from the Crown, which in the absence of misconduct on their parts they could not be called on by the Acting-Governor to resign. It was not in Wynyard’s power to change

either the principles of the Government or the persons by whom it was administered. It was however competent for him under the provisions of the Charter to add to the Executive Council such persons as he might deem qualified to advise him; and this was the only Constitutional means in his power of establishing a medium of communication with and securing the representation of the Government in the two Houses. The mover and seconder of the address in answer to the opening speech were accordingly “sent for” by the Acting-Governor and made acquainted with the course which, as a temporary expedient, he was prepared to pursue. “The officer administering the Government has acquainted us,” said the member who undertook to form the new Government, in communicating the result of their interview to the House of Representatives, “that he is prepared to carry out immediately the principle lately assented to by the House with respect to responsible government, so far as he is advised that it is in his power to do so; that is to say, to appoint some additional members of the Executive Council, who shall be charged with the policy of the Government, but who shall hold their seats in the Executive Council only so long as they shall command the confidence of the Houses of the Legislature.” Four leading members of the Assembly were accordingly added to the Executive Council. Without being appointed to specific offices, they were entrusted with the duty of conducting the Government business through the two chambers, and of preparing and superintending in their progress the measures necessary for giving effect to the policy of the Government; and they took office on the condition of holding their appointments so long only as they should retain the confidence of the Legislature. The official members of the Executive—the Colonial Secretary, the Attorney-General, and the Colonial Treasurer—continued to hold office until—consistently with a due regard to the public convenience, their duty as the appointed advisers of the Acting-Governor, and the servants of the Crown—they could with propriety retire. Wynyard had the satisfaction to find that the course pursued by him, in thus giving effect as far as it was in his power to do so, to the principle of responsible Government, proved satisfactory to the Assembly. For a period of several weeks the business of the session was carried on without difficulty in both Houses; and the most harmonious relations were established between the Executive and Legislative branches of the Government. The newly-appointed members of the Executive received the entire confidence of the Acting-Governor and the support of the working majority in the House of Representatives. But they soon became dissatisfied with their anomalous position; and before they had been two months in office they pressed the Acting-Governor to make further concessions; urging that the Colonial Secretary,

Attorney-General and Colonial Treasurer (proper pensions being provided for them) should immediately retire, and that the Government should be reconstituted on the ordinary responsible basis. In support of their views they urged that a formidable opposition had been formed in the House; that the Assembly would be unwilling to place in the hands of a government over whom they had no control the large powers proposed to be conferred on the Executive by measures at that time before the House; and that there was reason to believe that the House would not grant the supplies, except on the security that the Government would for the future be conducted in accordance with the will of the Assembly. Satisfied that he had no power to establish Responsible Government in a complete form, and that he could not, without a violation of the Charter, undertake that the Government of the colony should be conducted in accordance with the will of the Legislature, the Acting-Governor refused to comply with their demands. Neither on his own part however nor on that of his advisers was there manifested any disposition personally to stand in the way of arrangements for increasing the strength of the general government, and for establishing harmonious relations with the Houses of Assembly. But the members of the Executive were not prepared to advise the head of the Government to comply with those new demands. Nor were the time and circumstances favourable for making so sudden and complete a change in the administration of public affairs. The native race were still sensitively jealous of being governed otherwise than directly by the representative of the Crown; the Governor himself was absent from the colony; and a single false step or an ill-considered measure on the part of the Executive might again involve the country in a destructive native war. Wynyard's constitutional advisers therefore, who had been in office almost from the foundation of the colony, and on whose prudence and experience he would naturally be disposed to rely, felt that in the midst of a threatening political crisis they could not leave the temporary administrator of the Government to a council of new and untried men without incurring the imputation of abandoning their posts, bartering their places for a pension, and deserting the Acting-Governor in the hour of need. They all declared their readiness to retire from office if called upon to do so by Her Majesty's representative; but under the circumstances of his position they refused to advise him either to call on them for or even to accept their resignations. Failing to move him from his original position, Wynyard's new advisers resigned their seats in the Executive Council; and the new cloth which had been let into the old Government being thus torn away the rent was made worse. A long and angry altercation ensued between the Acting-Governor and the Assembly. At length matters came to a crisis. The House of Representatives passed a series

of resolutions daring the Government either to prorogue or dissolve the Assembly without asking for supplies; directing the Speaker to warn all receivers of public revenues that the penalties of the law would be enforced against them if they expended the revenues without the sanction of the Assembly; and resolving that Her Majesty be addressed forthwith to remove the members of the old Executive. The minority left the House or took no part; all pretence of deliberation was thrown aside; and before the ink was dry with which they were recorded, these and several other resolutions of a like character, were put and carried. In the midst of the proceedings a member entered the House and announced that the Assembly had been prorogued. A scene of uproar and confusion immediately ensued, little befitting the character of a deliberative assembly. Order having at length been restored, and the defiant resolutions having been hurriedly passed, a message from the Acting-Governor was read; it was found to convey official information that the Assembly was prorogued for a fortnight. During the period for which the Assembly had been in session not a single enactment had been added to the Statute Book, and the labours of the first session of the General Assembly were thus brought to an untimely and unprofitable end. The general excitement was so great that for several days after the temporary prorogation all prospect of a peaceable termination of the struggle appeared hopeless; and it was probable that to allow the Assembly to meet again at the end of the fortnight would be simply to provoke a renewal of unseemly strife; indeed for a while there seemed no course open to the Government but to prorogue the Assembly *sine die*, and in the meantime—the existing revenues by an oversight in the Constitution not having been placed at the disposal of the Assembly—to carry on the strictly necessary expenditure, subject to their responsibility to the Crown. Wakefield, though declaring his own unwillingness to become a member of the Executive Council, endeavoured but in vain to strengthen the Government. But it was evident that any Government in which he was even supposed to have an influence would be distasteful to a majority of the House; and amongst the minority it was impossible to find members for the several provinces of sufficient weight and influence to secure for the General Government the confidence of the country. Finding himself powerless, and believing that the Government was about to act independently of his advice, Wakefield retired from his anomalous position as temporary adviser of the Government, which he had retained even after his resignation as a responsible Minister. The prompt action of the Government in proroguing the Assembly took the majority by surprise; but it was evident that so long as the members could meet in the House, irritation and excitement would be kept alive, without a moment's time for cool reflection. The course pursued by the Executive

was followed by the most complete success. At first the members could hardly realise the powerless condition to which they had been suddenly reduced by having the doors of the House closed against them. The most influential portion of the press denounced their violent proceedings; the general community were indifferent, if not actually hostile to them; not a single expression of public sympathy was given in their favour, nor was a single public meeting got up in their behalf. With reflection came the unwelcome conviction that the Government were in fact masters of the situation; that the sinews of war were in their hands; that the revenues of the colony were neither *de jure* nor *de facto* subject to the approbation of the Assembly; and that if the Assembly refused to proceed with the business of the session, the Government were prepared to incur the responsibility of applying the public revenues to the maintenance of the public service. Under these circumstances, and with time for reflection, the members of the House could hardly avoid the conclusion that they were engaged in a hopeless contest. Private and personal considerations, too, with many of them were not without their weight. It had always been intended that a sum to defray the expenses of the members should be placed on the estimates; but the supplies had not been voted, and not one measure of public utility had been passed. Their travelling expenses and the cost of living three months from home amounted to no inconsiderable sum, to many of them a matter of serious consideration. The prospect of returning to their constituencies at their own charges, and without being able to point to a single useful measure as the result of their deliberations, was not without its sobering effect. Their fear also of Wakefield's ascendancy had been removed, and his retirement had the effect of paving the way for the restoration of a better feeling towards the Government on the part of the majority; so that before the end of the short recess all idea of further contest was abandoned, and how to retrieve themselves from the dilemma became the subject of common thought. Having ascertained through various channels that, if allowed to meet again, the House would proceed with the business of legislation, and vote the necessary supplies, the Government determined that the Parliament should re-assemble at the expiration of the period for which the Assembly had been prorogued. Wakefield had ceased to act as adviser in the emergency; but the party who acknowledged him as their leader still believed that a mixed Government might be formed which could successfully conduct the government of the country; and that if represented in the Executive Council, they could themselves devise and carry out a course of policy so obviously beneficial to the colony as to secure for the Government the support of a working majority in the Assembly. The Government however were not prepared to retain permanently in the Executive Council members who should

be proved to want the confidence of the Assembly. Four members of the minority were however appointed to the Executive Council, on condition that if the course of policy to be at once announced by them should be met by a vote of want of confidence on the part of the House, they should immediately retire. Hardly had their appointments been gazetted than their resignations were announced. On the re-assembling of the House at the termination of the recess their policy was formally announced to the Assembly; if it had been the perfection of human wisdom it would have been, under the circumstances, no less summarily rejected. Almost without discussion it was put to the vote and negatived by a decisive majority—the House agreeing to an amendment, “That a mixed Executive, as then constituted, composed in part of irresponsible officers, and in part of members drawn from a small minority of the House—a Ministry constructed on a delusive theory of representation of provincial interests—was a form of government in which the House declared its absolute want of confidence.” Nothing therefore remained for the Ministers of a day but to tender their resignations; which were immediately accepted. Thus the majority, Wakefield, and the minority, had each in turn made the attempt; and it had been demonstrated by a kind of exhaustive process, that consistently with the powers of the Acting-Governor no better form of Government could at present be established than that which was in existence when the Assembly first met. The same majority of twenty-two to ten, who on 15th August had denounced the Government as weak and incompetent; had discussed whether the Acting-Governor would deem it wise to return to the original state of things, and to attempt to carry on the government with his present officers; had resolved to pray Her Majesty forthwith to dismiss them; and had all but threatened to stop the supplies; agreed on the 1st of September to a mild, conciliatory address, recording the opinion (which the Government entertained from the outset) that until Responsible Government in a complete form should be established by competent authority, the Executive Government should be continued as formerly under the exclusive management of those public officers who derived their authority from and were responsible to Her Majesty; at the same time declaring their readiness to grant supplies to a Government conducted by the old Executive officers. Wynyard had always been ready to bury past differences in oblivion, and the pacific overtures of the House were met by him in a conciliatory reply. The old *régime* having been restored by common consent, all parties set themselves assiduously to the real business of legislation; and on proroguing the Assembly the Acting-Governor was able to congratulate its members on the amount of useful legislation they had accomplished during the brief period which had elapsed since the commencement of the session. In the course of little more than six months Wynyard was enabled to inform the

colonists that Her Majesty's ministers had sanctioned the establishment of responsible government, subject to the single condition that provision should be made for those officers of the Executive who had accepted their appointments on the understanding of their permanence. But the House of Representatives had become less eager on the subject. A year before the House had negatived by a majority of twenty-five to two a motion for the short delay for a reference to England. Now that competent authority had been obtained, the House by a majority of sixteen to three put a stop to the progress of a necessary preliminary measure for bringing the principle of responsible government into operation, and agreed to a resolution, "That seeing that it is intended to defer the introduction of responsible government until after a dissolution of the Assembly and a re-election, this House is of opinion that it is desirable to refer the question of providing compensation for retiring officers for the next Assembly." The eagerness for responsible government seemed to have changed sides, the Government pressing forward, the House making difficulties and suggestions for delay. At the commencement of the session however the Acting-Governor informed the House that it only rested with themselves to take the necessary steps; and at the conclusion of the session Governor Browne, who had just arrived in the colony, announced that he should hereafter defer all subjects of importance not requiring immediate attention, until the contemplated change in the Government should have taken place. With the old Executive still in office, without any official medium of communication between the Government and the Legislature, the business of the Assembly was easily conducted through the two chambers, and the short session of 1855, without being fruitful of much actual legislation, was brought to a peaceful close.

XIX. Responsible Government.—The measure providing for their retirement having become law on 7th May 1856 the Members of the old Executive were superseded by Members of the Assembly who were appointed to office on the responsible system. Unfortunately no special provision was made for the government of the native race; and because, with few exceptions, they take no part in the exercise of the elective franchise nor exercise any influence on party combinations, it appears to have been assumed that they could form no difficulty in conducting the government of the country. Without imposing any limitation or restriction, or securing adequate funds and providing guarantee for the special government of the native race, it was declared by the Colonial Minister, in answer to the petition of the Legislature, that Her Majesty's Government had no objection whatever to offer to the establishment of the system known as Responsible Government; and the Governor, then recently appointed to succeed Sir George Grey, left England with full authority to carry the principle into effect. On his arrival in the colony Governor Browne was very earnest in his desire to

see the Representative Constitution carried to the utmost limits of its development; but he had hardly completed the tour of the Islands before he was satisfied that the New Zealanders were not only warlike and well armed, but a still unconquered race; more numerous by far than the colonists, and hardly inferior to them as consumers of British manufactures and as contributors to the revenue and exports of the colony; the acknowledged owners of the soil, jealous of their territorial rights, impatient of control, and by no means prepared to see themselves handed over to a Government composed of unknown individuals, not chosen by themselves and irresponsible to the Crown. Her Majesty's native subjects, not the colonists, were the real "difficulty" in the government of N.Z. While on a visit to the Waikato district, several of the chiefs formally addressed the Governor on the subject of the rumoured changes by which their minds had been disturbed. The main purport of their speeches was to urge that no alteration should be made in the administration of native affairs. That they preferred being under the direct management of the Governor; and that it was not just that the Maoris should be placed entirely in the power of the white man; that salt water and fresh water do not exist well together; and that if their affairs were to be put into the hands of any Assembly, they should be placed in the hands of one consisting of their own race. Convinced that with reference to the government of the natives, the tranquillity of the country would be endangered by changes of opinions consequent on changes of advisers, Browne, while undertaking in all matters under the control of the Assembly to be guided by the advice of ministers responsible to it, found it necessary to limit the application of the principle of responsibility with reference to the native race, and especially in the purchase of native lands. He proposed to retain in his own hands the direction of native affairs. He was fortified in this resolve by the opinions of the best-informed persons in the country. He addressed a circular to different persons in various parts of the colony, of various political opinions, but all having more than ordinary knowledge of the native character, desiring their opinion:—Whether the management of native affairs could be entrusted to a Ministry liable to be changed at frequent intervals on political grounds? Or whether the management of native affairs, including the appointment of persons employed and the disposal of funds sufficient for the purpose, should be reserved to Her Majesty's Representative? The reasons and arguments of those to whom the questions had been addressed were various; their conclusions however were all but unanimous. More than forty gave a decided opinion that the management of native affairs could not safely be left to a Ministry not responsible to the Crown; and that the government of the native race should continue to be administered by the Queen's Representative; two only, subject to

qualification, arrived at a different conclusion. It was urged that native races look more to the persons governing than to the principles on which the government is formed; that they value permanence and stability; and are sensitive on the point of being allowed to deal directly with the principal, rather than with subaltern officers; that the general animus of the colonists was not favourable to the race, and it was not probable that the members of any Responsible Ministry would be especially acquainted with the native habits and feelings, or personally known to and respected by them; that special attention to native rights and interests would be by no means popular, and Ministers would not be induced to give any personal influence amongst them; and that, being left to be dealt with by subordinates, the Chiefs would gradually secede from communication with the authorities, forming leagues and schemes in secret of which the Government would have no cognisance. That they would thus become estranged, and when they came to be feared and suspected there would be constant risk of the Governor being driven by the Ministers to use the troops against them; and that the country would not be safe for six months after the question of peace and war had been entrusted to a Ministry who had virtually the command of the Queen's troops, but who were themselves irresponsible to the Crown. It was represented also that the natives being very susceptible of personal attachment, if the officers employed in the department were appointed and subject to removal by the Ministry for the time being, few would remain in office long enough to obtain an influence over them. That a nation just emerging from barbarism cannot be advanced in the scale of social life by mere negation of evil, and that a veto on the part of the Governor could only enable him to prevent injustice but not to do good. That a Ministry chosen by and from the elected representatives could have no claims to absolute authority over the Maori race; and that while the colonists claimed for themselves representative institutions and an irresponsible Ministry, they could not in reason refuse to the natives that form of Government which they preferred. And that the just and generous course would be to ascertain what amount of annual revenue was contributed by the native race; to pay into the General Treasury the proportion of income due to works and objects in which both races had a common interest, and to place the surplus at the disposal of the Governor for strictly native purposes; thus placing the native race in the position of a distant province paying a certain portion of the general revenue, and retaining the remainder for its own local expenditure. The course proposed by the Governor received the approval of Her Majesty; but no permanent provision was made for the efficient maintenance of this divided rule. It is well known what great influence, during his lengthened administration of affairs, Sir George Grey obtained amongst the natives, and with what

ability that influence was exercised; but Grey could not have acquired that influence nor have exercised it with so much advantage to the country if his powers had been restricted, and if his prestige had been impaired by the control of a board of officers subordinate to himself. Yet under all the difficulties arising out of the peculiar circumstances of the country the experiment of Responsible Government would bear comparison with that of the Australian Colonies, both as regards its practical success, and for the prudence, judgment, and moderation with which the change had been effected. Henceforward political office could only be filled by members of the Assembly; and every colonist was a possible minister, superintendent, or member of Parliament. To quote the words of the Acting-Governor in his opening address:—"To preserve and advance in the scale of civilisation the native inhabitants of these islands—to develop the resources of a country rich in all the elements of future national greatness—to be the pioneers for its colonisation by the Anglo-Saxon race—to lay the foundation of its religious, political and social institutions—to give laws to the present, and to influence the character of a future, generation—became henceforward the rare duty and the noble privilege of the Parliament of New Zealand."

XX. *The Maori King Movement.*—The attempt made by certain of the tribes in 1857 to unite themselves under a king, whether for the purpose of maintaining their nationality, consolidating their power, or raising themselves from barbarism by means of laws and institutions made and administered by themselves, showed a remarkable feature in the character of the race. When the movement for setting up a Maori King first attracted attention it was viewed by the authorities not only without apprehension, but as offering under wise guidance an opening for good. "If the Government," wrote Governor Browne, "does not take the lead and direction of the native movement into its own hands, the time will pass when it will be possible to do so. The influence of oratory, and perhaps evil counsel, aided by the actual excitement of the natives, may incline them to make laws of their own at these meetings, and thus add to the present difficulty; but they will probably refrain from doing so if they see that the Government is actually doing what they wish." But in the following year the Governor entertained a different view. "I trust," he said, "that time and absolute indifference and neglect on the part of the Government will teach the natives the folly of proceedings undertaken only at the promptings of vanity, and instigated by disappointed advisers." And until a general feeling of apprehension had been excited in the native mind by the military occupation of the Waitara, the movement had little or no vitality which, by prudent guidance, might not have been turned to valuable account. The object of a large section of the natives was distinctly expressed at

a great meeting held at the Waikato in April 1857, at which the Governor was present. It was understood by them that His Excellency promised to introduce amongst them institutions of law founded on the principle of self-government, analogous to British institutions and presided over by the British Government. "I was present," says the Rev. Mr. Ashwell, referring to that meeting, "when Te Wharepu, Paehia, with Potatau, asked the Governor for a magistrate, laws, and runangas, which he assented to; and some of the natives took off their hats and cried 'Hurrah!' I want order and laws," were in fact the first words of the leading member of the movement for establishing a Maori King: "The King would give us these better than the Governor, for the Governor has never done anything except when a Pakeha was killed; he lets us kill each other and fight. A king would stop these evils." The two most active leaders of the movement were representative men of the new generation of Maori chiefs. William Thompson was remarkably silent and reserved; listened patiently to what was said, but thought and decided for himself. He spent a great part of his time in writing; noting down everything remarkable he saw, heard, or read; and engaged in constant correspondence with all parts of the country. He was well versed in Scripture history;—a fluent speaker and a formidable antagonist in debate. Though the son of a celebrated warrior he prided himself on his character as a peacemaker. When several hundred armed natives descended the Waikato River in a state of dangerous excitement, to enquire into the violent death of one of their countrymen in the neighbourhood of Auckland, he formed one of the party for the purpose of restraining them, and was largely influential in keeping them from mischief. Several unruly and headstrong members of his tribe went to Taranaki to the support of William King, but it was without his sanction or authority; and he afterwards proceeded to the seat of war, and succeeded, though not without great difficulty, in withdrawing them, and in bringing about a general cessation of hostilities. "I thought," he said, describing his own share in the movement, "about building a large house as a house of meeting for the tribes who were living at variance in N.Z., and who would not become united. That house was erected, and was called Babel. I then sent my thoughts to seek some plan by which the Maori tribes should become united, that they should assemble together and the people become one, like the Pakehas. Evil still manifested itself; the river of blood was not yet stopped. The ministers acted bravely, and so did I, but the flow of blood did not cease. When you came, the river of blood was still open, and I therefore sought for some thought to cause it to cease, as the ministers had long persevered. I considered how this blood could be made to diminish in this Island. I looked into your books where Israel cried to have a king for

themselves, to be a judge over them, and I looked at the words of Moses in Deuteronomy xvii. 15, and in 1 Samuel viii. 4, and I kept these words in my memory through all the years;—the land feuds continuing all the time, and blood still being spilt, I still meditating upon the matters, when we arrived at the year 1857. Te Heuheu called a meeting at Tanpo. Twice 800 were assembled there, when the news of that meeting reached me. I said, I will consent to this to assist my work, that the religion of those tribes that had not yet united might have time to breathe. I commenced at those words in the Book of Samuel viii. 5: 'Givo us a King to judge us.' This was why I set up Potatau in the year 1857. On his being set up, the blood at once ceased, and has so remained up to the present year. The reason why I set up Potatau as a king for me was, he was a man of extended influence, and one who was respected by the tribes of this Island. That, O friend! was why I set him up; to put down my troubles, to hold the land of the slave, and to judge the offences of the chiefs. The King was set up; the Runangas were set up; the Kai-whakawas were set up, and religion was set up. The works of my ancestors have ceased, they are diminishing at the present time; what I say is, that the blood of the Maoris has ceased to flow. I don't allude to this blood (lately shed.) It was your hasty work caused that blood. I do not desire to cast the Queen from this Island, but from my piece of land. I am to be the person to overlook my piece." A similar account of the origin of the movement was given by Renata, another of its earliest and most influential supporters. After passing some time in captivity in the North, where he received (in 1842-3) some teaching at the Waimate school, Renata returned to his own people in the Hawkes Bay district, where both with the settlers and the natives he established a high character for ability and integrity. For several years he was engaged in promoting the building of native churches, schools and flour mills; for some time he employed at his own cost an English teacher to instruct the native children. "It was my wrongs unredressed by you," he said, "that induced me to set about to work out an idea of my own: that is, Waikato, the tribe who set it going. They were in doubt whether to term chief or governor, and neither suited, and they established him as the Maori King; it was tried experimentally, and proved as a means of redress for wrongs not settled by you, by the Government. The only wrongs you redressed were those against yourselves; but as for those all over the breadth of the country, you left them unnoticed. Sir, the enemies he (the Maori King) had to fight with were the crimes of the Maori; his murders, his thefts, his adulteries, his drunkenness, his selling land by stealth. These were what he had to deal with. Did I set up any king in secret? As I view it, Waikato wished

that his authority should emanate from the Governor. And then it was that we tried to do the best we could for ourselves. When it was seen that evil was partly put down by the Runanga, and the stupid drunkards became men once more, then the work (the King movement) became general. But is this (King movement) indeed to cause a division between us? No, it will be caused by secret purchases of land, the thing which has been going on for years." And Renata was careful to make it clear that the promoters of the movement had no intention to subvert the Queen's authority. "You say, 'The Maoris are not able to fight against the Queen of England, and kill (prevail against) her.' This is my answer. Sir, you know perfectly well that the Maori will be beaten; though it be said that this war is for sovereignty, the fault of the Governor can never be concealed by that. Who is the Maori that is such a fool as to be mistaken about the sovereignty or supremacy of the Queen of England? Or who will throw himself away in fighting for such a cause? No, it is for land; for land has been the prime cause of war amongst the Maoris from time immemorial down to the arrival of Pakehas in this island of ours. The Maori will not be daunted by his weakness, by his inferiority, or the smallness of his tribe; he sees his land going, and will he sit still? No; but he will take himself off (to resist.) The Queen's sovereignty has been acknowledged long ago; had it been to fight for supremacy, probably every man in this island would have been up in arms; but in the present case the fighting is confined to the land which is being taken possession of. There is a letter of William King's lying here, in which he says that if his land is evacuated he will put a stop to the fighting. It was proposed to leave it to the Queen to judge between the Governor and William King; you witnessed the general assent of all to that proposal that the Queen should be the judge. Well, does this look in your opinion like a rebellious word in regard to the Queen, that you have left it out of sight, and taken up that word of your own invention about the Maori making war against the Queen? Sir, the Maori does not consider that he is fighting against the Queen; I beg therefore that you will cease to pervert words, and rather consent to our proposal that we should all join in writing a letter to the Governor (to propose) that the war may be stopped, and that it may be left for the Queen to decide in this quarrel; and then let us write a letter to the Queen (to pray) that she will send a Commissioner (Kainhakawa) to stand between us, and let us all join together in inquiring into this dispute. Cease (arbitration) by guns, and now let it be left to inquiry, that a remnant of men be left." After a careful inquiry into the subject a Committee of the House of Representatives, comprising several of its leading members, reported their opinion in 1860 that a great movement had been going on amongst the native people, having for its

main object the establishment of some settled authority amongst themselves; that such movement need not have been the subject of alarm; that its objects were not necessarily inconsistent with the recognition of the Queen's supreme authority or with the progress of colonisation; and that it would have been from the first, and would then be, unwise to contradict it by positive resistance. Before the commencement of the Taranaki insurrection the colony was in a state of profound peace. For a period of several years friendly relations had been maintained between the settlers and the natives, and the colony had been making steady progress in agriculture, commerce, population, and wealth. Upwards of thirty millions of acres had been obtained from the native owners for purposes of colonisation; internal feuds had almost ceased; a growing desire for the establishment of law and order amongst them was showing itself amongst the natives in all parts of the country; and with wise government and prudent conduct on the part of the settlers there appeared to be a fair prospect of uninterrupted prosperity and peace. The new Governor had not been many months in the colony before he discovered, and like his predecessors pointed out, the danger of provoking a conflict with the natives. "In any real trial of strength between the natives and Europeans," he reported, "there can be no possible doubt as to the result. But it is not less certain that pending its duration a vast amount of life and property would be destroyed; numbers of thriving settlers would abandon their houses; immigration would entirely cease; and a great expense would be entailed on the Mother Country. In other words the prosperity of the colony would be annihilated for years after the termination of a struggle as successful as could be desired." Six years previously the Native Secretary had recorded his opinion, "that military operations in the Taranaki district would prove fatal to the prosperity of the settlement for some time to come, as the settlers would have to concentrate themselves in town for the protection of their wives and families, and their properties in the meantime would go to ruin." More recently the Governor had informed the Colonial Minister, "that the immediate consequences of any attempt to acquire Maori lands, without previously extinguishing the native title to the satisfaction of all having an immediate interest in them, would be an universal outbreak, in which many innocent Europeans would perish, and colonisation would be indefinitely retarded." Yet after having acquired more than thirty millions of acres of land under a system satisfactory, in the main, both to the buyer and the sellers, a new policy was believed by the natives to have been attempted, and the Province of Taranaki was plunged into a civil war, by an attempt to obtain possession by military force of native land with a doubtful or disputed title. When the British first became acquainted with N.Z., the whole country

from the North Cape to Stewart's Island was parcelled out by natural or other well-known landmarks amongst the numerous tribes and families of the Maori race. Each community held its land in common; but every individual member, besides having a general interest in the tribal property, might acquire by inheritance, by his own labour, or otherwise, a possessory or holding title to a specific portion, but was not allowed to exercise a disposing power over it. "It is right," said an intelligent chief, "that every individual should be free to sell his own bushel of wheat, potatoes and corn, for they are produced by the labour of his hands; but the land is an inheritance from our ancestors,—the Father of us all." And so general was the tribal system, that in the opinion of the Head of the Native Department in 1856, no native could claim an individual title to land in the Northern Island. There was really no such thing as individual title that was not entangled with the general interest of the tribe; and often with the claims of other tribes, who may have emigrated from the locality. Early in 1860 an attempt to purchase land without obtaining the consent of all who claimed to be entitled to a voice in the disposal of it, provoked the natives of Taranaki to take up arms in defence of their territorial rights, and led to a formidable insurrection. The Province in which the outbreak occurred was the smallest of the nine Provinces into which the colony had been divided; but no one can speak of the soil or scenery of the colony till he had seen both the natural beauties and the ripening harvests of Taranaki, which by concurrent testimony is described as the garden of N.Z. From the beginning of March 1860 to the end of March in the following year this beautiful district was visited by the scourge of war. Its once fruitful fields and pleasant homesteads were abandoned and laid waste; the ploughshare was exchanged for the sword; and the settlers, separated from their wives and families, and shut up in an entrenched camp, within sight of the wasted labours of nearly twenty years, were for many months doing military duty under the iron despotism of martial law. With a seaboard of about 100 miles, of which Cape Egmont is the centre, the Province extends inland from twenty to forty miles, and comprises an area of about two millions of acres. With the exception of a narrow and irregular strip of open fern-land near the sea, the country is heavily timbered. At the commencement of the outbreak the English population of the Province amounted to 2700 souls; and the native population was estimated to amount to about an equal number. But not having a harbour, being difficult of access, hemmed in between an open roadstead and a dense forest, and being almost impracticable for military operations, the Taranaki district—where the question of native title had always been unusually complicated—was not well chosen, with all its natural beauties, for the site of an English settlement.

The N.Z. Company, acting with their usual precipitancy, and ignorant as to who were the real owners of the land, dealt with a few natives who represented themselves to have the right to dispose of it, and hardly made the shadow of a purchase before the settlement was founded. The first difficulty with which the early settlers had to contend, as at Wellington and Nelson, was the want of a clear title to the land; and it was only by the exertions of the Government that the native title to a few blocks of land of limited extent was afterwards extinguished, and the settlers after a period of ruinous delay were ultimately put into peaceable possession of their homesteads. The Waitara, a fertile, open district, watered by a small river, ten miles to the north of the town, and navigable at high water by small coasting craft, was the locality which in the first instance was fixed on for the site of the settlement; and it was represented by their surveyor to the New Plymouth Company, by whom the settlement was originally founded, that if they were deprived of that river they would lose the only harbour in the neighbourhood and the most valuable district for agriculture. But this much coveted spot was not to be obtained from its native owners; so the Company were compelled with great reluctance to lay out the town upon a less eligible site; and for nearly twenty years the open land at the Waitara had, with the Taranaki settlers, been an object of almost passionate desire. When they first landed at Taranaki the neighbouring country was almost uninhabited. Ten or twelve years previously a large body of the Waitara natives, led by Rere, the father of William King, the so-called rebel chief, had formed an expedition to the south; and taking advantage of their absence their northern neighbours, the Waikatos, under Te Whero Whero (afterwards better known as Potatau, the Maori King,) made a raid on Taranaki, attacked, defeated, and dispersed the remnant of the natives, and having overrun the country and taken many prisoners returned with them to the north. After the marauders had retired a few of the original occupants of the country ventured to return and take possession of their houses, and their captive relations, most of whom were afterwards released, gradually flocked back into the district and again settled on the land. The Waikato raid greatly complicated the question of native title, and the difficulty of providing for the unfortunate immigrants sent out by the Company before land had been procured for them became daily more apparent. The chief of the Waikatos claimed a certain right over the country by right of conquest; and so far as he took actual possession, his claim according to native usage would be valid. It appeared however that he did not permanently occupy the soil; but being a chief of great influence, with might if not right on his side, it was deemed expedient by the Government to buy up his interest and satisfy his claim. The members of the Waitara tribe who

happened to be in the south at the time of the Waikato invasion maintained that they had not forfeited their right to the land by their temporary absence. "The Europeans were wrong," said William King and other Ngatiawa chiefs, addressing Governor FitzRoy in the year 1844, "in striving for this land, which was never sold by its owners, the men of Ngatiawa. Now when the Ngatiawa tribe went to Kapiti they left some men behind on our lands, who were surprised by the Waikatos and led away captive, who having arrived at Waikato were afterwards returned to Waitara to dwell there. Others came back from Kapiti. We love the land of our ancestors. We did not receive any of the goods of Colonel Wakefield. It was wrong to buy the land which belonged to other men. There are many chiefs to whom the land belongs who are now at Waikanae and Arapoa. It was love for the lands of our forefathers that brought us back to those lands. Friend Governor, our thoughts are that the lands were never settled by the Waikatos." And the claims of those members of the tribe who were absent in the south when the Waikatos overran the country, of those who had been carried away captive, and of the remnant left in the district (if they had ever been forfeited) were afterwards re-admitted by the Government and the tribe was recognised and dealt with as the owners of the soil. But amongst the tribe itself the Waitara had many claimants, and it was not without difficulty that they could for a length of time be prevailed upon to alienate any part of it. Seeing the many disadvantages of the site fixed upon by the Company for their settlement, and no peaceable solution of the difficulties by which the settlers were surrounded, the expediency of breaking up the settlement was seriously entertained by the authorities more than fifteen years before the commencement of the outbreak. As land for the purposes of the settlement had only been obtained in detached blocks, the settlers and the natives were settled together in closer proximity at Taranaki than in any other of the settlements. Relieved from all fear of a second Waikato raid, and following the example of their English neighbours, the natives of Taranaki soon became extensive cultivators of the soil and the proprietors of a large amount of valuable farming stock and agricultural implements. Comparing the condition of the resident natives with that of their countrymen in the north, the Bishop of N.Z. remarked that "the coasting craft and canoes of Auckland may here be represented by the almost innumerable carts which may be seen on market days coming from north and south into the settlement." William King and his people, then occupying the Waitara, alone possessed 150 horses, 300 head of cattle, 40 carts, 35 ploughs, 3 winnowing machines, and 20 pairs of harrows; and in the year 1855 they exported agricultural produce to the amount of upwards of £8000. But in the midst of this general prosperity the peace of the district was disturbed by native

feuds, and the district was soon studded over with numerous native pabs. The earliest and most serious of these disturbances arose out of an attempt to purchase land without the consent of all who claimed a voice in the disposal of it. Being exposed to continual pressure from the settlers to acquire land from the natives, the Taranaki Land Commissioner was always in danger of being urged into undue haste in conducting his negotiations. A piece of land was offered for sale to the local commissioner (Cooper) by a native assessor named Rawiri; but Katatore, a man of the same tribe and a near relation, had always expressed his intention to retain it, and threatened to oppose any one who should offer it for sale. To test Rawiri's power to dispose of the land, the Commissioner desired him to cut the boundary line; and while he and his party were engaged in the work, Katatore and his followers cautioned them to desist; firing twice into the ground by way of warning to deter them. But still they persisted, until Katatore and his people aiming a deadly volley at them shot Rawiri and six of his followers and wounded several others. For a length of time afterwards the relations and followers of the contending parties were engaged in a deadly feud; and two years afterwards Katatore himself was killed. Other causes of quarrel also arose amongst them; and for a period of two or three years their progress in industrial pursuits was brought entirely to a stand. Up to this time the settlement had never been occupied as a military post; yet throughout those native disturbances the settlers suffered little direct or immediate injury. But being closely intermixed with the resident natives who were all well armed, who occupied numerous defensible positions, and who were not unfrequently engaged in deadly strife, they naturally felt their situation to be painfully insecure; and they made repeated and urgent appeals to the Government to garrison the settlement with troops. But it was believed by the authorities that the presence of a military force would excite a feeling of jealousy and irritation in the mind of the natives, and would tend to increase rather than to obviate the danger; that so long as they exercised ordinary caution and forbearance the settlers would remain uninjured, while the presence of the small force at the disposal of the Government would be insufficient to overawe and preserve peace amongst the natives, calculated to give a false confidence to the settlers, and would lead them to be less careful to maintain peaceful relations with their Maori neighbours; and that military operations once commenced would end in the total destruction of the settlement. This opinion was confirmed by the Native Secretary, who being a military man was commissioned to make a careful examination of the ground. "The country about New Plymouth," reported Major Nugent, "is very favourable for the desultory warfare of the natives. With the exception of a narrow strip of land from one to

five miles in breadth, extending along the coast, the country is a dense forest intersected with numerous ravines; and except on this strip of land the country is most unsuited for the operation of English troops against a hostile native force. The settlement extends along the coast for twenty miles; some of the settlers have penetrated eight miles into the forest; and a much larger force than Great Britain could spare for the whole colony would be insufficient for the protection of the settlement; and in case of a collision between the troops and the natives the settlement would dwindle into a mere military post." The Executive Council advised that looking to the unfavourable nature of that part of the country for military operations, every effort should be made to avoid the risk of hostilities with the natives in the Taranaki district; and that as the recent disturbances had their origin in the attempt to purchase land from the natives with a disputed title, the Land Purchase Department should use great caution in entering into any negotiations for the purchase of land until the views of the various claimants should have been ascertained. Governor Browne soon afterwards arriving in the colony, and having before him so significant an illustration of the danger of attempting to purchase land with a doubtful or disputed title, condemned the conduct of the local commissioner in commencing a survey before he was assured that all who had even a disputed claim to the land desired it should be sold; and he declined to make a demand for reparation, on the ground that it could only be enforced at the expense of a general war, including sooner or later all the tribes in the Northern Island. After the settlers had long been kept in a state of ruinous uncertainty, the Government succeeded in completing the purchase of detached blocks of land of considerable extent for their occupation. In one instance 30,000 acres were obtained at the rate of 10d. per acre. But the land being for the most part heavily timbered, the open country at the Waitara continued to be regarded by the Taranaki settlers as essential to the extension of the settlement. This favoured spot however was highly valued by its original native occupants, many of whom were at that time still absent in the south. "This also is the determination of our people," wrote William King to Governor FitzRoy. "Waitara shall not be given up, the men to whom it belongs will hold it for themselves; the Ngatiawa are constantly returning to their land on account of their attachment to the land of our birth—the land which we have cultivated and which our ancestors marked out by boundaries and delivered to us. Friend Governor! do not you love your land England, the land of your fathers, as we also love our land at Waitara? Friend, let your thought be good towards us. We desire not to strive with the Europeans; but at the same time we do not wish to have our land settled by them; let them be returned to the places which

have been paid for by them lest a root of quarrel remain between us and the Europeans." It was not until further disturbance had occurred amongst the natives of the district, that the Acting-Governor Wynyard reluctantly gave way to the importunities of the settlers, and occupied Taranaki with a military force; but as appears to have been anticipated, the arrival of the troops in 1855, intended simply as a protection to the settlers, was regarded with suspicion by the natives. Soon after Governor Browne's arrival, the Government was informed that it was strongly apprehended by the Taranaki tribe that he would differ in his views and measures from Governor Wynyard, and that in all probability ere long his word would go forth to put the troops, sent down as a protecting force by the latter, into aggressive motion, and thus a war between the Europeans and the Aborigines would be commenced. Being still continually urged to part with the land, the Waitara natives were troubled by similar apprehensions, until they were visited by the officer in command of the troops, who went amongst them for the purpose of explaining the reasons for which a military force had been stationed in the district. The chief himself appears even to have had some fear of being seized suddenly like Te Rauparaha. "I assured him," said Major Nugent, "that nothing was further from my intention than to seize him treacherously in the night. He complained much of false statements which had been made against him in the local papers; and in proof that he had some ground for his complaints, I enclose copies of the last numbers which do not disguise the wish of some of the writers to drive William King and his party away from the Waitara. Now independently of the illegality of such a proceeding the people of the tribe have exported produce this year to the amount of between £8000 and £9000, the greater part of the proceeds of which is spent in British manufactured goods; and consequently the natives contribute indirectly a considerable sum to the revenue of the country. I have no hesitation in saying that these people, who in their position are useful and beneficial occupiers of the soil, have been on the point of being driven to become our declared enemies, and compelled to take a position in the forest, where all the discontented and troublesome characters would have assembled, and from which it would have required considerable force and a large expenditure of money to drive them. In the meantime the authorities would have been harassed by constant alarms, and New Plymouth might have been thrown back a generation. I think that for the present the natives are re-assured; but I cannot answer for the continuance of tranquillity between the races, so long as inflammatory articles are published in the newspapers, in which people of much local influence do not disguise their wishes to seize on the land of the natives." These suspicions however still continued. The old suspicion had been revived

amongst the natives, that the Europeans would not rest until they had slain and taken possession of that which the Maoris likened to Naboth's vineyard. As it was found impossible to obtain the assent of all who had an interest in the Waitara, it was thought that individual members having a special interest in particular portions of the land might be induced to sell. The Council of the Province presented a memorial to the General Assembly in the Session of 1858, in which they complained that the system commonly adopted by the Government of acquiring the assent of every claimant to a piece of land before a purchase was made had been found to operate injuriously to the settlement; and they urged the expediency of setting aside the tribal right—expressing their opinion that such of the natives as were willing to dispose of their proportion of any common land should be permitted to do so; and that the Government should compel an equitable division of such land amongst the respective claimants on the petition of a certain proportion of them. They added their opinion that “no danger of a war between the Government and the natives need be apprehended from the prosecution of a vigorous policy, inasmuch as a large proportion of the natives themselves would cordially support it, and the remainder would from the smallness of their number be incapable of offering an effectual resistance.” But these suggestions received no countenance either from the Government or the Assembly. “I will never,” wrote the Governor, “permit land to be taken without the consent of those to whom it belongs; nor will I interfere to compel an equitable division of common land amongst the respective claimants. This decision is not less one of expediency than of justice, for the whole of the Maori race maintain the right of the minority to prevent the sale of land held in common with the utmost jealousy. Wi Kingi has no sort of influence with me or the Colonial Government. We believe him to be an infamous character, but I will not permit the purchase of land over which he has any right without his consent.” Early in the following year (1859) the Governor paid a visit to the settlement; and although the settlers had not cultivated more than 13,000 of the 43,000 acres of land in their possession, and of the territory already ceded by the natives 20,000 acres of heavily timbered land still remained in the hands of the Provincial Government open for selection, the Governor was again pressed to obtain additional land for the extension of the settlement. “I found them,” he wrote, “dissatisfied with the Government and ill pleased with the Maoris, who although they possess large tracts of land which they cannot occupy refuse to sell any part of it. They complain that they had not sufficient pasturage for their flocks, and that immigrants and capitalists are driven to seek in other provinces the accommodation which Taranaki could not under present circumstances afford.” He made the declaration to the natives, in which he was unfortunately

understood by them to announce his intention to adopt a new policy in the purchase of native land, viz., to treat with individual claimants, to disregard the influence of the chiefs, and to set aside the tribal right. The Governor stated that he never would consent to buy land without an undisputed title; would not permit anyone to interfere in the sale of land unless he owned part of it; and would buy no man's land without his consent. Te Teira, a Waitara native, then stated that he was anxious to sell land belonging to him; that he heard with satisfaction the declaration of the Governor referring to individual claims, and the assurance of protection that would be afforded by His Excellency. He minutely defined the boundaries of his claim, repeated that he was anxious to sell, and that he was the owner of the land he offered for sale. He repeatedly asked if the Governor would buy his land. Mr. McLean, on behalf of His Excellency, replied that he would. Te Teira then placed a *parawai* (bordered mat) at the Governor's feet, which His Excellency accepted. This ceremony, according to native custom, virtually placed Teira's land in the hands of the Governor. Paora then informed the Governor that Te Teira could not sell the land he had offered without the consent of Weteriki and himself, as they had a joint interest in a portion of it. Te Teira replied to him, and was immediately followed by William King, who, before addressing the Governor, said to his people, “I will only say a few words and then we will depart,” to which they assented. He then said, “Listen, Governor. Notwithstanding Teira's offer, I will not permit the sale of Waitara to the Pakeha. Waitara is in my hands; I will not give it up, ekore, ekore ekore (*i.e.*, I will not, I will not, I will not.) I have spoken.” And turning to his tribe added, “Arise, let us go.” Whereupon he and his followers abruptly withdrew, and it is said that some of the natives present at the meeting cautioned Teira not to embroil the country by attempting to effect the sale. It soon appeared that the native by whom the land was offered for sale had great difficulty in making a satisfactory title. William King, chief of the Waitara, acting as the representative of the tribe and guardian of the common property, resolutely opposed the sale. Members of the tribe, including several who were residing in the south and claiming to have an interest in specific portions of the block, also refused to dispose of their respective shares; and denied the right of Te Teira to deal with any of the land comprised within the boundaries of the block, except the specific portion to which he was himself individually entitled. But it appears to have been determined from the outset, that this interference of the chief of the Waitara was a mere assumption, which should be set aside in case of need by force. “I have little fear,” wrote Governor Browne, “that William King will continue to maintain his assumed right, and I have made every preparation to enforce obedience, should he presume to do so.” The

chief of the Waitara however did venture to maintain his right; and in the course of the following month, acting as the mouthpiece of the community and guardian of the rights of those who, besides Te Teira, claimed various portions of land within the block and had not consented to the sale, he addressed a remonstrance to the Governor, claiming to be heard in their behalf. "Your letter," he wrote, "reached me about Te Teira and Te Ritemana's thoughts: I will not agree to our bedroom being sold (I mean Waitara here,) for this bed belongs to the whole of us. You may insist, but I will never agree to it. All I have to say to you, O Governor, is that none of this land will be given to you; never—never, not till I die. I have heard it said that I am to be imprisoned because of this land. I am very sad because of this word. Why is it? You should remember that the Maoris and Pakehas are living quietly on their pieces of land, and therefore do not you disturb them." In his letters addressed to the Archdeacon of Kapiti some months afterwards King used much the same language. "I am not willing," he wrote, "that this land should be disposed of; you must bear in mind the word of Rere (his father,) which he spoke to you and Mr. Williams. You know that word about Waitara. I will not dispose of it to the Governor and Mr. McLean. Let your word to the Governor and Mr. McLean be strong, that they may cease their importunity for Waitara here, that we and the Pakeha may live in peace. I will not give up the land. The Governor may strike me, and without cause, and I shall die! In that case there will be no help for it, because it is an old saying, 'The man first, and then the land.' They say that Teira's piece of land belongs to him alone. No; that piece of land belongs to us all; it belongs to the orphan, it belongs to the widow. If the Governor should come to where you are, do you say a word to him." From the moment he offered the land for sale, Te Teira's power to dispose of it was steadily contested. The duty of inquiring into the validity of his title was entrusted to the District Land Purchaser, who reported that, in the face of opposing claims, the purchase could not be safely completed. Some months elapsed without his being able to make any satisfactory report; but he was informed by the native minister that the Governor felt that it was impossible for him, as Her Majesty's representative, to withdraw from the position he had deliberately assumed; and the Governor directed that the purchase should if possible be closed without delay. "The Governor," wrote the native minister, "is very anxious about the completion of the purchase from Teira. I am sure you will press the matter as fast as appears prudent. It will satisfy his Excellency if, without writing officially, you will let me hear privately how things stand." The local land purchaser, who appears to have exercised prudence and caution, and to have fairly set before the Government the

difficulties in the way of a peaceable purchase of the land, was still unable to hold out any hope of a speedy and satisfactory settlement of the question. But a few days afterwards he received authority from the Governor to make an immediate advance in part payment for the land. Two months afterwards an instalment was paid. "I do not wish," said the chief, who still persisted in his opposition, "that the land should be disturbed; and though they (Teira and others) have floated it, I will not let it go to sea. It is enough, Parris; their bellies are full with the sight of the money you have promised them; but don't give it to them; if you do, I won't let you have the land, but will take it and cultivate it myself." Finding himself committed to effect the purchase the Governor consulted the Executive Council on the subject (25th January 1860), who advised that should William King or any other native endeavour to prevent the survey, or in any way interfere with the prosecution of the work, the surveyor's party should be protected during the whole performance of the work by military force; that the Commanding Officer should be empowered to subject the Province to martial law; and that he should be instructed to keep possession of the debateable land, if necessary, by force of arms. Before attempting a survey of the land the District Commissioner made a last ineffectual effort to obtain William King's concurrence in the sale. A young man named Hemi Te Koro spoke favourably; but before he had finished William King, perceiving the tendency of his views, got up and said, "I will not consent to divide the land because my father's dying words and instructions were to hold it." A few days afterwards (20th February) the survey was commenced; but being obstructed, though without violence, the attempt was for the time abandoned. "It was the wife of Wiremu Patukakawiki and their own two daughters, and some other women of their 'hapus,'" said Rewai Te Ahan, "who drew off the Governor's surveyors from their own pieces of land." In reporting the obstruction to the Secretary of State the Governor stated that no more violence was offered by the natives than was necessary to prevent the extension of the chain. Ten days afterwards, although there was no disturbance of the public peace, martial law was proclaimed, and a manifesto was published by the authorities in the Maori language, and widely circulated by special agents amongst all the tribes of the Northern Island, declaring that Te Teira's title had been carefully investigated and found to be good; that it was not disputed by any one; that payment for the land had been received by Te Teira; and that the land now belonged to the Queen. On 5th March the Queen's troops were marched out to the Waitara, and themselves or their native allies destroyed the homesteads of William King and his people, took military possession of the ground, and thus dispossessed by force the occupants of the soil.

Before military occupation was taken of the Waitara, an appeal was made to the Governor by one of the settlers showing that William King being chief of the Waitara, it was no mere assumption on his part to claim to have a voice as to the disposal of the land, especially as many who had never been consulted had claims to specific portions of the block; urging at the same time that a complete public and impartial investigation should be made, and deprecating in the most earnest manner the employment of military force. It was not until nearly a year after the war commenced that it was publicly known that such an appeal had been addressed to the Governor before the troops were marched into the field. The appeal however was in vain. Before it reached the Governor martial law had been proclaimed, and it was probably thought that it was too late to recede without compromising the dignity of the representative of the Crown. A few days after the troops had taken possession, a party of about seventy natives who had been driven from the land returned; and for the purpose of asserting their title, and of keeping alive their claim, built a stockade within the limits of the debateable land. It was afterwards admitted by the local authorities that no one had decided that the pah was not built on ground belonging to persons who built it; but the officer in command of the troops immediately (17th March) took up a position before it and sent a summons to its occupants to surrender, which however they would neither read nor receive. "The guns and rockets," he reported, "now opened fire on the pah at about seven hundred yards, and in half-an-hour I moved to the right to batter another face at shorter range, when the natives opened fire on us." Thus hostilities commenced, the first shot being fired by the troops. A heavy fire was afterwards kept up against the stockade with shot and shell. The consequences of this proceeding soon became apparent, and the error of those who urged the Governor to resort to force was visited on the settlers in a manner painful and humiliating. Within less than a fortnight after the adoption of the "vigorous policy" recommended by the Council of the Province, and which they declared would be attended by no danger of an outbreak, the Superintendent reported that with the exception of about ninety persons, the whole of the settlers had abandoned their homesteads, and were concentrated in the town; that into a small town intended for a population of 1000 upwards of 2500 were crowded, and that nearly 500 of them were living on rations supplied at the public expense; and he suggested that in point of economy and for other reasons, it would be expedient to deport women and children to the number of about 600 from the Province. Whether or not their claims were valid, it was evident that the natives who had been forcibly dispossessed would not submit to see them set aside by force, and since blood on both sides had been shed, the

Governor became alive to the dangerous consequences of commencing a survey before he was assured that all who had even a disputed claim to the land desired that it should be sold. He reported to the Duke of Newcastle that a much larger number of troops than had hitherto been asked for would be necessary to maintain possession of the colony; that he had written to the Governors of the Australian Colonies requesting them to send him such support as they were able; and that hitherto he had considered that 2000 men with a strong company of artillery would have enabled him to bring such a force into the field suddenly as would extinguish the first sparks of rebellion; but he was now compelled to say that he believed 3000 men, a steam gun-boat and a steamer of war, would be necessary for some time to come to ensure the maintenance of peace. Following closely on repeated assurances that the purchase of the land had been completed fairly—that it was not disputed by any one—that the chief of the Waitara had never asserted any title to it—and that no real opposition was expected from him—this startling intelligence surprised the British Cabinet, and drew from Sir Cornewall Lewis, then acting as Colonial Minister, a grave and significant reply. Months elapsed before the public generally was aware how little could be effected by military force; and with the insignificant number of troops at his disposal, the situation of the officer in command was painfully embarrassing. The pahi of the insurgents were invariably taken, but the occupants as certainly succeeded in making their escape; and instead of gaining credit for capturing their strongholds, Colonel Gould, after being involved in an unequal contest with a formidable enemy in an impracticable country, was given to understand that the Maoris construed escape into victory; that they must be made to feel British power both to protect and to avenge; and that it was expected he would find some means of striking an effective blow against them. At the same time the Governor was anxious to avoid unnecessary bloodshed; and two months after the commencement of hostilities he requested that Colonel Gould would abstain from all interference with William King, unless he should himself commence hostilities. He afterwards repeated the request, and for some time there was an almost total cessation of active operations. But, unfortunately for the officer in command, it was not generally known that he had been prohibited from taking the offensive and attacking William King; his unexplained inaction naturally bore the appearance of a want of energy and enterprise; and failing to gain any decided advantage over the insurgents, Colonel Gould was assailed on all sides with abuse. The danger of arousing the natives into armed resistance was now sufficiently apparent; for with more than 2000 British troops in the province, with the sea close at hand for the base of operations, and with five ships of war on the N.Z. Station, the insurgents, although inferior in

arms, numbers, and equipment, soon had the whole district in their power. The settlers, who bore their accumulated misfortunes with wonderful spirit, and who for several months were crowded together in a state of helpless inactivity within the narrow limits of the town, had the mortification to see their homesteads set on fire and their cattle driven away, within less than a mile of the military post. Those who ventured beyond the limits of the lines were liable to be waylaid and shot; the road to the Waitara, not more than twelve miles distant, could only be traversed in safety with a powerful military escort; and instead of convincing the natives of the power of the Government "to protect and avenge," its protecting power was seen to be practically limited within gunshot of the camp. In the attack on Puketekauere, both officers and men, who had only just landed in the colony, found that they had to deal with no despicable antagonists. Armed with the rifle and bayonet and supported by artillery the troops were driven from the field, to the astonishment of the insurgents themselves, by a Maori force not more than double the number, having no artillery, without a single bayonet, and armed only with common muskets, fowling-pieces and double-barrelled guns. During their retreat the troops were so closely pressed by the insurgents that the dead were left upon the field, and a number of the wounded also were abandoned to their fate. The day but one following the dead were buried by the enemy within a mile of the British camp, and within range of its guns. From that day all who were engaged in this untoward affair were taught that both in point of generalship, as well as on account of their energy and courage, the Maories even in comparatively open ground are a formidable enemy—a conviction which they carried with them unimpaired through the whole campaign. Even before the conflict, it had become an axiom that the sure way to have a settlement destroyed was to garrison it with troops. General Pratt, on succeeding Colonel Gould in command, found the settlers driven in from their farms, their cattle seized, and other property destroyed, many of their houses burnt, the enemy in the immediate vicinity round the town, an attack on it avowedly threatened, and the place crowded with women and children, whose only safety was the presence of the troops. He was not long in discovering that he was engaged in a novel species of warfare, in an impracticable country, and against an active, daring and formidable enemy; and that in superseding Colonel Gould, he had succeeded to a thankless office and a difficult command. As soon as he had made provision for the safety of the settlers, who were all crowded together within the entrenched portion of the town, General Pratt commenced operations in the field. But the moving of a body of regular troops, with heavy guns and a long line of bullock drays laden with supplies, through a rugged country without roads or bridges, and intersected in every

direction by forest and swamp-gullies and streams was a difficult, expensive and unprofitable undertaking. Whenever they were attacked the natives abandoned their defences as soon as they became untenable and always succeeded in securing their retreat; and notwithstanding his exertions the General was unable to bring them to a decisive encounter. Though he drove them from their strongholds in every direction, and in the course of a few weeks captured and destroyed nearly thirty pahs, his services were by no means gratefully acknowledged. Like Colonel Gould, he had the mortification to be reminded that by the Maoris their escape would certainly be regarded as a victory. In urging the Government to ignore the tribal right and to pursue a "vigorous policy," the Provincial authorities of Taranaki had represented that a large proportion of the natives would cordially support the British, and that the remainder would from the smallness of their number be incapable of offering any effectual resistance. But the adherents of William King, including reinforcements from Waikato and the South, already amounted to about 1700 men; while Teira's supporters, who received rations and a shilling a day each from the Government, never exceeded 300. Nor had they the spirit of the insurgents; finding themselves in a false position, they were for the most part unable to act with much cordiality in the cause. In addition to 300 native allies the British forces amounted to 2300 men, but the difficulty of carrying on war either with honour or profit in a wild country abounding with natural fastnesses, began to dawn on a few minds. The Governor saw that even with a body of the Queen's troops considerably outnumbering the insurgents, unless some decisive advantage were speedily gained the war might be continued indefinitely. Seeing how disastrous the war had proved to the settlers, the local authorities became impatient for some unmistakeable success; and they were urgent that the General should adopt a system of guerilla warfare. "I have no doubt," wrote the Governor, "that a system of sudden, secret and constant attacks, when and where they least expect it, will so distress the natives in your neighbourhood that, when their allies return, both parties will be disheartened and glad to end their trouble by submission." The General was of a different opinion. He had seen enough to know that it was in vain to attempt to distress the Maoris by a system of guerilla warfare carried on upon their own ground by regular troops, dependent on a regular commissariat, and no match for their enemy in their local knowledge or in their power of moving through the bush. As regards the capture of the natives, the General reported that the attempts he had made to surprise them had convinced him of the hopelessness of all endeavours to prevent their escape from any place which they did not intend to defend. The only course which remained for the General was to show the natives that their

strongest position could be approached, turned, and captured with little loss to the invaders. The contest had now continued for upwards of eight months. At its commencement it was generally expected that a few months of active warfare would exhaust the ammunition and supplies of the insurgents; but excepting a few, who had had an opportunity of witnessing the difficulty of military operations in former Maori wars, the public were ignorant of their resources. In common with the natives throughout the country—partly through an evasion of the law, and partly through the operation of the relaxed regulations of the Government—they had recently been abundantly supplied with arms and ammunition. Besides what had been supplied to them in contravention of the law, eight thousand pounds weight of gunpowder, more than 300 double-barrelled guns, and nearly 500 single-barrelled guns, had in the short space of nine months been sold to the natives with the sanction of the authorities. If lead ran short amongst them, they made use of puriri or other hard-wood bullets; and to economise percussion-caps, they used them over and over again, pressing the broken edges together, and reloading them with the detonating matter on the tip of a vesta match. Being in possession of the country, living at free quarters, and following Napoleon's plan of making the war support itself, the insurgents were thus enabled to continue to keep the field, and without incurring any serious loss to give the troops no small amount of harassing and unprofitable occupation. Foiled by their skilful and cautious tactics, the General had long to wait for an opportunity of meeting them on equal terms. At the commencement of the outbreak it was declared by the provincial authorities that the insurgents would soon be starved out, and that shut up in the forest by an overpowering force in the open land, and harassed by irregulars in their retreats, they could hardly be supposed to have subsistence for a longer time than twelve months. It was not the natives however, but the troops and the settlers, who were really harassed and shut up; and so far from wanting the means of subsistence, it was reported nearly a year after the commencement of hostilities that since the rebels were located at Waireka (a few miles distance from the town) they had collected a large number of cattle and horses, which were sent from time to time to the Ngatiruanui country; that they were living in clover, had plenty of potatoes, which were taken from the settlers' cultivations, and as much beef and mutton as they could eat. More than a year after martial law had been proclaimed, and when there was a military force in the Province of more than 3000 men, exceeding the number of natives in arms, the settlers of Taranaki addressed a memorial to the Governor stating that the position of the settlement was very critical, and the results of the system of carrying on the war most unsatisfactory. That notwithstanding the presence of a very

considerable military force in the Province it was unsafe for any person to venture beyond the outposts in consequence of the country being continually overrun by small bands of marauding natives within rifleshot of the barracks. That within the last fortnight a large number of houses belonging to the settlers had been burned, great numbers of horses and cattle carried off, and an estimable settler waylaid and butchered. The position of the Governor had for some time been most embarrassing. From the first the justice and the policy of the war had been called in question. It was seen that the ground had been ill-chosen for a contest by regular troops; and after a struggle, protracted for upwards of a year, it was obvious that little progress had been made, and there appeared to be little prospect of reducing the insurgents to submission. The Governor was told by the Duke of Newcastle that, instead of being an Imperial question, the contest was regarded by Her Majesty's Government as peculiarly a settlers' war, or as a quarrel with William King; and finding himself involved in a protracted and fruitless contest for the attainment of an object which a large body of Maoris regarded as unjust, it was not surprising that the Governor seized the earliest opportunity of bringing the contest to an end. Nor had the insurgents anything to gain by prolonging it. It was beginning to be apparent to them that they were unable to make an effectual stand before the troops, and that General Pratt was able with little loss to dislodge them from any position they might attempt to defend. They were also advised by their friends that they might appeal with confidence to the justice of the Crown, but that it was in vain to defy its power; that while they were in arms their complaints would not be listened to; and that they must first cease fighting before their wrongs could be redressed. After a period of great suffering to the Taranaki settlers, the war came suddenly to an end, without an agreement between the contending parties or any decided advantage on either side. Terms of peace were talked of and offered by both, but hostilities were allowed to cease before any conditions were finally agreed on. A few weeks before the termination of the war, William Thompson, a Waikato chief, who prided himself on being a peace-maker, went down to Taranaki in the character of mediator with the view of inducing the contending parties to leave their differences to be determined by the judgment of the law. On arriving at the seat of war, he applied to General Pratt to grant a truce for three days that he might confer with King and his allies; but as no satisfactory terms were afterwards proposed to the General, the fighting was resumed on the fourth day. A few days after the head of the Native Land Purchase Department arrived from Auckland, instructed by the Governor to hear what terms the insurgents had to offer; and he had a meeting with William Thompson and about 100 of

William King's Waikato allies. The meeting however broke off without any agreement having been arrived at. At the conference held between William Thompson and William King, a number of the Waitara natives and the leading men of their Waikato and Ngatiruanui allies were present. After an interchange of diplomatic courtesies between the two chiefs, it was agreed by all present that the subject of dispute—the land at the Waitara, and the question of peace or the continuance of war—should be left to the decision of William Thompson. In little more than half-a-dozen words, and with the air of brevity and decision of the head of a grand army, the chief of Ngatiawa dismissed the allies to their respective homes, and so far as Taranaki was concerned almost instantly brought the contest to an end. The public, not knowing what had taken place, were astonished to see the Waikatos suddenly break up and disappear like a dissolving view. Shortly afterwards, the Governor having heard that the Waitara natives were willing to make peace, and having determined to treat separately with the several bodies of insurgents, proceeded to Taranaki; but either because they could not agree as to the place of meeting, or for some other reason, William King and the Governor never met, and the chief of the Waitara and a number of his people soon afterwards retired inland, without having come to any terms. The terms proposed by the Governor were accepted by a remnant of the Waitara natives who remained on the ground, and peace was hastily concluded with them. The troops were withdrawn from the various redoubts and marched into the town; and shortly afterwards, to the astonishment of the Taranaki settlers, three-fourths of the military were suddenly removed from the Province. To satisfy the settlers—who were unable to see what advantage they were likely to obtain, after all their sufferings, from a war thus suddenly brought to an end, leaving many of their cultivated farms in the possession of the insurgents, who now claimed them by right of conquest; without indemnity for the past, security for the future, or any guarantee for the continuance of peace—the Governor informed them that “the terms granted to the Ngatiawa were determined on with a view to simplify the issue in the present struggle; that it had been called a land quarrel, but though it arose out of a land quarrel, it was itself a question of jurisdiction; that it was thought right by himself and his Executive Council to rid the issue of this extraneous matter at once, and that he thought the settlers would shortly see that this was right. The land league he believed was broken up for ever in Taranaki; and as the natives, now that its pressure was gone, were desirous to sell land, all that was necessary for the consolidation of the settlement would, he had great hopes, be very soon obtained.” During the continuance of the war, the productive industry of the Province was brought entirely to a stand, and the whole European population, crowded together

within the narrow limits of a small portion of the town, suffered severely from sickness, anxiety, and harassing suspense. Both in men and money, and in the destruction of property, the cost of the war was by no means inconsiderable. The British casualties amounted to 210, 67 killed and 143 wounded, several of whom afterwards died of their wounds; and the extraordinary amount of sickness, the result of over-crowding and other causes, carried off upwards of 100 of the Taranaki settlers. The loss of life on the side of the natives was not clearly ascertained, but there is reason to believe that it amounted to about 150. In addition to the ordinary cost of the ships and troops employed, the expenses of the war paid by the Imperial Commissariat amounted at least to half a million sterling. To the colony itself for militia, volunteers, relief, and other expenses, the cost amounted to more than £200,000. The neighbouring Province of Auckland also suffered severely from the sudden and complete check put to immigration, which was yearly adding some thousands to the population. But it was the unfortunate settlers of Taranaki by whom the sufferings of the war were most severely felt. Their losses it was stated in the memorial addressed by them to the General Assembly were variously estimated at from £150,000 to a quarter of a million sterling. Two hundred houses had been burned; horses, cattle and sheep killed or driven off; fencing destroyed; noxious weeds had overrun the cultivated lands, and the agricultural part of the community were deprived of their means of subsistence. In its indirect effects, the war was still more disastrous. A feeling of antagonism was excited between the natives and the settlers. At the end of nearly a year of war an official notification was published in the *N.Z. Gazette* stating that “dissatisfaction was spreading through the Maori population,” complaining that the “justice and legality” of the policy of the Government had been impugned by persons of “high authority” in various parts of the colony; and warning the colonists that an Englishman's privilege of freedom of speech could not any longer be exercised without danger to the State. But as the facts of the case gradually came to light, public opinion underwent a change; and before the war was brought to an end its justice appeared less clear, its policy was called in question, and the opinion was becoming general that it had been blindly commenced, feebly conducted, and after a fruitless waste of life and property had been brought to a hasty and unsatisfactory conclusion. The Ministers who had advised the Governor to risk the war, finding that it had been productive of nothing but disastrous results, and that the Home authorities regarded it simply as a settlers' war, appeared by no means unwilling, so far as the original cause of quarrel was concerned, to bring the war at the Waitara to an end, and to hazard an imperial contest at the Waikato for the suppression of the Maori King. But in addition to the virtual

destruction of the settlement, the war had cost three quarters of a million. The settlers in other parts, with the experience of Taranaki before them, and believing that the Government were prepared to take up a new ground of quarrel in another Province, and to march the troops into the interior to enforce the submission of the Waikato tribes and to put down the Maori King, became alarmed lest war might be brought to their own doors and find them unprepared. A committee was therefore appointed by the Assembly to report on the military defence of the colony; and a deputation of representatives of the Province of Wellington warned the Governor not to risk war a second time without making timely provision for the safety of the principal settlements. The Governor informed the deputation that 20,000 soldiers could not protect all the out-settlers; that in the event of an attack they would have to take refuge in the centres of population—build block-houses as the settlers at Taranaki had done, and defend them; and that war carried on in a country where wealth and property are scattered broadcast must be attended with great loss and very serious consequences. That the terms he had proposed to the Waikatos he intended should be insisted on; and that he believed at the first shot fired in the Waikato there would be a general rising of the tribes connected with the King movement in the several provinces. But the Government, who had already burdened the colony with a heavy debt for a disastrous war, were prevented from provoking a second war on a far more costly scale, being shortly afterwards defeated on a vote of want of confidence, and displaced by a ministry desirous of avoiding a renewal of the war. The home authorities also being satisfied at length that little effect had really been produced by the military operations at Taranaki, and that disaffection was spreading throughout the country, and feeling that no expedient should be left untried to arrest the growing evil, determined for the second time to avail themselves of the peculiar qualifications and experience of Sir George Grey; and commissioned him to proceed at once to N.Z. to take the place of Governor Browne. The colony was thus opportunely relieved from the imminent risk of a still more general war.

XXI. *Governor Grey's Second Term.*—So far the war had settled nothing. About 200 soldiers had been killed; New Plymouth was all but destroyed; Kingism was rife and ready to appeal to arms. There was peace, but it was a hollow peace: the fire only smouldered; it was not put out. In the event of war in Waikato the settlers, warned by the experience of Taranaki, trembled for their unprotected homes. When Governor Grey arrived in September 1861 there was a breathing time; hope was revived; the hatchet might be buried. The new Governor came with no common prestige; his mission was not war but peace; his advent was hailed as the morning light; and if any man could have restored the confidence of the disaffected

tribes it was he. But it was too late. Had the measures he now initiated been taken in time, there would have been no war. Years of woful neglect were working out their results. It was easy to evoke the evil spirit; not so to allay it. The attitude of the Taranaki natives was hostile, while the powerful Waikatos had thrown off their allegiance and chosen a king of their own. To conciliate them was important, not merely on account of their number, their intelligence, their influence, but because of their proximity to Auckland. With all their personal respect for the Governor they were sharp enough to detect his diplomatic genius, and listened to his overtures, not without mistrust. Comparing him with his predecessor, they were wont to say that the latter was like the hawk which hovered overhead, and though a bird of prey could be always seen; while the plans of his successor were not so evident; he was like a rat which worked underground, so that it could not be told where it went in or where it would come out. This feeling was strengthened by an unfortunate expression about Kingism, when he told them that he would not fight against it but would dig around its roots until it fell. Grey soon found that he had taken upon himself a huge task. Governor Browne had threatened Waikato with war if they did not give up their King. They firmly but peacefully refused. The new Governor said he would not make war; still they held fast to their King. He was in a dilemma. A new policy was framed. Civil institutions were to extinguish the war spirit. The whole Maori territory was divided into twenty districts; an English Commissioner was to preside over each one. There was a subdivision into hundreds, and two native magistrates, a warder and five constables were to be appointed for each hundred. The magistrates were to receive from the Government salaries ranging from £30 to £50, the warder £30 and the constables £10, together with a suit of uniform every year. The magistrates were to form the district Runanga (or Council) over which the Commissioner would preside. The Assembly had invested the Governor and his Executive with power to make by-laws for these native districts. Grey showed his wonted energy in seeking to make the new *régime* successful. By the natives who were friendly it was accepted with acclamation; but it failed after all. The first tribe to which it was offered was the Ngapuhi at the Bay of Islands. They received the Governor with joy and were charmed with his policy. On one occasion the welcome characteristic of true Maori style might have tried the nerves of a less experienced man. "A crazy old chief made a violent and hostile oration, dancing with excitement and declaring that he would separate from the Governor and fight him that very day. He ended his speech by jumping upon the verandah where the Governor was seated, and offering to stab him with a long steel-pointed rod which he had brandished while speaking. He then abruptly

burst out laughing, shook hands and said that he was only joking, and was really very glad to see his old friend Grey." The Waikatos were cautious; they were willing to consider the proposal, but their King they would not forsake. It was agreed to hold a great meeting at Taupiri. This took place on the 12th December 1861 and lasted several days. But before the meeting the natives discussed the matter among themselves. Tamihana Tarapipi was the prime mover in those meetings; he was a remarkable man; and if his great influence had been secured on the Government side, he would have been to it a tower of strength. He has been variously described as a patriot and a traitor, as a peacemaker and a disturber, as a man of honour and one not to be trusted. But those who knew him best admired him most. Could he have spoken for himself, justice would have been done to his superior character; but it was the misfortune of such men to be reviled without any medium of defending their reputation. As an instance of the suspicion with which the Governor's plans were regarded, Te Oriori said: "The usual way of catching owls was for one man to shake some object before the bird to attract attention, while his mate slipt a noose over its head from behind. So Sir G. Grey had sent his mate to dazzle them with laws and institutions, while he was watching his chance of entangling them in the meshes of the Queen's sovereignty." They were however generally agreed that if some such plan had been carried out five or six years before, they should not have thought of a Maori king. They had sought in vain help from the Government; and had therefore tried to set up a government of their own. "If a *weka* (landrail) escape from the snare, you never catch that same bird again." So they reasoned. Their conclusion was that if their King and their flag were permitted to stand, they would try to work with His Excellency for the common good. At the Taupiri meeting Grey made a long speech. Tipene was chosen as the spokesman on the Maori side. After long discussion they could obtain no pledge that their King would be recognised. They believed that the Governor would try to depose him; and this was confirmed by his proceeding to employ the troops to make a road through the Hunua forest. At this time native legislation was remitted to a responsible Minister. W. Fox, an old colonist and an able man, accepted this office, and had several interviews with the alien chiefs. At the Maori court he was received with marked honour and respect, but was not permitted to see the King. A guard of honour turned out to receive him. Forty young Maoris, dressed in white breeches and blue coats, with stiff military stocks of cardboard, lined the road on either side, and presented arms as Fox rode between. His horse was taken from him by a Maori lad; he was ushered into the best house in the village, and asked by a handsome young woman, in good English, whether he chose roast fowl or sucking-pig

for supper. For eighteen months the Governor and his responsible advisers were most untiring in their endeavours, but failed to persuade any but the "friendlies" to adopt the new institutions. General Cameron had a large force at his command. To utilise them as well as to be prepared for any ulterior measures, they were employed in forming a road through the wood leading to the Waikato. The natives took this as a sign of war-like intention; and they said that if the troops crossed the Maungatawiri, a creek which marked the boundary dividing the Crown land from their own, they should regard it as a declaration of war, and act accordingly. It was a necessary work, but it made a peaceful solution all but impossible. Nothing could persuade the natives but that, while the words of the Governor were "smoother than butter, war was in his heart." The Waitara question was still unsettled. A fine block of land on the south side of New Plymouth, called Tataramaika, was in the hands of the Maoris. This block was purchased many years before by the Government, and the title was undisputed. The natives, after driving off the settlers, held possession of it. The Governor made known his intention of retaking it, and with this view he repaired to Taranaki in April 1863 accompanied by General Cameron. He had found on enquiry that Te Teira's title to the Waitara was not sound, and he resolved to give it up. By a fatal blunder he sent troops to occupy Tataramaika, without a word of his purpose as to Waitara. Had he announced that he would deliver up Waitara and resume Tataramaika, the natives would have raised no objection; as it was, they prepared to retaliate. On 4th May an ambuscade cut off two officers and eight troopers who were in charge of stores. Then the Governor was betrayed into another and even greater blunder—he at once made known his decision to restore Waitara. This coming on the heels of the assault was taken as a proof of conscious weakness, and the result of fear. It was a serious error, giving boldness to the disaffected, and apprehension to the loyal natives. The war was renewed.

XXII. *The Maori Wars of 1863.*—To strengthen the frontier between the King party and Auckland, and for the purpose of asserting the Queen's authority, a court-house and a police barracks were to be built on land belonging to a loyal chief in Lower Waikato. The Kingites declared it should not be done. When all the materials were on the ground they came in force, and overpowering the friendly natives threw all into the river. At the same time they forcibly expelled from their territory the English magistrate, Mr. Gorst. All this happened while the Governor was at Taranaki; and it hastened his return. Satisfied that the Waikato tribes had instigated the Taranaki people to resistance; that their overt acts were evidence of a determination to fight; and that a plan of attack upon Auckland was already formed; he recalled General Cameron with all the soldiers he could spare from Taranaki. And now began the

Waikato campaign. A number of Waikato natives were living peacefully on their own land at Mangarei, near Auckland. The Governor believed that they were implicated in the design for attacking the city; he required them to take the oath of allegiance or remove to the interior. A day was fixed, after which failing of their submission they were to be dealt with as enemies. Whether there was solid ground for the suspicion is by no means clear. If there was just reason for mistrust the mode adopted was surely wrong. It was calculated to exasperate even friendly natives into foes; it had that effect on them. On a Sunday morning a mob of Europeans repaired to their settlements with carts and took away all they could lay hands upon, rifling their houses and destroying their crops. From their concealment in the bush the owners beheld the reckless spoliation of their homes. By an oversight, due perhaps to alarm, they were allowed to take their arms with them, and falling back into the forest they took the lives of several settlers. On the occasion of a public holiday the town was illuminated; seen from the distance it looked like so many bonfires. By the natives who saw it this was construed into a war token. On 12th July General Cameron crossed the boundary creek. A fight took place in the open on the Koheroa range; several engagements followed. The Maori warriors against great odds defended their positions with admitted valour, obstinacy and strategy. They had thrown up strong earth-works and dug rows of rifle-pits. On the river the General had two bullet-proof steamboats. After severe fighting the natives were compelled to fall back upon Rangiriri. The successes of the troops would have been more complete but for the slow, methodical routine of military tactics. The battle of Koheroa was fought on the 17th. Had the victory been promptly followed up the natives would have been disheartened; as it was, time was allowed them to rally; no forward movement was made for fifteen weeks. The Waikato plain resembles an equilateral triangle, the sides being from forty to fifty miles long. It lies between two rivers, the Horotiu and the Waipa. It is open and level—good ground for military operations. From the boundary creek to the plain the Waikato river flows for about thirty miles. The forts of Mere-mere and Rangiriri were on the left bank of this river. The former of these after a stout resistance was evacuated as soon as the troops were ready to assault. The attacking force numbered 1300 including 200 of the naval brigade. The Maoris opposed to them were from 400 to 500. Several attempts were made to storm the Rangiriri, from which the besiegers were mowed down by a heavy fire. At last, getting to the rear of the fort, it was seen that the occupants were escaping by a lake and a swamp. This was at dusk. Further exit was prevented. At daylight there remained 183 men and two women, all of whom surrendered themselves as prisoners of

war and were marched to Auckland. Ngarnawahia was taken without opposition. Peace could then have been made,—the natives expected it. Disappointed, they resolved to fight to the bitter end. Fierce battles were fought at Te Awamutu, Rangiaohia and Orakau. The last of these was a strong stockade. Surrounded by 2000 troops, a sap was begun, the guns were brought into play and hand-grenades were thrown in. The 300 natives were now at the mercy of the assailants. There were women and children among them. For three days they had been without water and had only a few potatoes among them. An interpreter was sent to tell them their lives would be spared if they would surrender. They answered, "We will fight for ever and ever and ever." It was urged upon them to send out the women and children. Again they replied, "The women will fight as well as we." The firing was renewed. It was now all but a hand-to-hand contest—there was only a parapet between them. A private threw his cap over a breached place and rushed after it; about twenty more—colonial troops led by Captain Hertford—followed. The Maoris dealt a withering volley and ran for the inner works. Ten of the twenty men were down. On the opposite side of the pah some men of the 65th and the militia made a similar attempt. It was four o'clock p.m.; the whole Maori force was escaping. A double line of the 40th, under Colonel Leslie, invested that side. The first line was stationed under a slight bank, which had sheltered it from the fire of the pah. Before they knew that the Maoris were out they had jumped over their heads, and passing on walked through the second line. They formed in a solid column—the women, the children, and the great chiefs in the centre; and they marched out as cool and steady as if they had been going to church. When the troops had recovered from their surprise they were got together, and with loud yells started in pursuit, firing at the fugitives as with quickened pace they made for a swamp and scrub. They would all have escaped but for a corps of colonial cavalry, which got ahead of them and shot them down as they were getting out of the swamp. About 200 of them were killed, while the casualties on the British side were sixteen killed and fifty-two wounded. Thus ended the Waikato campaign. The war was now carried to Tauranga, divided from Waikato by a range of hills. The Maoris had strongly fortified themselves in the Gate Pah. It was on a narrow neck of land with a swamp on either side. On a gentle rise a redoubt was constructed. It was oblong, about seventy yards wide by thirty deep. It was well palisaded and defended by lines of rifle-pits. These were in zigzag tiers thatched with fern, and the eaves of the roofs so raised that the garrison could fire out on their besiegers. Some of the roofs were covered with earth. There were not more than 300 natives in these works. The forces were five times that number, with nine or ten

Armstrong guns. The Maoris had no artillery and were without water in the pah. It was completely surrounded after dark on the 27th. Early in the morning the besieged opened fire, and the four batteries responded. One who was present said that the fire of shot and shell that was poured into the redoubt was enough to have smothered Sebastopol. The natives endured this cannonading with stolid indifference. "Imagine," says Fox, "the position of Maoris lying still in their grass-roofed and watted burrows, excavated in the banks of their rifle-pits, listening hour after hour to the roar of the big guns and the hurtling sounds of the projectiles, feeling the terrible concussions of the shells as they struck close by or just over them, or scattered in fragments and carrying death among them, with the certain conviction that before night they would be assailed by the bayonets of an overwhelming force of trained soldiers. It must have required something more than a dogged disregard of death in untutored men to enable them patiently to await their apparently inevitable end amidst such a terrible scene." By four p.m. a breach was made and an assault ordered; and seamen, marines, and soldiers entered the pah. The natives could not escape. The pah was all but taken when a sudden panic seized the troops, who rushed pell-mell out of the breach in headlong flight crying out, "There's thousands of them!—there's thousands of them!" The officers did their best to rally the terrified men, but it was too late. The natives took advantage of the causeless alarm, concentrated their fire on the flying column, and committed fearful execution. The British lost several valuable officers in this untoward affair. The General did not renew the assault, but directed a line of entrenchments to be thrown up within a hundred yards of the work, intending to resume operations next day. But the pah was abandoned by the Maoris during the night. Their loss was between thirty and forty men, and on the British side the loss was twenty-seven killed and sixty-six wounded. Three miles distant Te Ranga, another Maori entrenchment, was in course of construction. An attack was made on it by Lieutenant-Colonel Greer with complete success. The engagement was over in a few moments—the enemy leaving 109 dead bodies on the spot, while on the British side only eight were killed. While these events were taking place at Tauranga the native allies, the Arawa, under Captain Mair, were doing good service against the Taupo tribes, thereby preventing them from joining the Waikato insurgents. Skirmishes between the troops and the Maoris were also frequent at Taranaki, but nothing on an extended scale was attempted there. But no sooner was the Tauranga campaign ended, than news arrived that Wanganui was in danger. A reinforcement of 300 men was sent down. Ere they arrived the Maori allies had done the work. In 1868 fighting was resumed in that district, and Titokowaru with his warriors swept the country

to within a few miles of the town, which was threatened with an assault. There he was repulsed, and driven back by a body of volunteer cavalry. During this period heavy losses were inflicted on the Maoris by the European and native forces. Disputes arose between the Governor and the General which stood in the way of more signal success. Colonel M'Donnell, at the head of native allies whom he commanded, as well as some volunteers, distinguished himself both here and on the south-eastern coast. He was trained to bush-work on the Hokianga, and was a dashing officer. Through the impatience of ministers to have something done quickly he led his men, against his own judgment, to the fatal attack on the Ngutu-o-te-manu (bird's beak) forest. Here the gallant Von Tempsky lost his life. The natives fired from the tops of the trees. With much difficulty, and not without serious loss, the Colonel effected a retreat from that perilous position. Gradually the war died out. It had dragged along its slow length for ten weary years, evoking heroic exploits. It was marked by woful blunders, and was the cause of a frightful loss of blood and treasure.

XXIII. *Incidents of the War.*—In the course of the war many prisoners were taken. General Cameron handed them over to the Government for safe custody. They numbered 214, and included many chiefs of high rank. They were placed on board a hulk in the Auckland Harbour, and were well satisfied with the treatment they received. Very soon a difference of opinion was manifest between the Governor and his Ministers. The former wished them to be released on parole; the latter wished to bring them all to trial, and refused to release them except after trial; but they had no objection to be relieved from all responsibility in the matter. Grey proposed to send the prisoners to the Island of Kawan, his private property. He had his country seat there, and besides his own servants there were no inhabitants. It lies about thirty miles from Auckland. To this the Ministers agreed and placed them under the personal charge of the Governor, who employed them in clearing land and building houses. They had been there six weeks when news was brought to Auckland that they had made their escape and gone no one knew whither. Left without a guard, they utilised an old canoe, paddled themselves across to the mainland, and planted themselves on the top of a circular hill called Omaha in the midst of a district occupied by small farmers. By some means they obtained a supply of arms and food—the neighbouring natives must have given them these. The Governor tried to coax them back, and sent several officials to them; but they were not to be so taken. To use force would be to risk a war in the north and to expose the scattered settlers to danger. At last the Governor said he would allow them to return to Waikato. They said they would not move until after they had eaten their Christmas dinner. In the end they

broke up their party and went each to his own company. In 1866 the Governor confined sixty prisoners on board a vessel in the Wellington Harbour. These were captured when the Wereroa pah fell. They were guarded by an escort of the 50th Regiment. At night the prisoners were kept below, a sentry being on deck over the hatch. One night when it was blowing a gale of wind, a heavy sea running and the sky pitch-dark, the Maoris, with a screw-key, opened one of the bow ports, and before daylight all but three had gone. The darkness of the night and the roaring of the wind and sea prevented the sentry from seeing or hearing anything. The officer in charge was ashore; it was so rough that no boatman would take him to the ship, which was about three-fourths of a mile from land. Four Maoris were drowned in trying to swim ashore, three came back pressed by hunger, two were shot by parties sent out in pursuit, but the greater number were not seen again. The most serious escape was that of the Chatham Islands prisoners. They were taken in the east coast campaign, and numbered 187. They were well treated. After some time the guard of twenty-five men was reduced to fifteen. Among the prisoners was a man called Te Kooti. He composed a poem in which he claimed to be inspired. In this capacity he acquired an ascendancy over his companions in exile. A plan was matured for escape. On the 3rd July 1868 the schooner *Rifleman* arrived with stores. The next day the prisoners rose upon the guard and clove the skull of the only one who offered resistance; then they secured the Resident Magistrate, Captain Thomas, and all the male Europeans, leaving the women and children free. They boarded the schooner and bound the crew; they shipped their own wives and children, plundered the island, cut the cable of the only other vessel to prevent pursuit, and set sail for Poverty Bay on 5th July. They left the captain ashore, and the mate was compelled to navigate them on pain of death. During the voyage armed guards paraded the deck day and night; the crew were forbidden to cook, and a sentry with a drawn cutlass stood by the man at the wheel, to see that the right course was kept. When in sight of N.Z. Te Kooti ordered his uncle to be thrown overboard. He was one of the three who objected to the escape, and had informed the authorities, who took no notice of the warning. On the evening of the 10th the *Rifleman* arrived at Whareongaonga, six miles from Turanganui. That night and the following day were occupied in landing the cargo, women and children. They shipped two casks of water for the use of the crew, and the mate was told to go where he liked. The escaped prisoners made their way over a very rough country towards the interior. If unmolested they meant quietly to retire into the fastnesses and enjoy their freedom; it would have been well had they been allowed to do so. Major Biggs, however, collected all available forces, European and native, and gave chase; his zeal cost him his

life. The fugitives were brought to bay and offered fight. At the first brush the Europeans were defeated with the loss of seven men. Thus began another guerilla warfare which lasted two years.

XXIV. *The Hau Hau Rebellion.*—On more than one occasion an attempt was made to revive old superstitions. But those cases of fanaticism were limited in their extent and short in their duration. It was during the war of 1864 that a wide-spread and furious spirit of infatuation laid hold of the tribes that were in rebellion against the Government. It was first known as the Pai-Marire ("good and peaceful") movement, but it soon took the name of Hau Hau ("to deal blows to") from an exhaustive process of bellowing as they danced round a pole which they called Niu. This new faith, if it can be so called, was a compound of Judaism, Mormonism, and Spiritualism; and its rites were bloody, sensual, and devilish. It had a political rather than a religious meaning, so that the terms "Hau Hau" and "Kingite" became all but synonymous, although they were not all equally violent. It began in Taranaki in 1864. A man called Te Ua, who had been looked upon as little less than a maniac, believed that he had a revelation from the angel Gabriel, and he was raised to the dignity of a prophet. He said they had been wanting in homage to the Virgin Mary, that the priests had superhuman power, and that Gabriel would send legions to fight for them, if they obeyed his behests. About that time, a detachment of the 57th Regiment under Captain Lloyd was surprised and defeated with heavy loss; Captain Lloyd was among the slain. The fanatics drank the blood of those who fell, cut off their heads, and buried them separately from the bodies. A few days afterwards they said the angel Gabriel had appeared to those who had quaffed the blood of their victims, and by the medium of Captain Lloyd's spirit ordered his head to be exhumed, cured in their own way, and carried throughout the length and breadth of N.Z. From that time the head of Captain Lloyd was to be the medium of communication with heaven. Te Ua was made the high-priest, and Hapaniah and Rangitaurira his assistants. Then the head, in the most solemn manner, made known the tenets of the new religion, which were as follows:—(1) All its followers to be called "Pai-Marire." (2) Gabriel with his legions will protect them. (3) The Virgin Mary will be always with them. (4) The religion of England, as taught in the Bible, is false. (5) The Scriptures must all be burnt. (6) No notice must be taken of the Christian Sabbath. (7) Men and women to live promiscuously. (8) Complete victory to follow the vigorous "Hau." (9) The European population to be driven out of N.Z. (10) This will be done when the head has made its circuit of the land. (11) Men will then come from heaven to teach them knowledge. (12) The priests have the power to teach the Maoris English. The minds of the people were prepared for any extravagance that would

promise success against the Europeans by their previous disaffection. This new-fangled belief spread rapidly among the belligerent tribes. They had already renounced the sovereignty of the Queen; and required all Europeans, including missionaries, who would not promise allegiance to their King to quit their territory. Now they renounced Christianity and threatened the extirpation of all the white people. At Sentry Hill, about six miles north of New Plymouth, there was a redoubt occupied by seventy-five soldiers. About eight o'clock one moonlight night the men saw a Maori coming across the flat, throwing his arms about in a wild manner, and singing what sounded like a native hymn. He walked boldly up to the parapet and sat down on the edge of the ditch. The officers would not let the men shoot him. A sergeant with ten men went out to him; and as they came near the Maori jumped up, threw a stone which hit the sergeant on the throat, and ran away. They fired a volley, on which he sat down on a large stone and went on with his song. After another volley he took to his heels. A few days after, at early morn, the soldiers heard the Maoris in their pah chanting their war-song. In a while the sound changed to the barking of dogs and fierce yells. Very soon they saw a force of 300 armed Maoris at a distance of 800 yards, coming slowly towards the redoubt in fours. At 150 yards they halted. Order was then given to fire. The Maoris stood as if they did not expect to be hit; but they broke and fled, leaving thirty-four dead and wounded behind them. As the Maoris were advancing, the same man that previously came alone was a few yards in front of them, again singing and throwing his arms about. This was Hapaniah, one of the prophets of the new superstition. But this time he was killed. The surviving prophets said that the cause of their disaster was that the angel Gabriel had been offended by some neglect on the part of Hapaniah. They still believed in their invulnerability. Captain Lloyd's head was now in the hands of a prophet called Matene. He went with a large party to Upper Wanganui, and having obtained many adherents to the new faith decided on an attempt on the town of Wanganui, at the mouth of the river, about 100 miles lower down. The river is broad and rapid and rushes between lofty crags, through a country that can be traversed only by Maoris or trained bushrangers. The settlement could be reached in a few hours by canoes. The town was defended by 300 soldiers and a few militia. All they could have done was to protect their own position, while the hamlets and homesteads, scattered over fifty miles, were exposed to the ravages of the enemy. It was a perilous crisis. A party of 300 friendly natives undertook to oppose the progress of the invaders. At break of day on 13th May 1865 a battle took place on a small island called Moutua, about twelve feet above the level of the river. The loyal natives were victorious; the Prophet Matene was killed

and the remnant of his forces dispersed. In this fight Hoani Wiremu Hipango, a brave Christian chief, met his death-wound. He died the next morning in the town and was followed to his grave by all the civic and military authorities. A public monument was built in Wanganui in memory of this heroic man and those who fell with him in defence of their English friends. The rebels were not dismayed at their reverses; a potent spell bound them; all that befell them only added fuel to the fire of a fierce spirit. They sent out their messengers to every part of the islands. Their creed—framed on the principle of taking something from all creeds—spread like wildfire, new articles being added to it from time to time, to keep pace with the growing furore of their disciples. They wielded a kind of mesmerism which proved infectious. The least objectionable of their practices was that of running round a pole stuck into the ground, howling and yelling until sometimes they would fall senseless to the ground. Their bitterest hatred was reserved for the missionaries. Before this they had forced many of them to abandon their stations, but now they thirsted for their blood. An attack was made on Bishop Williams at Waipatu. His life was saved by a timely flight, but his house was plundered and the labour of years destroyed. But two useful lives were sacrificed—the Rev. C. S. Volkner of the Episcopalian, and the Rev. J. Whitely of the Wesleyan mission. The former was a Lutheran who for six years had lived among the rudest tribes of the Bay of Plenty. He was a devoted man and gradually won his way till he had around him a large body of converts, who built for him a handsome church and parsonage. There was no sign of disaffection among them until one day Father Garavel brought them letters from the hostile tribes at Waikato; then a change came over them. Volkner told the priest that he felt it his duty to inform the Government of the character of the said letters, which he did. The result was that Garavel was sent away to Sydney by Bishop Pompalier. Going to Auckland the missionary thought it prudent to take his wife with him and leave her there for a while, owing to the altered disposition of the natives. He returned to his station in company with the Rev. T. Grace; but meanwhile a body of Hau Haus, headed by Kereopa, had arrived. Volkner's property had been seized by them, and on the arrival of the two brethren in a small schooner called the *Eclipse* they were dragged ashore and shut up together in a large house. The captain and his brother, being Jews, were allowed to go about as they pleased. Next morning, 2nd March 1865, a party of armed men came for Volkner. He was taken to a large willow tree near his own church; a block and tackle brought from the vessel was fastened to one of the branches; he was told to prepare for death. Kneeling down he prayed for his murderers, and then rising up and shaking hands with them he said he was ready. They bade him take off his

coat and waistcoat; the rope was placed round his neck and he was hauled up. Life was scarcely extinct when they let him down and cut off his head. His companion, Grace, was allowed to bury the mutilated corpse, which he did in the chancel of the church. His head was stuck on the pulpit in the Roman Catholic Church, as though it was meant as a payment for his having caused the removal of Father Garavel. Grace was kept a prisoner for a fortnight, expecting every day to share the fate of his friend. At the end of that time Her Majesty's ship *Eclipse* arrived off the river, when Captain Levy—who owned the little schooner—at the risk of his own life, got him into his boat and pulled him off to the man-of-war. An attempt was made by the commander of the man-of-war to capture the murderers, but without success. Four months after, a small vessel arrived at Wakatane, not far from Opotiki, and a party of Hau Hau natives boarded her, and killed the captain and crew, together with Fulloon, a half-caste interpreter. These foul murders and others that were committed by the fanatics excited strong public indignation. A colonial force and native allies, altogether nearly 900, were sent to Opotiki. The Hau Hau rebels, having the heads of the murdered with them, were entrenched in strong paha and in great numbers. Several sharp engagements followed. The rebels fled through a most difficult country. They were pursued and overtaken; about 500 of them surrendered, including women and children. At the same time Major W. Mair was gallantly commanding a native contingent, the Arawa, and compelled the remainder of the Hau Hau combatants to an unconditional surrender. Te Ua, the prophet, and twenty-eight of the men implicated in the atrocious murders of Volkner, Fulloon, and others, were among the number. They were tried by a court-martial, and sixteen of them were pronounced guilty. These were sent to Auckland, where the trial was re-heard, and five of them were hanged. A great blow was inflicted on the Hau Hau, but the snake was not destroyed. The more moderate of the native insurgents were greatly shocked at the excesses which had been committed, and Tamihana Tarapipi, one of the highest, ablest and best of the chiefs on that side, volunteered his submission to Colonel Greer, saying, "We consent that the laws of the Queen be laws for the King, to be a protection for us all forever and ever. This is the sign of making peace, my coming into the presence of my fighting friend, Colonel Greer." Bloodshed left its trail from year to year—sometimes in one part of the country, then in another, and often in several places at the same time. No settlement had suffered so much as Taranaki, where the war began. A lull had come over it, and some of the settlers had ventured to return to their farms. The Rev. John Whiteley had lived there for many years, in charge of the Grey Institution for the education of Maori youth. He came to the country in 1832, and had been a laborious missionary. He

took up his abode at Taranaki in 1856. He was a good Maori linguist, and had great influence. All through the war he rendered valuable service to the Government by his counsels. He laid himself out for the good of all, whether Maori or European. On Saturday 13th February 1869 he set out on horseback, according to his wont, along the coast. His destination was at Puke-arube (Fern-root Hill) better known as the White Cliffs, about thirty miles north of the town. This was the remotest dwelling in that direction. An officer and his family, with a small body of men, were in charge of a redoubt. It was Whiteley's plan to sleep there, hold a short service on Sunday morning, then visit each hamlet in turn for service, and to preach at New Plymouth in the evening. The weather proved stormy on the Sunday, so that his non-return did not create alarm. On Monday morning, while a settler was looking for his cows he came upon the dead body of Whiteley, and that of his horse beside him. As far as could be learnt, when he reached the place on Saturday afternoon he found it in possession of an armed party of natives from Mokau, an all-but-inaccessible part of the country further north. They had already murdered every one in the redoubt. As the missionary came in sight they beckoned to him to return. He knew those natives well, and thought he had their confidence. It would be patent to him that they were bent on mischief, although he could not know what they had done. No doubt he hoped, by his presence, to prevent them; he therefore pushed on. Then several shots were fired at him; his horse dropped first, and then himself, pierced with five bullets. He was found a little way from the horse, with one leg doubled under the other, as though he had been upon his knees when he fell dead. Consternation filled the town when the sad tidings reached it. All classes attended the funeral. Letters of condolence reached his widow, written by chiefs in the extreme north; and in acknowledgment of the services her husband had given to the country, the Parliament voted her an annuity of £100. Whiteley was so generally respected by the natives, that he was the last man any one would think they would injure; nor would they, except under the influence of frenzy. Perhaps his death saved the town, or at least the outlying places, from a calamity. It would seem that their intention was to destroy and kill in all those places *seriatim*; and they could have done so. They had not expected to see their old missionary come upon the scene of blood. When he did so, and would not go back at their bidding, some fiery spirits shot him. Others would denounce the act; that they were ashamed of it was clear by their fabricating and circulating a report that the deed was that of some white men who were among them. At all events, instead of proceeding with their work of death, they returned to their own fastnesses, and the Government were unable to follow and arrest the criminals. Hau Hauism is not yet dead, but it exists in a greatly modified form.

XXV. *The Hau Hau Massacres*.—At Poverty Bay there were about 450 natives and 200 Europeans. Some of the latter manned a redoubt, but most of them lived in their own houses, more or less scattered. About midnight on 9th November 1868, they were surprised by an attack from Te Kooti and his followers, the Hau Haus. Some escaped by flight, and owed their safety to a faithful old chief, called Tutari; Te Kooti and some of his party were in hot pursuit of them. In an hour after they had left the old man's village, the pursuers were on their track. Tutari was promised his life if he would only say by what route the settlers had gone. Neither threats nor entreaties could prevail. He and his two children were taken a few yards away from the house and killed by Te Kooti's orders. Tutari's wife was compelled to witness the murder of husband and children. When they were dead, she was asked to say by what road the white men had gone; she would not betray them, and pointed out a track which they had *not* taken. Twenty-nine Europeans and thirty-two loyal natives lost their lives in that massacre. The settlement was destroyed. The tidings were everywhere received with a thrill of horror. The unhappy survivors found homes in Auckland and other places; and substantial tokens of sympathy poured in from every part of the colony. Many an exciting story could be evoked from that awful tragedy; the following account was given by one of the survivors. Captain Wilson's family had gone to bed, excepting himself, who sat up late writing letters for the English mail, which was to leave next day. The Hau Haus knocked at his door, saying they had brought him a letter from Hirini-te-kani, the principal chief of Poverty Bay. He suspected treachery, and told them to put the letter under the door. Looking out he saw many natives flitting about. He called his man-servant, who was asleep in an outbuilding, and told him the Hau Haus were upon them. As the man ran across the open space between the two buildings the natives tried to catch him, but failed; they perhaps did not wish to awaken other families by firing. As they could not induce Wilson to open the door, they burst it in with a log of wood; they hesitated to enter, knowing it would cost some of them their lives. For a while they were kept at bay, but at last they set fire to both ends of the house. Wilson defended it to the last, and left it only when the flames had singed his wife's hair and scorched his children's feet; then he headed his family in their retreat from the burning building, with his revolver in his hand. His courage at that terrible crisis seemed to cow his murderers. The family consisted of Mrs. Wilson, four little children, himself, and the servant Moran. As they left the house the Hau Haus declared that they had agreed not to kill him or his family; and as if to prove their sincerity one of them took up one of the children to carry; Wilson, his wife, and Moran carried the others. Some of the natives went with

them towards Goldsmith's houses, about a quarter of a mile away. When they had gone about two hundred yards a Hau Hau rushed on Moran and knocked him down; another stabbed Wilson with a bayonet in his back. He fell, with his little son James, whom he carried, uttering a dying cry. His little boy extricated himself from the death-grasp of his father, and got away in the dark to some scrub. Mrs. Wilson, hearing her husband's death-cry, turned round with an exclamation of horror; the same instant she was thrust through with a bayonet, her arm being likewise pierced whilst trying to defend her baby. She fell insensible, and received four or five more bayonet wounds, and was beaten on the breast with the butt-end of a rifle; yet she survived for several weeks, and related how when she regained consciousness she saw all her family lying dead around her with the exception of her boy James. All that day (Tuesday) she was unable to rise, with the murderers in sight busy at their dreadful work. While she lay helpless a native came and robbed her of her shawl, leaving her attired only in her night-dress. On Wednesday she managed to crawl to what had been her home, and found some water. Still the Hau Haus were about, and many buildings were being fired. She contrived to reach an outhouse left standing on her grounds, and hid herself. Meanwhile her little James, eight years old, after escaping from the murderers, wandered about unseen by them, although one night he slept in a house to which they came. He kept himself supplied with food he found in the houses not yet destroyed. He told his mother that he "did not think it would be exactly stealing," as "everybody had run away." He saw he thought as many Hau Haus as would fill the redoubt. One day he went back to his old home, and found his father and brother and sisters with Moran all dead, and "wondered what the Hau Haus had done with his mother. He thought they must have eaten her." At last he found his mother in the little outhouse to their mutual surprise and delight. Here he sustained her for several days upon eggs, and whatever else he could forage. The poor lady got a card and a pencil from her dead husband's coat pocket, and after four hours' labour and many failures, she contrived to write the following:—"Could some kind friend come to our help for God's sake. I am very much wounded, lying in a little house at our place. My poor son James is with me. Come quickly.—Alice Wilson. We have little or no clothing, and are in dreadful suffering." This note was placed in the hands of the little boy, that he might carry it to Turanganui six miles distant. He was not far from it when he was picked up by a party who were scouring the country in search of any missing settlers. The same day Major Westrupp sent a party of men who brought Mrs. Wilson in a litter to the redoubt. She was tended with the greatest care and rallied for a time; it was hoped she would recover, but she succumbed to the terrible injuries she received a few weeks

later. She died at Napier, whither she was conveyed in the *Sturt* steamer. Her orphan boy was sent to England to his grand-parents. For some time Te Kooti kept the country in alarm. His successes brought many wild spirits to his standard. He planted his fortress at Ngatapa, a wooded mountain whose summit is about 2500 feet above the level of the sea: it was supposed to be the strongest in N.Z. He had above 400 followers. From the altitude of his pah, he commanded a view of a wide extent of country by the aid of field glasses. He gave no quarter to either European or native found in arms against him. Under the command of Captain Mair, the native troops followed him from place to place after they had driven him from his stronghold. Often he was nearly captured, but he managed to elude all pursuit. No rest was given him; he was hunted down. Gradually his followers forsook him. At last tired of his wandering, perilous and murderous life, he threw himself upon the protection of the Maori King, and there he lived "a wiser and a sadder man" for all the brutal butcheries of his bloodthirsty career. He justly forfeited his own life to the claims of justice, yet no man dared to lay hands on him but at the risk of another disturbance. The Kingites sheltered the blood-guilty freebooter only on "good behaviour." Te Kooti bore a good character in his youth, and had some cause of complaint of the deception practised on him and his companions when they were taken prisoners and sent to the Chatham Islands.

XXVI. *Governor Bowen*.—Sir George Bowen succeeded Grey in May 1868. The colony was emerging from its troubles on his arrival; and in 1872 he was able to make a viceregal tour through districts in the interior which had been previously closed to European visitors. On 2nd April he went from Wellington to Napier—thence by the great inland lake of Taupo. From that point he visited many parts of the Lake District, and on to Tauranga. From Ohinemuri he went down the Waiho (Thames) in the *Luna*, and reached Grahamstown on 23rd April. In all places he was warmly greeted, and numerous speeches of welcome were addressed to His Excellency. He held meetings with the natives. At Napier he found that the large sums paid to the natives as rents had enabled the chiefs to build good houses in the English style, and to live in English comfort. They had good carriages, horses, cattle, and well-cultivated farms. At Tapuacharuru ("resounding footsteps") on the Taupo Lake a great assembly was gathered together, and numerous speeches followed—all of them on the side of loyalty. On the picturesque Lake of Rotokakahi was a small pah held by a detachment of the native militia under the command of Captain Mair. The Arawas composing this force were fine young men, well drilled according to English discipline, and had done good service in the war against their rebel countrymen. From Ohinemuri to Tauranga the road for eighteen

miles lies through a forest. In the very heart of it the Governor found triumphal arches in his honour erected by the Maoris who were at work on the road; they were most demonstrative in their welcome, and the volleys of musketry they fired echoed like cannon-shots through the primeval forest. Five miles from Tauranga the Governor was met by the Volunteer Cavalry of that town and district. They escorted him past the famous Gate Pah to the wharf, where the *Luna* lay at anchor, and where he was received by Mr. McLean and a guard of honour of the Rifle Volunteers. The volunteers of Tauranga at that time comprised one-fifth of the entire population of the district—men, women, and children. Bowen was a popular Governor; he well understood his position. It was to "do the ornamental," and he could do it. He very wisely confined himself to his own province, which was to represent royalty and to write glowing despatches. Avoiding all party bias he blended the *bonhomie* of the Irish gentleman with the dignity of his office, and so found favour with all classes of the community, including both races. Sir James Fergusson succeeded him in June 1873, but resigned in 1874. Short as his stay was he saw enough of the country to have an exalted idea of its importance. He was succeeded by the Marquis of Normanby.

XXVII. *The Troubles in 1879*.—The first chief, Potatau, who received the designation of King from the Maoris when he was dying, enjoined the avoidance of war with the settlers. But his son Tawhiao is a man of limited intelligence and is under the influence of those immediately around him. He raised a point of difficulty with the colonists about the railway which is to run across the island from Auckland to New Plymouth. The "King country" lies between, and Tawhiao was unfavourable to the project. He was opposed however by his powerful ally and host Rewi, chief of the Ngatimaniapotos, an allied section of the Waikatos. When by the war in 1865 the Waikatos were driven from the region of the great river which bears their name they took refuge in the remoter upper country belonging to the Ngatimaniapotos, whose chief, Rewi, had been their ablest leader in the campaign. They found homes there, and that district now constitutes the principal part of the King country. Rewi was in favour of the railroad, as calculated to raise the value of his own possessions and of the other lands through which it will pass. Differing from Tawhiao on this point, he had been further estranged by discovering that some of his chief opponents among the King's advisers had been privately selling for their personal behoof lands returned to them from the confiscated territory, without acquainting their Ngatimaniapoto hosts with the fact. Rewi's tribes composed nearly a third of the inhabitants of the King country, but they did not appear to be wholly in favour of their chief's policy, some of them leaning to Tawhiao. Tawhiao was sullen. Rewi however had not

broken with his titular leader, and seemed equally anxious to uphold the Maori King and to cultivate cordial relations with the Pakeha. When he visited Auckland for the first time since the war he was received with much attention by the citizens, for he was an honourable as well as formidable antagonist in the old times, and like many of the great Maori chiefs a man of much personal dignity. But it was from the state of things in Taranaki that there was real danger of the spark that would fire the train. An outbreak there would very likely be followed by war on the east coast, and perhaps the King country. There are three tribes in that quarter—the Ngatiawas, Ngatiruanuis and Taranakis. But it was the influence of Te Whiti, which was not confined to the district, which made the state of things dangerous. He assumed to be a Mahomet or Zoroaster in his miniature way. He is described as a man of considerable powers of observation and intelligence, with great oratorical talent, ascetic habits, and an implicit belief in his own inspiration. The township which he established on the skirts of Mount Egmont is described by medical men who have visited it as the cleanest and largest native settlement in N.Z. The prophet comprehends the importance of sanatory regulations, and insists on their being observed. A stream runs through the place, which is laid out in regular streets, and every where (or hut) has a cookhouse attached. Te Whiti would do his people much good if he had confined himself to such matters; but egotism and his secluded mode of life turned his head. He had been making fools of himself and his followers in the ploughing operations, and only succeeded in alarming and thoroughly arousing the whites. Though he only talked of testing in some peaceful and legal way the right of the tribes to certain disputed lands, there was really no knowing what turn things might take under the influence of his own fanaticism and the impatience or disappointment of his followers. The most considerable of the native allies are the tribes inhabiting the peninsula north of Auckland—the Ngapuhis, Rarewas, and Hapouris. They number 8395 persons. From among these and the friendly tribes near Lake Taupo, and in other parts of the east and south, the colonists could certainly obtain the help of 1200 or 1500 fighting men if occasion should have arisen. At the date of these pages going to press the troubles were not wholly ended. Large forces both of the volunteers and police had to be stationed in the disaffected quarters, and fears of another Maori war were imminent, but peaceable counsels would appear to be prevailing with the natives, or that they had been convinced of the hopelessness of the conflict with the colonists. It was expected a satisfactory settlement of the land dispute would be made; towards this end a Royal Commission was appointed to deal with the native question; they recommended liberal concession to the Maoris and that the disturbed district should be administered under special law, intimation being given to

Te Whiti of the proposed method of dealing with the disputed districts and inviting his concurrence in the proposed sharing the land between the natives and Europeans. In October 1880 upwards of 500 Maoris had been arrested and imprisoned for fencing in and trespassing on the lands of the settlers. At that date Te Whiti still continued to send his followers daily to fence across the road which the troops were constructing across the disturbed district, and the constabulary generally arrested them. Once or twice the experiment was tried of simply preventing their re-erecting the fence and turning them off instead of detaining them in custody. Te Whiti was deeply outraged and indignant at this slight, and sent down word that unless the fencers were arrested every day, according to his word, he should vary his tactics by sending down fifty for them to arrest, and if that would not do he would send 100 men. It was believed that Te Whiti would not offer further opposition *re* the Waimate Plains. These plains are being rapidly surveyed for sale and settlement. Te Whiti was evidently resolved to keep the peace. The "King of Peace" is the title he most proudly affects, and by sending all his best warriors to be arrested first, he gave a guarantee of his pacific intentions, because by depriving himself of these men he put it out of his power to offer armed resistance, even were he disposed to do so. He wished to be a martyr, and by defiantly fencing to compel the attendance of the constabulary at Parihaka. As to the native policy of the Government the plan is to arrest all the able-bodied native fencers as fast as they come down, and to stow them away safely in the different gaols in the South Island. These out of the way, the reserves recommended by the commissioners and sanctioned by the Legislature will be set apart and carefully marked off. The rest of the land will be surveyed, sold, and settled, roads being made through it and all necessary defensive precautions taken. Then the prisoners will be released by degrees, a few at a time, care being taken to ensure their good behaviour. The Governor recently sent a note to Te Whiti requesting an interview for the discussion of native affairs. This request was declined by the Maori prophet in metaphorical language: "The potato is cooked." Even in N.Z., where the whites are familiar with the prophet's style, they have been unable to agree as to what this expression meant. It is supposed that Te Whiti really meant to say that the colonial Government had taken possession of the land in dispute, and that it was no use to argue the point further.

XXVIII. *Political Progress.*—In 1865 the seat of Government was transferred from Auckland to Wellington, the latter city being more central. Sir George Grey retired from the Governorship on 5th February 1868; he was succeeded by Sir George Bowen, who held office till March 1873. About this time the "Public Works Policy" associated with the name of Sir Julius Vogel was initiated by the

passing of the Immigration and Public Works and Allied Acts. These provided for the expenditure of ten millions of money for the introduction of immigrants, the acquisition of land from the Maoris in the North Island, the supply of water to the gold-fields, and the construction of railways, roads, and telegraphs. From 21st March the Government was administered by Sir George A. Arney, Chief Justice, till 14th June, when he was superseded by Sir James Fergusson. Sir James Fergusson was Governor till 3rd December 1874, when he was succeeded by the Marquis of Normanby. During the interregnum Chief Justice Prendergast acted as Administrator. Sir Hercules Robinson assumed office on 27th March 1879, and during his short term of office was as successful in the administration of N.Z. affairs as he had been in those of N.S.W. He was promoted to the Cape in succession to Sir Bartle Frere in August 1880, and was succeeded by Sir Arthur Gordon, late Governor of the Fiji Islands. The cloud of depression which has spread over the other colonies has not missed N.Z., and a check in its progress has occurred, which however is believed will be but a temporary one. In 1880 it was found necessary to enter on a policy of general retrenchment, the Public Works scheme was partially suspended, a reduction of ten per cent was made on all salaries and wages, the civil service was curtailed, and in various directions efforts were made to bring the expenditure of the colony within the limits of its income. Within the abundant resources of the colony it is scarcely possible that there can be either permanent standing still or retrogression. Some account of the political changes that have occurred during the constitutional period will be found under the articles devoted to the leading public men. It remains to mention briefly the order in which the various settlements were formed:—

1. **WELLINGTON**, as already stated, was founded by the N.Z. Company in 1840. Preliminary expedition for selection of site, August 1839.

2. **AUCKLAND**, established by the first Governor, Captain Hobson, in the same year. It remained the seat of Government till 1865, when by Act of the Colonial Parliament, and the selection of certain commissioners appointed at its request by the Australian Governors, Wellington became the capital.

3. **NEW PLYMOUTH**, also founded by the N.Z. Company in September 1841. Preliminary expedition, August 1840.

4. **NELSON**, founded by the Company in October 1841.

5. **OTAGO**, founded in March 1848 by a Scotch company working in connection with the N.Z. Company, and by means of its machinery, under the auspices of the Free Church of Scotland, and with an appropriation of a portion of its lands and pecuniary resources to Free Church purposes.

6. **CANTERBURY**, similarly founded in December 1850, in connection with the Church of England.

7. **HAWKE'S BAY** was originally a part of

Wellington Province, but was separated from it and created a province of itself in 1858.

8. **MARLBOROUGH**, originally part of Nelson, separated in the same manner in 1860.

NICHOLSON, SIR CHARLES (1808—) is a native of Scotland and was educated at the University of Edinburgh. After graduating M.D. he came to Australia in May 1834. He was chosen Member of the first Legislative Council of N.S.W. in 1843, and was three times elected Speaker. He championed in the Legislature the cause of popular education. He filled the post of Vice-Chancellor of Sydney University in 1853, and was raised to the office of Chancellor in 1854. In 1859 when Q. was made a separate colony he was appointed the first Speaker of its first Legislature. Having been knighted by patent in March 1852, he was created a Baronet in April 1859 as a reward for his public services; and received the honorary titles of D.C.L. from the University of Oxford in 1857, and of LL.D. from the University of Cambridge in 1868. He returned to Europe in 1862.

NICHOLSON, WILLIAM, came to V. in 1842, and established himself in business in Melbourne. In 1850 he was chosen Mayor. In 1855 he was elected member of the Legislative Council for North Bourke. He introduced and carried the principle of voting by ballot at all political elections. In December 1855, on the defeat of the O'Shanassy Government on this question, he took office; but shortly afterwards left the colony for England and was absent for two years. He returned in 1858, and in August 1859 was elected member of the Assembly for Sandridge. On 17th November he moved an amendment on the address, which was carried, and on 27th October he formed a Ministry, which remained in office until 26th November 1860. He retired from politics, and died in 1870.

NICHOLSON RIVER, in N.A., was discovered by Leichhardt during his journey overland from Moreton Bay to Port Essington; it flows into the Gulf of Carpentaria to the westward of the Albert, and was so named in honour of Dr. William A. Nicholson, of Bristol, England, who had enabled Leichhardt to come to Australia to explore it, and to study its nature. The river is 100 yards wide where he crossed it.

NIXON, FRANCIS RUSSELL (1803—) first Bishop of T., studied at Oxford and was Fellow of his College there. He had been Chaplain to the Embassy at Naples, and in 1843 came out to T. as the first Church of England Bishop of that Diocese. Shortly afterwards he went to England on Church affairs. In 1851 he attended the first Synod of the Colonial Bishops in Sydney. Dr. Nixon, whose health was always bad, left in 1862, and not improving in health in 1864 resigned his see. He published a volume of *Lectures on the Church Catechism*.

NONDA COUNTRY, in N.A., was discovered by Leichhardt. It lies to the westward of the river Lynd and between the rivers Mitchell and

Van Diemens, near the Gulf of Carpentaria, and was named by the discoverer from a fine shady tree with a yellow eatable fruit which he and his companions very much enjoyed.

NORFOLK ISLAND, is situated nearly midway between N.Z. and New Caledonia, about 900 miles east of Brisbane. It is not quite five miles long, with an average width of two and a-half miles. Mount Pitt at the N.W. corner is 1050 feet high. There are precipitous cliffs round the greater part of the coast, and many small streams fall in cascades into the sea. There are no harbours, but tolerable landing places in fine weather. The surface is generally a table-land with numerous gulleys, and is covered with grass sprinkled in beautiful park-like fashion with white oaks, and the handsome Norfolk Island pine, which often exceeds 200 feet high. The gulleys and slopes of Mount Pitt are covered with a thick scrub, with tree-ferns and guavas. Phillip Island, a mile and a quarter long, lies three and a-half miles south of the main island, is nearly as high, very precipitous, and densely wooded; and there are two or three other small rocky islets. Norfolk Island was discovered by Cook in 1774, and now forms part of the Colony of N.S.W. It is a beautiful island, and its climate is mild and uniform when compared with the excessive vicissitudes of temperature experienced in continental Australia. Norfolk Island is interesting to naturalists for its peculiar birds. It has fifteen species of land-birds, eight of which are Australian, while three are peculiar species of Australian genera; but there are three others which connect the island unmistakably with N.Z. These are the *Nestor productus*, which formerly inhabited Phillip Island but are now said to be extinct; a fine parroquet, and a remarkable white rail. All these are peculiar N.Z. forms, and two of them would be quite unable to pass over any great width of ocean, while the Australian birds are mostly such as fly well, and might easily have migrated to the island. This sufficiently explains why, although the great majority of its birds are Australian, yet naturalists consider this group of islands to belong really to the N.Z. zoological district.

HISTORY.—On 14th February 1788 Governor Phillip despatched Lieutenant Philip Gidley King in H.M.S. *Supply*, from Sydney, with Lieut. Ball, to form a penal settlement at Norfolk Island. The party consisted of Lieut. King, with the title of Superintendent and Commandant of the Settlement, James Cunningham subaltern officer, Surgeon T. Jamieson, Assistant-surgeon John Alltree, Roger Morley, William Westbrooke, J. Sawyer, John Batchelder and Charles Heritage, with nine men and six women convicts, twenty-four in all. King arrived at the island on 5th March, and named the bay at which he landed Anson's Bay, in honour of Admiral Anson the circumnavigator. On the following day he took possession of the island in the name of the Sovereign of Great Britain. The party celebrated the occasion by hoisting the

British colours and drinking the healths of His Majesty the King, the Queen, the Princess of Wales, and success to the settlement. King was instructed to commence at once the cultivation of corn, flax and cotton. It was the intention of Phillip to use the island both as a storehouse and as a receptacle for refractory convicts. Immediately after landing the party began clearing the land and sowing the seed they had brought with them. On the 19th March Ball returned to Sydney, bringing with him a glowing account from the commandant of the fertility of the soil and the fine climate. Phillip in consequence sent a reinforcement of sixty-nine persons. Hardly had the party established themselves than a conspiracy was formed by the convicts to overpower their officers, take possession of the ship *Sirius*, and leaving the settlement sail for Norfolk Island. The plot was defeated through the fidelity of a female prisoner. On 26th February 1789 a tremendous hurricane swept over the island, destroying nearly all the property possessed by the settlers. The wheat harvest in December was fortunately very abundant. In March 1790 Governor Phillip, in order to relieve the settlement at Sydney, then very much in want of provisions, sent another party of 280 persons, including two companies of marines, under the command of Lieut.-Governor Ross, in the *Sirius*, to Norfolk Island. The voyage thither was prosperous, but when making preparations for the return voyage the *Sirius* was wrecked on the rocky shore of the island, and all the stores intended for the Sydney settlers were lost. Lieut.-Governor Ross relieved King in the command, whilst the latter proceeded to England to report to His Majesty's Ministers on the new settlement. The inhabitants of Norfolk Island then numbered 498, of whom 191 men and 100 women were convicts. In December 1791 King returned and resumed command of the settlement. The wheat harvest was again abundant for several years in succession. In 1793 the population had risen to 1008 souls. In June 1800 Major Foveaux was appointed Lieutenant-Governor in succession to King. In March 1803 Lieut. James Bowen of H.M.S. *Glatton* was appointed to take charge as Deputy Lieutenant-Governor during the absence of Foveaux. The latter resigned in September and left the Island, leaving the command of the settlement to Captain Wilson. Governor Hunter, on his return to England in 1800, visited the settlement, and formed the conviction that having served its purpose, the place ought to be abandoned on grounds of economy. The Imperial Government accordingly, upon Hunter's recommendation, issued an order for its abandonment, but the order was not executed till 1805. The settlers were then mostly emancipists, and had farms of from thirty-three to forty acres each. These settlers were conveyed either to V.D.L. or N.S.W. at the public expense, and had grants of land given to them double the amount of their former possessions, with cattle

on loan, and were rationed at the public stores as new settlers. The majority of the settlers went to V.D.L. and there founded a settlement naming the place where they located New Norfolk and Norfolk Plains, after the name of the island they had been compelled to leave. In 1826 an order was issued to re-establish the penal settlement on the island. The following year a vessel bound to the island with prisoners was piratically seized by the passengers when within one day's sail of the destined port. The leader of the mutiny was a desperado named Walton, who had long been notorious as a felon of the most audacious description. So well was the scheme devised and executed that no blood was shed, a few slight wounds inflicted in a scuffle which took place after the seizure excepted. The pirates resolved upon seeking South America; but being destitute of a nautical almanack, and short of water, they steered towards N. Z., where they hoped to obtain from one of the whaling vessels which frequented that country the appliances necessary for navigating their ship, as well as such other necessities as they required. The master, Harwood, and the crew were compelled to navigate the ship under the directions of Walton and his associates, who had assumed the arms and uniforms of the military guard. Arriving at the Bay of Islands they found two whalers anchored in that port, and to the inquiries of the commanders they replied that they were bound for the River Thames with troops and provisions; but the awkward appearance which the ship and crew presented, and the lax discipline everywhere observable, aroused the suspicions of the whaling captains, and after a little time the true character of the newly arrived vessel became apparent, and the whalers resolved to make an effort to retake the vessel. For this purpose Duke and Clark, the whaling masters, communicated with the missionaries on shore; these exercised their influence in assembling a large number of the natives, armed and accoutred for war; and everything being in readiness for an attack, both from the shore and the ships, the pirates were summoned to surrender. To the first summons they gave a refusal; but the whalers discharging their guns, and some shots striking the vessel, the pirates fled into the hold and concealed themselves wherever there was a hiding place, whilst some leapt overboard in their terror and confusion. Walton now parleyed, and after a few more shots had been discharged, and a threat having been held out that the natives, who all this time were spectators on the shore, would be let loose on the refractory ship, the pirates surrendered, making no other condition than that they should be protected from the fury of the New Zealanders. The prisoners were now landed, not without considerable danger from the natives, who disappointed in their anticipations of a battle, resolved not to miss the profits which they expected from a victory; for they stript several of the prisoners and plundered

the vessel of many valuable articles before they could be restrained. The damage done to the captured ship having been repaired, and several of the convicts who escaped into the woods having been brought back by the natives, the pirates were carried to Sydney by Duke in his own vessel and in the captured brig. A new conspiracy among the prisoners to repeat their piracy was frustrated by the fidelity of one of the crew, with whom the pirate leader tampered during the passage. While these events were transpiring at sea, a still more serious mutiny broke out on land. At the island in September, a gang of fifty-one prisoners on being mustered in the morning previous to commencing their daily labour, suddenly rushed, according to a preconcerted plan, on their guards and overseers, and having disarmed them after a struggle in which one of the guards was killed and another wounded, they placed them in close confinement in various cells, so that tidings of the outbreak could not be conveyed to the barracks. It was the intention of the mutineers to have suddenly attacked the garrison, after having secured all the remaining officers who were to be found in the stockades, and having taken the fort by surprise, to have made themselves masters of the island; but chance luckily frustrated these schemes. Four soldiers having occasion to go from their quarters to the hospital early in the morning, saw what was going on in the town, and made all haste back to communicate the alarming intelligence to their commanding officers. They were pursued and fired at by a party of the insurgents, who killed one, wounded another, and captured a third; but the fourth, fortunately escaping, gave the alarm to his companions. Finding themselves frustrated in their secret arrangements, the mutineers now betook themselves to the boats, which they had previously loaded with provisions, arms, ammunition, and such other articles as they deemed of use or value. The commandant, Captain Donaldson, in the meantime hastened to Kingston with all the troops under his command, and arrived at the sea-shore just as two of the three boats which the insurgents seized had passed the reef which ran round the island, at a short distance from the shore, while the third had just been got under weigh preparatory to following. The troops discharged their muskets at the fugitives, but without effect; and the boats proceeded to Phillip Island, distant about seven miles from the main settlement. One boat still remained at Kingston, but this the mutineers had disabled before leaving, and still more to delay if not prevent pursuit, they carried away the boat-builder. The disabled craft was repaired; and on the morning after the day which witnessed the transactions, Captain Donaldson, with Lieutenant Donnellan, the second in command, and twenty-two of the military, proceeded towards Phillip Island starting before daybreak in the hope of taking the fugitives by surprise, but wind and tide being adverse they did not arrive until after

sunrise. They were received with a cheer and a volley of musketry from the insurgents, who occupied an advantageous position behind the rocks. The military landed without sustaining loss, and after some firing the convicts fled, leaving three of their number killed, and eleven prisoners. Satisfied for the present with this victory, the commandant returned to the settlement, taking back the prisoners, the three boats, and the plundered property, leaving the remaining mutineers, not without means of escape, to subsist as best they could on the goats and swine which luckily for them were numerous in their fastness. A few days later the military again visited the island, when ten more of the fugitives were captured. The remainder, now reduced to twenty-five, continued for some time in the island, but were eventually glad to surrender to the authorities, their resolution to hold out completely giving way on the capture of their leader—one Goff—who was surprised by the military while sleeping under the shelter of a rock. In June 1839 Captain Wakefield of the 39th Regiment resigned his position as commandant, and was succeeded by Lient.-Colonel Morissett, late Superintendent of Police at Sydney. In 1842 the *Governor Phillip*, a vessel employed by Government to carry supplies to and from Norfolk Island, was piratically seized by the prisoners of that island. The boat's crew, numbering twelve men, all prisoners, who were employed between the island and the vessel, by a preconcerted plan disarmed the sentry on board, compelled such of the crew as were on deck to jump overboard, and secured the captain, mate and soldiers below deck. The captain and mate, by breaking through a partition got into communication with the soldiers and commenced an attack by firing through the crevices, which took effect, when they rushed on deck, and after a brief struggle with the pirates recaptured the vessel. The soldiers lost one man, and five others were wounded; of the convicts five were killed and two wounded. The others were tried, and four of them were convicted and executed. At this time Captain Maconochie was commandant; and this and other incidents did not testify favourably to his celebrated "humane" system of applying mild persuasion rather than severity in the treatment of even the most desperate criminals. Maconochie had come out with Sir John Franklin, who was favourably inclined to his new system of discipline. In his estimate of prisoners Maconochie, it is said, was equally deceived by a generous confidence, or by his pity for human suffering. He embodied the results in a report and sent it home to the Colonial Office, without having fully explained the contents of the despatch to Franklin. On its publication he was dismissed by the Governor, and stormy discussions followed the charges made against the settlers. A select committee of the House of Commons, presided over by Sir W. Molesworth, recommended that transportation to N.S.W. and T. should cease. It was determined to adopt a middle course, and

Norfolk Island was selected for the new experiment. Maconochie was appointed by Governor Gipps Commandant of the island, "to test the ideas he had propounded, and to seek the success he had foretold." At once he removed all outward signs of the severest discipline. The gaol doors were thrown open, the gaoler loitered before the deserted prison, and the prisoners "yielded to the spell of a transient enchantment." The "mark" or reward system, by which they could obtain freedom by good behaviour, was explained to them, and they were exhorted and entreated in tones humane even to tenderness. In May 1840, 1800 prisoners were set for one day (the Queen's Birthday) absolutely free to join in a general festivity, at which sports and a theatrical performance took place. Glee and songs were sung, tobacco and rum were served out, and three cheers for Her Majesty, and three for the Commandant, rent the air. No accident occurred—the goal was entirely unoccupied—no theft or disorder had disgraced the day. "Its novelty gave to Maconochie's system the air of delirium; the disciplinarians of the ancient *regime* raised their hands with astonishment." The reaction was brought about by the daring attempt of the conspirators to capture the *Governor Phillip*. The condemned men met their fate with fortitude, and their last words were in grateful remembrance of Maconochie. But his recall had been determined on. The colonial press teemed with ludicrous allusions to a system supported by plays, rum and tobacco. His administration was however prolonged till 1844, from the difficulty of finding a qualified successor. Meanwhile a new scheme (the probation system) was launched on the sea of penal speculation. "Norfolk Island was again to be made the lowest deep of transportation, and well has its destiny been fulfilled." It may be urged that Maconochie's plan did not receive a fair and sustained trial, and human sympathy, shuddering at the cruelties of other systems, not unnaturally turned to one which was by many laughed at and stigmatised as "sentimental." This new system succeeded no better than the old one. The prisoners were not reclaimed; and Norfolk Island became a perfect hell of crime and rigorous punishment. The place was visited by Governor Gipps in 1843, and the following year the Government of it was transferred from N.S.W. to T. The convict establishment was finally broken up in 1855, and in the following year the Pitcairn Island community of 194 persons were landed there. The island, with its buildings, 2000 sheep, as well as horses, pigs, and poultry, was given to them by the British Government. They were allotted land for cultivation, and supplies for a limited period; they were also supplied with seeds and implements of husbandry. A magistrate and chaplain were appointed. The instructions from the Secretary of State were that the islanders should be as little interfered with as possible, and that their existing social system was to be maintained. They inhabit the old convict town,

occupying themselves with agriculture and with whale-fishing. Forty of them returned to Pitcairn Island and the remainder have increased to about 300 souls. The island has been again placed under the Government of N.S.W., and is visited occasionally by the Governors of the colony.

NORMANBY, MARQUIS OF (1819—) Governor of V. He joined the Regiment of Coldstream Guards, and became Lieutenant in 1838. In 1844 he was made Deputy-Lieutenant of Yorkshire. In 1847 he was elected member of Parliament for Scarborough, but relinquished his seat in 1851 on accepting the office of Comptroller of the Queen's Household. In 1853 he was advanced to be Treasurer of the Household; in 1858 he was made Governor of Nova Scotia, and in 1863 he succeeded to the peerage on the death of his father. In 1866 he delivered his maiden speech in the House of Lords as mover of the Address in reply to the Throne. In 1871 he was appointed Governor of Q.; in 1875 Governor of N.Z.; and in 1879 Governor of V.

NORTHERN TERRITORY.—The Northern Territory, or Alexandra Land, comprises the immense tract of country made over to S.A. as one of the results of the explorations of McDouall Stuart. It contains an area of 531,402 square miles, or 340,097,280 acres. It is bounded on the N. by the Indian Ocean; on the S. by the 26th parallel of S. latitude; on the E. by the 138th meridian of E. longitude; and on the W. by the 129th meridian of E. longitude.

HISTORY.—When Stuart returned from his last journey across the continent after having shown the practicability of the overland route, the Government entered into successful negotiations with the Imperial Government for the cession of the newly-discovered territory to S.A. It was resolved to survey and offer for sale a considerable quantity of land on the north-western portion of the continent. The land sales took place in Adelaide in March 1864, before the surveys had commenced. The land was readily taken up and preparations were made for despatching a party to carry on the survey, and to protect life and property. Lieut.-Colonel Boyle Travers Finniss was appointed first Resident Commissioner. He was an old colonist of large experience in public life, and had been Treasurer of the colony and Acting-Governor. He was an officer in the volunteer force and a surveyor by profession. He set to work immediately to prepare for the departure of the first expedition and was liberally assisted by the Government. The Government chartered the *Henry Ellis* and well supplied it with stores, instruments and weapons for the protection of the party. In the instructions to the Government Resident, Adam Bay was suggested as a likely place for the first town; but he was left with full discretion to select another site if after examination he found that unsuitable. He was also to cultivate friendly relations with his party and to see that no injustice was done to the natives. A few days afterwards,

the expedition sailed and in June 1864 the *Henry Ellis* cast anchor in Adam Bay, and the party landed. The first river camp was fixed on 1st July and the men celebrated the commencement of their work by broaching a barrel of beer. The expedition resulted in failure. Quarrels between the Government Resident and his officers led to a state of disorganisation. Finniss selected Escape Cliffs as the site of the town, against the remonstrances of some of his officers and gentlemen who represented the selectors. But little progress was made with the survey. Quarrels took place with the natives, who stole the stores and who were punished without discrimination. The reports which reached Adelaide were of the most disheartening character. The Government Resident complained of his officers, and his officers complained of him. Meanwhile precious time was wasted, and little was being done towards the survey. Some of the settlers purchased a small boat—the *Forlorn Hope*—with which to leave the settlement. In this boat they sailed 1600 miles to Champion Bay, and proceeded thence to Adelaide where they brought before the Government what they averred to be the state of things at Adam Bay. Finniss was called upon for explanations, which being deemed unsatisfactory, he was recalled in 1868 and Manton was left in command. A Court of Inquiry was appointed which reported that the Government Resident was wanting in tact in the management of his men, had not shown skill in organising their labour, and had not taken sufficient care to protect the stores. They also blamed Finniss for selecting such an unsuitable site as Escape Cliffs for the township. The result of the inquiry was the removal of the Government Resident. Under Manton there was not much improvement. The impression became stronger that Adam Bay was not the proper place for the settlement. The next step was to find if possible a better site, and Captain Cadell was dispatched to the Gulf of Carpentaria to see what advantages offered there; but his report of his explorations was received with ridicule. The state of things was becoming serious. The five years within which the Government had pledged themselves to have the surveys completed and the land open for selection were passing, and nothing had been done. Escape Cliffs was abandoned and the party recalled. The London selectors demanded back their money with interest. This demand was resisted by the Government who still hoped to finish the survey. They passed a Bill through Parliament to give the original selectors a greatly increased area over that to which they were entitled, in consideration of the delay which had taken place in the surveys; but this offer was limited to those who undertook to withdraw the threatened legal action against the Government. Many of the selectors accepted this offer, but the bulk of those in London refused it and persisted in their demand for a return of their money. In 1869 G. W. Goyder, Surveyor-General, was

requested to go to the Northern Territory with a competent party to select a site and complete the survey. He undertook this responsible work, got a party together, and started. He selected Port Darwin for the site and laid the foundation of Palmerston as the chief town. He set his band of surveyors to work, and under the controlling spirit of one energetic man the task was completed in a few months. The Northern Territory, notwithstanding its disastrous early history, is a rich country and destined to become a great settlement. One melancholy incident has marked its brief history. In 1876 the Government determined to hold a Circuit Court at Palmerston, presided over by one of the Judges of the Supreme Court. Mr. Justice Wearing was dispatched, attended by the necessary officers. The party reached Port Darwin in safety; the Court was held, and they embarked in the steamer *Gothenburg* for the return voyage. Unfortunately the steamer ran on a reef lying off the coast of Queensland, and in the course of a few hours became a total wreck—the greater portion of her passengers and crew thus meeting with an untimely death. Over a hundred persons—men, women, and children—were swept from the deck of the ill-fated vessel. A few escaped in boats, but the great majority went down, and amongst them Judge Wearing; his associate, Mr. Pelham; Mr. Whitby, acting Crown Prosecutor; T. Reynolds, a leading politician of the Province, and his wife; and the Captain and his chief officers. No calamity that ever befel the Colony produced such a feeling of sorrow or such an expression of heartfelt sympathy as this. The Parliament made liberal provision for the families of those who died in the service of the Government, and the benevolence of the public took charge of the rest. Between £9,000 and £10,000 was at once contributed and distributed amongst the sufferers. Captain Douglas was next appointed Government Resident of the Northern Territory with a permanent staff. He retired in May 1874; and till the following October Dr. Millner took charge of the settlement, when G. B. Scott arrived to succeed Douglas.

DESCRIPTION OF THE COUNTRY.—Tropical in its character the climate is not very different from that of Northern Queensland. A great deal of the land is good, cattle thrive well upon the pastures, pearl and bêche-de-mer can be established, while mines of gold and other metals are being opened up. Contiguity to Java and other Indian islands will promote the success of the settlement. Conscious that the rich flats near the sea will one day have plantations of rice, sugar, cotton, &c., while horses, cattle and sheep can be raised on the pastures for the Indian market, the Government of S. A. has made use of a wise and liberal policy to attract emigrants and secure a permanent establishment. The land bounding the coast is in a great measure low and uninteresting, in very few instances being more than 100 feet above the sea level; wherever the coast is high it is generally

cliffs composed of sandstone, marl and ironstone; the lower portions are partly sandy beaches, but principally mud flats thickly fringed with mangroves. The country inland is generally speaking of a level character over which railways could be easily constructed, and is in a great measure destitute of conspicuous land marks. At a distance of from 30 to 100 miles from the coast a tableland is met with varying in height from 300 to 900 feet, and near the Victoria River it attains a height of nearly 1700 feet. The rivers must not be overlooked: many of them—the Roper, Adelaide, South Alligator, Liverpool and Victoria—will hereafter prove to be of considerable importance for inland navigation. The character of the soil in so large an area is necessarily variable; but its general fertility is unquestionable, and nearly all tropical plants, including maize, cotton, and the sugar-cane, have been grown successfully in the Botanic Garden at Palmerston. About 200,000 square miles of country have been taken up for pastoral purposes, and liberal regulations have been framed to encourage pastoral settlement. Gold-mining has hitherto been the only industry carried on to any extent. Some splendid nuggets—recently one of forty-two pound weight—have been obtained from the alluvial diggings, and the quartz-crushing returns have in many cases shown from four ounces to six ounces to one ton. The population of the settlement is estimated at about 400 whites, 30 Malays, and 2040 Chinese.

NORTHUMBERLAND CAPE, a headland at the south-easternmost extreme of S. A. to the westward of the river Glenelg, named by Grant after the Duke of Northumberland.

NORTHUMBERLAND ISLES are situated off the N.E. coast of A. about ten miles from the W. end of Percy Isles.

NUYTS ARCHIPELAGO. An assemblage of islands off the western coast of S.A. at Eyria Peninsula. The principal islands of the group are St. Francis, St. Peter and Lounds islands.

NUYTS CAPE is situated on the southern shore of S.A. near Point Fowler.

NUYTS LAND comprises that portion of the southern coast of the continent extending from Leeuwen's Land to the meridian of 124 deg. E. and was discovered by Peter Van Nuyts in 1627.

O.

OAKOVER. River in W.A., was discovered and named by Frank Gregory in 1861.

OAMARU, a township in N.Z., is the most northern township in Otago, ranking next to Dunedin, from which it is distant seventy-eight miles. It is connected with that city and Christchurch (152 miles) by railway. The district surrounding the town is the largest grain-producing district in the Middle Island, producing more than

a third of the entire produce of Otago. It abounds in building stone of magnificent quality, a pure white limestone, of which the town is principally built. Originally an open roadstead, an artificial harbour, rendered necessary by the large export of agricultural produce, is in course of construction, a break-water and wharves having been built of concrete, the works being now sufficiently advanced to shelter vessels drawing fifteen feet of water. The Oamaru harbour works are probably the most substantial in Australasia. The population is about 5000.

O'CONNELL, SIR MAURICE CHARLES, formerly Commander of the Forces in N.S.W., was a cousin of the celebrated Daniel O'Connell. He came to Sydney in 1809 in command of the 73rd Regiment, and bearing a commission as Lieutenant-Governor of N.S.W. and its Dependencies. After his arrival he married the daughter of Governor Bligh. Sir Maurice remained in the colony till 1814, when the regiment was ordered to Ceylon. In 1838 he again returned to the colony as Commander of the Forces, and continued to hold that appointment till relieved by Major-General Wynyard. He was Acting-Governor of N.S.W. from 12th July to 2nd August 1846. He never took an active part in public affairs, but in private life was much esteemed by all under his command, especially by the private soldiers. He died in Sydney 25th May 1848.

O'CONNELL, SIR MAURICE CHARLES (1812—1879) son of the preceding, was a native of Sydney. He accompanied his parents to Ceylon, and in 1819 was sent to England. He was educated at the High School of Edinburgh, and special studies were subsequently pursued at Dublin and Paris, where he was for some time a student of the College of Charlemagne. Destined for the military profession he entered the army as Ensign at the age of sixteen, and joined the 73rd Infantry at Gibraltar. During the prevalence of yellow fever at "the Rock," he was subject to quarantine for six months. Afterwards he served at Malta, and proceeded thence in 1831 to Jersey, remaining with the dépôt of his regiment as Adjutant until 1835. At twenty-three he went to Spain; and under the Orders in Council of King William IV. permitting British subjects to volunteer for foreign service, the young soldier raised in the county of Cork and other parts of Munster a regiment of the British Legion, and embarked for the Peninsula to fight for the Queen and Constitution. O'Connell, with the rank of Colonel, headed his regiment, the 10th Munster Light Infantry, in the stirring times which ensued. During the campaign he was present in several engagements between the Christinos and the Carlists, and for his gallantry in action was repeatedly mentioned with distinction in general orders and despatches. On the retirement of Sir Gaspard Le Marchant, Colonel O'Connell was appointed Deputy Adjutant-General; afterwards, on the return to England of Sir De Lacy Evans, he succeeded to the rank of General of Brigade in

command of the New British Auxiliary Legion in Spain; and shared in the vicissitudes which preceded and the triumphs which succeeded the close of the Spanish civil war. Amongst the honours conferred on him were those of Knight Commander of Isabella the Catholic, Knight of San Fernando, and Knight Extraordinary of Charles III. At the end of 1837 at San Sebastian the dissolution of the Legion was promulgated in general orders. Shortly after O'Connell returned to England and was re-appointed to the 51st Regiment; he was next promoted to a Captaincy in the 28th, and as military secretary on the staff of his father returned to N.S.W. in 1835. When his regiment was recalled home O'Connell sold out of the army and settled down in the colony, connecting himself with pastoral pursuits. In the social and political changes of the succeeding ten years he took an active part. He was a candidate for the representation of his native city in the first Legislative Council of N.S.W., but was not successful, owing to his connection with what was then regarded as the "exclusive" party. At a subsequent election he was returned without personal canvass for the district of Port Phillip. In 1848 he was appointed Commissioner for Crown Lands for the Burnett district, then a squatting district, and in 1854 was made Government Resident at Port Curtis, which office he held until the north-eastern territory was separated from N.S.W., and erected into the colony of Q. O'Connell was called to the Legislative Council of Q. on the assumption of the Government by Sir George Bowen. He took his seat as one of the Commissioners to open the first Parliament in May 1860, and represented the Ministry throughout the session. During this period his name became identified with some of the most important measures of legislation—notably the Primary Education Act and the Grammar Schools Act. At the close of the year he was appointed President of the Council, on the retirement of Sir Charles Nicholson. He also held the command of the local military force as Colonel of the Q. Volunteer Brigade. When Sir George Bowen left the colony, O'Connell administered the Government, and during his occupation of Government House had as a guest the Duke of Edinburgh. Following the death of Governor Blackall, and until the arrival of the Marquis of Normanby, O'Connell a second time administered the Government, and again during the period that elapsed between the departure of Lord Normanby and the arrival of Governor Cairns. The honour of knighthood was conferred on him in 1868. He was four times Acting-Governor of Q., and this office he was, under sign-manual of the Queen, entitled to bear on all occasions of necessity. He was President of the Q. Legislative Council at the time of his death on 23rd March 1879. Sir Maurice stood high in the craft of Freemasons, having been up to the time of his decease Provincial Grand Master under the Irish constitution. He was also President

of the Australasian Association and of the Q. Turf Club, and Vice-President of the National Agricultural Association. His remains were accorded the honour of a public funeral.

O'CONNOR AND BRADLEY, noted bushrangers who escaped in a whaleboat from V.D.L. in 1853 and crossing Bass Straits landed in V. The first act of bushranging these villains perpetrated in V. was to walk up to a ploughman of Mr. King's near Brighton and order him to deliver up his team. He declined, upon which he was shot dead by one of them, and they rode off with the horses. They committed many other robberies and excited the utmost terror amongst the settlers. They were at last discovered at the farm of a person named Cain, near Kilmore, and a smart skirmish took place between them and three mounted troopers, in which one of the latter was dangerously and one mortally wounded. They were overpowered and brought to Melbourne, tried before Justice Williams, convicted and sentenced to death.

OFFICER, SIR ROBERT (1800-1880) a native of Scotland, came to T. in 1821. He had obtained his diploma as Member of the Royal College of Surgeons, England, and he was at once appointed by Governor Sorell Government medical officer for New Norfolk and adjacent districts, this office including the surgeonship of the old Hobart Town Hospital. He acquired a considerable private practice which ultimately induced him to resign his Government connection, and he went into partnership with Dr. Agnew, which he continued for about a year. When the gold fever broke out in V. like many others he was induced to try his fortune over the straits, but after a few months stay he returned to his island home and resumed his private practice. After holding successfully the appointments of Assistant Colonial Surgeon, Surgeon Superintendent of the New Norfolk Hospital, and Principal Medical Officer and President of the Medical Court of Examiners, he retired from the active duties of his profession and went to live at his residence, Hall-green, near New Norfolk. He resigned his private practice to Dr. Agnew, but he was not long allowed to remain in seclusion. In the election for the Legislative Council of 1853—then the only Chamber in the colony—he was prevailed on to come forward for the constituency of Buckingham. He was opposed by Dr. Crook, but defeated his opponent by a substantial majority. He took his seat for the first time on the assembling of the Council on 18th April 1854. During that session the new Constitution Act was passed, and the measure having received the Royal Assent on being transmitted to England, the Council was dissolved for the election of two Houses of Parliament under the present form of representative government. This election took place in September 1856, on which occasion Dr. Officer was elected member for the district of Glenorchy for the Assembly. He was chosen Chairman of Committees, an office which he continued to fill with such ability and

tact that on the Speakership becoming vacant in August 1861, by the retirement of Fenton, he was chosen by the House to fill this important office. He filled the chair with credit to himself and the Assembly uninterruptedly until 1877, having been elected five times: namely in August 1861; January 1863; November 1866; November 1871; and October 1872. All this time he was member for Glenorchy, having been elected for the constituency without opposition on each occasion that he sought its suffrages. In 1869 he received the honour of knighthood from the Queen for his services as Speaker, and when failing health compelled him to retire from the post he had long and honourably filled, the House unanimously expressed its grateful sense of the manner in which he had discharged his duties and the loss entailed by his resignation. He sent in his resignation on 20th April 1877, and at the same sitting (on the 24th) at which it was read to the House, the Colonial Secretary, Reibey, without notice moved as follows: "That the thanks of the House be given to its late Speaker, Sir Robert Officer, for his able services during the period of nearly sixteen years in which he filled the chair of the House; that this House fully appreciates the zeal and ability with which he discharged his duties of Speaker and the urbanity and kindness which have uniformly marked his conduct in the chair, and which have secured to him the esteem and respect of every member of this House." The motion was seconded by F. M. Innes and supported by W. R. Giblin and Balfe. On 4th May the newly-elected Speaker (Dr. Butler) in accordance with the resolution of the House presented to Sir Robert Officer, in the presence of the House, the address; and the ex-Speaker, standing for the last time on the dais which he had occupied so long, replied in the words of farewell to the political arena in which he had held a distinguished place. From that date his health rapidly declined. Of all the enterprises calculated to benefit the colony on which Sir Robert entered with indefatigable energy—and they were many—none received such an enthusiastic support at his hands as the acclimatisation of salmon, the success of which is largely due to his efforts. He was the leader of this movement in Parliament and out of it, and by his earnest pleading oftentimes saved the acclimatisation vote from being sacrificed as a wasteful expenditure. He took pride in showing visitors the salmon ponds above New Norfolk, and among these was the Duke of Edinburgh. He was extremely benevolent and a staunch patron of education. He was himself a master of arts of Aberdeen College, and almost to the end of his life kept up his classical and other studies. His sons are engaged in pastoral pursuits in Victoria.

O'FLYNN, REV. WILLIAM (1828—) a clergyman of the Roman Catholic Church, arrived in N.S.W. in 1817. Although not the first Catholic priest who had visited the colony, he was the first deputed expressly to minister to the spiritual

wants of the members of his communion of whom there were probably at that time ten thousand in N.S.W. and V.D.L.

OHAĒAWAI, a native village of N.Z., halfway between Russell and Hokianga, is a place of considerable historical interest, having been the scene of an action disastrous to the British troops during the first Maori war. It is celebrated for its hot springs, which find vent in numerous places, extending over an area of five or six square miles. The most important are situated two miles from the village, and range in temperature from 90° to 150°. They are strong in mineral properties, and are famous for their beneficial effect in rheumatism and skin diseases, while to invalids benefiting by change of air a short residence within the influence of the strong gases issuing from the ground in the vicinity acts as a powerful tonic. Important mineral indications are also found, particularly sulphide of mercury, native mercury, sulphur, iron, &c. The village is fifteen miles from Auckland overland, 120 by sea; it has a Government and native school and a native Episcopal church.

O'HALLORAN, THOMAS SHULDHAM, (1797—) after an eventful military career retired from the army in 1838, and came to S.A. in 1839. In February 1840 he was gazetted Commandant of the S.A. Militia, and in June Commissioner of Police. In 1840, when the ship *Maria* was wrecked in Lacedpede Bay and the crew were murdered by the blacks, O'Halloran went down to investigate the matter. The result of the investigation was that he hanged two or three of the natives. This proceeding was severely condemned by a number of colonists who made strong representations on the subject to both the local and Home Governments. The result showed however that the summary measures adopted were the wisest and safest. On 17th August of the same year he was sent in command of an expedition against the Milmenura (Murray) blacks; in April 1841 he commanded an expedition against the Murray and Rufus blacks; in May he was again sent against the same tribes; in November he was in command of an expedition to Port Lincoln against the Battara blacks. In April 1843 he resigned his appointment as Commissioner of Police. In June of the same year he was nominated a non-official Member of the Council, which position he held for eight years, until the establishment of Representative Government. He was returned for the Legislative Council at the first election in March 1857. In 1863 he resigned. He was the principal founder and supporter of Christ Church, O'Halloran Hill, and one of the original Governors of St. Peter's Collegiate School.

O'LOGHLEN, SIR BRYAN (1828—) was educated at St. Clement's School, Oxford, then at Ascot College, Birmingham, and in 1846 at Trinity College, Dublin. He was called to the Irish Bar in 1856 and joined the Munster Circuit for five years.

He came to V. in 1862 and was admitted to the Victorian Bar in 1863, when he was appointed Crown Prosecutor which office he resigned in 1877, and in 1878 was elected a member of the Assembly. On the death of his uncle Sir Coleman O'Loughlen, in 1879, Sir Bryan was elected, though absent, member for Clare, Ireland, in the House of Commons but did not take his seat; and the Committee of Elections of the House of Commons declared the seat for Clare vacant by reason of Sir Bryan O'Loughlen's acceptance of an office of emolument (the Attorney-Generalship of V.) in the Berry Ministry. He acted as Chief Secretary during the absence of Berry on the embassy to England; he was defeated at the general elections in February 1880, and went out of office with the Berry Ministry.

OMEQ, a mining township in V. on Livingstone Creek about 250 miles E.N.E. of Melbourne. The diggings are of a rich character, and likely to last for many years to come, especially the quartz reefs on which little has been done for want of capital. Some portion of the district which is mountainous is parcelled out in runs. A large extent of valuable land suitable for grazing and cultivation is still unoccupied, although much has been taken up during the past two years. Selection is steadily progressing. The gold-field extends over eleven square miles of ground; there are twenty-three distinct quartz reefs.

ONSLOW, ARTHUR, (1833—) a Captain in the Royal Navy, came to A. in March 1857 as officer on board the *Herald* surveying vessel on the Australian station. He was employed surveying Shark's Bay and the numerous detached coral reefs outside the Great Barrier Reefs, and in Torres Straits. He returned to England in 1861, but came to Sydney on sick leave in 1863. He was elected member for Camden in the Legislative Assembly in 1870, which constituency he has since uninterruptedly represented. In 1874 he accompanied William Macleay in his expedition to New Guinea in the *Chevert*.

OPHIR, a township in N.S.W. contiguous to the Summerhill Creek, 154 miles W. of Sydney. It is famous as being the first gold-field in N.S.W. having been discovered by Hargreaves on 14th February 1851. It has now very few marks left of its former greatness, and the population from thousands has dwindled away to about 150 persons. The land in the vicinity of the town is taken up by sheep and cattle stations.

O'QUINN, JAMES (1820—) Roman Catholic Bishop of Brisbane, is a native of Ireland. He was ordained priest in 1843 and took charge of an academical institution in Dublin. On 29th June 1859 he was consecrated first Roman Catholic Bishop of Brisbane, where he arrived in 1861.

ORD, SIR HARRY ST. GEORGE, Governor of W.A., entered the Royal Engineers in 1850; in 1854 served in the Baltic under Sir Henry Jones, and distinguished himself by his courage

and ability. He also took part in several engagements in the Baltic resulting in the capture of Bomarsund. In 1861 he was appointed Governor of Bermuda and held that position for five years. He was also employed in diplomatic functions on several occasions on the W. coast of Africa. In 1867 when Singapore, Penang, and Malacca were separated from the Government of India and formed into a Crown Colony under the title of the Straits Settlement, he was selected by the Colonial Office as the first Governor of the new colony. He was also Commander-in-chief of the forces there. In 1877 he was appointed Governor of W. A.

O'SHANASSY, SIR JOHN (1818—) a native of Ireland, came to Port Phillip in 1839. He settled ultimately in business in Melbourne, and from the first devoted himself to public affairs. He took an active part in the agitation in favour of the separation of Port Phillip from N.S.W. and also in the formation of the Anti-Transportation League in 1851. In that year he was elected to the first Legislative Chamber of V.; in 1856 he was elected for Kilmore; and in 1857 became Chief Secretary, but only held office for six weeks. In 1858 he again came into power, and retained it until the end of 1859. In October 1861 he returned to office for the third time. His Government passed several important measures, amongst others the Electoral Law Amendment Act and the Land Act of 1862. In 1863 they retired, and he remained in opposition until 1866, when he paid a visit to Europe. He returned in 1867, and was elected to the Upper House for the Central Province in 1868. In 1874 he resigned his seat, intending to re-enter the Lower House, but was twice defeated. In 1877 he was elected for Belfast. He has always been an unwavering free-trader, for immigration, and supporter of a united form of government for the Australian Colonies rather than the Federal system. In 1870 he was made Companion of the Order of Sts. Michael and George, and in 1874 was created K.C.M.G. and Knight-Bachelor, by special warrant.

OTWAY, CAPE, the southernmost point of Portland Bay district in V., was discovered by Lieutenant Grant and named in honour of William Albany Otway, Captain in the Royal Navy and one of the Commissioners of the Transport Board. It is a bold headland and has a lighthouse 500 feet above high-water mark.

OVENS RIVER, in V., was discovered by Hume and Hovell in 1824, and named after Major Owens, Private Secretary to Governor Brisbane, who in company with Captain Currie had in 1823 explored the country around Lake George and discovered the Murrumbidgee River.

OVERLAND TELEGRAPH. On the return of John Macdougall Stuart to Adelaide in 1862 after having successfully crossed the continent and proved the existence of a practicable route, interspersed with tracts of valuable country in a region hitherto considered an impassable desert, the idea

of constructing a line of telegraph two thousand miles in length to the northern coast, and so opening up the country discovered, and also to connect with an Anglo-Australian cable to be brought down to meet it from Singapore or Java, was formed by Charles Todd, Postmaster-General of S.A., and laid before the Government. The measure, though generally approved of, was considered too large for the resources of the colony; so the question was postponed from year to year although Todd never lost sight of it, and frequently urged its importance on the Government. In the meantime the colony had formed the settlement on the northern coast at Escape Cliffs, which after two or three years had to be abandoned in favour of another at Port Darwin. These settlements suffered from their isolated position and want of communication with the settled districts in the southern portion of Australia, and the idea of a line of telegraph from Adelaide to Port Darwin gained favour till 1870, when the successful working of the Atlantic and Anglo-Indian cables gave an impetus to telegraph extension all over the world, resulting in the formation of the British-Australian Telegraph Company, for the purpose of putting down a cable from Singapore to Port Darwin *via* Java. The South Australian Government, under the advice of Governor Sir James Fergusson, decided to carry out the scheme of the telegraph recommended by Todd, and undertook to complete and have it ready to meet the cable on 1st January 1872, a period of about twenty months. The work was placed in the hands of Todd, who with an admirable system of organisation and ingenuity tided it over many unforeseen difficulties, and brought it to a successful completion. Six hundred miles of the work at each end were let to public contractors acting under Government superintendents, but Todd reserved the section in the centre extending to nearly eight hundred miles—which had hitherto only been traversed by one lightly equipped party of white men—to be constructed under his own immediate supervision. He divided the work on this central portion into five different parts and organised parties for each section; five officers of ability and experience, Knuckey, McMinn, Mills, Woods and Harvey—all of whom had taken leading parts in the pioneer expedition to the Northern Territory—being selected to take command of the different parties. The region was so unproductive of game and other articles of sustenance that every ounce of food required until the completion of the work and also for the return journey had to be taken with them. The parties proved to be so well organised that they arrived on the ground without any hitch, completed their portion of the line within the estimated time, and also erected one hundred miles extra of poles and finished in all about two hundred miles of line in addition. Great difficulty was experienced throughout the sections owing to the scarcity of suitable timber for poles, but by

traversing the country in every direction and carting the poles great distances—sometimes over one hundred miles—the requisite number was at last obtained. While everything was progressing satisfactorily on the most difficult portion of the work the contractors at both ends were encountering difficulties. Assistance was promptly rendered to the southern contractor which enabled him to complete the works within a few weeks after time; but the expedition of the northern contractor, after erecting about 220 miles of poles, collapsed entirely—most of the draught stock required for transit having died and nearly all the men returned to Adelaide. The Government immediately sent round to Port Darwin by sea a large and well equipped expedition under the command of R. C. Patterson, Assistant Engineer-in-Chief of the colony, to finish off the work, offering him a bonus of £1500 if he managed to get the work done in time; but this party also encountered difficulties which rendered the completion of the work within the specified time hopeless. The Government therefore sent Todd himself with reinforcements, and he wisely took his steamers 100 miles up the River Roper in the Gulf of Carpentaria and made that place the base of operations instead of Port Darwin, thus saving about 300 miles of carting and obtaining a better road. An unprecedentedly wet season was encountered immediately after his arrival, rendering the country impassable for loaded teams for some time; but as soon as the weather improved great activity took place and Todd completed the line on 22nd August 1872, being a little over eight months after time. The British Australian cable after being successfully laid broke, and was not repaired until 22nd October 1872, when telegraphic communication was established between Australia and all parts of the world—the first recipient of a message from London being Messrs. James McEwan and Co. of Melbourne. The beneficial results of this great work became apparent at once. Within six months after the opening of the line the colony gained nearly a quarter of a million sterling extra on its wheat harvest, through the telegraph enabling sales to be made in foreign markets. Gold discovered in payable quantities by the northern contractors' party led to the opening up of valuable goldfields and the settlement of the Northern territory. Deposits of copper, lead and iron have since been discovered, and will no doubt at some future time prove remunerative. Stockholders quickly pushed their herds out along the line and the country near the centre of Australia was rapidly taken up for pastoral purposes. All classes were directly or indirectly benefited and all saw the utility of this great work, which it is to be hoped will soon be followed by a railway along the same route.

OXLEY, JOHN (1781-1828) explorer, a native of England, whilst quite a youth entered the navy, saw some active service in various parts of the world; and rose to the rank of lieutenant. He came

out to Australia and was appointed Surveyor-General of N.S.W. in January 1812. Being a young officer of great spirit and enterprise he was sent out as a leader of an expedition from Sydney in 1817. He had with him Allan Cunningham, botanist and explorer; Evans, Deputy Surveyor-General; C. Frazer, botanist; and Parr, mineralogist. The expedition started early in 1817, and on 14th April arrived at Bathurst Plains, where they found the young settlement formed by Governor Macquarie in a flourishing condition. They reached the Lachlan River on 26th, at a place where it was about 100 feet wide, with deep banks. Here a depôt was established, and two boats constructed to assist their progress down the river. Numbers of natives were found encamped on the banks, and behaved in a friendly manner. They reached the settlement on 29th August, after an absence of four and a-half months, having added greatly to what was previously known of the interior. In May 1818 Oxley again set out with a party consisting of Dr. Harris, surgeon of the N.S.W. Corps; Evans, Deputy Surveyor-General; C. Frazer, botanist; and twelve men, with nineteen horses and six months' provisions. A lofty range of hills, which in their outward journey they had seen was the object to which they directed their course. These hills had been named Arbutnot's Range, but were afterwards known as the Warrumbungle Range. On 27th July when they had been out about two months they came to the banks of a stream more than 500 feet wide, and apparently in flood by the heavy rains which were now falling. This was named the Castlereagh, in honour of Lord Castlereagh, and after waiting on its banks for a few days it fell so much that they were able to cross it. Ascending Arbutnot's Range they ascertained that its loftiest point (Mount Exmouth) was about 3000 feet high. From this elevation they described a lofty range of hills, to which they gave the name of the Earl of Hardwicke. Its highest elevations were named Mounts Apsley and Shirley. On 2nd September they reached a stream which they called the Peel, after Sir Robert Peel, and they named another fine stream the Hastings, after Lord Hastings. They reached Port Stephens, and from thence were conveyed to Newcastle on 5th November, after an absence of more than five months. Oxley was made a member of the Legislative Council in 1824, and died on 25th May 1828.

OXLEY, a township in Q., on the S. and W. Railway, eight miles south of Brisbane. The river at this point is spanned by a fine iron bridge called the Albert. It consists of eight lengths—one of 40 feet, six of 80 feet, and the largest of 160 feet, which is formed of bow-string girders of the "hogback" type, the smaller ones being lattice with parallel booms. The girders at either end rest on massive freestone abutments, and are supported by piers of cast-iron cylinders 8 feet in diameter. The dimensions of the bridge are: length 716 feet, width 22 feet, height above

high-water 43 feet. 1274 tons of iron were used in its construction, and its cost was £52,135. The surrounding district is agricultural.

OXLEY'S PEAK. A mountain of N.S.W. in the Liverpool range.

OXLEY'S TABLE LAND in N.S.W. consists of two hills that appear to have been rent asunder by some convulsion of nature, since the passage between them is narrow, and their inner faces are equally perpendicular. The one named Mount Oxley is steep on all sides, but the other gradually declines from the south. It is from four to five miles in length, and is picturesque in appearance, and lightly wooded with cypresses.

P.

PALMER, ARTHUR HUNTER (1819—) a native of Ireland, came to N.S.W. in 1838. In 1845 he went to Q. In 1866 he was returned to Parliament, and in the following year became Colonial Secretary in the Mackenzie Ministry, and successively Minister for Public Works and Minister for Lands in the same cabinet. After holding office for eighteen months, his Ministry resigned; but Palmer again came into power in 1870, and formed the Palmer Ministry, which held office for nearly five years. In January 1879 Palmer joined M'Ilwraith, and formed the Ministry now in power, taking the office of Vice-President of the Board of Lands and Works.

PALMER. A goldfield in the extreme north of Q., named after the river of the same name, about 1250 miles N.W. of Brisbane, and 120 miles S.W. of Cooktown. The diggings were discovered about the middle of 1873 by James V. Mulligan. A large digging population was drawn thither and much gold raised. Tin is found on Granite Creek waters, where in the form of stream tin it occurs in association with gold. The gold in the alluvial deposits is fast disappearing, but the quartz reefs are proving remunerative. There are it is estimated 119 well-defined reefs on the Palmer. Nine crushing machines are at work and some of the stone is very rich. The gold is pure, averaging an assay value of £4 2s. 6d. to the ounce. In 1879, 4814 tons of quartz were crushed yielding 10,002 ounces of gold, an average of 2oz. 1dwt. 23grs. to the ton. The geological evidences betoken a regular formation of gold-bearing rocks extending in a northerly and southerly direction for some hundreds of miles. During the year 1879 the population fell from 10,000 to 6500, of whom only 500 were Europeans, and the yield of gold from 120,233 ounces in 1878 to 90,000 ounces in 1879. Reefing is not in a flourishing condition, as the present appliances are not capable of overcoming the water found in the lower levels. The population is estimated at 300 Europeans and 5000 Chinese.

PALMER, SIR JAMES FREDERIC (1814-1873) was a native of Devonshire in England, and was educated for the medical profession. He came to Port Phillip in 1839, and practised his profession. In 1846 he was elected Mayor of Melbourne, and Member for Normanby in the Legislative Council, and in 1851 was chosen first Speaker of the Council. In 1856 he was returned for the north-western Province, and again elected President of the Council. He was knighted for his public services in 1857.

PALMER, REV. THOMAS FYSSHE, one of the "Scotch Martyrs," was a native of Bedfordshire, England, and descended from one of the oldest families in that county. He was educated at the University of Cambridge and was fellow of Queen's College, but in consequence of perusing the writings of Dr. Priestly he had embraced Unitarian opinions, and in 1792 became minister of a church of that denomination in Dundee, Scotland. He was a man of excellent understanding, unimpeachable morals, and great simplicity of character, but he incautiously took part in republishing an old "Address to the people of Scotland concerning the Reform of Parliament." For this offence he was tried in Edinburgh in August 1793, convicted and sentenced to seven years transportation to Botany Bay, where he arrived in September 1794. Palmer was voluntarily accompanied in his banishment by two devoted friends, Ellis and Boston, who by instances of devotion and self-sacrificing sympathy were the means of saving his life, which had been threatened by a plot laid by the captain of the *Surprise*, the vessel which brought them to Australia. When Palmer's sentence had expired in 1801 Ellis, who had meanwhile established himself in Sydney as a brewer, fitted out a small vessel to convey himself and his friend and pastor to England, but they were wrecked on one of the Ladrone Islands, where they were taken prisoners by the Spaniards, and Palmer debilitated by hardship and suffering caught a fever and died in December 1801.

PALMERSTON, the metropolis of the South Australian settlement in the Northern Territory, is situated on the eastern side of Port Darwin, on the peninsula dividing the main portion of the harbour from Frances Bay, and terminating at Fort Point. It is about 2000 miles N.N.W. of Adelaide. The site of the city is eligible and healthy for a tropical climate, being about sixty feet above the level of the sea and almost surrounded by it. From the nature of the ground the heavy rains of the wet season run off into the harbour immediately after falling, and so lessen the danger of malaria. Cool breezes blow almost constantly throughout the year and so temper an otherwise unbearable climate. The town is admirably laid out. Substantial buildings and stores of wood and iron abound. The South Australian Government has erected good stone buildings for public purposes, comprising court-house, post-office, land and survey office, and the

Government House or Residency which was completed in 1879. There is a large population of Chinamen who have separate quarters. In June 1880 the greater portion of the town inhabited by them was burned to the ground. The township was selected as the site of the settlement by Goyder in 1869, and named after Lord Palmerston, Prime Minister of England. The area as laid out covers 800 acres, each allotment occupying half-an-acre. It is a station of the British-Australian Telegraph Company, and of the South Australian Overland Telegraph.

PALM TREE CREEK, a beautiful stream of fresh water in N.A., joining the River Dawson. Fine corypha palms grow along its banks; it was discovered by Leichhardt in 1846.

PAMPHLET, THOMAS. When Oxley in his expedition to Moreton Bay in 1823 anchored at the mouth of the Pumice Stone River, scarcely had the crew landed when a number of men, supposed to be natives, were seen approaching the vessel. When they got near however, the man who was foremost was perceived to be of a much lighter colour than the others, and so soon as he was within speaking distance he hailed them in English. He was so bewildered with joy that we could make very little out of his story that night. He said his name was Thomas Pamphlet, and that with three other men he had left Sydney in a small coasting vessel on 21st March—more than eight months previous—to procure a cargo of cedar at Illawarra. They were driven out to sea, with very little water on board, by a heavy gale shortly after leaving the port. They believed that during the storm they had been driven south, and that when it abated they were off V.D.L. They steered north with the hope of reaching Port Jackson. The water was soon exhausted, and on the thirteenth day one of their number named Thompson became raving mad and died a few days after. A shower of rain at length partially supplied their wants; and steering north they made the land, and in their eagerness to reach a small stream of water they ran their boat on shore at a place where, in a few minutes, it was dashed to pieces. Some bags of flour were washed on shore, and they secured from twenty to thirty pounds each, being as much as in their exhausted state they were able to carry. Still thinking they were to the south of Sydney they set out along the coast in a northerly direction, and after travelling for some distance fell in with a tribe of friendly natives who treated them very kindly. They continued their journey north for several days, and at length found they were on an island. This must have been Stradbroke Island, whose western shore forms the south-eastern boundary of Moreton Bay. They were a month in crossing a stream, and on arriving at its mouth struck off northwards, but meeting with a large party of natives Pamphlet lived with them until he was seen by Oxley. Whilst with the natives he and his companions were frequently separated from

each other and were taken by their black friends to engage in hostile encounters with other tribes. Oxley and Lieut. Stirling learning from Pamphlet that he and his companions had discovered a large river set out to explore it, taking Finnegan, one of the shipwrecked men, with them as guides. This was on 1st December 1823. On the following morning they reached the mouth of the river, which was named the Brisbane in honour of Governor Sir Thomas Brisbane.

PARKER, SIR HENRY WATSON, (1808-1881) a native of Kent in England, came to N.S.W. in 1843. He was Private Secretary during the Government of Sir George Gipps, and was for many years a member and Chairman of Committees of the Legislative Council. He was Prime Minister and Colonial Secretary, and member of the Executive Council of N.S.W. from October 1856 to September 1857. He was knighted for his public services, and for many of the latter years of his life resided in England.

PARKES, HON. SIR HENRY (1815—) Colonial Secretary and Premier of N.S.W., came out to N.S.W. in 1839. In 1848 he took an active part in the election of Robert Lowe for Sydney. Subsequently he took a leading part in the agitation for the abolition of transportation, and was a member of the Council of the Australasian League. In December 1850 he started the *Empire* newspaper, which he conducted for seven years. By that time he had begun to make himself known in Sydney as a public speaker; and the establishment of the paper as the leading organ of liberal progressive views in the colony increased his political influence. In 1853 he contested with Thurlow the representation of Sydney, but was defeated. In 1854 he was again brought forward at a few days notice, and defeated Kemp by a majority of more than two to one. In 1856 he was elected one of the four representatives of Sydney for the new Legislative Assembly. He took an active part against the nominee principles of Wentworth's Constitution Act. After the introduction of the new Constitution he was elected by a large majority, and in 1858 gave effective aid in Parliament to the carrying of the Electoral Act, and was returned at the head of the poll for East Sydney at the first general election under that Act. For some time, after twice retiring from Parliament, he represented the district of Kiama. In 1861 he proceeded to England in company with Dalley as Immigration Commissioner, and returned to the colony in 1863. He again entered Parliament, and first took office in 1866, in Martin's Ministry, as Colonial Secretary. The great work that he accomplished whilst in that Ministry was the passing of the Public Schools Act. He resigned in September 1868, in consequence of a difference of opinion with his colleagues in reference to the treatment of Duncan the Collector of Customs. Less than two years afterwards he resigned his seat in Parliament, but towards the end of the year 1871 was elected for

Mudgee. In May 1872 the Martin-Robertson Ministry was defeated on the motion of William Forster, on the subject of the Border duties. Forster failed to form a Ministry; and the most influential members of the Opposition having indicated their opinion that Parkes ought to be a member of the new Ministry, he was sent for and formed his first Administration. During his Ministry he effected, with the sanction of Parliament, a change and enlargement in the constitution of the Ministry. The office of Solicitor-General was abolished; a new office, that of Minister for Justice and Public Instruction, was created, and also that of Minister for Mines. The retirement of Sir Alfred Stephen from the office of Chief Justice gave the Premier the opportunity of naming a successor to the highest position under the Governor. Butler, the Attorney-General, had reason to expect that this high office would be offered to him. When it was given to Martin, Butler left the Ministry. About two years and a half later the Parkes Ministry was defeated on a motion of John Robertson's, censuring their conduct in relation to the release of the prisoner Gardiner. From February 1875 to March 1877 Parkes was in opposition. He resigned the position of leader of the Opposition, which was successively taken up by Fitzpatrick, Farnell, Piddington and Stephen Brown. Just as the weakness of the Government came to a crisis he again took the lead, and carried a vote of censure by thirty-one to twenty-eight. The Governor, after consenting to dissolve Parliament, on the assumption that supplies would be granted for the interval to be occupied by a general election, refused to grant a dissolution when he found that the Assembly withheld supplies. The Ministry thereupon resigned, and Parkes was summoned a second time to form an Administration, which he did on 22nd March 1877. In 1877 Parkes, having declined a previous offer of distinction from the Crown, was offered the rank of Knight Commander of the Order of St. Michael and St. George, which he accepted. In the excitement of the general election of December 1877, consequent on the continued interchange of the two leaders to opposite sides of the House, Parkes was defeated for East Sydney (at the same time that the rival leader, Sir John Robertson, was defeated for West Sydney,) but was immediately afterwards elected for Canterbury, which place he still represents. On 17th August he resigned, and remained in opposition until December 1878, when he was again sent for by the Governor. He formed a coalition with Sir John Robertson, and now occupies the post of Colonial Secretary and Premier. Parkes is a man of great ability as a writer and speaker on public subjects, and has published a volume of his collected speeches, with an introduction by David Blair.

PARRAMATTA is, next to Sydney, the oldest town in N.S.W. It is situated on the Parramatta River which in reality is an elongation of Port

Jackson. It is distant from Sydney fourteen miles W., with which communication is by steamers and the Great Southern Railway. It was originally known under the name of Roschill which was afterwards changed to its old aboriginal name. It was established as early as November 1788, the year in which Phillip landed; the natural beauty of the country and the fertility of the soil at once attracting his attention and causing him to make it his residence. Much of the early history of the colony is bound up with Parramatta and the first grain was grown and harvested here. The town has many features of interest, it is well laid out and is not altogether unlike an English town of the same size. The public buildings are numerous and comprise the Government House, which however is not occupied by any of the authorities. There are two tweed manufactories, and two others outside the town, a brewery, a meat-preserving factory, a drain and tile works, and five public schools. A beautiful park is reserved for the recreation of the inhabitants. The walks are planted with oaks which are the largest in Australia. The population is about 6103, the district containing 11,560. The district is mainly devoted to fruit-growing, and the orangeries and orchards of Parramatta have an almost world-wide reputation. The largest orange trees in the world are believed to be here, the earliest having been planted soon after the colony was founded. Upwards of 10,000 oranges have been gathered in a season from one tree. The town has been under municipal government since 27th November 1861. It is lighted with gas, contains thirty-six miles of street, and the rateable property is valued at £235,000.

HISTORY.—Parramatta has a history. It was originally known under the name of Rosehill, which was afterwards changed to the aboriginal name. It was established as early as November 1788, the year in which Phillip landed, the natural beauty of the country and the fertility of the soil at once attracting his attention and causing him to make it his residence. Much of the early history of the colony is bound up with Parramatta. The first grain was grown and harvested here, and the earliest grants of land to convicts who had served their time were made. It was for a long time the central penal station of the colony, and also the country residence of the Governors. In January 1793 John Macarthur was appointed to the command of the settlement. St. John's Church of England was completed in September 1796. In September 1800 instructions were issued by Governor King to the Rev. Samuel Marsden, delegating to him the general superintendence of the Police Convict Settlement and of Government Affairs at Parramatta. St. John's Church was opened for worship in April 1803. The first Roman Catholic service was held by Rev. James Dixon on 24th May 1803. The foundation-stone of the Church of England parsonage was laid by the daughter of Rev. Samuel Marsden on 5th May 1816. The Observatory was built by Mr. Dunlop, the

Astronomer, in 1822. The School of Industry was opened in July 1829. The annual conference with the aborigines was held in the Market Place by Governor Darling in January 1830. The foundation of the King's School by the Home Government (Rev. Robert Forrest first Head Master) took place in May 1831. Lady Bourke, wife of Sir Richard Bourke, died at Parramatta and was buried in the Church of England Cemetery, in May 1832. The King's School (present building) was opened in November 1856.

PATERSON, CAPTAIN, succeeded Major Grose as Acting-Governor of N.S.W. from 13th December 1794 to 1st September 1795.

PATERSON RIVER (or YIMMANG); a river of N.S.W., which flows into the river Hunter, at the town of Hinton. It was named in honour of Colonel William Paterson.

PATTESON, JOHN COLERIDGE (1826-1871) first Bishop of Melanesia, was educated at Eton, and graduated at Baliol College, Oxford. He came out to N.Z. in 1855 to assist Bishop Selwyn in his missionary work amongst the Solomon and other islands; and after spending five years in this work, in 1860 was consecrated in N.Z. by the Bishops of Nelson and Wellington, as Bishop of Melanesia. He visited Sydney and Melbourne in 1864, and established the head quarters of the mission in Norfolk, where native youths of the islands were educated and afterwards returned to impart to their fellow-countrymen the blessings of Christianity and civilisation. It is supposed that he owed his death to the ill-feeling engendered by the coolie traffic, to which he was strongly opposed. He was murdered at Nukapu in the Santa Cruz group, 20th September 1871.

PEARSON, CHARLES HENRY, M.A., (1830—) was lecturer on Modern History at Trinity College, Cambridge, from 1869 to 1871. He then came to S.A., where he remained till 1874, when he was appointed Lecturer on History to the Melbourne University. After a few months he accepted the head-mastership of the Presbyterian Ladies College, which he resigned in 1877. Entering public life he stood for the electorate of Boroondara at the general election in that year, but was unsuccessful. He was then appointed by the Berry Government a commissioner to examine into and report on the working of the State system of education in V., for which duty he was paid the sum of £1000. He was elected Member for Castlemaine on the retirement of James Farrell, who received in exchange for his seat the appointment of Parliamentary Librarian. He was chosen by the Chief Secretary as his colleague in the embassy to the Imperial Government in December 1878. Pearson is the author of—*A History of England during the Early and Middle Ages*, and *Historical Maps of England during the First Thirteen Christian Centuries*. He edited the *National Review* in 1862-3. He is also author of two works written in Australia—*History of*

England in the Fourteenth Century, and an *English Grammar* written in conjunction with Professor Strong.

PEDDER, SIR JOHN LEWIS (1784—1860) first Chief Justice of Tasmania, arrived in the colony in 1824, and retained office till 1855, when he retired on his pension and returned to England.

PELSART, FRANCIS, Dutch navigator. In 1628 eleven vessels equipped for an expedition by the Dutch East India Company, sailed from Texel 28th October. After they had passed the Cape of Good Hope one of them, the *Batavia*, commanded by Pelsart, became separated from the others in a storm. While beating about for some time the crew discovered Australia, but in a most dismal manner. The vessel carried an enormous crew, besides passengers, making a living freight of human beings utterly unprovided for in case of accident. The *Batavia* drifted about for many days, the pilots fancying they were steering for Bantam, but without the slightest idea where they were. On 4th June 1629, fair and calm, while the ship was going easily along, the master of the vessel called attention to the white appearance of the water beyond them. The steersman said it was the moonlight reflection from the waters; but he was wrong. It was foam from breakers, and when the ship got fairly into it she struck heavily. The spot was the Abrolhos, or Rocks of Houtman, lying off the west coast of the continent. The people on board endeavoured to reach some islands they saw not far off, and many succeeded. But the weather was so stormy that it was nearly a week before they could all leave the wreck, and great numbers were drowned before they could reach the shore. Those who escaped from the sea seemed to be but little less miserable than they were before, for the islands were quite bare and afforded them neither shelter nor fresh water. Water was found at last on one of the islands; but it was a long time before it was discovered, because the holes in which it was were filled and emptied at the rise and fall of the tide, and were naturally concluded to be salt water. When things were a little in order, Pelsart put a deck to one of the ship's boats, and coasted along towards Batavia. This he reached in safety. Those who were left behind had a sad time of it. Half of them mutinied, and tried to murder the other half for the sake of getting control of the cargo. They nearly succeeded, but the few survivors, fighting resolutely for their lives, succeeded in escaping to a neighbouring island. Here they were exposed to daily attacks from the mutineers, until he returned. The majority voted for the execution of the mutineers, which was there and then carried into effect. But two of them were spared and were set ashore or marooned on the mainland. In proceeding to Batavia Pelsart was enabled to see a good deal of the western coast. The mainland was about sixteen miles N. by W. from the place where they suffered shipwreck. He landed

above Shark's Bay on 14th June, and found that there was in front of the coast a table of sand one mile in breadth and none but brackish water to be found on it. Beyond this the country was flat, without vegetation or trees, with nothing in view but ant-hills, and these so large that from a distance they were taken to be the habitations of the natives. Some of the savages were seen carrying clubs, and apparently anxious to surprise and massacre the boat's crew, as they crept towards the seamen who were seeking for water, on their hands and feet. One of the seamen stood up on an eminence, and the savages perceiving him took to flight. They are described as wild, black, and altogether naked. On the 16th savages were again seen in another part of the coast, but they took to flight upon the Dutch sailors approaching them. The voyagers reached Batavia in safety. When Tasman was sent out in 1642 it was part of his instructions to inquire after the two Dutchmen whom Pelsart had marooned; but no account of them was ever obtained.

PERRY, CHARLES, D.D. (1807—) was consecrated first Bishop of Melbourne in Westminster Abbey in 1847, and the following year arrived in Melbourne accompanied by Dr. Macartney, the Rev. Messrs. Hales, Newenham, and Dr. Learmonth. On 28th January 1848 he preached his first sermon in Australia in St. James' Church Melbourne. On landing he found only a few very modest Anglican churches with a mere handful of ministers; and he left behind him in 1874 many stately edifices with numerous clergymen of his denomination scattered broadcast over the colony. In 1872 the twenty-fifth anniversary of his arrival was celebrated by special services in St. James' Church, Melbourne. In 1874 he left Melbourne for London, and resigned his charge; and early in the following year was succeeded by Dr. Moorhouse.

PERTH, capital of W.A., was constituted a city in September 1856. It is pleasantly and picturesquely situated on the Swan River, about twelve miles above Fremantle, with which there is communication by the river and land, a well macadamized road connecting the two towns. Approached from Fremantle by road or water, the city presents a striking appearance—a splendid lake-like reach, known as Melville water, washing the base of the slope on which it is built. The city is, on the whole, well laid out; the streets are regular, and of sufficient width. The principal building is the City Hall, an imposing-looking structure, standing on a slight eminence in the centre of the town. Of cathedrals there are two, one Protestant and one Catholic. Most of the houses are built of stone and brick; very good samples of bricks are made both in Perth and Fremantle. The population at the last census was 5000 persons, inclusive of the military. The city is under the control of a council of wardens and a chairman. The site of Perth

possesses much natural beauty, and advantage has been taken of the physical formation of the ground in the alignment of the streets and in their width to preserve an attractive character. The main street from west to east comprises a distance of nearly two miles, and is planted with Cape lilac and mulberry trees, which not only afford a grateful shade, but add to the beauty of the city. In the district round Perth there are 1512 acres under cultivation.

PHILLIP, CAPT. ARTHUR, first Governor of N.S.W., was born in London in 1738. His father, Jacob Phillip, was a native of Frankfort in Germany, who having settled in England, maintained his family by teaching languages. Phillip entered the navy at the age of sixteen, and was present at the taking of Havannah in 1761, when he gained prize money and was made Lieutenant on board the *Stirling Castle* by Admiral Sir George Pococke. At the close of the Seven Years War in 1763 he returned to England, and having married, settled at Lyndhurst, in the New Forest. A rupture taking place shortly after between Portugal and Spain Phillip offered his services to the Portuguese, and was employed in their navy till 1778, when Great Britain being again embroiled with France, he returned to England. In 1779 he was made master and commander, and appointed to the *Basilisk* fireship. Two years after he was promoted to the rank of post-captain, and appointed first to the *Ariadne* frigate and subsequently to the *Europe*, sixty-four guns. In January 1783 he sailed with a reinforcement to the East Indies, but returned to England shortly after. He was not again in active service till he was appointed first Governor of New South Wales in 1787. When the first fleet anchored in Botany Bay on 20th January 1788, Phillip took three boats and sailed out to search for some more convenient harbour. As he passed along the coast he turned to examine the opening which Cook called Port Jackson, and soon found himself in a winding channel with great cliffs frowning overhead. All at once a magnificent prospect opened on his eyes. A harbour, perhaps the most beautiful and perfect in the world, stretched before him far to the west till it was lost on the distant horizon. To Phillip, whose mind had been filled with anxiety and despondency as to the future prospects of his charge, it opened out like the vision of a world of new hope and promise. Three days were spent in examining portions of this spacious harbour and in exploring a few of its innumerable bays. Phillip selected as the place most suitable for the settlement a small inlet, which in honour of the Secretary of State, Lord Sydney, he called Sydney Cove. About daylight two strange ships were seen in the offing showing French colours. Scarcely were the anchors down when boats put off, and mutual explanations followed on both sides. Phillip learned with surprise that the vessels before him were the exploring vessels, *Boussole* and *Astrolabe*, on a voyage of discovery under the command of

La Perouse. After a mutual exchange of civilities the two commanders proceeded to the work each had in hand—the Frenchman to provide his fleet with wood and water, the Englishman to establish the settlement of the new colony. On 26th January the fleet, having been brought round, anchored in deep water close along the shore of Sydney Cove. A formal disembarkation then took place. A detachment of marines and bluejackets leaped from their boats into the primeval forest. After hoisting the British colours at a spot near where the Colonnade in Bridge-street, Sydney, now stands, the Royal Proclamation and Commission constituting “The Colony of New South Wales” were read, a salute of small arms was fired, and the career of the British Dominion in A. commenced. The whole party landed amounted to 1030 souls, who encamped under tents and under and within hollow trees in a country which they described as resembling the more woody parts of a deer-park in England. Such were the circumstances of the foundation and such were the founders of the magnificent colonial empire in the Southern Ocean! The ground had been cleared and the work of erecting storehouses and other buildings begun. All this was not easy. The work of felling gigantic gum trees was in itself a fearful task, and to remove them afterwards and grub the stumps required the labour of all their men for weeks together. When things began to look a little orderly and the sickness which raged among them had begun to abate, the Governor went with the long-boat and cutter on an excursion to Broken Bay. Continued rains prevented the party from making a survey of their discoveries upon this expedition, more especially as the land was much higher here than Port Jackson, more rocky, and equally covered with timber. Above them soared the Blue Mountains in huge, precipitous walls of red sand-stone, crowned on the summit with trees, and quite inaccessible. Upon the south side of the bay there was a headland, which seemed to obstruct the view, but on rounding it the finest harbour of all was discovered, and it received the name of Pittwater. The solemn ceremony of establishing a regular Government in the newly-founded colony was performed on 7th February 1788. On that day, a sufficient space having been cleared for the tents and stores, the people were all landed on the shores of Sydney Cove, and assembled on the western side of the Cove, then named Point Maskelyne, but afterwards known as Dawes Battery; the military were drawn up under arms; the prisoners stationed apart; and near the person of the Governor, the gentlemen who were to fill the principal offices. The Royal Commission was then read by the Judge-Advocate; afterwards the Act of Parliament authorising the establishment of the courts of judicature; and lastly the patents under the Great Seal empowering the proper officers to convene and hold those courts. Three rounds of musketry concluded this part of the ceremony. Governor

Phillip then advanced and addressed the soldiers, thanking them for their steady good conduct. Turning to the prisoners he explained to them the nature of their position. He reminded them that they were now so placed that by industry and good behaviour they might soon regain the advantages which for a time they had forfeited, and promised that every encouragement should be held out to induce them to make the effort to regain that place in the estimation of society of which they had deprived themselves by their offences. He concluded by declaring his earnest desire to promote the welfare and happiness of all who were placed under his control; and his determination, with the help of the Almighty, to render the colonisation of N.S.W. advantageous and honourable to the country. The latter part of 1788 and the first four months of 1789 was one of the darkest periods ever experienced in the history of the settlement. The stock of provisions brought out from England was well-nigh exhausted; the few head of cattle also brought out had disappeared no one knew where, and nothing eatable had yet been produced in the colony with the exception of a few vegetables. Governor Phillip at this time of depression and anxiety set a noble example of disinterestedness and self-sacrifice. He lived on the same rations as was allowed from the public store to the meanest person in the settlement. The weekly quantity issued to every person indiscriminately at this time was but two and a-half pounds of flour and two pounds of pork. The latter, says Collins, when boiled, from the length of time it had been in store shrunk almost to nothing, and when divided barely afforded three or four morsels. “The Governor,” continues Collins, “from a motive that did him immortal honour in this season of general distress gave up three hundredweight of flour which was his own private property, declaring that he wished not to see any more at his table than the ration which was received from the public store, without any distinction of persons; and to this resolution he rigidly adhered, wishing that if a prisoner complained he might see that want was not unfelt even in Government House.” Phillip during the darkest hour had never allowed a shadow of doubt to cross his mind as to the ultimate success of the settlement and the eventual greatness of the colony. From the first he devoted most of his spare time to making excursions in search of better land for cultivation than was to be found on the shores of Port Jackson. On 6th July 1789 he discovered a large river, which he named the Hawkesbury, in honour of Lord Hawkesbury. He sailed up this fine stream for more than a hundred miles until he came to the shallows near a hill, which he named Richmond Hill. In 1790 Phillip had a very narrow escape from being murdered by the natives. He had educated and treated kindly two native youths at Government House; but they escaped to their old companions. Phillip hearing that they were amongst a tribe of natives camped

on the Manly Beach proceeded thither. In the course of the negotiations one of the blacks threw a spear at Phillip, which pierced him in the side. The wound was at first thought to be mortal, but the spear being carefully extracted and the wound dressed, Phillip recovered in six weeks. Phillip, whose health had suffered from privation, exposure and anxiety, announced his intention of proceeding to England. He sailed on 11th December 1792, six years having elapsed since the date of his commission and nearly five since his landing in the colony. Phillip was undoubtedly one of the most remarkable men of his day, and was admirably adapted both by nature and education for the important duties with which he was entrusted. Kind and confiding under ordinary circumstances almost to a fault, where firmness and decision were required, where a warning was needed, where duty had been neglected, deceit practised, or the public interest jeopardised, he regarded leniency as a most culpable weakness. His punishments were not frequent, but prompt and terrible. With a man of less self-sacrifice, less decision of character, or less humanity, the shores of Sydney Cove would probably have witnessed in the first year of the existence of the colony more terrible scenes of vice and crime than any which history has recorded. Under his rule public order was never for a moment endangered; and considering all the circumstances by which the people under his charge were surrounded, the offences were few and insignificant. He left the colony loaded with the blessings of those over whom he had ruled, and followed by earnest wishes for his safe return to England and speedy restoration to health. The first Australian Governor in point of time, he must also be regarded as the first in point of character and ability. The limited and remote sphere in which he exercised his talents, his death in a short time after his return to England, and the absorbing interest which attached at that period to the great events transpiring on the European Continent, prevented that recognition of his services and that appreciation of his character which he certainly merited from the British Government and people, and which in more peaceable times and under other circumstances he most assuredly would have received. He brought to England two native youths, Bennilong and Yemmerawannie. They had acquired, from residing with the Governor, a knowledge of the usages of civilised life, and both were persons of more than ordinary sharpness and address. The latter died in England, but the former returned to the colony.

PHILLIP ISLAND, an island in V., situated at the entrance of Western Port; its principal capes are Cape Wollamai and Point Grant. It was named Snapper Island by Lieutenant Grant, from its great resemblance to a snapper's head, or horseman's helmet; but was subsequently named Phillip Island after Governor Phillip. The greatest length

E. and W. of the island, from Point Grant to Cape Wollamai, is fourteen miles, and its greatest breadth N. and S. six miles. Its S. portion is swampy, and in the S.W. is a small marshy lake, called Swan Lake. These swamps abound in fish and waterfowl, and wallaby and other game in the scrub to the N., which is well grassed. The Acclimatisation Society has made this island a regular depôt, and has liberated a number of hares, Cape, English, and Indian pheasants; Ceylon, Indian, and Chinese partridges: Chinese, Californian, and Tasmanian quail; starlings, Algerine sand grouse, and wild ducks.

PIETERSEN, PETER, Dutch navigator, sailed along the coast of Arnheim or Van Diemen's Land, as the northern part of the continent was then called by the Dutch, in 1636.

PIGEON HOUSE, a mountain and singular land mark in the county of St. Vincent, N.S.W., so named by Cook; it resembles a cupola superimposed upon a large dome.

PINCHGUT ISLAND, (native name MATTEWAE;) an island of N.S.W. situated in the harbour of Port Jackson, near Sydney; it was named Rock Island by Governor Phillip, but the prisoners gave it the name it bears in memory of the physical privations they endured there.

PLATTER ISLAND, near Point Upright, is a remarkable cliff to the northward of Bateman's Bay, in N.S.W., 158 miles from Sydney.

PLATYPUS (or WATER MOLE.)—This strange animal is described in the article "Fauna." Sydney Smith humorously describes it as a "quadruped as big as a large cat, with the eyes, colour and skin of a mole, and the bill and web feet of a duck." It is known to naturalists as the *Ornithorhynchus Paradoxus*. The first complete description of it printed in English was written by Dr. George Bennett of Sydney, the eminent naturalist, and contributed to an annual publication in 1828. Dr. Bennett writes:—"It was on a beautiful evening in the month of October, the commencement of summer in southern latitudes, that, arrived in a district lying about two hundred miles to the south-west of Sydney, I approached the banks of the Yass River, in the interior of Australia. The scenery here is of the most picturesque description; the open forest country and wooded hills; the neat cottages and gardens, with the grain of a vivid green just bursting into ear,—the tranquillity around being only occasionally disturbed by the lowing of cattle, bleating of sheep, or the gay and blithesome notes of the feathered tribe. The silver stream of the Yass continued its silent course, its banks adorned by the beautiful pendulous acacias, which at that season were profusely covered by their rich golden and fragrant blossoms; while the lofty and majestic gum-trees, the graceful manna, or the dark swamp-oak, added to the variety and beauty of the landscape. The sun was near its setting, when up a more quiet part of the river, I sought the burrows

of those shy animals the water moles, known also to naturalists as the platypus or duck-billed animal. Among the colonists it is known by the name of water mole from some resemblance it bears to the common European mole. By the aboriginal tribes at Bathurst, Goulbourn Plains, Yass, Murrumbidgee and Tumut countries, it is designated by the two names, Mallangong and Tambreet, the latter being more in use with them than the former. The illustration may assist the reader in forming a correct notion of the peculiar shape and character of the animal. The body is depressed like the otter, mole, and beaver. It is covered by long and thick dark brown hair, underneath which is a short and very soft fur, resembling the two distinct kinds found on the seal and otter; on the abdomen, breast, and throat, the fur and hair is of much finer quality, and more silky in its nature. In young specimens the under surface of the tail is covered by hair of a beautiful silvery white; this is lost however in the adult; the under surface of the tail in such having merely a few coarse hairs scattered over it. This circumstance induced many to suppose that the animal uses its tail as a trowel, in a manner similar to the beaver; but from an examination of their burrows, I have no doubt that the hair is rubbed off by the attrition of the tail on the surface of the ground. The tail is flat, broad, and inclining on each side abruptly off at the termination, beyond which the long hairs project. The hair on the upper part of the tail is of a dark colour, long and coarse, and destitute of the peculiar glossy appearance of the other parts of the body. There was no variation in the colour of the fur in all the specimens I have seen; the under short fur is of a greyish hue. The whole of the under surface of the body is of a ferruginous colour, varying in intensity according to age. The legs are short, feet five toes webbed, and in the fore feet the web extends a short distance beyond the claws, is loose, and falls back when the animal burrows. The head is flat; and from the mouth two lips, or mandibles, project, resembling the beak of a Shoveller-duck; the lower mandible is shorter and narrower than the upper, and its internal edges are channelled, with numerous *strice*, resembling in some degree those seen in the bill of the duck. The colour of the superior mandible above, when seen in an animal recently taken out of the water, is of a dull, dirty, greyish black, covered with innumerable minute dots, and the cartilaginous continuation around the mandible is uniformly smooth and soft. The eyes are very small, but brilliant, and of a light brown colour; they are situated rather high up the head. The ears are not visible, but are perfectly formed within. The size of the animals varies; but the males are usually found to be, in a small degree, larger than the females. The average length is from eighteen to twenty inches. When the fur is wet the animal has a soiled and far from attractive appearance, resembling more a lump of dirty weeds which are often seen floating about the rivers, than any production

of the animal kingdom; it would therefore often escape observation, but for its paddling motion in the water; such was its appearance when lying dead on the surface, or when drifted by the stream against the stump of a tree, or among the reeds and bulrushes growing profusely near and upon the banks of the river. The animals are seen in the Australian rivers at all seasons of the year, but are most abundant during the spring and summer months. The best time for seeing them is very early in the morning or late in the evening. During floods and freshes they are frequently perceived travelling up and down the rivers; when going down they appear to allow themselves to be carried by the force of the stream without making any exertion, but when swimming against the stream, all their muscular power is exerted to the utmost to stem the force of the current." The Platypus abounds in the rivers, creeks, and lagoons of the S. and E. of the continent as well as T. It makes burrows in the banks sometimes forty or fifty feet long, in the extremity of which it forms a nest. It is by excellence a *lusus nature*,—the one unclassable anomaly of the animal kingdom.

PLUNKET, JOHN HUBERT, (1802—1869) was a native of Ireland, and educated at Trinity College, Dublin. He was called to the English Bar, and in 1832 was appointed Solicitor-General of N.S.W. by the Home Government. He landed in the colony in June of that year. In 1837 he became Attorney-General, with a seat in the Executive and old Legislative Councils, which office he held for nearly twenty years, whilst the Government was under the control of the Home authorities. He visited Europe in 1842. Whilst Attorney-General he distinguished himself by prosecuting ten Europeans for the massacre of a number of aboriginals—men, women and children. He procured their conviction, and seven of the ringleaders were executed. Under the new Constitution in 1856 he represented Argyle in the Legislative Assembly. In 1857 he was appointed President of the Upper House, on the resignation of Sir Alfred Stephen. In 1858 he was removed from the Chairmanship of the Board of Education, an office he had held for several years, by the Executive Council. This act gave rise to an angry feud, in which sectarian feeling largely mingled, Plunket being a Roman Catholic. He made his dismissal the cause of a personal quarrel between himself and Cowper the Premier. He resigned the office of President of the Legislative Council, together with his seat in that House. A public meeting was held in Sydney, attended by influential men of all denominations, at which resolutions were unanimously carried expressing sympathy with Plunket in his "abrupt and arbitrary dismissal" from the Chairmanship of the Board, and a deep and grateful sense of his public services in various official capacities during a period of more than twenty years. Similar meetings were held in many of the country districts. A vote of censure on the Ministry for their treatment of

Plunket in the matter was moved in the Assembly by James Macarthur. It was negatived, but a milder resolution of the same general tenor was carried. The Government offered to restore Plunket if he would consent to withdraw certain portions of a correspondence that had taken place between him and them, and which they considered offensive; but this he refused to do. In 1866-68 he represented the Martin-Forster Government in the Legislative Council. He died in Melbourne on 9th May 1869, and was buried in Sydney. Plunket was a man of considerable ability and of undoubted integrity. His popularity with his fellow-religionists was almost unbounded. He was of a rather austere nature, and inclined to severity in his administration of the law. But his private charity was very large, and was motivated by the highest principles.

POHLMAN, ROBERT W. (1811-1877) was educated for the legal profession and was called to the English Bar. He arrived in Melbourne (the Port Phillip settlement of those days,) in 1840, and was admitted a member of the Colonial Bar in 1841. He held a seat in the first nominee Legislative Council of V. under the Government of Sir Charles Hotham; was the first County Court Judge that ever sat on the bench of V.; and held office as Master in Equity, Commissioner of Insolvency, and Chairman of the Board of Education. On the introduction of Parliamentary Government he retired from political life, and devoted himself to the exercise of his judicial duties at the County Court.

POLDING, JOHN BEDE, D.D. (1794-1877) first Roman Catholic Archbishop of Sydney, was a native of Liverpool, England. At the age of eleven he entered St. Gregory's College in Ireland, and after eight years training for the priesthood was ordained in March 1819. When in 1834 it was resolved to send out a Bishop, as chief pastor of the Roman Catholics of Australia—who had before been under the superintendence of the Bishop of Mauritius—Dr. Polding was selected for the office. He was consecrated Bishop of Hiero-Cæsarea, with instructions to act as Vicar Apostolic of New Holland and V.D.L. The Bull of Pope Gregory XVI., appointing him to this position, was dated 2nd May. He arrived in Sydney in September 1835. In 1841 he visited England, and thence proceeded to Rome. In April 1842 he was appointed Archbishop of the newly-erected See of Sydney. During his stay in Rome he was created by the Pope a Count of the Holy Roman Empire, and a Bishop Assistant to the Papal Throne. Much excitement arose on his return to the colony with the title of Archbishop. The Bishop of the Church of England publicly protested against the assumption of such a title by any one within the dominions of Her Majesty, without the authority of the Crown. But the protest was treated as a dead letter. The community in Australia accepted without reserve the principle that every religious denomination has perfect freedom

to carry out its own organisation, with whatever titles it may see fit to use. Polding was remarkable throughout the whole of his career in Australia for a calm and conciliatory demeanour towards those who differed from him in theological views. In 1848 he again visited Rome, and brought with him on his return a number of priests and sisters of charity. In 1854 he made a third visit to Rome accompanied by Dr. Gregory; and as before brought out priests and sisters of charity. He spent much of his time in traversing the interior of the colony, and visiting the towns of V., T., and Q. As the fruits of his labours nine dioceses have been established within the arch-diocese; those of Melbourne, Hobart Town, Adelaide, Perth, Maitland, Goulburn, Bathurst, Brisbane, and Armidale. He was always ready to acknowledge and honour the services of those who laboured with zeal and fidelity in the work of the Church. His concern for the training of the young was unremitting. His large flock held him in deserved reverence and respect. In November 1865 he left Sydney for Europe for the fourth time. His zeal in encountering when over three-score and ten years of age the perils and hardships of a long voyage elicited warm expressions of admiration. This, it was supposed, would be the last time he would venture on so arduous a journey. But five years afterwards, when the Pope summoned the bishops of the Church from all parts of the world to meet in the Œcumenical Council of the Vatican, Polding would not be deterred, by any consideration of the ease to which his advanced years might well be supposed to entitle him, from setting out to join the Assembly. This was the fifth time he left Australia to visit Rome on the business of the Church. But he was not able to bear the fatigues of the journey, and after landing at Aden in the Red Sea, in compliance with the advice of those who watched with anxiety the effects of the passage and the tropical heat on his frame, he returned to Sydney. After that time he repeatedly travelled long distances in the colony. He died at Darlinghurst, Sydney, on 16th March 1877. His remains were honoured with a public funeral.

POLO, MARCO, the famous Venetian traveller of the thirteenth century. He brought back to Europe on his return from China, glowing accounts of the great wealth of the islands of the unknown sea which formed the boundary of China on the E. and S. It was reported to contain, he stated, no fewer than 7440 islands, mostly inhabited, and these abounded in gold, fragrant spices, precious stones, and forests of perfumed trees. He was careful to explain that this sea was not a mere gulf or arm of the ocean, but a boundless expanse of waters. At a distance of 700 miles in a direction between S. and S.W. from Lesser Java, he places two uninhabited islands; and fifty miles S.E. from these he states that there existed a country called Loehac, which formed part of a great mainland of a wild and mountainous character, little frequented by strangers, where

gold was abundant to a degree scarcely credible, and whose inhabitants were idolaters, having a language peculiar to themselves. They paid no tribute to any power—the situation of their country protecting them from attack. Were it assailable, he says, the Grand Khan would not have delayed to bring it under his dominion. The position assigned by Marco Polo to the two uninhabited islands agrees with that of Barrow's Islands in Dampier's Archipelago; and Marsden the translator of Marco Polo's "Travels," and, after him Major, have shown that Lochac was also an island in the Eastern Archipelago.

PORT ARTHUR, in T., is situated on Tasman's Peninsula, 185 miles from Launceston, and sixty-four miles S.E. of Hobart Town. It was formerly the principal penal establishment of the colony, and inhabited solely by convicts and the officers in charge. It has ceased to be a prison since May 1877, and the establishment is now broken up.

PORT CHALMERS, in N.Z., lies at the entrance of the Harbour of Otago, distant from Dunedin about nine miles N.E., of which city it is the port. The Otago Graving Dock, opened in May 1872, is one of the largest in the southern hemisphere. The floor is 328 feet long, and width forty-one feet; the length and width at the copings are respectively 342 feet and sixty-eight feet. There are extensive workshops and machinery in connection with this dock. There is also a floating dock 170 feet long by forty-two feet broad. The Port Chalmers stone is well known, and is extensively used for building in Dunedin and other cities. The population is about 1800. In the municipality are 320 dwellings, and rateable property of the yearly value of £13,600. The town is lighted with gas. The place is named in honour of the Rev. Dr. Chalmers, the Scottish Divine.

PORT CURTIS is situated just on the verge of the tropic of Capricorn, on the eastern coast of the continent, and was so named by Flinders, in honour of Admiral Sir Roger Curtis, who then commanded at the Cape of Good Hope. He discovered it in 1802. This port is nearly as large as Port Jackson, and is protected from the sea by Facing and Curtis Islands, the former being the most southerly and the lesser island. There is a channel separating these islands about a mile wide.

PORT ESSINGTON lies on the northern coast of the continent. In 1838 it was resolved by the Home Government to found a settlement at this point, and Captain Gordon Bremer was sent out with H.M. ships *Alligator* and *Britomart* for that purpose. A station was selected, and a town was commenced and named after Queen Victoria. The first impressions of the settlers regarding the place were very favourable. They wrote of it in this glowing strain:—"The port has a very fine harbour. Victoria is the capital—a very admirable little town. The position is on a considerable piece of rising ground midway on the western side

of the inner harbour. The soil around is of the finest description, and well supplied with fresh water. On Point Record and Spear Point are wells where ships can water most expeditiously, while around the town are large ponds and many running streams, all excellent. The climate appears to be as fine as any tropical one, but there may be reason to doubt whether it is not equally subject to drought as the rest of Australia. This town being in the vicinity of New Guinea and several other islands where slavery prevails, promises the inhabitants a supply of free labour from the runaway slaves, and it will afford an asylum to many islanders driven from their homes, and who will, as at Singapore, find protection under the British flag." Notwithstanding these advantages the settlement was abandoned, as being too unhealthy, in 1850. Leichhardt's overland expedition reached Port Essington on 17th December 1845.

PORT FAIRY, in V., was discovered and named by Wishart in 1827, after his vessel, the *Fairy*. He had been driven into the port by stress of weather.

PORT JACKSON, the harbour in N.S.W. on which stands Sydney, the capital of the colony. The entrance to it was described by a seaman from the mast-head of Cook's ship, the *Endeavour*, on 6th May 1770. Cook named it after Sir George Jackson, who afterwards took the name of Duckett. In the parish church of Bishop's Stortford, in Hertfordshire, England, there is a monument to this gentleman, with the following inscription:—"To the memory of Sir George Jackson, Bart., afterwards Sir George Duckett, Bart., Judge Advocate of the Fleet, who died 15th December 1822, aged ninety-seven years. He was for many years a Secretary of the Admiralty, and a member of Parliament for Weymouth and Melcombe Regis, and Colchester. Captain Cook, of whom he was a zealous friend and an early patron, named after him Point Jackson in New Zealand, and Port Jackson in New South Wales." Phillip, on his arrival at Botany Bay in January 1788, finding its shores so wild and solitary, the heat so great, the land beyond the circle of half a mile from the sea so encumbered with sands, swamps and heavy forests, and the anchorage so unsafe when the weather was rough, and the easterly winds prevailing, resolved to go northward with an expedition or pioneering corps in the ship's boats, for the purpose of examining another harbour discovered, and called Broken Bay by Cook; and on his passage upward along the coast curiosity led him to enter this harbour, laid down as an "inlet" on the chart of Cook's expeditions. His astonishment cannot be described on his finding a harbour equal to any in the world; hither he at once proceeded and laid the foundation of the City of Sydney. The approach to it through Bass Straits is through striking scenery. Cunningham thus describes it:—"The shore is bold and picturesque, and the country behind, gradually rising higher and higher into swelling

hills of moderate elevation, to the utmost distance the eye can reach, is covered with wide-branching, evergreen forest trees and close brushwood, exhibiting a prospect of never-failing foliage, although sadly monotonous and dull in tone compared with the luxuriant summer foliage of Europe. Grey rocks at intervals project among these endless forests, while here and there some gigantic tree, scorched dead by the summer fires, uplifts its blasted branches above the green saplings around." Port Jackson, if equalled, is certainly not surpassed by any other natural harbour in the world, not even by the magnificent haven of Rio Janeiro. The bold coast fronting the Pacific is suddenly broken, and the giant cliffs form a portal to an estuary about a mile in width, with an enormous perimeter, capacious enough to shelter the navies of the world. A vessel making the port sails in a few moments out of the long swell of the ocean into calm deep water, protected on every side by high lands. On entering a splendid vista is presented to the voyager, the elevated shore being broken into innumerable bays and inlets, and the central expanse of water relieved by many a picturesque islet. The rocky shore on each side stretches from heights of above 200 feet down to the water's edge, disclosing at intervals in the distance the white sandy beach of a bay which Stanfield or Copley Fielding would have loved to paint. The well-wooded hills, clothed in the bright garb of spring, or in the russet of summer, and bathed in the glorious light of an Australian atmosphere, form a charming margin to the bright blue waters they enclose. As the city is approached, pretty villas and imposing mansions, surrounded with gardens and orchards, crown the heights or extend along the shore. Trollope—a man not given to enthusiastic praise—speaks of it as "so inexpressibly lovely that it makes a man ask himself whether it would not be worth his while to move his household gods to the eastern coast of Australia, in order that he might look on it as long as he can look at anything." Some of the estates and pleasure-grounds on its shores, he adds, are perfect. They leave nothing for the imagination to add. Mossman writes with equal enthusiasm:—"It is the sailor's delight to be snugly moored in Sydney Cove at the present day, as it was to the captains of the first fleet that entered Port Jackson. As the traveller or emigrant passes between the perpendicular and overhanging precipices that stand at its entrance like the portals of some giant edifice, he is struck with feelings of dread at the swell of the Pacific Ocean and the rocky desolation around. This is suddenly changed to pleasure, as the picturesque scenery of the inner harbour opens up its panoramic beauties, and he sails along a lake-like inlet where the agitation of the sea ceases. As the ship passes between a succession of bays and coves, indented by picturesque points of land and guarded by small islets, he is charmed with the fairy-like aspect of the scenery; and when the captain informs him that each of these bays is

deep enough to float a line-of-battle ship, with sufficient room to hold all the navies of Europe, he cannot but marvel at the maritime advantages of Sydney Harbour. Then, as the ship comes to anchor in the cove, the city appears the perfection of a great seaport. It has landing facilities at quays where the largest merchantmen moor alongside, and there is no current or impetuous tide to endanger the shipping and boats. No dirty, muddy stream around the ship, nor dingy-looking warehouses on shore to offend the eye and nostrils, as too frequently happens in seaport towns. All is bright, clean, and wholesome, spreading a cheerful aspect around the haven. The clear waters below, and the blue sky overhead, throw out in bold relief the white freestone buildings that compose the city. The public edifices are perched on the surrounding heights, and the church spires arise out of the densely-packed streets beyond. Sydney is admirably situated for a city in a hot climate, as it is built upon hills where the natural drainage is flushed by the rains that clear the streets of anything that otherwise would create malaria. Extensive suburbs spread in every direction as far as the eye can reach from any of these elevated points, and numerous villas dot the landscape to the extreme horizon. Within this area dwells a population surrounded by all the luxuries, adornments, and amenities of life; and the architectural designs of Greece and Rome have a habitation and a name beneath a sky that surpasses in purity and intensity of hue the far-famed skies of Italia." Five miles from the Heads, on Sydney Cove, stands Government House, looking down on a lovely scene. The still waters, alive with steamers passing and repassing, with ships of English and American flags, and a crowd of small craft, yachts, and pleasure-boats, betoken the approach to a centre of busy commerce, even before the church spires show themselves against the sky." Sidney writes:—"The entrance to the port is marked by the N. and S. Heads, about three quarters of a mile apart. On the southern head a stone lighthouse, bearing the often-repeated name of Macquarie, affords a revolving flame at night and a white landmark by day to the great ships from distant quarters of the globe, and to the crowd of large-sailed coasters which ply between innumerable coast villages and Sydney. Steering westerly, the great harbour, like a landlocked lake, protected by the curving projecting heads from the roll of the Pacific storms, opens out until lost in the distance, where it joins the Parramatta River. The banks on either hand, varying from two to five miles in breadth, are sometimes steep, and sometimes sloping, but repeatedly indented by coves and bays, which fringed with green shrubs down to the white sandy water-margin, when bathed in golden sunlight, present dainty retreats as brilliant as Danby's Enchanted Island. On one of the first and most romantic coves stands Vaucluse, the marine villa of William Wentworth." The harbour of Port

Jackson proper has an area of 9 square miles—Middle Harbour, one of its arms, 3 square miles; and the coast-line of the whole is 54 miles. From the Heads to the city the distance is 4 miles, beyond which the waters extend 8 miles into what is called the Parramatta River, giving 15 miles as the length of navigation. The average breadth of the navigable waters is three-quarters of a mile, though at some points they widen to 2 miles or more. The shallowest part is between Middle Head and George's Head, where the soundings show 23 feet at low-water. Beyond this the depth ranges between 5 and 18 fathoms. There are miles of wharf frontage in use, and about 25 miles of deep-water frontage in sheltered places that may be made available for a like purpose. The chief light-house is 76 feet high, erected on cliffs 268 feet above the sea-level. It is a white revolving light, visible 25 miles to seaward. On a rocky point, 60 feet high, situated immediately within the South Head, stands a second light-house, 30 feet high from the base; it has a bright fixed light visible at 15 miles. Within the entrance there is a light-ship with two fixed white lights; and at Fort Denison, nearer the city, there is a red harbour light, beyond which ships are forbidden to proceed until they are boarded by the Health Officer and other authorities. The Circular Quay, at the head of Sydney Cove, has a length of 3100 feet available for the largest vessels. Cowper Wharf in Woolloomooloo Bay is 1200 feet long.

HISTORY.—The history of Port Jackson is, in fact, the history of the foundation and settlement of the Colony of N.S.W.

PORT MACQUARIE, a town of N.S.W. situated at the mouth of the river Hastings. It was named by Oxley after Governor Macquarie. The population is about 700. The surrounding district is an agricultural one, the principal crops being maize, wheat, barley, oats, and potatoes. The vine is, next to maize, the principal object of culture; soil and climate suit it well, and the quantity of wine made is yearly increasing. Tobacco also is largely grown. The cultivation of sugar, after persevering efforts, has almost been abandoned, the seasons being too uncertain.

PORT PHILLIP, the original name of V., but now restricted to the spacious harbour on which Melbourne is situated. This magnificent sheet of water is about forty miles long, with a breadth varying from twenty to sixty miles, and embraces an extent of 875 square miles of open water. The northern part is named Hobson's Bay, and a considerable indentation into the land, formed by a promontory to the S.W. called Bellarine, is named Geelong Harbour. Port Phillip receives the waters of numerous rivers, the principal of which are the Werribee, Saltwater, and Yarra-Yarra. Three-fourths of Port Phillip is available for anchorage, the depth nowhere within the lighthouses exceeding fifteen fathoms; ships drawing twenty-six feet

of water can come up as far as Hobson's Bay at the mouth of the Yarra-Yarra, but vessels requiring more than thirteen and a-half feet of water cannot get over the bar there. Although the distance from the Bay to Melbourne along the course of the river is about seven miles, the distance by land is not two miles. The Heads, or opening connecting Port Phillip with Bass Straits is about two miles wide, but the passage for ships is only about a mile across. Through this narrow channel the ebb and flood tides sweep over the uneven bottom with great force, and raise a sea which, particularly when the wind happens to be fresh from the opposite direction, is extremely dangerous to small craft. The rise and fall of the tide is about three feet. The distance from the Heads, Point Lonsdale on the W. and Point Nepean on the E., to the anchorage in Hobson's Bay, is over thirty miles, and the channel is obstructed part of the way by sandbanks, which render the assistance of experienced pilots necessary. Hobson's Bay is the principal anchorage; it is capable of affording shelter to upwards of 800 sail, and has excellent holding ground, the bottom being stiff clay and mud, with a depth of from three to four fathoms of water. Sandridge, the port of Melbourne, lies at the head of this bay; it has two fine piers capable of berthing the largest vessels alongside; a railway runs from the Railway Pier directly into Melbourne. Williamstown lies on the W. of Hobson's Bay, and has also two piers, several ship building and repairing yards, and a large patent slip capable of accommodating vessels of the largest tonnage; there is a railway from the township to Melbourne. Geelong Harbour lies on the S.E. of Port Phillip, and consists of two parts: the inner and outer harbours, and a smaller harbour, called Corio Bay; there are four jetties in this bay, with sufficient water to float vessels of the largest tonnage visiting the port. There are several small harbours on the E. coast, the principal of which is Snapper Point. The traveller arriving in Hobson's Bay is particularly struck with its animated appearance, where a fleet of large merchantmen may be seen at anchor or loading and discharging at the railway pier and other jetties. It looks more like a harbour in England than one at the other end of the globe, not yet fifty years in existence. To the British emigrant there is nothing strange about it; as he lands upon the pier there is nothing foreign to his eye, all seems familiar, and he may wonder how he has journeyed fifteen thousand miles, during three or four long months, finding at the end a place similar to that which he left, and people speaking his own mother tongue. From the pier he arrives in ten minutes by railway at the city, and finds the streets just like those in England. Melbourne is quite a smaller London, with all the conveniences and luxuries of the English metropolis.

HISTORY: I. Discovery.—It is only very recently that the original materials for the early history of Port Phillip have been dragged to light. It was

to be found in print that Bass had discovered and spent a fortnight in Western Port during the early part of 1798; as also that Lieutenant Grant of the Government brig *Lady Nelson* had, in the months of March and April 1801, in company with Bareillier, an officer of the N.S.W. Corps, made a tolerably accurate survey of it. Neither Bass nor Grant however appear to have had the slightest suspicion that another and far finer sheet of water lay almost at their elbows. This discovery was reserved for Lieutenant Murray, Grant's successor in the command of the *Lady Nelson*, who discovered it on 5th January 1802, but was prevented by contrary winds from entering. On 15th February he passed through the Heads, remaining in the port until 11th March, but confining his examinations entirely to the lower portion near the entrance. Nothing was known of Murray's discovery—beyond the bare facts that he made the discovery in January 1802; that he named Arthur's Seat from a fancied likeness to the hill of the same name in the neighbourhood of Edinburgh; that he named Swan Bay and Point Nepean; and that some of the hill which surrounded the port reminded him very strongly of Greenwich-park,—until the publication of Labilliere's *Early History of the Colony of Victoria*, in 1878. This author, a native of the colony, whilst studying for the bar in London, was bent on searching out the full particulars of the discovery of Murray. An application to the Admiralty for leave to examine the log of the *Lady Nelson*, led to his being permitted to make what use he pleased, in the way of research, of many hundreds of volumes of despatches and letters, stored up in the National Record office, relating to the earliest days of Australian colonisation. The result of his search was the discovery of many original documents of extreme interest and value, that had never been printed. Selecting the most important of these, Labilliere, by inserting them in his work, has placed them for ever beyond the chance of perishing or being buried in oblivion. One document he could not find—the journal kept by Grimes in his exploration of Port Phillip in 1802; but the zeal of John Shillinglaw has brought that precious record to light, after being hidden away for three-quarters of a century. The only original document of worth still remaining to be disinterred is Bass's journal of his whale-boat expedition to Western Port; but the substance of this is undoubtedly given by Flinders in his great work. The labours of G. W. Rusden and of Gurner leave nothing to be desired in respect of what may be termed the archaeology of Port Phillip. The next visitor to Port Phillip was Flinders, who made another independent discovery of it on 26th April, and remained in it until 3rd May, during which time he made a close examination of all these parts which lie between a line drawn from the You Yangs to Arthur's Seat. Although doubtful of the suitability of Port Phillip for settlement, his report made Governor King anxious to know more of the place.

II. *First Survey*.—The fears of King that France had a design to establish herself somewhere in Australia—to convert Western Port perhaps into a second Pondicherry—lent weight to the concurrent testimony of Bass, Grant, Murray, and Flinders, as to the suitability of the south coast as a place for settlement; and the expedition of Collins was the prompt result determined on by the British Government. But meantime King saw fit to have a more particular survey made of Port Phillip. For this purpose the colonial schooner *Cumberland* of twenty-nine tons (the same in which Flinders, twelve months afterwards, was made prisoner in the Isle of France) was equipped in Sydney, and placed in charge of Lieutenant Charles Robbins of H.M.S. *Buffalo*. Robbins carried despatches to the French Commodore Baudin, then known to be on the coast, in case he should fall in with him. Besides the crew, the party consisted of Charles Grimes, Acting Surveyor-General of N.S.W.; Dr. McCallum, surgeon; James Meehan, surveyor; and James Flemming, a man in whom the Governor had great confidence, who was to observe the nature of the country explored. Their orders were to "walk round" Port Phillip. A journal of the expedition was kept by Flemming, and a chart of the survey made by Grimes. The *Cumberland* sailed from Sydney on 23rd November 1802, and on 8th December fell in with Baudin at Sea Elephant Bay, on the east coast of King Island. Peron, the naturalist of the French Expedition, tells us what followed:—"Just as we had made these arrangements for the safety of our ship, we saw the little schooner, the *Cumberland*, appear. She had come from Port Jackson and had on board Mr. Grimes, Engineer-in-Chief of the English establishment, who came by order of the Government to make a declaration to us which was as singular in form as remarkable in its object. 'It being reported,' wrote Mr. King to our commander, 'that you propose to leave some men either in V.D.L. or on the western coast of N.S.W. in order to form there a French colony, I think it my duty to declare to you, M. le Commandant, that in virtue of the Act of 1788 for taking possession, solemnly proclaimed by England, all these countries form an integral part of the British Empire; and that you cannot occupy any part of them without breaking the bonds of friendship which have been so recently re-established between the two nations. I shall not even attempt to dissemble, for such is the nature of my special instructions with regard thereto, that I must oppose by all means in my power the execution of the project you are suspected of being about to execute. In consequence of which H.M.S. *Cumberland* has received orders not to leave you until the officer who commands her is satisfied that your operations are foreign to any kind of invasion of British territory in these parts.'" Having delivered their message and made an exploration of King Island, the *Cumberland* sailed on her mission to Port Phillip, which it entered on 20th January

1803. The journal and chart show how faithfully Grimes carried out his instructions. He was undoubtedly on this occasion the discoverer of the river on which Melbourne stands; but excepting the notice of his survey by Flinders, his meritorious services to A. have met with almost total neglect.

III. *Collins's Expedition*.—Grimes's report of the nature of the country seen round Port Phillip was considered unfavourable, and was sent home to England by the *Glatton*. Before the information reached the Government, however, Collins had been despatched—27th April 1803—to form a penal settlement at the place which had been described by Murray as resembling the scenery of Arthur's Seat and Greenwich Park. The expedition was embarked on board the 50-gun ship *Calcutta*, Captain Daniel Woodriff, and the chartered transport *Ocean*, John Mertho, master. Labilliere gives a full and interesting narrative of the objects and instructions of the British Government, and of the reasons given by Collins for the abandonment of the place. The prompt and energetic action of the first Australian Governor—Phillip—in searching for a more suitable spot than Botany Bay, to which he had been despatched by the British Government, had saved the eastern sea-board of A. to Great Britain. But the bright example was lost on Collins. King sent him the report and survey of Grimes, which mentions the Yarra. Indeed, Collins knew that the king's ship which had brought him hither lay at her anchors in Hobson's Bay for ten days, and filled up her water-casks with fifty tons of fresh water obtained from the river; and also that one of her lieutenants (McCulloch) had actually walked from Sandridge to the camp near Arthur's Seat, a distance of fifty miles. But there can be no doubt of his having had from the outset a personal preference for T. The letters from Sir Joseph Banks to Governor King, which Rusden found in the papers of the latter, clearly show that Collins before he left London intended to go to V.D.L. During the stay of Collins at Port Phillip Heads he issued from time to time a number of orders. These were printed at a small hand-press set up under a gum tree on the beach, and a printed set has been preserved in London. The original MSS. are treasured in the Parliament Library of T. The date of the first of these printed is 16th October 1803. An encampment was formed at the place now known as Sorrento; but disappointed at not finding water at a spot which he regarded as being sufficiently near the Heads, and an examination of the port as far as Frankston on the E., and nearly as far as the head of Corio Bay on the W., having disclosed no good land, on 6th November he despatched an open boat to Sydney for the purpose of informing Governor King of the unsuitability of the place for the purposes of settlement, and asking his permission to return to V.D.L. On 12th December he received King's answer, dated 26th November, granting the required permission, and forwarding a copy of Grimes's report with the

remarks, "The enclosure and accompanying survey will inform you that your observations have been fully anticipated. . . . It appears as well by Grimes' and Robbins' survey as by your report that Port Phillip is totally unfit in every point of view to remain at without subjecting the Crown to the certain expensive prospect of the soil not being equal to raise anything for the support of the settlement. Unless you should have made any further observations to encourage you remaining there—perhaps the upper part of the bay at the head of the river may not have escaped your notice, as that is the only part Grimes and those that were with him speak the least favourably of." This was the first intimation Collins had that there was a fresh water river at the north of the Bay. It was brought to him by the *Ocean*, one of the ships which brought the party from England, and which had been re-chartered to Sydney for the purpose of removing the people and stores to the River Derwent. Shillinglaw however believes that the *Calcutta*, the other of Collins's ships, and a man-of-war, sailed up to Hobson's Bay on 18th November, and lay there taking in fresh water from the Yarra, after which she returned to the settlement on the 30th, and Labilliere has come to the same conclusion. There are grounds, however, for doubting the statement. Tuckey, first-lieutenant to Collins, wrote and published in London an account of the voyage. This book bears internal evidence of not being a log written from day to day, but a narrative of events and facts, some of which occurred outside the sphere of his own observation, and even after he had left the place. Thus he speaks of the abandonment of the settlement, an event which did not take place for four weeks after the *Calcutta* had left the Bay for Sydney, and this fact must be borne in mind as accounting for expressions which might otherwise be taken to imply a personal knowledge of certain facts on the dates at which they are brought forward. On 16th October Tuckey was sent with a party in two boats in order to search the bay to the northward to find, if possible, a more eligible site for settlement. On the 21st he returned and reported that he had discovered a stream of fresh water, which appeared to be a branch from a large river at the northern extremity of the port, and which, after running through an extensive swamp, emptied itself into the E. side of the port, about twenty-eight miles from the entrance. He also said, "the bed of the stream was covered with foliaceous mica, which those in the boats at first conceived to be gold dust, and thence expected they had discovered an *Elsatedorado*." This description can refer only to the Kananook Creek, which after running through the Carrum Swamp empties itself into the bay at the township of Frankston. Knopwood, the chaplain to Collins's expedition, kept a manuscript diary of the incidents of the voyage to and first attempt at settlement on Port Phillip. This diary is reprinted in Shillinglaw's *Historical Records of Port Phillip*. The incidents

detailed are of very little interest taken separately. Thus : On 25th November, Knopwood notes the arrival at the settlement of Lieutenant M'Culloch, of the *Calcutta*, who had walked round from the watering-place during the day,—“not less than forty or fifty miles, a very great undertaking.” The distance agrees with the distance round the beach from Frankston to Sorrento, and this was the only way a man would have dared to walk, for the natives were gathering in large numbers—so large that Collins feared an attack on the settlement. On 28th November, M'Culloch returned to the ship. His conveyance was Knopwood's boat ; and Knopwood and Humphries, the mineralogist, accompanied him. His entry is as follows :—“At 9 a.m. Lieut. M'Culloch, Mr. Humphries and self, went in my boat to the Fresh Water River, on the E.S.E. side of the Bay, where H.M.S. *Calcutta* was watering ; they were cutting wood. The distance across from the camp to the ship is not less than thirty miles per water. At seven we got on board ; at half-past it rained and blew very hard, with thunder and lightning. That eve Mr. Pattshall with the watering party left the shore, having watered the ship.” On the 25th the first child was born in the settlement and named William James Hobart Thorne. On the 28th November the first marriage was solemnised : “Richard Garratt, prisoner, to Hannah Harvey, free.” Tuckey grows poetical over the circumstances of these first settlers. He writes :—“Nothing could offer a more imposing picture of reposing solitude than the wilds of Port Phillip on our first arrival. Here Contemplation, with her musing sister Melancholy, might find an undisturbed retreat. Often at the calm hour of evening I have wandered through the woods—

Where the rude axe with heaved stroke,

Was never heard the nymphs to daunt,

Or fright them from their hallowed haunt.

The last hymn of the feathered choristers to the setting sun, and the soft murmurs of the breeze, faintly broke the death-like silence that reigned around ; while the lightly trodden path of the solitary savage, or the dead ashes of his fire, alone pointed out the existence of human beings. In the course of a very few weeks the scene was greatly altered ; lanes were cut in the woods for the passage of the timber carriages ; the huts of the woodmen were erected beneath the sheltering branches of the lofty trees ; the busy hum of their voices, and the sound of their axes, reverberating through the woods, denoted the exertions of social industry, and the labours of civilisation. At other times, sitting on the carriage of a gun, in front of the camp, I have contemplated with succeeding emotions of pity, laughter, and astonishment, the scene before me. When I viewed so many of my fellow men sunk, some of them, from a rank in life equal or superior to my own, and by their crimes degraded to a level with the basest of mankind ; when I saw them *naked*, wading to their shoulders in water to unload the boats, while a burning sun

struck its meridian rays upon their uncovered heads, or yoked to and sweating under a timber carriage, the wheels of which were sunk up to the axle in sand, I only considered their hapless lot, and the remembrance of their vices was for a moment absorbed in the greatness of their punishment.” On 27th December four of the convicts absconded. Their names were Buckley, Marmon, Pye, and Gibson. The latter returned to the camp in a very exhausted state on 24th January, and reported having seen the river now called the Yarra Yarra. Buckley's remarkable story is narrated under his name. Pye and Marmon seem to have perished in the bush, or, it may be, were murdered by the blacks. On 24th January 1803 Collins, with all the settlers and convicts, sailed for the settlement formed by Bowen on the Derwent in V.D.L. McCombie says of Collins' abortive experiment :—“In reading the history of the first effort to colonise V., we may almost be inclined to believe that an especial decree of All-wise Providence had gone forth, that a colony so fair and fertile should not be degraded by a convict origin. Nothing prospered with the settlement ; and, as with the Pilgrim Fathers on their landing at New Plymouth, everything was found desolate and gloomy : sterile soil, and distressing scarcity of fresh water, appear to have given all connected with the expedition a perfect dread of the country ; the whole of the convicts, with the exception of a few (amongst whom was the celebrated Buckley, who had escaped and taken to the woods,) were re-embarked, and the establishment removed to the Derwent River. Tuckey has left a history of this expedition. He seems to have had quite a literary turn, as he gave to the world a narrative of an expedition to explore the River Zairee, or Congo, in South Africa. He appears to have been an adventurous, brave, and ready-witted man ; and so enthusiastically devoted to exploring, that like many more of similar disposition he sacrificed his life to his desire for the extension of geographical and scientific knowledge. It seems however that Collins had landed on the eastern shore of the harbour, where the country is poor and sterile, and water scarce in several spots. It is quite apparent that no proper survey of the surrounding country could have been made, as there are several tracts of rich ground and excellent forest land at no great distance from the shore. Collins seems to have resolved to quit the shores of the bay without making a proper survey of the inlet ; for, had he examined its shores thoroughly with his boats, he could not have helped discovering the Bay of Corio, and many spots of great attraction. He might have sailed up the Yarra and Saltwater rivers and seen the beautiful and picturesque scenery upon their banks.”

IV. *Hume and Hovell*.—In October 1824 Hume and Hovell succeeded in travelling overland from Sydney, and struck the shores of Port Phillip on 16th December, and camped near the present site of Geelong. They learned this native name from

the natives as denoting the inner harbour. The picturesque eminence called by Flinders "Station Peak" was named by the natives Willanmaneter, and the Downs were called Iramoo. On the 18th the party started on their return journey. In 1826 Hovell again saw Port Phillip, having come to Western Port with the party under Wright.

V. Batman and Fawcner.—The foundation of the colony by Batman and Baker in 1835 is fully detailed under their respective names, and need not be repeated here. From this point the history of Port Phillip merges into that of Melbourne and the colony.

PORT STEPHENS, a beautiful harbour of N.S.W. The entrance points are named Yacaba and Tomaree. Within the entrance are extensive sand banks. It may be considered a large estuary about fifteen miles in length, contracted near the centre to the width of about a mile. The Karnah River flows into this harbour at the north-west corner, on which river stands Bourral, about twelve miles up, it being the furthest point navigable. The River Myall also discharges its waters into this harbour. On the northern bank of Port Stephens stands Carrington, a neat little town, distant from Sydney by water 100 miles, and by land 200 miles.

PORTLAND, a seaport town in V., on the west coast of Portland Bay, 225 miles (277 postal) S.W. of Melbourne, about the same distance E. from Adelaide, fifty-five miles from Hamilton, to which a railway line has been constructed. Portland is in direct railway communication with the metropolis. Portland was founded by the late Edward Henty, who arrived on 19th November 1834; it is consequently the oldest settlement in V. excepting Old Settlement Point on the shores of Western Port Bay, where for nearly twelve months detachments of the 3rd and 30th regiments, under Captain Wright, were located in the year 1826. It was first used as a whaling dépôt. The town, on the high road to the west, overlooks the bay, which is twenty-four by twelve miles, capable of affording anchorage to the largest fleet in the world. The bay is the natural outlet for an immense tract of back country, comprehending many millions of acres of agricultural and pastoral land. There is jetty accommodation for the loading and discharge of vessels, and the harbour accommodation will eventually be much improved by the construction of a breakwater. Portland possesses a well-laid out botanical garden. The population is about 2000. To the north-west of the town lies the valley of the Wannon, which cultivated with corn would produce as much annually as would feed the whole population of Victoria; and still further west, but within easy reach of the bay, lies the Mount Gambier district, second to no part of Australia for productiveness. The chief exports are cattle, horses, sheep, wool, tallow, hides, bark, butter, and recently wheat, corn, and the different sorts of agricultural produce.

PORTLAND BAY, a fine harbour of V., was discovered by Grant and named by him in honour of the Duke of Portland. The principal rivers which flow into this harbour are the Fitzroy, Shaw, Hopkins, and Surrey rivers.

PORTUGUESE NAVIGATORS (EARLY.) In 1486 Bartholomew Diaz reached the southern extremity of Africa, to which he first gave the name of the Cape of Storms, subsequently changed to the Cape of Good Hope. In 1497 Vasco di Gama doubled the Cape and conducted a fleet to India. In 1500 Pedro Alvarez de Cabral discovered the coast of Brazil and took possession of it in the name of the Portuguese Crown; but Brazil had been previously visited by Diego Lope and Vicente Yonez Pinzon, who was the first to cross the equator in the Atlantic.

POSSESSION POINT, in W.A., was discovered and named by Vancouver in 1791.

POSSESSION ISLES are situated off the N.E. coast of the continent. Possession Island, the largest, was discovered by Cook in 1770, who says, "As I am about to quit the eastern coast of New Holland, which I have coasted from lat. 38° to this place, and which I am confident no European has ever seen before, I once more hoist English colours, and though I have already taken possession of several parts, I now take possession of the whole eastern coast in right of His Majesty King George III." His men then fired three volleys of small-arms, which were answered by the same number from the ship and by three cheers from the main shrouds. He re-embarked on the boat and left this island, to which, from the ceremony just performed, he gave the name of Possession Island.

PRATT, SIR THOMAS SIMSON (—1879) entered the Army as Ensign in February 1814; served in Holland in the campaign of that year with the 56th Regiment, and was present at the attack on Merxem and the bombardment of Antwerp; served with the 26th Cameronians in the China Expedition, for which he received the medal; commanded the land forces at the assault and capture of the forts of Chuenpee in January 1841; again at the capture of the Bogue forts, 26th February. He commanded the 26th at the attack on Canton; also at the night attack on Ningpo Woo Sung. He was Commander of the Military Forces in Australia throughout the N.Z. war in 1860; while thus employed in Australia and N.Z. he held the rank of Major-General. For his services he received the medal and was created K.C.B. On 8th January 1860 he succeeded Sir Edmund Macarthur in command of the Military Forces of V. In May 1862 he was appointed to the colonelcy of the 37th Regiment, and retired from the active list under the provisions of the Royal Warrant of May 1878, being over the age of seventy years.

PRICE, JOHN, a native of Cornwall in England, came to V.D.L. in 1835 and commenced

agricultural pursuits, but gave them up to enter the service of the Government. He attracted attention by his daring in the capture of bush-rangers. In 1838 he was made Police Magistrate of Hobart Town; in 1848 he succeeded Captain Mackenochie as Chief Superintendent at Norfolk Island; in 1853 he was appointed Chief Inspector of Penal Establishments in V. On 26th March 1857 he was murderously attacked by eighty-two of the convicts employed on the public works at Williamstown, and received such severe injuries that he died on the following day.

PRINCE OF WALES ISLANDS, a cluster of islands situated off the N.E. coast of the continent. They are much intersected by straits and openings; there is an appearance of a good port a little to the S.W. of Horned Hill.

PRINCESS CHARLOTTE'S BAY, is an extensive bight on the N.E. coast of the continent, twenty-two miles deep and thirty-one broad. There is, over the head of this bay, a remarkable level topped hill, called by Cook, Jones' Table-land, rendered conspicuous from the low nature of the surrounding country.

PUDDING PAN HILL, on the N.E. coast of the continent, is 384 feet high. It received this appellation from Bligh, from a resemblance it has to an inverted pudding-dish commonly used by sailors.

PYRAMID HILL, a remarkable hill of granite, in V., five and a half miles from Mount Hope. It is a triangular pyramid, and stands quite isolated, closely resembling the monuments of Egypt.

Q.

QUEENSCLIFF, a township at the entrance of Port Phillip Bay, about thirty-two miles S. of Melbourne—sixty-five miles by land. It is situated on a small peninsula, connected with the mainland by a narrow neck of land about 400 yards in width. Two lighthouses are here so placed that when seen from seaward in one line they form a leading mark for vessels entering. The width of Port Phillip Heads, between Point Nepean on the E. and Point Lonsdale on the W., is about 4000 yards, but the navigable channel, called the Rip, through which the tide rushes with great velocity, is only about 1600 yards wide. The entrance is protected by two batteries, one mounting three 300-pounder guns, and the other three 80-pounders; in case of war these would be supplemented by lines of torpedoes laid across the channels. A battery of seven guns is also erected on Swan Island, which has been purchased by the Government. Queenscliff is connected with Geelong by railway. It is a fashionable watering place, much frequented by Melbourne visitors in summer. All vessels arriving from foreign ports are here boarded by the Health Officer.

QUEENSLAND, the youngest of the Australian Colonies, having been established in 1859, prior to which date it formed the Moreton Bay district of N.S.W.

GEOGRAPHICAL POSITION AND AREA.—Q. occupies the whole of the north-eastern portion of A., commencing at a point of the E. coast about 400 miles N. of Sydney, called Point Danger. The greater portion of the southern boundary-line is formed by the 29th parallel of S. lat. The eastern seaboard extends about 1300 miles to Cape York, the extreme northern point of the continent. The mean breadth of the territory is 900 miles from the eastern coastline to the meridian of 138° E. long., which forms the western boundary-line. This includes the greater portion of the Gulf of Carpentaria, which has a seaboard of about 900 miles. The whole of Q. comprises about 670,000 square miles, nearly twelve times the area of England and Wales. It is larger than the German and Austrian empires with France and Belgium added. It equals in size the united areas of California, Oregon, Washington, Nevada and Utah.

PHYSICAL FEATURES.—The physical features of Q. are strongly marked. They consist (1) of a seaboard from 50 to 100 miles broad; (2) an elevated table-land, or more strictly speaking, a succession of undulating downs or plains, situated some 2000 feet above the sea-level, and stretching back to the W. for 400 or 500 miles, without continuous rise or fall; and (3) a succession of terraces descending, generally with rapidity, but in some places less perceptibly, until the more extended level of the interior of the continent is reached. There are thus three portions of territory, widely differing in their peculiar capabilities. The seaboard owes its origin to the action of a network of streams issuing from the more elevated table-land, and bringing down with them the disintegrated particles from the flanks of the Great Range. Indeed the process may be still seen going on in the immediate neighbourhood of the sea-shore, and on a series of muddy and sandy islands lying off the coast, which are thus yearly growing in size. The more upland portions however, nearer the Great Range, have long ceased to derive any addition from this source, and now form excellent districts for the growth of wheat, maize and other cereals, which they produce in great luxuriance, yielding generally two crops in the year, and as much as 80 and 100 bushels to the acre. Indeed the deep alluvial character of the soil and the plentiful supply of warm showers, caused by the influence of the Great Range, combine to produce a very remarkable degree of fertility, while the well-sustained slope of the whole seaboard prevents that accumulation of stagnant waters which communicates so unhealthy a feature to many similarly luxuriant regions within the tropics. The scenery throughout the whole tract, and more especially along the course of its numerous streams is of the most delightful character. Lang writes:—"Close to the water's edge rises a complete wall of

luxuriant foliage. Fig-trees, bean-trees, pines, and a variety of other trees stand thickly set and overhung with a rich drapery of creepers, presenting the forms of turrets, buttresses, festoons and stalactites in endless variety, and bespangled with flowers and fruit. There is a purple convolvulus, wild roses, tulips and some yellow flowers scattered high and low; and close to the water's edge a pure white lily. Cherries, figs and mulberries overhang the water." More often however, the course of these streams lies through a succession of thinly-treed plains where the principal feature of the day's journey is a series of beautiful flats or plains of limited extent, each surrounded with an amphitheatre of hills, with the river, flanked with tall trees, and occasionally with lofty cedars, stealing silently along in its deep bed. There is nothing more remarkable in this part of the territory than the way in which the fruits of the temperate and torrid zones grow harmoniously together in the same garden-plot, and fructify and come to maturity each in its proper season. The following almost incredible example of healthy and rapid growth is reported by the same writer:—"I may also mention, as a remarkable instance of the extraordinary fertility of the district, that a young peach tree, about eight feet high, and covered with blossoms, happened to attract my notice in the garden of the Rev. James Collins, near Grafton; and Mr. Collins informed me that the peach-stone from which that tree had grown had been planted by himself in the month of January preceding, only eight months before." As we descend this slope, however, to the immediate borders of the sea-coast, much of the land assumes a more dreary aspect, consisting chiefly of mangrove-swamps, sand-banks and "drowned land," in actual process of formation. But though less refreshing to the eye, there is reason to suppose that these tracts will prove highly valuable for the cultivation of those varieties of the cotton plant which love "salt swamp." The shore is well supplied with bays, some of very considerable extent, as Moreton Bay, Wide Bay, Port Curtis and numerous others. These bays however are not so much indentations of the coast-line as enclosures formed by the islands we have already mentioned. Moreton Bay itself is some 60 miles long and 20 wide; and they are all supplied with rivers navigable for 50, 60 and 100 miles inland. Moreton Bay possesses no less than five such valuable rivers besides some smaller ones. One of these, the Brisbane, gives its name to the capital city of the colony, situated twenty-two miles from its mouth. At this distance the mangrove-swamps are entirely passed, and the city stands upon a scene of surprising beauty. The noble river which winds almost under foot, and appears and disappears, and appears again, as it pursues its tortuous course through the dark forest to the bay, or is traced upwards to its sources, presents, ever and anon, points of view surpassingly beautiful; the thick brushes on its banks, with the

majestic Moreton Bay pine overtopping all the other giants of the forest, merely indicating the spots of extraordinary fertility where the hand of man is perhaps erecting his future dwelling, and transforming the wilderness into smiling farms and fruitful fields. The river here is a quarter of a mile wide—a width which it preserves for several miles upwards: indeed the Brisbane is navigable for 150 miles inland, and steamers daily ply up its course. The population of the city amounts to about 35,000. Numerous handsome villas on a succession of terraces overlook the town and command splendid views of the surrounding country. The city itself stands considerably above sea-level, and is distinguished for its very healthy climate, both during the summer and winter months. Excepting the neighbourhood of Sydney, which is perhaps the most beautiful city-site in the world, it would be difficult to select a more charming scene. The bays abound with fish, turtle (of an excellence long known throughout the neighbouring colonies,) crabs of three and four pounds weight and very superior quality, and the deep fisheries off the coast team with several varieties of large fish of peculiar and most delicate flavour. The next great physical feature of Q. is the table-land constituting the flat back of the Great Coast Range. This range attains to its mean elevation, or almost to its mean elevation, at a distance of from 50 to 100 miles from the sea-shore. Nor does it begin to descend into the interior with any marked or continuous depression until the sources of Mitchell's Victoria River, about the 147th meridian, are passed. Thus, commencing from the southern bounds of the colony, an elevated region some 400 or 500 miles broad stretches away thence to the shores of the Gulf of Carpentaria—a distance of over 1000 miles, giving an area of more than 400,000 square miles. The whole of this area, with the exception of the two partial interruptions already mentioned, may be described as a succession of wide open downs, enclosed each within small subsidiary basaltic ranges traversing the great plateau. These downs are each of immense extent, and contain deep and excellent agricultural soil, clothed with the richest grasses, growing in wonderful luxuriance. They are in a great measure destitute of trees, but the bases of their enclosing ranges are furnished with a handsome and stately description of pine, behind which, and retiring into their recesses, are found some valuable cedar trees. These recesses are plentifully supplied with numerous springs and rills, which, trickling down the slopes of the ranges and traversing the enclosed plains, unite and form the abundant network of rivers by which this immense plateau is watered. Some of the rivers—as the Clarence, the Richmond, the Brisbane, the Fitzroy, the Burdekin, the Maranoa, the Balonne, the Warrego, the Victoria—are of considerable extent, and traverse in their windings, peculiar to all Australian watercourses, immense tracts of country. The Victoria, without taking

into consideration its windings at all, possesses a curiously protracted length of some 1500 miles. These streams, according as their main course tends to the east or the west, discharge themselves into the Pacific or the interior of the continent, and hence the term, "Great Dividing Range," applied to this vast table-land, as parting the eastern and western waters of the continent; though, as the range is entirely confined to the eastern seaboard, the term itself is somewhat misleading. Lang writes of this extensive river system:—"Notwithstanding the generally received calumny to which the great South Land has hitherto been subjected in Europe, as being destitute of springs of water, and to a vast extent hopelessly barren and unavailable for the purposes of man, it would perhaps be difficult to point to any tract of country of equal extent, and within the same parallels of latitude in either hemisphere, in which there is a greater number either of streams of water or of rivers available for navigation." Travellers throughout these vast plains all concur in their admiration of the luxuriance of the soil, the coolness and salubrity of the climate, and the loveliness of the entire landscape. They describe its countless rills issuing cool and limpid from their pine-clad slopes—deep rivers stealing through waving meadows—the golden sunlight, the rosy atmosphere and the songs of innumerable birds which give an additional charm to each scene. Sir George Bowen, in a speech delivered on the occasion of his visit to the Darling Downs, said:—"I wish to avail myself of this opportunity to state publicly that my recent journey over the Darling Downs has filled me with surprise and admiration. Even before I left England, I knew by report the rich natural resources and the picturesque beauty of this district, the scenery of which vividly recalls to my mind the general aspect of the classic plains of Thessaly. But I confess that I was not fully prepared for so wonderfully rapid an advance in all that can promote and adorn civilisation—an advance which has taken place during the fourth part of an average lifetime. Not only have I seen vast herds of horses and cattle and countless flocks of sheep overspreading the valleys and forests which, within the memory of persons who have yet scarcely attained to the age of manhood, were tenanted only by wild animals and by a few wandering tribes of savages; not only have I travelled over roads beyond all comparison superior to the means of communication which existed less than a century ago in many parts of the United Kingdom; not only have I beheld flourishing towns arising in spots where, hardly twenty years back, the foot of a white man had never yet trodden the primeval wilderness; not only have I admired these and other proofs of material progress, but I have also found in the houses of the long chain of settlers who have entertained me with such cordial hospitality all the comforts and most of the luxuries and refinements of the houses of

country gentlemen in England. The wonderful advance of this portion of the colony during the last ten years is due to no sudden and fortuitous discovery of the precious metals; it is derived wholly from the blessing of Providence on the skill and energy of its inhabitants in subduing and replenishing the earth. Assuredly I have observed during the past week very remarkable illustrations of the proverbial genius of the Anglo-Saxon race for the noble and truly imperial art of colonisation." The whole of this almost boundless plateau—extending within the tropics, but elevated 2000 feet above sea-level—is peculiarly fitted for a wide range of crops. Indeed, as vegetation is continued during the whole year, the farmer has only to choose his various seasons for bringing most of the productions of the temperate and tropical zones to maturity. Thus wheat, oats, barley, maize, potatoes (and more especially the sweet potato, which here grows to the weight of twenty and even thirty pounds,) arrowroot, indigo, and more generally, all the productions of the kitchen garden, have already been cultivated with great success. At present however, with the exception of some townships and their surrounding farms, these table-lands are clothed throughout their vast extent with the rich and luxuriant natural grasses of the country, and are roamed over by the flocks and herds of some widely-scattered sheep and cattle owners.

MOUNTAINS.—The highest mountains are the Bellenden Ker peaks, not far from the coast, to the north of Rockingham Bay, while Mount Dalrymple, about 100 miles farther south, is over 4000 feet. The ranges in the southern part of the colony are not very lofty, but they contain the "Glasshouses" and other singular volcanic peaks.

RIVERS.—The principal rivers are the Burnett, the Fitzroy and the Burdekin, emptying themselves into the Pacific; the Flinders, the Albert, the Mitchell, the Gilbert and Norman emptying themselves into the Gulf of Carpentaria; the Victoria or Barcoo flowing through Cooper's Creek to Lake Eyre; the Dumaresque, Condamine and Warrego flowing towards the Darling.

BAYS.—The coast has many good harbours. Besides the fine and extensive harbour of Moreton Bay it has Hervey Bay, Keppel Bay, Port Curtis, Port Bowen, Port Denison, Rockingham Bay, and Port Albany, near Cape York.

DISTRICTS.—(1) The East and West Moreton District lies between the Main Dividing Range and the sea, and almost encircled by a rough semicircle of hills. This tract of country, of which Brisbane and Ipswich are the chief towns, was the site of the original settlement of Moreton Bay. It is watered by several rivers descending from the ranges, of which the most important are the Brisbane and Bremer, which uniting form a navigable stream. Two long-shaped sandy islands lie off the coast, forming the sheltered harbour of Moreton Bay, into which, besides the Brisbane, several smaller rivers rising in the mountain ranges

also fall. In this tract of country the soil is of better average quality near the ranges, and worse near the sea, where the only really good land is on the banks of the rivers and creeks. But that good land is nearly all in the hands of selectors, who profit by the remarkable range of production rendered possible by the mild climate of the district, and its moderate, well-distributed rainfall. In no part of Q. and in few parts of the world is it possible to grow such an infinite variety of plants, vegetables and shrubs as in these districts. Turnips, potatoes and cauliflower are grown within sight of fields of cane, which mature and yield excellent sugar. Bananas, oranges, pineapples and peaches are the fruits most commonly grown; but a wonderful variety of trees indigenous to the tropical and temperate zones are growing and thriving in experimental gardens. Sugar cane is cultivated in localities where the soil is suitable, generally on the bank of a river, which also serves as a waterway for the transport of canes from the field to the mill. Besides sugar, arrowroot of fine quality is produced. The settlers also grow maize, potatoes—English and sweet—oats for hay, lucerne, sorghum and tobacco. There are a number of vineyards, and the cultivation of the grape vine is increasing, especially in the country around Ipswich and near the range. The winter frosts, especially near the coast, are seldom severe enough to injure any but the more delicate tropical plants, while the cool season is sufficiently prolonged to give those from the temperate zone an opportunity of gathering vigour and strength. As in all the coast districts the country is pretty thickly covered with trees, and on the banks of some of the rivers the pencil cedar is found. The local pine furnishes employment to sawmills in Brisbane and several townships of the districts. The Moreton districts are not so rich in minerals as some parts of the colony. Gold has been found in reefs in different places, and has been worked in the immediate neighbourhood of Brisbane; but the finds have not been important. But the Brisbane and its tributaries intersect an important coal basin from which large and increasing quantities of the mineral are being raised. (2) The Darling Downs District, although on the western side of the watershed of the Main Dividing Range, enjoys many of the advantages of the coast districts. The atmosphere is fairly charged with moisture, and the rainfall frequent; running streams are numerous, and the high average fertility of the soil has gained for it the name of the Garden of Q. Agricultural settlement has made considerable progress, especially in the eastern portion, and several important towns, as Toowoomba, Warwick and Dalby, have grown up as centres for the pastoral and agricultural population. Originally the Darling Downs was the best known and most highly esteemed pastoral district in Q. It possessed unusual advantages, having to a great extent the same open grassy plains as the interior, fertile

soil growing a thick sward of sweet and very nutritious pasturage, as well as an abundant rainfall. These advantages attracted the attention of the land selectors and agriculturists, to whom, after a prolonged struggle, the pastoral occupiers had partly to give way. The construction of the railway from Brisbane to Toowoomba, and thence towards the N.S.W. border, gave a great impetus to settlement. Still the district, though appearing as a small patch on the map of Q., is a large tract of country containing some millions of acres not yet alienated from the Crown. The grazier finds the Darling Downs equally suitable for sheep or cattle, and climate and natural pasturage are of the kind that suit either the merino or the coarser woolled sheep. The sharp winter frosts, however, debar the agriculturist from attempting the cultivation of tropical plants or trees, but they enable him to cultivate with marked success all the products of the temperate zone. There is reason to hope that this will become a great wheat district. The principal mineral in this district is tin, found near the southern border. The discovery of stream tin in that locality led to the foundation of the town of Stanthorpe. Gold has been found in one or two places and some promising reefs are being worked near Warwick. But the district is so rich in the fertility of the surface soil that, with its regular rainfall, temperate and bracing climate, it would be certain to maintain an important position even without the tin on its borders, its reefing patches, or the coal seams in more than one locality. (3) The Wide Bay and Burnett Districts. The first of these lies nearest to the coast, and takes its name from a sheltered sheet of water somewhat similar to Moreton Bay, enclosed by a large island known as Frazer's Island. Into this bay the Mary River, running from S. to N. and draining the larger half of the district, falls. Maryborough, the chief seaport town, is built on the navigable part of it, about twenty-five miles from the mouth. The northern end of the district is crossed by the Burnett River, on which the seaport of Bundaberg is built. Other smaller streams, of which the Burrum is the most considerable, fall into the sea within the limits of the Wide Bay district. The remarks made concerning the soil in the Moreton district apply to Wide Bay, and it enjoys a similar climate, though perhaps warmer. The banks of the Mary and its tributary creeks were originally clothed with thick scrub, but on the lower reaches these have been nearly all cleared, and sugar-growing as well as general cultivation is carried on. On the Upper Mary the prevalence of frost and the absence of water carriage has prevented settlers from growing cane; but the rich lands which flank the mountain ranges that form the western watershed of the Mary have been largely selected, and are being used for depasturing stock, and some cultivation. In the northern end of the district traversed by the Burnett River the soil is of more uniformly good character, even close

to the sea coast, and is becoming an important agricultural centre. At present the farmers confine themselves mainly to maize, but steps are being taken to establish sugar cultivation, for which soil and climate are both suitable. The Wide Bay district is extremely rich in minerals. On the Upper Mary is the goldfield of Gympie, the first of any importance discovered in Q. Although not so extensive as the auriferous areas of the North, Gympie maintains a high average of productiveness as a reefing-field. It was discovered in 1867, and the exceedingly rich alluvial field attracted a great "rush" from all the colonies. The reefs were speedily found, and after the alluvial had been partly exhausted were vigorously attacked. The output of gold has averaged about 40,000 ounces for many years, and the reefs show no sign of deteriorating in the lower levels of the mines. Besides gold, the ores of a variety of other metals are found in this district. The ranges that form the northern watershed of the Mary are seamed with metallic veins. Of these a large proportion are copper lodes which were worked some years ago, when the high price of the metal enabled the miners to overcome the disadvantages of land carriage and inadequate mining plant. Galena has been found in the same locality; and veins of cinnabar, which have been superficially worked to extract quicksilver for the use of the Gympie machines. Antimony has been mined at Neardie, and exists in large accessible lodes. Zinc and other ores have been found—bismuth and cobalt among the number. Coal abounds. According to surface indications the whole country from the Lower Mary to the Burnett River appears to be more or less of a coal basin. A number of pits have been sunk on the seams, and several thousand tons of excellent coal raised. The timber forests of Wide Bay have always been a considerable source of wealth to the district. They contain cedar, immense quantities of pine, and excellent hardwood, consisting of iron-bark and other timbers. Noosa, the timber scrubs, are found in the neighbourhood of a connected string of picturesque shallow lakes, separated from the coast by a narrow strip of land. The timber is cut up on the spot and sent around by sea to Brisbane. The Maryborough saw mills are supplied with logs from the timber scrubs of Frazer's Island, and the opposite mainland as well as the upper reaches of the Mary River. Those at Bundaberg draw their supplies from the extensive coast scrubs. Both Wide Bay and Moreton Bay abound with fish. In their sheltered waters a number of men find employment in capturing the dugong, and preparing a valuable medicinal oil from its fat, and thick tough leather from its hide. The pasturage of Wide Bay resembles that of the Moreton district, and is more suitable for cattle than sheep; but in the Burnett district which lies directly west of it, the pastoral country is of higher average quality. This district is as yet mainly pastoral. It includes

the whole watershed of the Upper Burnett and its numerous tributaries. About 10,000 square miles of country are held under pastoral lease in the district, and a good deal of land has been selected, but the selections are almost exclusively used for depasturing stock. Its climate is drier and colder than that of Wide Bay, but moist enough for agriculture, and the district resembles the Darling Downs in this respect and in the fertility of the soil, suitable both for sheep and cattle, but the latter are preferred. In the north-eastern portion of the district valuable copper deposits occur. One mine was worked for some time, yielding a profit in three or four years equal to about five times its capital. A sudden fall in the price of copper led to the abandonment of most of the mining operations. (4) The Port Curtis and Leichhardt districts embrace the whole watershed of all the numerous tributaries of the Fitzroy River, which falls into the sea in Keppel Bay at the point where the tropic of Capricorn intersects the coast line of Q. Port Curtis is a comparatively narrow strip of country occupying the whole seaboard. The Leichhardt is two or three times as large, stretching westward to the watershed of the Main Dividing Range, which at this point is about two hundred miles from the coast. Port Curtis is crossed by the Fitzroy River, which is for the last twenty or thirty miles of its course a broad navigable stream. The seaport of Rockhampton, built on it, is the outport for the central districts of Q., and the terminus of one of the trunk lines of railway now being extended westward from the coast. A number of small streams rising in broken and hilly country in various parts of the district fall into the sea at several points on the coast. Near the southern end of the district is the sheltered harbour of Port Curtis, which has given its name to it. But although this is the finest harbour in southern or central Q., and Gladstone, which is built on it, is one of the oldest settlements in the colony, it has never grown beyond the size of a township; the trade current having set entirely to Rockhampton. That portion of the district of which it is the natural outport is full of metalliferous veins and gold reefs; but mining of all sorts has been carried on only in a fitful manner. Small gold reefing areas have been worked near Rockhampton, but none have attained any importance as mining centres. Copper mines have been opened and worked in the district, but are now all abandoned. There is little agriculture carried on in the Port Curtis district, though a good deal of land has been taken up in the neighbourhood of Rockhampton. The selectors confine themselves mainly to stock-keeping and dairy work. The soil of the district is on the whole good, it is pretty thickly wooded, although with the exception of the ordinary hardwood there is not much marketable timber. But the rainfall is unevenly distributed, and prolonged intervals of dry weather militate against agriculture. As

to climate it occupies an intermediate position between the temperate and tropical portions of the coast country, and the temperature is decidedly high. For pastoral purposes Port Curtis is well adapted, though stockowners are compelled to confine their attention to cattle. But the native grasses are of higher average quality than in Wide Bay. The large district of Leichhardt is distinctly pastoral country, the area of available country held under lease in 1879 amounting to 18,732 square miles. Although portions of it are sandy and scrubby, others are exceedingly fertile land. The blacksoil volcanic plains and downs of the Comet were considered at one time to be equal to the finest pastoral country in Q., but a few of the stations have deteriorated, owing mainly to overstocking. The Leichhardt is well watered, and contains a fair proportion of running streams and brooks. The country is adapted either for sheep or cattle, but the latter are chiefly depastured on it. (5) The North and South Kennedy Districts consist of the extensive watershed of the Burdekin, embracing an even larger area of country than the affluents of the Fitzroy. They form two irregular triangles, joined by a base line running about east and west. Of the South Kennedy district little more than an angle touches the sea; of the North Kennedy, a whole side is seaboard. The western boundary of both districts is the Main Dividing Range, which forks opposite their connecting point, one division of the great watershed stretching westward, the other forming the boundary of the North Kennedy, trending rapidly towards the sea. The small seaboard of the South Kennedy includes the sugar-growing district of Mackay, formed on the rich lands of the Pioneer river. The town of that name situated on the navigable portion of the river owes its rise entirely to the establishment of sugar-growing, which prospered almost from the beginning. Not only is the soil very fertile, and of the character most suitable for cane-growing, but the climate is unusually favourable for the manufacture of sugar. It is tropical and free from frost, and while there is a sufficient rainfall to ensure the growth of the cane, the planter can nearly always reckon on a prolonged spell of dry weather when he requires to turn his crop into sugar, and rain would interfere with crushing operations. It is estimated that over 100,000 acres of excellent sugar land are to be found in this locality; and about 12,000 acres are actually under crop. In the southern inland angle of South Kennedy, on the watershed of the Belyando, one of the tributaries of the Burdekin, is the pastoral and mineral district of Peak Downs. The surface of the country is covered with fertile black soil clothed with a fine sward of grass and herbage. The Peak Downs sheep stations are reckoned among the finest pastoral properties in the colony, and immense sums of money have been spent on improving them. A small goldfield near Clermont, the chief centre of population, has been worked since the separation

of Q. from N.S.W., and still continues to yield small quantities of gold. But the most important mine has been the Peak Downs copper mine. This rich mineral deposit, discovered in 1860, was taken in hand by a N.S.W. company and worked with vigour. The lodes were large and produced immense quantities of rich ore, so that in spite of the cost of wood fuel, and the land cartage of 180 miles to port, the operations were profitable. During the years that copper was high priced the mine gave dividends nearly equal to its whole capital. The fall in price of copper threw the affairs of the company into confusion from which they did not recover. The mine is still being worked, though on a small scale, by tributors, and appears to be far from exhausted. Several unworked copper lodes exist in the district. North Kennedy is eminently a mineral and above all a gold producing country. The reefing districts, of which Charters Towers is the centre, produced in 1879, 83,275 ozs. gold, and the neighbouring reefing centre of Ravenswood 15,744 ozs. But the actual gold production of this district gives no idea of its capabilities. There is practically no alluvial mining, and the quartz reefs extend over an area of about 120 square miles of proclaimed auriferous ground, besides a great deal of country not yet included in any official proclamation. Besides gold, the silver lodes of Ravenswood are attracting attention and are likely to prove profitable. Copper lodes are also found in several localities. The mining centre of Charters Towers having assumed a settled and permanent character, attention is being paid to the surface soil in its neighbourhood. Homesteads embracing an aggregate area of about 3000 acres have been taken up; the holders, though but mainly engaged in stock-keeping and dairying, practise a little agriculture. Although close on the 20th parallel of south latitude, the country lying at a considerable elevation above the sea has a climate rather sub-tropical than tropical, and grapes have been found to thrive and mature. The summer though hot is distinctly healthy, and there is a pleasant cool season. The interior of the district contains some excellent pastoral country, but unsuited for sheep. On the coast of North Kennedy lies the beautiful harbour of Port Dennison, a land-locked sheet of water, unequalled for shipping purposes by any other natural port north of Port Jackson. But the town of Bowen, built on it, has been commercially unfortunate. Possessing this noble harbour, a climate so temperate and equable that the place is used as a sanitarium by those who have to endure the fiercer heat of the far north, it has been deprived of its inland trade by the newer settlement of Townsville on Cleveland Bay. Nevertheless, Bowen is a prosperous little place. It is the main centre of general agriculture—as distinct from sugar-planting—in the north. A number of settlers have formed homesteads and cultivated maize, potatoes, &c., besides planting orchards in which oranges, mangoes, custard

apples, lemons, citrons, pineapples, limes, &c., grow with marked success. There is excellent agricultural land in the neighbourhood, and much of the soil is said to be quite suitable for sugar cultivation. Gold is found at no great distance, galena exists, and tin has been discovered. The Government geologist speaking of the coal measures on the Bowen River says:—"The coalfield is the geological equivalent of the most valuable part of the N.S.W. measures." At the extreme northern end of the seaboard of the district, where the Main Dividing Range sends down its spurs to the sea, lies the port of Cardwell, near which, on the rich alluvial flats of the Herbert River, sugar-growing has been long established. Although both soil and climate are suitable for cane cultivation the industry has not advanced; its progress being delayed by the isolated position of the settlement. Some plantations however seem to have overcome the initiatory difficulties. (6) The Cook District occupies the whole of the Cape York Peninsula, having on its seaboard on one side the ocean—the coast here being sheltered throughout its length by the Great Barrier Reef—and on the other the Gulf of Carpentaria. This large district—the largest in the colony—is hardly yet thoroughly explored, and was almost unknown till the Palmer "rush" of 1874; but so far as it has been examined it appears to possess in unusual variety and abundance all the sources of natural wealth with which Q. is so richly endowed. The Main Range running parallel to the east coast from south to north is visible for several hundred miles from the sea. In some places it runs to lofty crests such as the Bellenden Kerr Mountains, of which some peaks are 6000 feet high; in others it forms a mountain wall which viewed from the sea appears to forbid access to the interior. But the mountains themselves are clothed to their summits with luxuriant vegetation; in the belt of coast land at their feet are tracts of good land; they are pierced by valleys carved out by swift rivers, enshrouded by dense forests of pine, cedar and other valuable timbers growing in the richest soil; and in places they fall back and encircle large tracts of the richest agricultural country. From the western slopes of the range descend rivers which fall into the Gulf of Carpentaria. The head waters and tributaries of these rivers have all given names to gold workings, such as the Gilbert and Etheridge, the Hodgkinson, including the Tate and Walsh, and the Palmer, which with its tributaries form the well-known goldfield of that name. It is the range which is auriferous, or rather metalliferous, for even on the narrow belt of country between it and the east coast gold and tin have been found; and where further north it trends more towards the centre of the peninsula the rivers descending from it and falling into the ocean, such as the Normanby and Coleman, also traverse auriferous country. It may almost be said of the Cook District so far as it is known that it is one vast goldfield. The extensive but shallow

alluvial deposits of the Palmer attracted the first great "rush" of miners, European and Chinese; but the former soon discovered reefs in all directions. The Palmer, Hodgkinson and Etheridge are names applied generally to what are really provinces seamed with gold reefs. The extent of auriferous ground actually included in the proclaimed goldfields is 14,600 square miles; but there are thousands of square miles of gold-bearing country on which no discovery of a sufficiently startling nature has attracted a "rush" of miners, and which has not therefore been formally proclaimed. The latest official report of the Mines Department gives the number of lines of reef proved to be auriferous in the proclaimed fields as 854, but these constitute only a small percentage of the reefs known to exist. But the workings being in the hands almost exclusively of the Chinese, they add little or nothing to the capital stock of the colony. Only about a third of the coast line on the eastern side of the district has been partly occupied, and the western or Gulf side has hardly been even examined. On the east coast the principal seaport is Cooktown, founded by the rush to the Palmer, of which field it is the outlet. To the south of Cooktown are Port Douglass and Cairns, smaller ports originally opened as outlets for the Hodgkinson. There is a good deal of agricultural land in the neighbourhood of these places, which is leading to some permanent settlement. Tin is found in the mountainous country at the back of the two last-named ports. In the southern part of the district a fine tract of agricultural country on the banks of the Johnstone River has been taken up for sugar-growing. Large quantities of cedar are cut on the river side scrubs of the Daintree and Mossman Rivers, and shipped south in log. In describing the east coast its peculiar formation should be mentioned. It is everywhere sheltered by the line of the Barrier Reef, which with a few breaks extends as far as Cape York. Inside the Reef are archipelagos of islands of all sizes and shapes, for the most part rocky and unfertile, but of the most picturesque form. The coasting steamers follow a deep wide channel between the mainland and the reef and among the islands. No more pleasant pleasure trip can be taken in Australia than a coasting voyage along the north coast of Q. The sheltered water, stirred only into a gentle ripple by the fresh cool trade wind, is seldom rough enough to discompose the most sensitive traveller. As the boat pursues its journey every mile discloses a new combination of mountain and island scenery; the grand outlines of the former softened by their mantle of luxuriant green, and the fantastic shapes of the latter, rendered attractive by the contrast of grey rock, dazzling white sand, and blue sparkling water. The pearl shell and bêche-de-mer fishery, carried on among the islands off the coast, especially in or near the Torres Straits, must be mentioned. This industry gives employment to a number of boats and men. The Chinese have engaged in the collection of

the bêche-de-mer, and a junk built by them in Cooktown trades among their fishing stations. (7) The Interior District includes the districts of Maranoa, Warrego, Mitchell, North Gregory and South Gregory. According to the last report of the Lands Department the extent of country held under pastoral lease was, of available pasturage 178,433 square miles, and of unavailable 72,360; in all a territory about one-fourth larger than the colony of N.S.W. There is some country not yet taken up, so that the gross area of this division is larger than the total amount of land held under pastoral lease. It may fairly be calculated that the interior of Q. contains at least 200,000 square miles of good pastoral country. As a rule it is all open, there is very little of what is known as "forest." Enormous plains stretching to a vanishing point on the horizon, or undulating downs over which, from an elevation, the eye can range forty or fifty miles without a check, and the whole sheeted with grass or nutritious herbs; such is the general description of the interior. Belts of timber fringe the watercourses, and there are in places extensive scrubs comprised mainly of short gnarled trees with no entangling creepers or vines, but often filled with saline shrubs or plants which are eaten greedily by the stock. The watercourses are mere channels connecting pools of greater or less magnitude; there are very few springs, and no running water, and the whole unite to form one or two main channels leading into the huge shallow lakes of S.A. The scarcity of surface water is the main defect of the country, but is easily remedied by the construction of dams and reservoirs, for which the formation of the water channels is generally suitable. The air is pure and exceedingly dry, there is seldom any dew at night, and the rainfall is scanty and irregular. Naturally under these climatic conditions the temperature is variable and apt to be in extremes. The sun's heat in the daytime is very great, but by no means so oppressive as the thermometer readings would lead one to suppose, for the air is always elastic and the fresh breeze that plays incessantly over the downs and plains is singularly invigorating. When the sun sets the temperature falls rapidly, and it is rarely that the bushman is inclined to dispense with his blanket even in the midst of summer. In winter the cold is severe, and four, five and six degrees of frost during the night or early morning are not uncommon. It is a decidedly healthy climate, and Europeans preserve their vigour undiminished through a great deal of hardship. For persons having a tendency to phthisis the interior is one of the best climates in the world—its dry, pure, invigorating atmosphere is a more efficacious remedy for this disease than any medicine in the pharmacopœia. It is essentially a pastoral country, and peculiarly suited for rearing merino sheep. At present it is mainly occupied by cattle, but the fact is due to its recent occupation, as pioneers prefer this description of stock

when pushing out into the wilderness. However in all directions the squatters are preparing their runs for sheep, and it is probable that in a few years the wool production of these districts will be very considerable. Already Queenslanders are apt to speak of this territory as their Riverina, but a Riverina on a gigantic scale. It is, however, doubtful whether it can be used for any but pastoral purposes, as the dry climate seems to preclude the possibility of growing anything but wheat, and perhaps in places grapes and deep rooting fruit trees. Nor does it seem to possess any great store of minerals. Indications of coal have been seen in some places, and at one locality a number of very beautiful opals have been found. (8) The Burke District is hardly yet thoroughly explored, although 31,542 square miles of available and 7315 square miles of unavailable country are at present held under pastoral lease. This however is only a portion of the area included within its boundaries. The southern part of the district resembles, in its general character, the interior; but as the shores of the Gulf of Carpentaria are approached its appearance changes, and it becomes more thoroughly tropical. The northern part of the district is well watered by numerous rivers falling into the Gulf, and on one of these the small town of Normanton is built. When the project of a trans-continental railway is carried out there will, of course, be a large commercial town formed on the Gulf. At present the population of the country is scanty, and is only partly occupied even by pastoral settlers. For pastoral purposes the greater part of the Burke is very good. It is mainly cattle country, although sheep have been put on runs near its southern boundary. It is rich in minerals, the Dividing Range and spurs leading from it showing indications of gold and other metals in many places. One remarkable deposit of virgin copper and rich ores of the same metal was discovered many years ago near the upper part of the Cloncurry River, but its great distance from port and the absence of roads have up to the present time prevented its utilization. For the same reason there has been little regular exploration for metals, which could not in such a remote country, be profitably worked. Enough however has been discovered to make it certain that the Burke district possesses a good deal of mineral wealth in addition to its excellent pastoral country.

CLIMATE.—In addition to the remarks made on the climate of the several districts of Q., the following general observations are quoted from Wallace:—"As Q. extends only five degrees beyond the tropic, it of course possesses a more uniformly hot climate than the more southern settlements wholly in the temperate zone. It may however be doubted whether the heat is so oppressive as farther south, since Q. is almost wholly free from the exceptional hot winds from which the other colonies suffer; while their sudden and extreme changes of temperature are equally unknown here.

During a large part of the year the weather is fine, the sky cloudless, the atmosphere dry and exhilarating. The three summer months—December, January and February—are hot, and as much rain falls at this time tropical moisture and heat are combined. In all the coast districts the rainfall is great, being about 50 inches at Brisbane and Rockhampton, while at Rockingham Bay it is 90 inches. Inland it decreases rapidly. At Gympie, about 30 miles from the coast, it is 44 inches; at Nebo, 70 miles, 21 inches; while at Springsure, 160 miles inland, it is only 17 inches. At greater distances inland it is much less and altogether uncertain; the Alice Downs, on the Thompson and Barcoo rivers, having about 10 inches, with excessive evaporation. The north coast has the regular tropical monsoons, giving about seven months dry and five months wet weather. The mean temperature at Brisbane is 69° Fahr., and the changes of the thermometer are far less extreme than at Sydney or Melbourne, while cool southerly breezes prevail throughout the year, so that the heat is rarely felt to be oppressive. Over by far the larger part of the colony frost and ice are unknown, while at Brisbane the winter is a most delightful season, with cool mornings and evenings, bright and warm days, the sky always blue, and the air wonderfully transparent. This colony is almost entirely free from epidemic diseases, and is very favourable to the European constitution, especially to those with a tendency to consumption. Although most of the mining districts are well within the tropics, the dryness and purity of the air are such that Europeans pursue the laborious occupation of gold-mining as easily as in other parts of A."

NATURAL HISTORY.—"The natural products of Q. differ chiefly from those of N.S.W. by the presence of a number of tropical forms, which everywhere intermingle with the usual Australian types. Thus in the vegetation of A. we first meet with the screw-pines at Moreton Island, in latitude 27° S., and Araucarias at Port Bowen, just within the tropic. The sea-coasts are chiefly tenanted by an Indian vegetation, including mangroves and pandani. Farther inland we have many Indian genera of leafy trees, very different from the usual Australian type. This is hence called the 'brush-wood' or 'cedar' country, and it also contains numerous Malayan forms, especially palms of the genera *Cycas*, *Areca*, *Caryota* and *Calamus*. Bamboos and epiphytic orchids are however rare, and everywhere *Eucalypti*, *Acacie* and other specially Australian forms make up the bulk of the vegetation. Farther inland, over the elevated sandstone plains, is found a peculiar vegetation of small trees and shrubs and the curious bottle-trees with swollen trunks. It is very singular that in tropical A. the number of genera and species of plants is much less than in the temperate parts of the continent. Only about 2200 tropical species are known, and Sir Joseph Hooker thinks that the total number will not exceed 3000. The known

species are therefore hardly more than a third of the numbers found in temperate A. It is to be noted too that about 500 species are quite identical with those of India and Malaya. Another peculiar feature of the tropical Australian flora is that several important families, abundant in the *tropics* of other parts of the world and also found in *temperate A.*, are either scarce or altogether absent. In the animal world there is no such striking difference. There are no peculiarly tropical forms of mammals in A., except a *Cuscus* allied to those found in the Moluccas and New Guinea, and a sea-cow allied to that of India. In birds however several forms allied to the Paradise birds of New Guinea occur near the northern coasts. In insects, too, there is a great change in the numbers, size, and colour of the butterflies. The golden-green bird-winged butterfly is found all through Q., and even as far south as Richmond River in N.S.W.; but its small size, in comparison with its Papuan relatives, betrays the inferiority in climate and vegetation; and on the whole, the butterflies of Northern Australia are far inferior in variety and beauty to those of the Moluccas and New Guinea. In beetles Australia is very rich, and differs greatly from the Austro-Malayan fauna; and this difference appears to pervade the tropical as well as the temperate regions. The Australian weevils abound in large and peculiar forms, while the allied Anthribidæ, which abound in Austro-Malaya, are almost unknown even in the most tropical parts of Australia."—Wallace.

GEOLOGY.—"The geology of Q. has been tolerably explored by travellers and colonial geologists. The eastern and northern portions consist of ancient formations, producing coal, gold, granite, slate, and basalt; while the western interior is largely covered with the Tertiary desert sandstone, alike unproductive of minerals and deficient in water and vegetation. The ranges next the coast are granitic, those farther inland of Palæozoic rocks, and it is in the intervening country that the coal formations are developed. Granite extends with little interruption from Cape York in the extreme north to Broad Sound in lat. 22° S., with patches farther south. It rises to 2500 feet high on Hinchinbrook Island in lat. 18½° S. At the Ravenswood gold-field (200 miles west of Repulse Bay, in the upper valley of the Burdekin River) the formation is described as syenitic granite. Mr. Daintree estimates that one-sixth of the area of the colony is granitic. Metamorphic rocks occur near Brisbane, and at the gold-mines to the north. Palæozoic rocks are very extensive. The carboniferous cover 14,000 square miles and the Devonian 40,000, the latter extending 200 miles inland between lat. 18° and 29°. They are found at the Gympie goldfields on the Mary River, and are of immense thickness from the Burdekin to the Gilbert rivers. The Mesozoic formations are better developed in Q. than in any other part of Australia. In the southern part of the colony there is an Oolitic

coalfield, with fresh water and estuarine deposits. Rocks of similar age occur on the Barcoo and Thomson rivers far in the interior; while in the west and north-west are vast cretaceous beds, believed to extend over an area of 200,000 miles, or one-third of the entire colony. Both deposits contain numerous marine shells of the same genera as occur in the Oolitic and chalk formation of Britain. We have here a probable explanation of the curious fact of the poverty and want of specialty in the tropical fauna and flora of Australia; for if so much of the tropics was beneath the sea during the cretaceous period, there may have been no room for special tropical forms to be developed; and when the area in question became dry land it was at once overrun by such of the specialised temperate forms as were suited to it, and by a number of waifs and strays from the tropical lands to the north, thus producing that intermixture of types and want of special character which are now its most prominent features. The coal formations of Q. are very extensive and of great prospective value, some of the coal having been proved to be of good quality. It consists of Paleozoic or true coal, found in the central parts of the colony about the Mackenzie and Dawson rivers; while farther south, near Brisbane, and on the Upper Darling, there are almost equally extensive and valuable deposits of Mesozoic age. Volcanic rocks abound, covering more than 30,000 square miles, and forming open basaltic downs, dome-shaped hills, peaks, or tabular ranges, with precipitous ravines and prismatic columns. True volcanic cones also abound in the Dividing Range, extending as far north as the York Peninsula. Well-defined craters and ancient lava-streams are often found, especially about lat. 20° near the Burdekin River. Signs of very recent volcanic action are to be seen in the Murray Isles off Cape York. Tertiary formations cover about one-fourth of the colony, consisting of conglomerates and desert sandstone. The latter often renders a country uninhabitable, the loose surface being blown or washed into parallel ridges, sometimes forming hilly undulations, at others furrow-like ripples, and almost wholly barren. This sandstone is usually conformable to the cretaceous rocks beneath. When ferruginous it forms the singular flat-topped hills of Central Australia, and near the Cloncurry River in the north reaches 3000 feet above the sea. These sandstone hills are often very picturesque, and have been compared by the explorers to ruined castles or the wild pictures of Salvator Rosa. Gorges and precipitous escarpments abound, with vertical walls 600 or 1000 feet deep, and occasionally even 1800 feet, according to Leichhardt's estimate. The Great Barrier Reef of Australia belongs entirely to Q., and is one of the most remarkable geological and geographical phenomena in the world. It is 1200 miles in length, and extends along the whole eastern coast from opposite Port Bowen in lat. 23° to Torres

Straits. Near its southern end it is seventy miles wide, and nearly 100 miles from the coast; but it is generally of much less width, and the channel between it and the shore from five to fifteen miles wide. The navigation is dangerous for ships owing to the numerous sunken reefs. Here and there are openings to the ocean, some very narrow, some ten or twelve miles wide; and it contains examples of all the various kinds of reefs—atolls, fringing reefs and other coral formations. The portion of the reef above water with its numerous islands is estimated to cover an area of 30,000 square miles. Its outer margin probably indicates the position of the ancient coast-line of Australia. This was fringed with coral reefs; but as the land sank the coral animals continued to build upwards to the level of the sea, and thus a great ridge was formed, which broken and heaped up by the waves of the Pacific forms the present huge barrier. Fresh water is very inimical to coral, and openings are thus formed in all fringing reefs at the mouths of rivers. These openings remain in the Barrier Reef, the largest being opposite the mouth of the Burdekin River, which drains a considerable portion of tropical Eastern Australia."—*Wallace*.

POPULATION.—Owing to its fine climate and the mixture of mining adventure with the culture of tropical products, Q. has attracted to itself a more varied population than most of the other colonies; and this may be said to consist of four distinct races—the White, the Yellow, the Brown and the Black. The White, or Europeans and Americans, are by far the most numerous, forming about nine-tenths of the whole; then come the Yellow, or Chinese and Japanese, about two-thirds of the remainder; the Brown or Polynesian labourers (most of whom are, however, Melanesians, and nearly black,) forming the other third. This is exclusive of the Black, or aboriginal Australians, whose numbers are unknown, but which are probably more numerous than the Chinese and Polynesians combined. The rate of increase has been very rapid. Soon after the formation of the colony in 1860 the population was 28,056; in 1876 it had reached 173,283. Of these about 16,000 were of various non-European races. Of the 157,000 Europeans about 71,000 were native-born Australians, 70,500 British, 900 Americans, 10,000 Germans, and 4000 of other European nationalities. The estimated population on 31st December 1879 was 217,851, of whom 130,867 were males, and 86,984 females. Unfortunately the difference in the numbers of the two sexes still continues very great. The Chinese may be said to be all males; the Polynesians nearly all; and even among the population of European race there is a surplus of 21,000 males. In 1879 there were 7870 births to 3207 deaths, while the increase due to emigration was 13,828.

AGRICULTURE AND STOCK.—Agriculture has not as yet made progress commensurate with the wide possibilities of soil and climate. In other new countries a large proportion of settlers have

attached themselves to the soil because it offered the surest and most certain hope of a home and pecuniary independence. In Q. so many chances have been offered to the adventurous of reaching fortune by a shorter cut than the slow track opened by the plough, that the fertility of the soil has not received its due attention. Chief among these for men of means has been the pastoral industry. The whole colony is one great pasture-ground, its capabilities varying according to the climate. Cattle can be kept in every part of it. In the southern coast districts the grass is not so rich in nutritive properties as in the interior; but on the other hand, the more frequent showers cause it to spring oftener, and grow more thickly. On some of the black-soil basaltic plateaux of tropical Q. the cattle are almost hidden in the tall, thick-springing, sweet grasses. For sheep only a portion of the colony is suitable, equal in area to about 300,000 square miles of good country. The sheep country is on the interior high lands; but it is impossible to define exactly the division between it and that which is only suitable for cattle. The true sheep districts include the North and South Gregory, Mitchell, Warrego, Maranoa, Leichhardt, Darling Downs, South Kennedy and part of the Burnett, besides portions of other districts. In the divisions named the amount of country held under pastoral lease at the close of 1878, according to the report of the Under-Secretary of Lands, was—available 235,280 square miles; unavailable 83,624 square miles. Much country taken up as “unavailable”—*i.e.* unfitted for pasturage, and therefore subject to a reduction of rent—proves on official examination to be very good indeed. It is at least certain that the good sheep country largely exceeds in extent the whole Colony of N.S.W., and most of it is of a quality not to be surpassed in A. Nearly the whole of it is occupied up to the border line of the S.A. territory. Except in tropical Q., and more especially in the huge Burke district, which includes the watershed of most of the rivers falling into the Gulf of Carpentaria, there is not very much good country not already included in the existing pastoral leases. The cattle stock of the colony is proportionately very much larger than that of sheep: official reports giving the number of the former at 2,469,555 in 1878, and of the latter 5,796,742 at the close of 1879. The disproportion is due to several causes. Of these the simplest is the fact that while the whole colony is suitable for cattle-breeding, only a portion is fitted for sheep. But a good deal of the sheep country has been occupied with cattle. Its occupation has been quite recent, and cattle are preferred by pioneers for many reasons: they are more easily managed, fewer hands are required—a great consideration when land-carriage is long and costly—and less expensive improvements are needed. Consequently during the year that the great movement for the occupation of western country was in progress, there was a constant

demand for store cattle. This constant demand increased the prices, and stimulated production. Much of the capital and energy available for pastoral enterprise was therefore diverted from sheep to cattle during the last decade. This diversion was the more marked because during the preceding ten years a great many mistakes had been made in sheep-breeding. Unsuitable country had been stocked with sheep, and the proper attention to breeding and appliances for getting up wool in good marketable condition had been neglected. The financial difficulties of 1866, followed by some bad seasons, came with disastrous effect on an industry which had not been firmly established on a sound basis, and brought about something like a collapse, followed by a regular rush into cattle-breeding. But this branch of the pastoral industry has quite recovered itself, and sheep are increasing in numbers. The pitfalls into which the early breeders fell are well known and marked now, and capitalists, both in the colony and from other parts of Australia, are preparing to stock with sheep great tracts of suitable country, on which they are storing water and making other provisions for their maintenance. The agricultural returns for the year ending 31st March 1880 were:—Total extent of land under cultivation during the year 106,864 acres; total extent of land under crop 101,052 acres. Wheat 3607 acres, produce 29,259 bushels; for hay 1197 acres, produce 1774 tons; oats for grain 175 acres, produce 4330 bushels; for hay 4430 acres, produce 8180 tons; for green food for cattle 624 acres; barley 1789 acres, produce 44,160 bushels; for hay 242 acres, produce 374 tons; for green food for cattle 488 acres; maize 48,365 acres, produce 1,511,006 bushels; for green food for cattle 554 acres; rye, bere, millet 259 acres; potatoes 4760 acres, produce 14,404 tons; cotton 105 acres, produce 30,423 lbs. of ginned cotton; sugar-cane, total area under crop 17,652 acres; area crushed (included in crops) 12,029 acres, produce 18,714 tons of sugar made; Arrowroot 132 acres, produce 258,057 lbs. made; tobacco 35 acres, produce 284 cwt. of dried leaf; sorghum, for green food for cattle 197 acres; sown grasses, lucerne, rye-grass, &c., for hay 5776 acres, produce 12,526 tons; for green food for cattle 5919 acres; vines for wine-making 399 acres, produce 104,674 gallons of wine made; for table use 205 acres, produce 480,230 lbs. of grapes; unproductive 138 $\frac{3}{4}$ acres; bananas 443 acres, produce 297,443 dozen; pine-apples 180 acres, produce 55,877 dozen; oranges 219 acres, produce 92,140 dozen; other crops 787 acres; garden and orchard 2370 acres; land in fallow 5812 acres. The return of live stock for the year was:—Horses, including foals, 163,083; cattle, including calves, 2,800,633; sheep, including lambs, 6,065,034; pigs 64,686. The area selected as homesteads and conditional purchases during the year 1879 amounted to 278,609 acres. Of this area 67,723 acres were comprised in homesteads and 210,886 acres in conditional purchases. There are

still open for general selection 23,130,774 acres and 1,798,118 acres for homestead areas. The gross area held under conditional purchase and homestead selection on 31st December 1879 amounted to 3,720,000 acres. The area of land sold at auction during 1879 was 12,617 acres, the amount realised being £23,195 10s. 4d. The statistics of the sugar industry for the season 1879-80 were—sugar manufactured 18,714 tons; molasses produced 641,486 gallons; rum distilled 238,710 gallons; sugar exported 12,001 tons; rum exported 92,629 gallons; 70 sugar mills and 9 distilleries.

MINERAL RESOURCES.—The first important discovery of gold was made at Canoona, about thirty-five miles from Rockhampton. In the year 1867 the Government offered rewards varying from £200 to £1000 for the discovery of new and paying goldfields. This led to the discovery early in the year of several goldfields, and in September of Gympie, where a nugget weighing nearly 100 lbs. and valued at £4000 was found near the surface. The gold-bearing quartz at Gympie is very rich, and numerous claims are being profitably worked. There are at present upwards of twenty goldfields in the colony, comprising the Palmer, Etheridge, Gilbert, Cape River, Charters Towers, Ravenswood, Normanby, Marengo and Mount Wyatt, Mulgrave, and Barron Rivers, Cloncurry and the Hodgkinson. The last-named was discovered by Mulligan and Warner towards the end of 1875, and has proved to be of superior reefing qualities. The last report of the Department of Mines stated that there are 1453 distinct lines of reefs "proved" on the various goldfields, and these include an area of auriferous ground amounting to 14,878 square miles. The returns given by the crushing mills amounted to a total for the year of 110,032 tons of stone, yielding 165,786 oz. of gold, or an average all round of 1 oz. 10 dwt. 3 gr. The lowest average return for each miner working on any field was 29 oz. 8 dwt. 23 gr. of gold, worth £97 3s. 7d.; and the highest was 68 oz. 7 dwt. 8 gr., worth £239 5s. 9d. The appliances on some of the outside fields are very rough and wasteful, and in the year for which the figures are quoted (1878) the miners were hindered by a severe drought. In quartz-mining the poorest miner can ensure not only good wages (reaching in the N. £3 10s. and £4 a week,) but can take a chance in the golden lottery, often drawing sudden wealth as a prize. Copper, tin and coal are the other chief mineral products of Q., so far as is at present known. The former is found in various parts, but the richest mines are at Claremont, Mount Perry and Cloncurry. Antimony is found at Tiaro. In 1878 three mines only were at work, the product being 7405 tons of ore, value £23,030, and 642 tons of smelted copper, value £35,810. Tin kept three mines at work, the yield being 1178 tons of ore, valued at £35,340. Iron has also been found in various parts, and a bonus of £5000 has been offered for the production of the first 500 tons of good marketable iron from ores raised and smelted in Q. Since 1872 tin has been found

in almost exhaustless quantities. It was first discovered at Stanthorpe, afterwards at several places on the border, and extensive deposits have also been laid bare on the Palmer and other northern goldfields. During 1880 extensive deposits were found not far from Gladstone, and still larger at the Wild River in the N. Coal is extensively diffused throughout the colony, and has yet to take its place among its leading products. It is found on the banks of the Brisbane and Bremer rivers, and in other parts of the West Moreton district, on the Darling Downs, at Burrum near Maryborough, at Bowen, at Cooktown, and other places in the N. As yet comparatively surface coal only has been got out, but the deposits at greater depths are believed to be a true coal of much better quality. It is estimated that the coal beds underlie a surface of nearly 24,000 square miles. During 1878 ten mines were at work, producing 52,580 tons, valued at £21,272. The stone quarried and raised during 1878 was:—blue stone 54,000 tons valued at £11,000, from three quarries at Ipswich, Toowoomba and Rockhampton; sandstone 2958 tons, value £2958, from four quarries at Gatton and Toowoomba; freestone 5149 tons, value £2658, from nine quarries, one at Brisbane, one at Goodna and seven at Warwick; felstone porphyry, 11,870 tons valued at £3916, from four quarries in the Brisbane district; limestone 1280 tons of the value of £318.

PEARL FISHERY.—In the extreme north considerable attention is paid to the pearl fishery. A large number of schooners are engaged in the trade; the work is carried on partly by the employment of the aboriginals as divers (South Sea Islanders, Malays, and a few Lascars and Chinese assisting,) and partly by improved diving apparatus. The localities of the pearl fisheries are Wai Weer, Albany Island, Jervis Island, Somerset, Goode Island, Endeavour Strait, Friday Island, Prince of Wales Island, Possession Island, and Thursday Island. The bêche-de-mer fishery is carried on at the Barrier Reef, Murray Island and Darnley Island. The dugong fishery has for years been carried on; the oil extracted is said to have medicinal virtues not far below those of cod-liver oil. The collection of the bêche-de-mer, a kind of sea-slug used in Chinese cookery, employs a large number of hands, and is a profitable source of revenue. The produce of the fisheries was: pearl shell (live) 418 tons 18 cwt.; pearl shell (dead) 3 tons 14 cwt.; bêche-de-mer 50 tons 16 cwt. 1 qr. 10 lbs. Live shell is valued at £130 per ton; bêche-de-mer at from £40 to £90 according to the quality.

RAILWAYS AND TELEGRAPHS.—There were 428 miles of railway open for traffic in the colony in 1878, and 5718 miles of telegraph line. In 1878 the total length of railway open was increased by 110 miles, and the lines are being rapidly pushed forward. The whole system of roads in the colony has been placed under the charge of local bodies, who have the power of rating property-owners,

and receive grants from the general revenue in the proportion of two pounds for one raised by assessment. The estimated value of rateable property in corporate towns is given in the official statistics for 1878 at £5,124,352.

IMPORTS AND EXPORTS.—In 1879 the exports amounted in value to £3,434,034; the imports to £3,080,889. The principal exports in name and value were:—Tin ore, 50,264 cwts.; value, £96,448; smelted tin, 6570 cwts., value, £23,868; tin slag, 35 tons, value, £35; copper ore, 560 cwts., value, £900; copper smelted, 9994 cwts., value, £32,641; cotton, £664; gold, £1,023,237; rum, £9814; sugar, £275,769; wool, £1,238,518; tallow, £72,366; hides, £50,690; preserved meats, £22,391; skins, £20,566; maize, £14,777; green fruit, £3,736; shell fish (oysters), £2729; arrow-root, £2802. The imports comprise every description of manufactured goods, the bulk coming from Great Britain. A large trade in American manufactures, particularly agricultural implements, tools, and articles for domestic use has lately sprung up. Among the exports the pearl shells from the Strait fisheries, and cedar from the Northern district, form no inconsiderable items. The shipping entered inwards included 1261 vessels of all nationalities, with an aggregate tonnage of 637,695; the clearances were 1251 vessels, with an aggregate tonnage of 618,699. There were registered 28 ocean steamers of 14,077 tonnage; and 38 river steamers, with 1314 tonnage.

MILLS AND MANUFACTORIES.—There are seven steam-mills, two water-mills, sixty-eight sugar-mills, thirty-eight steam saw-mills, sixteen soap works, twelve distilleries, five tobacco and cigar manufactories, twenty-three tanneries, nine arrow-root manufactories, two steam biscuit manufactories, one salt works, twenty-two agricultural implement manufactories, six fellmongeries, nine breweries, fifty-seven cordial manufactories, sixty-four brick-yards, thirteen lime-kilns, seven potteries, twenty-two iron and tin works, fifteen foundries, thirty-eight coach manufactories, ten cooperages, fifty printing establishments, three ice works, seven ship and boat-building yards, four smelting works, and numerous other works, for the manufacture of articles of general requirement. At Ipswich an extensive tweed factory has for some little time been in operation.

REVENUE.—The revenue for the year ending 30th June 1880 was £1,483,090 13s. 1d., being an increase on the previous year of £20,955 9s. 1d., or if the balance of Railway Reserve Fund (£129,821 1s. 4d.,) transferred to revenue be included, an increase of £150,776 10s. 5d. The expenditure for the year was £1,673,695 5s. 2d. The estimated revenue for the financial year 1880-1 is £1,722,500, and the estimated expenditure £1,689,982. The public debt is £10,192,086, and the annual interest £476,851; to this will have to be added the loan floated in 1880.

SAVINGS BANKS, &c.—On 31st December 1879 there were eighty-one branches of the Government

Savings Banks in operation, the amount to the credit of 15,922 depositors being £684,444 6s. There are also numerous friendly and benefit societies in operation.

EDUCATION.—The system of education in Queensland has, since January 1876, when the new Education Act came into operation, been placed under a special department called the Department of Public Instruction, under the control of the Minister for Education. Education is free and secular, the children finding the duplicate text books and slates for home use, copy books and exercise books, and such minor requisites as pens and pencils. Under certain conditions religious instruction may be given to the children out of school hours by ministers or others (of this provision very little use is made.) The primary schools are of three kinds—State-schools maintained wholly at the public expense; provisional schools only partially maintained by the public funds, and non-vested schools. The State also assists the formation and maintenance of educational establishments of a more advanced character than the primary schools. Upon the inhabitants of any district raising by subscription a sum of £1000 for the purpose of establishing a grammar school in that district the Government supplements it by double the amount for the erection of the necessary buildings; and if the sum of £250 per annum be guaranteed for three years as school fees by responsible parties the Government gives £500 per annum for the salaries of masters and current expenses. Brisbane, Ipswich and Toowoomba have availed themselves of this grant, and Maryborough and Rockhampton are about doing so. The pupils from the Brisbane Grammar School have greatly distinguished themselves in the competitive examinations for University honours. Scholarships entitling the holders to three years' instruction in any one of the grammar schools are annually competed for by children attending the primary schools. In December 1879 sixty scholarships, fifty for boys and ten for girls, were offered by competitive examination; and 121 candidates presented themselves—96 boys and 25 girls, of whom 24 boys and 8 girls were successful. A girls' grammar school has been established in Brisbane, and is well attended. On 31st December 1878 there were in all 314 primary schools in operation, 210 State or vested schools, 82 provisional schools and 21 non-vested schools. All of the latter save one are in connection with the Church of Rome. The number of teachers employed was 478 males and 446 females; of these 312 were classified, 230 unclassified, and 382 were pupil-teachers. The number of children on the roll during the year was 41,380. The average daily attendance was 21,418. The gross expenditure on primary education during the year was £101,253 14s. 5d., or exclusive of proportionate share of departmental expenditure chargeable to non-vested schools, £100,441 6s. 2d.; the average cost of the education of each child, on the

basis of annual enrolment, was £2 15s. 7½d. The value of the school buildings exclusive of the sites was estimated at £142,170. The private schools numbered 65, with an aggregate attendance of 848 boys and 1569 girls. In the three grammar schools there were 25 teachers, 312 day pupils and 78 boarders. Inclusive of Government aid the total receipts of these institutions were £12,815 7s. 2d., the expenditure being £8882 18s. 9d. There are 27 schools of art, two free libraries and two miners' institutes, having an aggregate of 3684 subscribers at rates averaging £1 per annum, and 41,282 books in the libraries.

RELIGION.—There is no State Church in Q. The voluntary system has prevailed since 1860, in which year an act was passed abolishing State aid to religion. Those ministers who at the time this act was passed were receiving stipends annually from the public treasury continue to receive them so long as they officiate in the colony. The only connection between Church and State is in the annual registration of ministers of religion to enable them to legally celebrate marriages. The voluntary system has hitherto worked satisfactorily, the members of the various denominations as a rule subscribing liberally to the funds for providing salaries for the ministers and church accommodation. In the towns ample means exist for public worship for all denominations. Nearly all the leading religious denominations are represented in the population.

BANKING.—On 30th June 1880 six banking companies were in business, having seventy-eight branches or agencies throughout the colony. Of these one only, the Queensland National Bank, is a local institution. This corporation does now the Government banking business. Their total assets were £5,386,446 7s. 4d., the liabilities being £3,934,816 9s. 2d. The paid-up capital of these companies amounted to £5,200,570; the aggregate of the last dividend to £401,903 10s. The lowest dividend was that of the Queensland National Bank, which was 10 per cent.; the highest was that of the Commercial Bank, which was 25 per cent. The average dividend was 15½ per cent. The deposits not bearing interest amounted to £1,146,359 3s. 6d.; the deposits bearing interest to £2,324,021 7s. 3d. The note circulation amounted to £315,174 0s. 10d. In addition to the dividends declared and paid, the aggregate amount reserved for contingencies was £2,725,388 14s. 10d.

CONSTITUTION.—The form of Government is vested in a Governor (the Queen's representative,) an Executive Council, and a Parliament of two Houses, the Legislative Council and the Legislative Assembly. The Council consists of thirty members, nominated by the Crown for life, presided over by a President elected by themselves. The House of Assembly comprises fifty-five members, elected for five years, representing forty-two electorates. The number of registered electors is 35,197. To exercise the franchise a person must be of the age of twenty-one years; he must also

possess a freehold worth £100, or pay rent for a house or land of not less than £10 per annum, or hold a pastoral license from the Crown, or be in receipt of £100 per annum as a salary, or pay £40 per annum for board and lodging, or £10 for lodging alone. He must also be a natural-born or naturalised subject of the Queen, and have resided in the colony six months before voting. Persons having property, either leasehold or freehold, or a license to depasture land in any electoral district in which they do not reside, have the right of a vote in any district in which such property is situated as well as in the district for which they claim as residents. The administration of justice is carried on by a Supreme Court, composed of a Chief Justice and three puisne Judges, and by District Courts, each presided over by one of three Judges.

HISTORY.—I. *First Discoveries.*—Q. was originally the Moreton Bay District of N.S.W. The bay was discovered by Cook in 1770 and named after the Earl of Moreton. It is supposed that this portion of the continent was visited by Dutch and Portuguese navigators in the early part of the seventeenth century: but there are no accounts available of these voyages, if they ever were made. The history of the settlement begins with Cook's visit. The great navigator made only a cursory survey of the north-eastern coast, naming the several conspicuous features as he sailed along. His journal contains little or no information respecting the character or capabilities of the territory, and is therefore only interesting from a maritime point of view.

II. *Flinders' Expedition.*—In August 1799 Governor Hunter, being an enthusiast in the prosecution of maritime discovery, despatched Flinders from Sydney in the *Norfolk*, a small colonial vessel, to examine Moreton Bay, and also another opening considerably to the northward which Cook had also indicated on the chart and named Hervey's Bay, leaving it uncertain whether either afforded any navigable inlet into the interior. The period allotted to the voyage was six weeks, and Flinders was directed, if he had sufficient time to spare for the purpose, to enter and examine the river Hunter, and observe the coal country there, as well as the general character of the adjacent territory. The vessel was manned with volunteers from the King's ships in port, and the commander was accompanied by Bongaree, an aboriginal from Broken Bay, who had become noted for his ingenuous disposition and manly conduct. To guard against accidents provisions for eleven weeks were put on board. Sailing out of Port Jackson on the 8th August, on the third day after the voyagers found that their ship had unfortunately sprung a leak which admitted as much water as one pump constantly going could keep under. Next day the vessel was opposite a bay which it was resolved to enter, with the two-fold object of examining the place and of stopping the leak. Casting anchor, Flinders and a party

of the crew landed. The first object which met their view were three huts of the Aborigines, superior in construction to those hitherto seen. They were circular in form and about eight feet in diameter. The frame was composed of the stronger tendrils of vine, crossing each other in all directions, and bound together by strong grass. The covering was of bark of a soft texture, so compactly laid on as to keep out the wind and rain. The entrance was by a small avenue, not leading directly into the hut, but turning sufficiently to prevent the rain beating in. The height of the hut inside was about five feet, and the interior of the roof was covered with a coating of soot. One was a double hut, comprising two recesses under one entrance, and was large enough for twelve or fifteen persons. A small basket made of some kind of leaf, and capable of containing five or six pints of water, was found in one of the huts. The leak having been temporarily repaired, the voyage was resumed, and on the 10th the voyagers passed Moreton Bay. They now sailed close to the shore, and observed numerous aboriginals as they proceeded. The blacks made many antic gestures towards the vessel. One would wave to and fro a green branch—among those untutored savages, as well as among civilised people, the symbol of peace; while others would from time to time run into the water and beat the surf with their sticks, as though they would chasten the rolling waves into making a passage for the boat, which they appeared to hope would visit the shore. Sailing along the shore in the day and anchoring at night, on the morning of the 16th the vessel was brought to anchor at the head of Glass-House Bay. Flinders proceeded in a boat towards the shore, accompanied by Bongaree. As they neared the shore several aborigines, each having a fishing-net over his shoulder, came down to the beach. After a parley of some duration, Bongaree jumped ashore unarmed, as the others seemed to be. He quickly made an exchange of the yarn belt from his waist for a fillet made of kangaroo hair. Flinders soon joined his black companion, taking his gun with him. Making friendly signs, laying down his gun, and offering a woollen cap as a present, he was suffered to approach. One of the blacks took the cap, but on Flinders making signs that he intended to get a net in return, the black indicated that he must also have the cabbage-tree hat which the former wore; and the aborigines becoming importunate, Flinders and Bongaree now retreated slowly towards the boat, the blacks pressing closely behind. When the Europeans pushed off from the shore the blacks evinced great displeasure, and tried to persuade their visitors to land again. Failing in this one of them threw a piece of wood at the boat, but the missile fell short, and the matter was treated as a joke, the blacks laughing heartily. Another running up to his middle in the water threw a spear. The dart passed over the centre of the boat a little above the gunwale,

but luckily did no injury. Flinders now rightly judging that further forbearance would be improper snapped his gun at the thrower of the spear, but it missed fire. Another attempt to wound or frighten the more forward of the assailants proved successful, the contents of the gun which was loaded with buckshot, striking the man in the water on the back. The merriment, if indeed mirth longer prevailed, was now transferred from the aborigines to the Europeans, for no sooner had the former heard the report of the gun, to them apparently a new sound, than every man fell flat where he stood. Recovering from their surprise, they rose up, however, almost instantaneously, and proceeded to scramble behind a bank, some crawling on their hands and feet, others running in a stooping attitude, and all presenting a ludicrous spectacle. One of the men in the boat now fired among the group, when they all fell a second time on their faces; but getting up immediately, they fled into the woods beyond the reach of further injury or fright. The man in the water also rose up after the second shot and made off; but his progress was much slower than that of the others, and he stooped considerably, evidently from the effects of his wound, and carried one hand behind him on his back. As he went he frequently looked over his shoulder as if expecting to see the weapon which inflicted his wound standing out like the shaft of a spear. As the bay was to be examined, and the leak which the vessel had sprung was to be more completely repaired in this place, the lesson which the blacks had received on this occasion was not to be regretted, inasmuch as it was likely to have a salutary effect in preventing future hostility. From this place, which was named Point Skirmish, the voyagers proceeded up an opening, which proved to be a river leading to the peaks resembling glass-houses, which gave its name to the bay. In exploring the surrounding country they met with some clusters of huts, which showed that the aborigines hereabout paid considerable regard to comfort. They were shaped like an arch, rounded at the end opposite the opening, and were about fifteen feet long. In one of the houses was found a net or seine, about fourteen fathoms in length, the meshes of which were much larger than those of any English seine, and the twine much stronger. To each end was affixed a pointed stick. Upon a shoal near the house there was more than one enclosure of a semi-circular form, and the sticks and branches of which it was made were set and interwoven so that a fish could not pass between. It was conjectured that the seine was employed in connection with those enclosures. While passing through a group of islands, the voyagers were thrown into some alarm by the appearance of a party of the aborigines in what appeared to be an aggressive attitude. About twenty blacks were counted, who seemed to be standing in their canoes and pulling toward the vessel with all their strength, and in

very regular order. Each seemed to hold a long spear in his hands, which also appeared to be used in paddling; the whole number shifting their hands and striking the water at the same instant. As they seemed to be coming on with great resolution, the people on board prepared to encounter an attack of a formidable character. The sloop was put under easy sail, the decks cleared of every incumbrance, and each man was provided with a musket and pistol. Thus prepared the vessel bore towards the apparently hostile force, but great was the surprise and satisfaction of the Europeans to find that instead of advancing in canoes to attack them the blacks were standing on a large flat that surrounded one of the islands and were engaged in the peaceable work of driving fish into their nets. They were ranged in a line splashing in the water with long sticks first on one side and then on the other. Instead of twenty canoes they had but two among them, and so far were they from evincing a warlike or hostile spirit, that they sank their frail bark on the approach of the vessel, and retreated to the shore, where they kindled a fire to cook the meal which they were previously engaged in providing. Proceeding into the river the sloop was laid ashore and the leak, which was found to have been occasioned by the starting of a plank, was permanently repaired. The depth of the water in the deepest part of the river was from four to six fathoms; but the channel was narrow. Large quantities of pumice-stone were found lying on the shores, and the stream was named the Pumice-stone River. The country was for the most part low and swampy; and beside the trees usually met with, a quantity of pine and some cedar grew in the vicinity of the river and the bay. Numbers of the natives were met with, whose conciliatory and timid demeanour seemed to show that they had heard of the punishment inflicted on their countrymen at the mouth of the river. They constantly invited the Europeans ashore by calls and signs, frequently giving proofs of their goodwill by entertaining their visitors with singing and dancing, in both of which accomplishments they displayed a large amount of rude skill and taste. The strain of their songs was melancholy and soothing. Their singing was accompanied by slow and not ungraceful motions of the body; their hands being held up in a supplicating posture. On one occasion, observing the attention with which they were listened to, each of the singers selected a European, near to whose ear he placed his mouth, either with the view of producing greater musical effect, or of teaching the stranger the song. Nor was their singing confined to one air, for they favoured their visitors with several, more or less pleasing. They appeared not to be so warlike as the aborigines of Port Jackson, their weapons of offence and defence being inferior to those of the latter. They excelled however in the arts of peace. Besides the large and well-made seine before described, they were possessed of scoop nets, which they used with skill

and dexterity in drawing fish from the river. On 31st of the month the sloop was got under weigh, and proceeded to Hervey's Bay. Here Flinders remained till the 7th September. He found the bay deep and extensive, but with very irregular soundings, and in several places the breakers prevented an approach to the shore. The fires of the aborigines were observed in several places, but none of the people themselves were encountered. Flinders now resolved to return, and on the 8th the vessel proceeded on her voyage towards Port Jackson. On the evening of the 20th the voyage was completed and the vessel anchored in Sydney Harbour. The results of this voyage, the first that had been made in this part of the coast since the establishment of the colony, were twofold. In the first place the observations of Cook respecting the currents and the shoals and islands along the coast, were either confirmed or corrected; so that the navigation of those parts was permanently facilitated, to the great advantage of colonisation and commerce. Next, the capabilities and resources of an extensive section of the country were to a great extent ascertained. Harbours and rivers were discovered and explored, which hereafter could be made the centres of those settlements which might either be established by the parent country or emanate from the chief colony, while at the same time the researches of Flinders formed the groundwork on which might be based the investigations of future voyagers and explorers. Lang, narrating this expedition of Flinders, says:—"The result of this voyage must have greatly disappointed the sanguine but not unreasonable hopes of Hunter; but it affords one of the most instructive lessons for the guidance of future Governments, whether imperial or colonial, in the department of geographical discovery, that perhaps the whole annals of British maritime enterprise afford. In running to the northward Flinders discovered and lay at anchor for nearly twenty-four hours in Shoal Bay, into which the Clarence River disembogues, and which he examined in a cursory manner, but without discovering that important river, although he was close to its entrance. In times of flood the rivers of A. bring down vast quantities of earthy matter, which they deposit along the bottom of any bay or other expanse of salt water at their mouth; and these bays or lakes, if at all sheltered from the full sweep of the ocean waves, are gradually filled up, and become at length solid land, leaving a deep water channel for the flow of the river. Had Flinders happened to hit upon the channel in this instance he would doubtless have followed it up through all its windings till he had found the mouth of the river; but he merely found a shoal bay with a fringe of gloomy mangrove trees along its shores, and reported accordingly that all was barren! In like manner, in pursuance of Hunter's instructions, Flinders entered Moreton Bay by what is called the Northern Passage, and passing several of the low islands with which it is studded

got right abreast of the entrance of the Brisbane River, which however being concealed from his view from the vessel's deck by two low flat islands at its mouth, which he named the Fishermen's Islands, he deemed the bay unworthy of any further examination, and reported to the Governor on his return that it afforded no inlet into the land. So confident on this point was Flinders that he summed up his report to Hunter in the following words:—"I must acknowledge myself to have been disappointed in not being able to penetrate into the interior of N.S.W. by either of the openings examined in this expedition; but however mortifying the conviction might be, it was then an ascertained fact that no river of importance intersects the east coast between the 24th and 39th degrees of south latitude." This assertion of so high an authority in all matters relating to maritime discovery was but indifferent encouragement for exploratory expeditions along the coast to the northward; and accordingly the Brisbane and the Boyne Rivers—the latter of which empties itself within a mile of the northern limit of the line of coast indicated by Flinders—were only discovered accidentally by Oxley when searching for something else still farther north in 1823, while the Clarence River was not discovered till 1838, when some sawyers happened to light upon it unexpectedly when searching for cedar for the Sydney market along the rivers to the northward. In explanation however of what might otherwise be regarded as a strange instance (or rather three such instances) of inadvertency on the part of Flinders, it must be observed that it is quite impossible to discover the outlets of many of the Australian rivers or even the entrances of some of the best harbours from the deck of a vessel off the coast. A minute examination must be made—of course in a whale-boat—of every nook and corner along the coast before the navigator can venture upon so sweeping an assertion as that of Flinders in the instance in question." To the northward of Moreton Bay there is a long island called Frazer's Island, parallel to the coastline, about sixty-five miles in length, with an average breadth of ten miles; the northern half of which, being abreast of a bight in the mainland, gave the latter the appearance of a deep bay, and induced Cook to designate it Hervey's Bay, anticipating, doubtless, that a river would be discovered at its head. In this anticipation Governor Hunter concurred; but when it was ascertained that the land forming the east side of the bay was merely an island, the idea of finding a river on that part of the coast was at once abandoned. The southern half of Frazer's Island forms a long narrow sound available for coasting navigation; and Wide Bay, into which the river Mary empties itself, is situated at its southern extremity. Frazer's Island received its name from Captain Frazer, of the ship *Stirling Castle*, a Scotch vessel, which brought to N.S.W. a number of Scotch mechanics (the first free immigrants of this class who had

ever arrived in that colony,) to erect the buildings for an academical institution in Sydney in 1831. On a subsequent voyage to the colony Frazer was unfortunately wrecked on the Barrier Reef on his way to India. He reached the coast however in his boat; but it was only to experience a more awful fate, for he was seized by the natives on his landing and inhumanly murdered with most of his crew. The next inlet to the northward of Frazer's Island is Port Curtis. It was discovered and partially surveyed by Flinders, and the following is the account given of it by him:—"This part of the east coast had been passed in the night by Captain Cook, so that both the openings escaped his notice, and the discovery of the port fell to our lot. In honour of Admiral Sir Roger Curtis, who had commanded at the Cape of Good Hope, and been so attentive to our wants, I gave to it the name of Port Curtis, and the island which protects it from the sea, in fact forms the port, was called Facing Island. It is a slip of rather low land eight miles in length and from two to half a mile in breadth, having Gatcombe Head for its southern extremity. The northern entrance to Port Curtis is accessible only to boats; but ships of any size may enter the port by the southern opening."

IV. *Oxley's Expedition*.—In 1817 Lieutenant King, by order of the Home authorities, examined and charted the eastern shores of Q., and added considerably to the gradually accumulating stock of knowledge of North-Eastern Australia. On 23rd October 1823 the *Mermaid*, the vessel employed by Lieutenant King, having on board Surveyor-General Oxley, left Sydney for the purposes of exploration, and particularly for ascertaining the fitness or otherwise of the new land for a convict settlement. After examining the coast line north of Cape Moreton the expedition returned to Moreton Bay, and on 2nd December the river Brisbane was discovered through the information given by Pamphlet and Finnegan, as narrated under that heading. The suitability of the place as a penal settlement was recognised by the Governor, and in August 1824 a detachment of the 40th Regiment, under the command of Lieutenant Miller, was despatched with a batch of convicts of the most desperate and incorrigible character. They landed at Eagle Farm, near the present site of Brisbane, in the belief that there was but little chance of their returning to the head station in N.S.W. From this unpromising beginning rapid progress in any direction could not be expected. The convicts were principally employed in making roads and improving the communication inland, and in this respect alone their presence was valuable. Oxley, during his expedition, had also discovered the Boyne River, of which discovery the following account is taken from the observations of Mr. Uniacke, a gentleman of great promise, who had accompanied Oxley on his expedition to the northward, but who died shortly after his return

in Sydney. During the examination of Port Curtis, Uniacke observes:—"On our arrival on board, the master reported that he had discovered a fine fresh-water river emptying itself by an outlet which was visible astern of the vessel to the southward. From his account Oxley was induced to defer our departure to Port Bowen for another day, in order to have an opportunity of viewing it himself. Accordingly Stirling and he started early the next day, while I remained behind to collect specimens of minerals on Facing Island for the Governor. Late in the evening they returned, having proceeded up the river to about where the tide reached, and Oxley deemed it of sufficient consequence to remain three or four days more, in order to examine the country more minutely. Accordingly the next morning early we again left the vessel, taking three days provisions, and proceeded with our boat about twelve miles up the river, where we pitched our tent on a bank about forty feet above the level of the water. The soil was of the richest description, and calculated to grow cotton, sugar, indigo, and all other Indian productions. There were, however, marks of the flood having reached at least fifteen feet higher than the level of our encampment, owing to which the whole surface was covered about two inches deep with drift sand. Indeed the floods here in the rainy seasons must be tremendous, as we observed in many of the trees, at least sixty feet above the level of the water, the wrack which had been deposited by successive inundations. On the banks we saw three or four different kinds of timber, but the small quantity rendered them unimportant. The river was covered with multitudes of teals, widgeons and wild ducks, and on the banks I shot two swamp pheasants (a pretty black bird not unlike the English pheasant in shape,) a very beautiful species of small deer not known in Sydney, and a kind of owl that none of us had seen before. Shortly after dinner we proposed to go to rest, with an intention of proceeding farther up the river at a very early hour the next morning. We turned out the moment it was light, dispatched our breakfast, and getting into the boat proceeded about six miles further up the river. The country through which we passed this day was similar to what we had seen the day before. The timber however was becoming larger and more plentiful. In many places the right bank of the river was composed of a remarkably fine slate, while the left was a hard close-grained grey granite, and the soil everywhere rich and fertile. Before we returned we ascended a high hill, on the left from which we had a beautiful and extensive view of the river for many miles, through a rich brush country, the banks in many parts well clothed with timber. To the river which we discovered here Oxley gave the name of the Boyne. It empties itself into Rodd's Bay, Port Curtis, and its mouth is in lat. 23° 59' S., long. 151° 34' 45" E."

V. Lockyer's Expedition in 1825.—The earliest notice of the character of the country on the

Bremer River, at the head of the navigation of which the town of Ipswich is situated, was contained in the "Journal of an Excursion to Moreton Bay and up the River Brisbane in the year 1825," by Edmund Lockyer, Major in the 57th Regiment, and afterwards Usher of the Black Rod in the Upper House of Parliament in N.S.W. It is in the following terms:—"Took one of the boats and went up this branch above three miles; then landed, and on ascending the banks found a large open country, with scarcely any wood of consequence to impede cultivation on it—the trees, chiefly blue-gums, being at least an acre or more apart, and more ornamental than otherwise. The natives had lately set fire to the long grass, and the new grass was just above ground, making this plain appear like a bowling-green; the soil rich beyond any idea, and from its being easily flooded it would be particularly adapted for the cultivation of rice, sugar-cane, cotton and coffee. I saw plenty of kangaroos and wild turkeys. After traversing this fine piece of land, which was at least six or seven thousand acres in extent, I returned to our encampment." The vessel in which this expedition was made by Lockyer was the cutter *Mermaid*, probably the identical vessel used by King and Oxley. She left Sydney on 2nd September 1825, called at and landed a detachment of the Buffs at what is now Newcastle, and on the 6th anchored in Moreton Bay. The exploration of the river was commenced on the following day, the party embarking in a boat and leaving the *Mermaid* at the bar. The first landing took place at what is called in the journal "Den Glassie" (supposed to be Eagle Farm,) where Captain Bishop of the 40th Regiment was commandant. Here the boats were provisioned and further equipped, and the ascent of the river continued. On the 11th a "large branch called the Bremer Creek," joining the main river, was reached. It would appear from the narrative that Oxley had ascended the river about seventeen miles beyond this point. Many natives were met with, who it is stated had never before seen Europeans. From here fallen trees and numerous falls greatly impeded the progress of the party, and finally navigation had to be given up, it being found impossible even to tow the boat against the stream, which was greatly swollen by floods. Some of the party walked to Mount Brisbane, which was the terminal point of the journey. The land on both sides of the river, and particularly the fine timber, frequently calls forth the praises of Lockyer. A rapid journey was made down the river, and the settlement was arrived at on 6th October, the party having been away twenty-seven days. The cutter was joined at Moreton Bay, and on 16th October anchor was again cast in Sydney Cove. Lockyer gives it as his opinion that "Moreton Bay is well calculated to become a place of trade when once settled." Of the aborigines, he writes:—"The attachment of these people to their dogs is worthy of notice; I was very anxious to get one of the wild

native breed of a black colour, a very handsome puppy which one of the men had in his arms. I offered a small axe for it; his companion urged him to take it, and he was about to do so when he looked at his dog, and the animal licked his face, which settled the business; he shook his head, determined to keep it. I tried him afterwards with handkerchiefs of glaring colours and other things, but it would not do—he would not part with his dog. I gave him however the axe and the handkerchief.”—In 1827 Captain Logan, also of the 57th Regiment, Commandant of Moreton Bay, in tracing the Bremer from its junction with the Brisbane, discovered at ten miles through its many windings from that point the calcareous hummocks on its right bank now named the Limestone Hills. Landing, he was much struck with the singular appearance of the lofty grass-tree which abounds on the open flats, low hills and forest grounds at this particular part, and which the Commandant had not inaptly compared to bee-hives elevated on stools. Some months after this discovery a kiln was built, and a party of convicts, consisting of an overseer (acquainted with the operations of sapping and mining) and five men were stationed at these hills to commence lime-burning. It was from this small beginning that the town of Ipswich, which now contains a busy commercial population, of upwards of 7000 inhabitants, has since arisen.—Lieutenant Miller was the first commandant of the penal settlement; after him were successively Captains Bishop, Logan, Clunie, Fyans, Major Cotton and Lieutenants Gravett and Gorman. Partly from the turbulent character of the convicts over whom they ruled, and in part from the almost unlimited power entrusted to the officers in charge, this period of the history of the settlement is not of the most satisfactory character, and will not bear dwelling upon. In August 1837 the first steamer, the *James Watt*, anchored in Moreton Bay. In 1839 the first direct steamer from England, the *Sophia Jane*, ploughed the waters of Q. The first steamship of the Australasian Steam Navigation Company arrived on 27th January 1842.

VI. *Exploration*.—The first exploration of Q. was made by Oxley in 1823. The beautiful tract of country called the Darling Downs, situated to the westward of the coast range of mountains which divides the eastern from the western waters, was discovered in 1827 by Alan Cunningham, botanical collector for the Royal Gardens at Kew, a man of superior ability and indefatigable zeal in the department of geographical discovery. On crossing the parallel of 30° south lat., at an elevation of 1900 feet above the level of the sea, Cunningham descended to “a beautiful and well-watered valley, affording abundance of the richest pasturage, and bounded on either side by a bold and elevated rocky range.” This valley terminated sixteen miles farther north, on the left bank of a stream flowing north-west, in lat. 29° 51' S. at an elevation of 911 feet above the sea. This stream Cunningham named the Gwydir. Proceeding northward, between the meridians of

150° and 151° E., and passing through rather an indifferent country, the scene was found gradually to improve; and in lat. 29° S. long. 150° 40' E. he came upon the Dumaresq River running westward, 80 or 90 yards wide and very deep, at an elevation of 840 feet above the sea and 170 miles from the coast. Travelling from thence northward and eastward 80 miles through an arid country to 151° E. he discovered a beautiful tract of country at an elevation of 900 or 1000 feet above that of the Dumaresq River, which he called the Darling Downs. “These extensive tracts of clear pastoral country,” observes Cunningham, “commence about the parallel of 28° S., and stretch to 150° E. Deep ponds supported by streams from the highlands immediately to the eastward extend along their central lower flats. The lower grounds thus permanently watered present flats which furnish an almost inexhaustible range of cattle pasture at all seasons of the year, the grass and herbage generally exhibiting in the depth of winter an extreme luxuriance of growth. From these central grounds rise downs of a rich black and dry soil, and very ample surface; and as they furnish abundance of grass and are conveniently watered, yet perfectly beyond the reach of those floods which take place on the flats in a season of rain, they constitute a valuable and sound sheep pasture.” In an article on this journey which he communicated to a colonial journal in the year 1828, Cunningham adds the following particulars:—“The elevation of the dividing range above the level of the ocean may be considered about 4100 feet. The forest ridges, which were heavily timbered with stringy-bark of great bulk, were found clothed to their summits with grasses of the most luxuriant growth; and being well watered by numerous trickling rills that appeared to originate between the shoulders of the hills constitute a very spacious range of the richest cattle pasture. The summits and flanks of the ranges produce great abundance of well-grown stringy-bark, whilst their lower ridges furnish stately pine of the species already well known on the Brisbane from sixty to eighty feet in height; and as small saplings of the red cedar were observed on the skirts of the brushes that invest the base of the hills large trees of this valuable wood are doubtless to be met with in their more distant recesses. The base of these mountains is of a compact whinstone; on the higher ridges was observed amygdaloid, or the trap formation, with nodules of quartz, whilst the summit exhibited a porphyritic rock, very porous, and containing numerous minute quartzose crystallisations.” In a private letter addressed to the late Robert Lynd, Sydney, Leichhardt describes this beautiful tract of country as follows:—“German Mission Station, 23rd June 1843.—From the Condamine River (the western limit of the Darling Downs,) the country rises very gently, almost imperceptibly, till the road passes between two hills or ranges, when the basaltic rock reappears again. Very extensive shallow valleys or plains, generally with

a creek, overgrown with reeds, covered with high rich grass, were spread before my eyes when I had passed these hills, the right of which goes under the name of Rubislaw and the left under that of Sugar-loaf. Here and there the grass-tree is seen, either single or in groups and groves. It is one foot and more in diameter and eight to ten feet high. Till then I had never seen the grass-tree in rich soil; on the contrary, it was the sign of the poorest sandstone rock and sand. Here the case is reversed; the grass-tree grows in the finest soil, and generally in plains. The ranges which border the plains are covered with box, with a gum tree called the Moreton Bay ash, with a different species of angaphora, and with another white gum. The trees are generally very scattered, and the forest becomes only denser, the vegetation more powerful, as we approach the range of its eastern slopes. All this country, from the Condamine to the range, is called the Darling Downs. There is no equal to them over all the colony for sheep rearing, for the fatness and tenderness of the mutton, for the excellent qualities of the wool (which however is not generally admitted,) and for the cheap rate for which flocks can be managed. One shepherd can look after 2000 to 3000 sheep, which would require four shepherds in other parts." Leichhardt gave the following additional notices of this very interesting region in commencing his famous overland expedition to Port Essington the following year:—"These stations (the sheep and cattle stations on the Darling Downs) are established on creeks which come down from the western slopes of the coast range—here extending in a N. and S. direction—and meander through plains of more or less extent to join the Condamine River, which also rising in the coast range where the latter expands into the table-land of New England, sweeps round to the northward, and flowing parallel to the coast range, receives the whole drainage from the country to the westward of the range. The Condamine forms for a great distance the separation of the sandstone country to the westward from the rich basaltic plains to the eastward. These plains, so famous for the richness of their pasture, and for the excellence of the sheep and cattle depastured upon them, have become equally remarkable as the depositaries of the remains of extinct species of animals, several of which must have been of a gigantic size, being the Marsupial representatives of the Pachydermal order of other continents. Mr. Isaacs' station is particularly rich in these fossil remains. At Isaacs Creek they occur together with recent freshwater shells of species still living in the neighbouring ponds, and with marly and calcareous concretions; which induces me to suppose that these plains were covered with large sheets of water, fed probably by calcareous springs connected with the basaltic range, and that huge animals, fond of water, were living either on the rich herbage surrounding these ponds or lakes, or browsing upon the leaves and branches of trees

forming thick brushes on the slopes of the neighbouring hills. The rise of the country, which is very generally supposed to have taken place, was probably the cause of the disappearance of the water, and of the animals becoming extinct, when its necessary supply ceased to exist. The elevation of Darling Downs—about 1800 to 2000 feet according to the barometrical observations of Cunningham renders the climate much cooler than its latitude would lead one to suppose; indeed ice has frequently been found during the calm clear nights of winter. The plains as we passed were covered with the most luxuriant grass and herbage." The explorations of Mitchell and Leichhardt are narrated under their proper headings. The process of inland discovery concluded with the simultaneous expeditions of Macdonall Stuart and Burke and Wills. Immediately after the return of Stuart, the three colonies of S.A., V. and Q., alarmed for the safety of Burke and Wills, despatched three independent expeditions in search of them. Walker's party started from Port Curtis, and crossing over the Great Coast Range successfully crossed through to the shores of the Gulf of Carpentaria. Landsborough about the same time left the shores of the Gulf, and descending through the whole of the tract, reached its southern boundary in June 1862. McKinlay starting from the north of the Torrens Basin entered it from the south-west, and was equally successful in effecting a northern passage, returning in the following August. Thus, strangely enough, a region which for years had defied the attacks of such persistent and daring explorers as Sturt, Mitchell and Leichhardt, was crossed almost simultaneously, by no less than five separate and wholly independent routes. More strangely and more lamentably, ere any of the searching parties had left their starting-points, Burke and Wills had already solved the great problem of crossing the continent, and had returned to their depôt to find it abandoned by those they had left in charge of it. Kennedy's fatal expedition, and the successful exploration of Cape York Peninsula by the Jardine Brothers must be mentioned here. Minor and more recent expeditions made by adventurous bushmen and gold seekers in various directions have laid bare the most secluded spots of this vast territory.

VII. *Pastoral Settlement.*—In course of time the solitude of the penal settlement was broken by the approach of neighbours; for after the discoveries made by Allan Cunningham in 1825, the squatters of N.S.W. had hastened northwards in order to depasture their flocks on the fine lands of the Darling Downs. They founded many little towns, such as Ipswich, Drayton and Toowoomba; and when in 1829 a pass leading across the Dividing Range from the Darling Downs to Moreton Bay was discovered by Cunningham, the squatters on the west of the mountains began to hold frequent communication with the settlement at Moreton Bay, from which they obtained convicts

to act as shepherds on their runs. In these early years the squatters of the district were scattered at wide intervals throughout a great extent of country, and being in the midst of native tribes who were not only numerous but of a peculiarly hostile disposition, they often found themselves in a very precarious situation. The blacks swarmed on the runs, killing the sheep and stealing the property of the squatters, who had many annoyances to suffer and injuries to guard against. But their retaliation oftentimes exhibited a ferocity and inhumanity almost incredible in civilised men. The Government troopers showed little compunction in destroying scores of natives, and the most inhuman atrocities were committed by the blacks who were employed to act as troopers. On one occasion, after the murder of a white man by two blacks, a band of troopers in the dead of night stealthily surrounded the tribe to which the murderers belonged whilst it was holding a corroboree, and at a given signal fired a volley into the midst of the dancing crowd—a blind and ruthless revenge, from which however the two murderers escaped. When the new land regulations were proclaimed in 1840 by Governor Gipps, who had visited the district, the country around Moreton Bay was entitled the “Northern District of New South Wales,” and land was thrown open for sale at twelve shillings per acre. A considerable number of free immigrants shortly afterwards settled on the banks of the Brisbane River, and as they found the soil well adapted for the cultivation of wheat and maize they made rapid progress, and others soon followed to share their prosperity. In 1841, after transportation to N.S.W. had been discontinued, the remaining convicts were all removed from Moreton Bay, and two years later the free settlers of the district began to send representatives to the Legislative Council at Sydney.

VIII. *The Separation Movement.*—Lang gives the following account of the rise and progress of the movement for the separation of Q. from N.S.W., in which he was unquestionably an able and effective leader:—“I happened to visit the district of Moreton Bay, now the Colony of Queensland, for the first time in the month of November 1845. Struck with the general capabilities of the country I was strongly impressed at the same time with the idea that the great inlet of Moreton Bay was as well fitted to become the head-quarters of a separate and independent colony as either Port Phillip or Port Jackson; and I was strongly of opinion that the welfare and advancement of that important portion of our Australian territory could never otherwise be effectually promoted or secured. Well knowing however that such an idea—which was regarded at the time even at Moreton Bay as utterly hopeless and chimerical—would be still more distasteful to our Sydney Legislature than the separation of Port Phillip, I embraced the opportunity of my being in England during the years 1847, 1848 and 1849 to address

a series of letters on the subject to Earl Grey, Secretary of State for the Colonies; recommending, for various reasons which I stated at length, that in the future Act of Parliament, which was then announced as under consideration for the better government of the Australian Colonies, there should be inserted a clause enabling Her Majesty to separate from N.S.W., and to erect into a distinct and independent colony the territory situated to the northward of the 30th parallel of latitude, which I showed was the only proper point of separation between the two conterminous colonies. And when the Act was finally passed in the year 1850 I found to my great gratification, although to the surprise and mortification of most of our Sydney legislators, that it *did* contain a clause to the effect I had recommended. That clause, I am happy to add, providing as it did for the separation of Moreton Bay, has proved the *Magna Charta* of Q. It is a saying of the great Martin Luther, that wherever God plants a church the devil is sure to have a public-house erected right opposite. In accordance with this principle, no sooner was the boon of separation obtained *in prospectu* for the future colony of Q., than a great effort was made by the principal squatters—gentlemen who considered themselves the veritable aristocracy of the country—to get that colony established as a penal settlement or convict colony, in order to enable them to procure cheap labour for their flocks and herds. I had succeeded however, in the face of much unexpected discouragement during the three years I spent in England, in directing a stream of emigration, consisting of three shiploads of emigrants—about six hundred persons in all—to Moreton Bay. These emigrants, whom I had collected and selected myself, were all persons of reputable character and industrious habits, and almost all members of evangelical churches in the mother-country; and settling as they did in and around the only two towns then in the country—Brisbane and Ipswich—they set themselves vigorously from the first to oppose this movement of the squatters, and to prevent if possible the degradation of their adopted country into a mere convict colony. And I am happy to be enabled to add that through the incessant agitation they kept up on the subject, by public meetings, addresses and petitions, &c., they succeeded at length in defeating the foul conspiracy. It was stated before a Select Committee of the House of Lords on Transportation in the year 1856, by Arthur Hodgson, late member for Newcastle in the Parliament of N.S.W., and one of the two gentlemen who had taken the lead in endeavouring to get the new colony transformed into a penal settlement, that it was owing entirely to the emigrants I had sent out to Moreton Bay that the proposal of the colonial aristocracy of the time, which was well received and would have been strongly supported by influential parties in the mother-country, proved unsuccessful. Opposition however to the best interests of the future

colony, although of a somewhat different character, speedily arose from a different quarter. Finding that they could not prevent the separation of the Moreton Bay district, certain of the leading colonists of N.S.W., backed by majorities in both Houses of the Colonial Parliament, endeavoured to curtail the dimensions of the new colony to the southward, by getting the boundary, which the Act of the Imperial Parliament had fixed at the 30th parallel of latitude, moved to the 28th and 29th parallels, so as to retain the Clarence and Richmond rivers district, which is situated immediately to the northward of the 30th parallel, in the colony of N.S.W. The means that were used to effect this object were sufficiently discreditable. In the first place Mr. Hargrave, member of the Legislative Assembly of N.S.W. for the district of New England, got up and presented to the Assembly a petition, which a few of the residents in the Clarence and Richmond River districts had been unwittingly induced to sign, against the annexation of that district to the new colony. This petition purported to have been signed by upwards of fifteen hundred persons, and there was a great flourish of trumpets on the occasion in both Houses of the Colonial Parliament at the prevention of the dismemberment of the colony which had thus been so happily effected; but by far the greater number of the signatures attached to that petition were notoriously those of persons who had no right whatever to sign it, as they were residing to the southward of the thirtieth parallel and not within the parliamentary limits at all. Undue influence was used at the same time by the Government of the day to induce persons residing in the Clarence district to sign Mr. Hargrave's petition, and thereby to protest against the separation of their district from N.S.W. Mr. E. Deas Thomson, for many years Colonial Secretary of N.S.W., who in a letter addressed to Sir William Molesworth, of date London, 27th September 1855, had expressed himself strongly in favour of the thirtieth parallel as the only proper boundary between the two colonies, was induced by the strong colonial pressure from without to eat his own words on his return to the colony, and to vote as a member of the Legislative Council of N.S.W. for a different boundary from the one he had himself recommended in England. Alluding in his letter to Sir William Molesworth to the efforts of certain parties to have the boundary line struck still farther S. than the thirtieth parallel, Mr. Thomson says:—"I should greatly prefer the thirtieth parallel of S. latitude as the frontier line between the two colonies; first, because it was the most southern boundary line contemplated by the Act of Parliament 13 and 14 Victoria, cap. lix.; and secondly, because any encroachment upon that line would be received with great jealousy and discontent by the colonists of N.S.W. I believe also that it would form an appropriate geographical boundary, having reference to the natural outlet of produce and the reception of supplies,

whilst for this reason its adoption would probably secure to each colony the collection of its appropriate revenue." This was doubtless an honest opinion on the part of Mr. Thomson. It is pitiful however to think that he should afterwards have turned his back upon himself by voting against the thirtieth parallel when he had got out again to N.S.W. Sir William Denison, Governor of N.S.W., who having two brothers holding nearly a quarter of a million of acres of land as squatters on the northern frontier of that colony, at a merely nominal rental of a twentieth of a penny per acre, could scarcely be supposed to be a disinterested referee in such a case, fixed the boundary for the present, when the question was very improperly I conceive referred to him for his decision by Mr. Labouchere, Secretary of State for the Colonies, at the twenty-eighth parallel on the coast and the twenty-ninth in the interior—with what propriety or justice a numerous signed petition to Her Majesty from the resident householders of the Clarence and Richmond Rivers district will sufficiently show. In short, every effort was made in N.S.W., first to prevent separation, which it was kindly alleged by its opponents would be ruinous to the new colony, and afterwards to get the parliamentary boundary changed, so as to leave an extensive and important district of the proposed colony of Q. in N.S.W.; the interests, convenience and wishes of the inhabitants of that district being entirely disregarded. The whole period, indeed, from the passing of the Imperial Act of 1850 till the separation of Q. was finally consummated on 10th December 1859 by the arrival of Sir George Ferguson Bowen as Governor, and the proclamation of the colony amid the rejoicings of the inhabitants was the close of a protracted struggle in all the various forms of agitation for the accomplishment of an object which that Act was supposed to have secured; in this struggle I had the honour to bear no inconsiderable part. This indeed has been fully acknowledged in a very gratifying manner as the following letter from Sir George Bowen transmitting a copy of the unanimous vote of the first Parliament of Q. will show:—"Government House, Brisbane, Queensland, 17th September, 1860. Sir,—At the request of the Legislative Assembly of Queensland I have the honour to transmit herewith a copy of the resolutions unanimously adopted by the House on the 14th inst., thanking you for your able and successful efforts to effect the separation of Moreton Bay from New South Wales, and to found the Colony of Queensland. I beg further to assure you on behalf of myself and of my Government of our full and cordial concurrence in the sentiments of the Assembly as recorded in the enclosed resolutions. I have the honour to be, Sir, your most obedient servant—G. F. BOWEN." The separation of Moreton Bay and its erection into a separate colony occupied the attention of the Legislature at Sydney. A copy of the *London Gazette* of 3rd January containing the official announcement of that event having been received

there, the colonists were led to reflect seriously on the bearing which the separation of a large portion of their territory would have on the parent colony, more especially in reference to the debt which had been contracted on the security of the waste lands, including that portion of the public domain which was about to be taken away. In October the matter was formally brought before the Legislature. Darvall moved a resolution to the effect, "That the proposed separation of Moreton Bay from N.S.W. was premature and inexpedient—(1) Because the power reserved to Her Majesty by the Constitution Act to alter the boundary of N.S.W. to the north in such a manner as to Her Majesty might seem fit had not been generally invoked by the people of the colony nor by their representatives. (2) Because the assent of the Legislature of the colony to the proposed separation had not been obtained, and it was manifestly harsh and inconsistent to split into fragments without their own consent a community possessing responsible government and absolute control over their local affairs. (3) Because the population of the proposed colony of Q. was so small and scattered as to be unable to discharge the duties of self-government economically or efficiently." In the discussion which followed the chief point dwelt on was the public lands. On these was secured a debt of £800,000, and it was contended that the matter should be settled before separation took place, otherwise its adjustment would sow the seeds of dissension between the two colonies. Some even argued that as the Constitution made over all the public lands to the Government of N.S.W., the waste lands of Moreton Bay would still be the property of the parent colony even after separation took place. The affirmatory part of the proposition having been adopted the first reason was withdrawn, and, as an amendment on the second, a proposition moved by Hay was adopted. It was to the effect, "That such arrangements as had been made, either by the Imperial Government or that of N.S.W., seem calculated to establish the metropolitan predominance of the country of Stanley and the town of Brisbane—a predominance which was not justified by natural advantages, and was opposed to the interests of the districts further N." The third of the original reasons was withdrawn. The measure of separation was warmly defended by some even among the representatives of N.S.W. proper. It was contended that to establish a colony to the northward would, by giving the elder colony a central position, enable her to maintain that pre-eminence which by her seniority and her achievements in the sphere of colonisation was her right, at the same time to establish a new colony was a step towards that Australian federation which was now eagerly looked for as an event that would have the effect of consolidating a great Anglo-Saxon nation in the southern hemisphere.

IX. *Responsible Government.*—Sir Geo. Ferguson Bowen, first Governor, arrived on 10th December

1859. For some time previous the colonists had been anticipating his arrival with great eagerness, and his coming was accordingly hailed with general rejoicing. The form of government for the new colony was to be precisely similar to that of the older colony of N.S.W., from which it had just been dis severed—an Elective Assembly and a Nominee Upper House. There was one particular, indeed, in which the constitution of Q. differed from that of N.S.W.; for as the imperial arrangements for the separation of the Moreton Bay country and its erection into a distinct colony had been made previous to the passing of the Electoral Reform Act of N.S.W., it was decided by the judges that the new colony could only be established under the previously existing colonial constitution. This however was merely a question of time; for an Act similar to the Electoral Reform Act of N.S.W. was passed by the Parliament of Q. during its present session. It was earnestly desired by all parties concerned that the first parliament should be constituted and assembled as speedily as possible; but in consequence of some technical difficulties the writs for the election of members to serve in the Legislative Assembly could not be issued till the close of April 1860, and the Parliament did not meet till June. The Assembly consisted of twenty-six members, and the first President of the Legislative Council was Sir Charles Nicholson. "For a whole twelvemonth before the first meeting of the Parliament," writes Lang, "there had been no end to the predictions of certain prophets of evil in the Parliament of N.S.W. that the whole scheme of a separate government for Q. would prove an utter failure and that the unhappy people whose interests had been compromised and sacrificed by certain visionary speculators, in separating them from the parent stock, would themselves very speedily come back to solicit readmission into the parental bosom. I had occasion to visit Q. shortly after the opening of the new parliament; and being somewhat concerned to know whether these predictions were likely to be fulfilled, I embodied the result of my observations on what I saw and heard on the spot in the following letter to the *Empire* one of the Sydney daily papers:—'Two Days in the Queensland Parliament. Sir,—When the prophets of evil in our House of Assembly were predicting night after night, a few months ago, that the fatal experiment of a separate government for this insignificant community would soon prove a miserable failure, and that the people of Q. would shortly be coming back to us weeping and wailing, praying us to govern them from Sydney, I maintained that there was a larger amount both of intelligence and general ability in matters of government in this colony, in proportion to its population, than there is in N.S.W. and that the truth of this statement would soon be exhibited in the result of the experiment that was then about to be made. Let the proceedings of the Q. Parliament for these two days past bear witness to the

soundness of my views in regard to their general ability for the important work of legislation, and the propriety of my anticipations in regard to their noble future. I must premise however by observing that they have managed most adroitly to form the Legislative Chambers out of the old Convict Barracks, which you will bear in mind were erected in the olden time with British money and not with ours; for certainly no part of our three or four millions of debt was incurred in the erection of public buildings or other improvements here. The Chambers are both plainly but neatly fitted up, commodious and in every respect suited to the wants of the country. Without any pretensions to such eminent talents as unquestionably characterised our first Legislative Council, they have certainly, from anything I can either see or hear, got the right men in the right places here. The Premier or Colonial Secretary (R. G. W. Herbert) is a first-class man from one of the English universities, but without the slightest assumption or pretension of any kind. I would not say that he is either eloquent or impressive; but he is remarkably fluent, putting the right words in the right places, saying all that is requisite to elucidate his subject, but nothing more, and saying it in the shortest possible time; exhibiting a perfect acquaintance with anything he speaks about, calm and self-possessed, knowing how and when to yield when he cannot carry his point, and doing it with the best possible grace, so as to deprive an opponent of the vulgar triumph over an imaginary victory, such as is so frequently exhibited on the boards of our own political Theatre Royal in Macquarie Street, Sydney. Without mentioning particularly the other members of the Ministry—the Attorney-General and Treasurer—I would observe that both the Speaker (Mr. Elliott) and the Chairman of Committees (Mr. Macalister)—who were both members of our Legislative Assembly till that untoward event, Separation, sent them over the border—are remarkably well fitted for their respective places and fill their respective chairs uncommonly well. And although there are no Burkes or Sheridans among the members generally, I am happy to say that there is no talking for talking's sake, no opposition for opposition's sake, no such factions bidding for office as to have become perfect nuisances with us, and almost complete obstructions to the business of the country. I have seldom indeed heard so much plain common sense, delivered in plain unassuming and sometimes forcible English, as I have heard these two days, in the same space of time, in any other deliberative body with which I have become acquainted. To the proof therefore:—The House of Assembly meets on the first floor up the broad stair of the old barracks; the Upper House strangely enough meets on the ground floor, as if they meant to enact the comedy of 'High Life Below Stairs.' The hour of meeting for the former is three p.m. and for the latter half-past four. They both commence with prayer, a practice

which even the American Republicans observe, but which our Legislature has uniformly repudiated ever since I first moved in the matter seventeen years ago. After some preliminary business had been gone through in the Assembly (which I am happy to observe—for it is right and proper to take notice of the manners and customs of one's betters just to try to imitate them if one can—meets exactly at the hour) the Colonial Secretary, in a speech remarkably characterised by the qualities I have mentioned, moved the second reading of a bill for the establishment of grammar schools throughout this colony, which I may observe embodies a plan somewhat similar to the one I had sketched out in a series of resolutions which was some time on the Notice Paper of our House of Assembly shortly before the late prorogation of Parliament. A short debate ensued, in which the principle of the bill was assented to most cordially on all sides while a few short but sensible speeches were made suggesting improvements and stating objections to one or two of the details. In the course of his speech the Colonial Secretary observed that the Sydney Grammar School had proved a failure, which he ascribed to the too high pitch and mediæval character of the education it gave. If he had imputed the failure rather to the expenditure of £29,000 on the building, with an endowment of £1500 a-year (which he rightly thought excessive and unnecessary) and £18 a-year from each pupil or student notwithstanding, I should have been more inclined to join with him. At all events the second reading of an admirable bill was agreed to by half-past four yesterday, when the House adjourned for the day and I was in time for the meeting of the Upper House downstairs. How long should we have been with our slow coach about such a job? As long I suppose as a bullock dray would take with a load of flour from Barker's mills to Kiandra with perhaps an overturn, not of the dray but of the Ministry, in the meantime. To-day after several other matters of minor importance, including the passing through committee of the Census Bill the Anti-State-aid Bill was also got safe through committee after a debate of the character I have mentioned of several hours. That matter therefore of transcendent importance is now settled here and settled well. When shall we be able to follow these sensible people in N.S.W.? Not, I fear, till the Greek kalends, which are a long way off. I was examined to-day before Captain O'Connell's Select Committee of the Legislative Council on the propriety of forming a settlement at the head of the Gulf of Carpentaria, as also of establishing an overland telegraphic line from Rockhampton to the head of that gulf, and a steam communication from Sydney and Queensland by Torres' Straits to Singapore. They are strongly in favour of this line here but totally disinclined towards supporting a line to Panama, which they think is impracticable and will prove a failure. In one word, separation has unquestionably

created a soul under the ribs of death here, and I venture to predict that, if it has not the effect of stimulating our colonial Legislature into something like vigorous action in the right direction, the example of our brethren in Q. will very soon lead to other chapters in the great drama of separation, Messrs. Darvall, Piddington and Martin notwithstanding. It is nowhere written in the Fates that there shall be no more separation; let those whom it concerns therefore beware of putting their heavy drag upon the wheels of the State carriage as they have already done so often, so long and so fatally for their adopted country.—I am, sir, yours, &c., John Dunmore Lang. Brisbane, 8th July, 1860.” The following list of the Acts and Ordinances of the first Parliament will show the amount of business transacted by that body during their first session, and their fitness for the work assigned them:—

1. An Act to indemnify the Collector and Officers of Customs in respect to the omitting to collect the Duty payable upon Gold in the Colony of Queensland, and to repeal an Act of the Legislative Council and Legislative Assembly of New South Wales, intituled “An Act for granting a Duty upon Gold.”
2. An Act to limit the Number of Persons holding Office under the Crown, who, under the Constitution Act, 17 Vic., No. 41, may be declared capable of being elected Members of the Legislative Assembly.
3. An Act to discontinue Grants from the Revenue in Aid of Religion.
4. An Act to appoint Commissioners for the Adjustment of Accounts with the Colony of New South Wales.
5. An Act for taking an Account of the Population in 1861.
6. An Act to provide for Primary Education in Queensland.
7. An Act to provide for the Establishment of Grammar Schools in Queensland.
8. An Act to authorise the Appropriation out of the Consolidated Revenue Fund of Queensland of certain Sums to make good the Supplies granted for the Service of the Year 1860.
9. An Act to abolish the Collection of Electoral Lists.
10. An Act to give a Lien on Wool, and to make Mortgages of Sheep, Cattle and Horses.
11. An Act for regulating the Occupation of Unoccupied Crown Lands in the Unsettled Districts.
12. An Act to regulate the Occupations of Land applied for by Tender.
13. An Act for the Prevention of Scab and other Diseases in Sheep.
14. An Act to regulate the Exportation of Gunpowder and Warlike Stores from the Colony of Queensland.
15. An Act to provide for the Alienation of Crown Lands.
16. An Act to provide for the leasing of Crown Lands previously occupied.
17. An Act to authorise the Appropriation out of the Consolidated Revenue Fund of Queensland of certain Sums to make good the Supplies granted for the Service of the Year 1860-61.

“The first of these Acts and Ordinances that requires to be noticed,” writes Lang, “is the Act to discontinue grants from the revenue in aid of religion. Fortunately this important question presented itself to the

Legislature of Q. in a very simple form. The whole burden on the revenue, under the previously existing system of N.S.W., for the salaries of ministers of the Episcopalian, Presbyterian, Roman Catholic and Wesleyan Methodist communions, did not exceed £750 a year; and while all were willing that the recipients of that amount should retain the salaries they were respectively receiving under the previous system during their lives, the voice of the public strongly demanded the entire discontinuance of State support for religion for the future. A preliminary motion had been made by one of the members who advocated the system of State support, to the effect that the sum appropriated for distribution among the clergy of the different communions should be increased to £4000 a year; but this motion having been lost by a large majority, the Government having thus felt the pulse of the Assembly, made a virtue of necessity and introduced the bill, which was passed almost without opposition as a Government measure. The Government were anxious to retain the power which was still left them in the Act to discontinue grants from the revenue in aid of religion, to give grants of land for ecclesiastical purposes—for the erection of places of worship and ministers’ dwellings; but as it was seen and felt that this power would give rise to the charge, or at least the suspicion, of favouritism and occasion jealousies and heartburnings in the community, it was judiciously taken away. The Anglican bishop (Dr. Tuffnell) arrived in the colony with seven clergymen of the Church of England very shortly after this virtual revolution, at which he was much displeased, had been effected. The Acts to provide for primary education and for the establishment of grammar schools provided that a Board, to be presided over by a minister of the Crown, was to be incorporated, to carry out a system of national education similar to the one established in N.S.W., with a provision however for the assistance of schools under denominational management and of which the property may not be vested in the Board. For the establishment of grammar schools it was enacted that, in the event of not less than £1000 being raised in any locality for the establishment of such a school, the Government should grant for the purpose double that amount; and that when fees for three years should have been pledged to an amount not less than £250 per annum the Government should grant for the general support of the school £500 a year. Under these arrangements there was established a primary school, partially endowed by the State, for the common branches of an English education, in every small centre of population throughout the territory; and in every town with a population of from 2000 to 4000 souls, in due time, a grammar school for superior education, under popular management.” Lang concludes by stating:—“It will be abundantly evident from these notices and statements that popular and responsible government has hitherto been a great success, and

no failure, in Q. Where is there a single instance in the whole history of British colonisation, of any colonial legislature passing so many acts of the highest importance and of such incalculable value to the community, and effecting so many and such sweeping reforms during its first session? The case is altogether unparalleled in the annals of the empire." The Treasurer's Estimates of Ways and Means for the year 1861 show an anticipated revenue of £182,200, with a probable expenditure of £197,663. The amount expected to be realised from Land sales was £55,000; from Customs £70,000; and from Rents and Assessment £30,000. The items of probable expenditure contained a sum for the Department of Public Lands and Works of £73,431, including £39,592 for roads, bridges and public buildings.

X. *The Gold Discoveries.*—In 1858 it was reported that gold had been discovered far to the north, on the banks of the Fitzroy River, and in a short time many vessels arrived in Keppel Bay, their holds and decks crowded with men, who eagerly landed and hastened to Canoona, about sixty or seventy miles up the river. Ere long there were about 15,000 diggers on the scene; but it was soon discovered that the gold was confined to a small area, and by no means plentiful; and those who had spent all their money in getting to the place were in a wretched plight. A large population had been hurriedly gathered in an isolated region, without provisions or the possibility of obtaining them; their expectations of the gold-field had been disappointed, and for some time the Fitzroy River was one great scene of misery and starvation, till the Governments of N.S.W. and V. sent vessels to convey the unfortunate diggers from the place. Some however in the extremity of the famine had selected portions of the fertile land on the banks of the river and had begun to cultivate them as farms. They were pleased with the district, and having settled down on their land they formed the thriving town of Rockhampton. A greater amount of success attended a subsequent effort in 1867. The Government of Q. offered rewards varying from £200 to £1000 for the discovery of payable gold-fields; and during the course of the next two or three years many districts were opened up to the miner. Towards the end of 1867 a man named Nash, who had been wandering in an idle way over the country, found an auriferous region of great extent at Gympie, about 130 miles from Brisbane. He concealed his discovery for a time, and set to work to collect as much of the gold as possible, before attracting others to the spot. In the course of a day or two he gathered several hundred pounds' worth of gold, being however often disturbed in his operations by the approach of travellers on the adjacent road, when he had to crouch among the bushes until the footsteps died away and he could again pursue his solitary task. After some time it seemed impossible to avoid discovery, and lest any one should forestall him in making known the

district he entered Maryborough, announced his discovery, and received the reward. A rush took place to the Gympie, which was found to be exceedingly rich, and it was not long before a nugget worth about four thousand pounds was met with close to the surface. Far to the north, on the Palmer River, a tributary of the Mitchell, there have been discovered rich gold-fields, where in spite of the great heat and dangers from the blacks there are crowds of diggers at work. Many thousands of Chinamen have settled down in the district, and to these the natives seem to have a special antipathy, as they spear them on every possible occasion.

XI. *The Cotton Industry.*—Throughout most of its territory, Q. possesses a climate of tropical warmth, and it is therefore, in its more fertile parts, well suited for the growth of cotton and sugar. About 1861 the cultivation of the cotton-plant was commenced on a small scale; but although the plantations were found to thrive, the high wages of labour, and the low price of cotton in Europe, caused these first attempts to be altogether unprofitable. Matters were changed however in 1863, for then the civil war was raging in America, and as the people of the Southern States were prevented by a long chain of blockading vessels from sending their cotton to Europe, there was a great scarcity of cotton in England and its price rose to be exceedingly high. This was a favourable opportunity for Q.; the plantations were of course still as expensive as ever, but the prices obtained for the cotton not only covered the increased expense but left considerable profits. The cultivation of the sugar-cane was introduced in 1865, and after a few years had passed away great fields of waving cane were to be seen in various parts of the country growing ripe and juicy beneath the tropical sun. The prices of cotton and sugar remained high for some years, but when the war was over they fell to their former rates and the planters of Q. found it necessary to find some cheaper substitute for their white labourers. At first it was proposed to bring over Hindoos from India, but nothing came of this idea, and afterwards when Chinese were introduced they were not found to give the satisfaction expected. But it happened that Robert Towns, one of the planters, was owner of a number of ships which traded to the South Sea Islands, and having persuaded a few of the islanders to cross to Q. he employed them on his sugar plantation. He took some trouble in teaching them the work he wished them to do and found that they soon became expert at it. As the remuneration they required was very small they served admirably to supply the necessary cheap labour. The practice of employing these South Sea Islanders or "Kanakas" as they were called soon became general, and parts of Q. had all the appearance of an American plantation where crowds of dusky figures decked in the brightest of colours plied their labours with laughter and with song, among the tall cane brakes

or the bursting pods of cotton. The Kanakas generally worked for a year or two in the colony, then having received a bundle of goods—consisting of cloth, knives, hatchets, beads, and so forth, to the value of about £10—they were again conveyed to their palm-clad islands. A system of this kind was apt to give rise to abuses; and accordingly it was found that a few of the more unscrupulous planters, not content with the ordinary profits, stooped to the shameful meanness of cheating the poor islander out of his hard-earned reward. They hurried him on board a vessel, and sent after him a parcel containing a few shillings worth of property; then, when he reached his home, he found that all his toil and his years of absence from his friends had procured him only so much trash. Happily this was not of very frequent occurrence; but there was another abuse both common and glaring. As the plantations in Q. increased they required more labourers than were willing to leave their homes; and as the captains of vessels were paid by the planters so much for every Kanaka they brought over, there was a strong temptation to carry off the natives by force, when by other means a sufficient number could not be obtained. There were frequent conflicts between the crews of labour vessels and the inhabitants of the islands. The white men burnt the native villages and carried off crowds of men and women; while in revenge the islanders often surprised a vessel and massacred its crew; and in such cases the innocent suffered for the guilty. The sailors often had the baseness to disguise themselves as missionaries, in order the more easily to effect their purpose; and when the true missionaries, suspecting nothing, approached the natives on their errand of good will, they were speared or clubbed to death by the unfortunate islanders. But as a rule the Kanakas were themselves the sufferers; the English vessels pursued their frail canoes, ran them down and sank them; then, whilst the men were struggling in the sea, they were seized and thrust into the hold, and the hatches were fastened down; and when in this dastardly manner a sufficient number had been gathered, and the dark interior of the ship was filled with a steaming mass of human beings densely huddled together, the captains set sail for Q., where they landed those of their living cargoes who had escaped the deadly pestilence which filth and confinement always engendered in such cases. These were the deeds of a few ruthless and disreputable seamen; but the people of Q. as a whole had no sympathy with such barbarities, and in 1868 they passed a law to regulate the labour traffic. It enacted that no South Sea Islanders were to be brought into the colony, unless the captain of the vessel could show a document signed by a missionary or British consul, stating that they had left the islands of their own free will; Government agents were to accompany every vessel, in order to see that the Kanakas were well treated on the voyage; and on leaving

the colony no labourer was to receive less than six pounds worth of goods for every year he had worked. These regulations were of great use, but they were often evaded; for by giving a present to the king of an island the sailors could bribe him to force his people to express their willingness before the missionary. The trembling men were brought forward, and under the fear of their chief's revenge they declared their perfect readiness to sail. Sometimes the Government agents on board the vessels were bribed not to report the misdeeds of the sailors; and in the case of the *Jason*, on which the agent was too honest to be so bribed, he was chained below by the captain on the pretence that he was mad. When the ship arrived in Q. the unfortunate man was found in a miserable state of filth and starvation. For this offence the captain was arrested, tried and imprisoned. The Imperial authorities have recently given their assistance to the Colonial Government to suppress this traffic and British cruisers now sail among all the islands to prevent the perpetration of such enormities.

XI. *Constitutional Progress.*—When in December 1859 in deference to the repeated petition of the leading settlers the Moreton Bay district was erected into an independent colony, the name of Queensland was given to it in honour of the august lady who has so long presided over the interests of the vast British Empire. From the date of the separation the colony advanced by rapid strides and soon began to take a place among the Australian group. The first Governor was Sir George Ferguson Bowen. In December 1861 the population had increased to 34,367, in the following year to 45,077, and in 1864 the census returns gave 74,036 persons. In 1860 the returns of stock were 23,504 horses, 432,890 horned cattle, 3,166,802 sheep, 7,147 pigs. In 1864 the exports had increased to £1,247,054, of which wool formed the chief item. In 1866 the shadows of adversity fell upon the young colony, and a season of disaster was experienced which is not even yet forgotten. The failure of the local bank, the depression in the pastoral interests, and bankruptcies in all quarters mark this as the black-letter year in the colony's history. In 1869 the population was enumerated at 109,897. In the same year the revenue from all sources was estimated at £772,851 and the expenditure at £784,356. On 31st December 1873 the population had increased to 146,690 and the revenue for the year was £1,120,034 13s. 8d., the expenditure being £154,856 9s. 6d. Sir George Bowen was succeeded in the governorship in August 1868 by Colonel Blackall, who however did not hold office for long, as he was seized with sickness in the latter part of 1870, to which he succumbed on 2nd January 1871. During his term of office he won the respect of all classes. The system of immigration at the expense of the colony now began to exert an influence on its fortunes, and the influx of large bodies of carefully-selected

immigrants has done much to develop the resources of the country. The Marquis of Normanby succeeded Colonel Blackall in August 1871; he was transferred to N.Z. in 1874, and was followed by Sir W. W. Cairns, who was appointed to the Governorship in August 1874, and was sworn in on 23rd January 1875. He did not stay out his full term of office, being transferred to S.A. in the early part of 1877. His successor was Sir Arthur Kennedy, late Governor of Hong Kong, who was sworn in on 10th April 1877. In the intervals between the departures and arrivals of Governors, the Government was ably administered by Colonel Sir Maurice Charles O'Connell. At the end of 1877 the population had increased to 203,084, the land under cultivation to 105,049 acres, sugar-cane covering 15,220 acres—evidences that the industry had established itself; the live stock was enumerated at 140,174 horses, 2,299,582 cattle, 6,272,766 sheep (the last figures showing a decrease owing to the drought and to more attention being paid to the rearing of cattle;) the yield of gold amounted to 234,851 ozs., of the value of £838,544, being the largest amount produced since the discovery; the exports had risen to £4,613,275, and the revenue to £1,436,581. During 1877-78 the colony suffered from a severe drought; a serious falling off in the gold returns from the far northern gold-fields, from which so much was expected; and a great depression in trade arising from the foregoing and other causes. Though both the grain and sugar harvests of 1878 were good, and the seasons for the pastoral interests very favourable, the improvement in the prospects of the colony had not been so great as was anticipated. Owing to the overcrowding of the labour market, free immigration was suspended in the early part of 1878; it is now resumed on a limited scale. The copper industry, for some little time has been in a depressed, if not moribund, state, owing to the low prices ruling in England, but there are some appearances of a revival. The gold returns have fallen off, though the decrease is believed to be attributable in a great measure to the decreased number of gold getters, as in some of the districts the yield shows an advance on the figures of 1878. On every account, from its vast extent, from its fertile soil, from its delicious climate, from its extensive seaboard and abundant watercourses, from its judicious institutions, and from the wise and temperate spirit which has hitherto prevailed in its administration, Q. deserves to be regarded as one of the most interesting and promising of these youthful States with which the maritime and colonial genius of England has studded the globe. It ranks fourth amongst the Australasian Colonies, and already high amongst the freest and most prosperous communities on the face of the earth.

QUIN, MATTHEW (1821—) Roman Catholic Bishop of Bathurst, N.S.W., is a native of Kildare in Ireland, and was educated in Rome at the Propaganda and Irish Colleges, where he studied

from 1837 to 1847. He was ordained a priest in February 1845, and consecrated Bishop in Dublin by Cardinal Cullen in November 1865. There are twenty-nine priests in his diocese, which extends to the borders of S.A. and Q., being divided from the diocese of Maitland by the Macquarie, and from the diocese of Goulburn by the Lachlan, Murrumbidgee and Murray.

QUIROS, PEDRO FERNANDEZ DE, Spanish navigator, was chief pilot to Mendana's expedition in 1595, and took command of it after the death of the leader and his brother-in-law, Lorenzo Berreto. After bringing the expedition back to Peru, Quiros made urgent applications to the Spanish Government to be allowed means "to plough up the waters of the unknown sea, and to seek out the undiscovered lands around the antarctic pole—the centre of that horizon." He expressed his determination to devote the remainder of his life to that object, and brought forward abstruse scientific arguments to prove the truth of the popular belief in the existence of a Great South Land. Phillip III. supplied funds to build three ships for another expedition, of which the chief command was entrusted to Quiros, Luis Vaez de Torres being appointed to the second place. Quiros sailed from Lima in 1605 and steered a course west-by-south. On the 10th of February 1606 he discovered the island now known as Tahiti, and on 26th April, having kept on in the same course, sighted land which he believed to be part of the new continent of which he was in search. He gave it the name of TIERRA AUSTRAL DEL ESPIRITU SANTO (the South Land of the Holy Spirit.) It is now generally believed that the land so named by Quiros was not in reality part of the Australian continent, but one of the islands of the group afterwards named the New Hebrides. The separation of the vessels forming the expedition, disputes with his officers, and the loss by sickness and accidents of many of his companions, prevented Quiros from ascertaining the extent and character of the land he had found, and soon after the officers and crew of his vessel determined to proceed no further. But two of the ships of the expedition under the command of Torres, after being separated from their consort, and not knowing of Quiros' determination to return, continued their course to the westward, and in a few days passed safely through the STRAITS dividing the continent of A. from New Guinea. Torres sighted the mainland at its most northern point, but took it for a group of small islands. Quiros returned to Acapulco nine months after his departure, and soon afterwards presented a memorial to the King of Spain, in which he enumerated twenty-three islands he had discovered, besides certain parts of a country which he believed was portion of the Australian mainland. He attempted with extraordinary perseverance to induce the King to grant him funds for another expedition. For many years he was unsuccessful, but at length in 1614 a commission was granted, and Quiros set out for

Lima to fit out his vessels. He died at Panama on his journey thither. He was the last of the illustrious line of great Spanish navigators.

R.

RAFFLES BAY, an indentation of Coburg Peninsula on the N.W. side of the continent, a little to the E. of Port Essington. It is named after Sir Thomas Stamford Raffles. Here a settlement was attempted, with Captain Barker as Superintendent, in 1823; but after a terrible struggle of three years was abandoned. In June 1827 Captain Sterling arrived in H.M.S. *Locust* and formed a small settlement at Fort Wellington on the N.E. coast of Raffles Bay. The colonists had a visit from one of the Malay vessels having a Dutch commander with a crew of fourteen men. She belonged to a fleet of fifty-two vessels which had left Macassar in company, with the object of fishing for trepang. They annually visit the northern coast of New Holland for that purpose.

RAM HEAD, a headland in Gippsland, V., a few miles to the S.W. of Cape Howe. It was the second point of land on the continent seen by Cook in 1770, and was named by him from its resemblance to Ram Head at the entrance to Plymouth Sound in England.

RANDELL, WILLIAM RICHARD (1824—) explorer, is a native of Devonshire in England. He came to S.A. in 1837, and was for some years engaged in pastoral pursuits. In 1853 he planned and built a steamer, the *Mary Ann*, for the River Murray navigation, and took her up to Maiden's Punt before Cadell, who was assisted by the Government. Randell in the *Mary Ann* pushed on to Maiden's Punt (Moama,) and on returning overtook at Euston the *Lady Augusta* with the Governor on board, and brought her despatches down to Adelaide. Two years after thus opening the Murray trade Randell constructed a more powerful twin steamer, which he named the *Gemini*, and in this he proceeded up the Murrumbidgee as far as where the township of Hay now stands, then known as Lang's Crossing. The following year he took the *Gemini* up the Darling, which had been previously navigated by Cadell as far as Mount Murchison. Randell went about 1000 miles further up the river to where the township of Brewarrina now stands, but the water being low a rapid prevented further progress. The next trip, the river being higher, he was enabled to go about 250 miles further up to Walgett on the Namoi, a tributary of the Darling, and then the farthest post-town in Riverina. Since then Randell has been constantly engaged in the Murray trade and has three steamers and six barges on the river. Great credit is due to him for having, unassisted, displayed so much perseverance in opening up a trade of such importance to S.A. and to the settlers on the river. He worked

with most untiring energy at the building of his steamers, though he had never been on board a steam-vessel in his life until he built the *Mary Ann*. His enterprise deserved substantial public recognition, and he received a bonus of £300 from the Government and a purse of £400 with a testimonial from the public.

RECHERCHE ARCHIPELAGO, a group of islands lying off the S.W. corner of the Continent, was so named from one of the ships in the expedition of D'Entrecasteaux, the French navigator, in 1792.

RECHERCHE ISLAND, in T., was similarly named.

REGENT'S LAKE, (Or CUDJALLAGONG,) in the district of Lachlan, N.S.W., near the Lachlan River, between the Baloon or Taylor's range and Peel's range, was named by Oxley in honour of the Prince Regent, afterwards George the Fourth.

REID, GEORGE HOUSTON (1845—) is a native of Scotland, and came to V. in 1852. In 1864 he received a junior appointment in the Civil Service of N.S.W.; in September 1869 was appointed Clerk of Correspondence in the Treasury department; and in 1878 Secretary to the Attorney-General. He is the author of *Five Free-Trade Essays*, and of a work entitled *New South Wales, the Mother Colony of the Australias*. For his *Essays* Reid was elected an Honorary Member of the Cobden Club in London.

RESTORATION ISLAND, an island of Q., lying off the N.E. coast of the continent a little to the S. of Cape Weymouth, and within the Great Barrier Reef. It is of some interest from having been first visited by Bligh in 1789, during his unparalleled voyage in the *Bounty* from the Society Islands. The name was given to it by Bligh from his having made it on the anniversary of the recall of Charles II. to the throne of England. It is a mass of granite.

RICHARDSON CREEK, in V., was discovered and named after one of Mitchell's party in 1836.

RICHARDSON, SIR JOHN LARKINS CHEESE (1810-1878) was a native of England, but born in Bengal. He was educated for the military profession, and in 1829 went to India as an artillery cadet. He entered the East India Company's Service in 1830, and for twenty-two years was engaged in active military service in India. In the Afghan and Sikh wars he was aide-de-camp to Sir H. Smith, and was wounded at Ferozeshah. He was engaged in Cabul in 1842, and received medals and clasps for these services. In 1851 he retired from the service, and in 1852 visited N.Z. and published an account of it entitled *A Summer's Excursion*, and also a volume in blank verse entitled *The First Christian Martyr in N.Z.* He returned to England the same year, but came to Otago in 1856 and settled in the Molyneux district. He was elected Member and Speaker of the Provincial Council, and in 1861 was chosen Superintendent of the Otago district, but in 1863

was defeated by Harris. He was again elected Member and Speaker of the Council, which post he held till 1865, when he resigned on taking office in the Stafford Government. From 1861 he was a Member of the General Assembly of N.Z. until he was elevated to the Upper House, of which he became Speaker. He was knighted for his public services in 1875.

RICHMOND, a river in N.S.W., falling into the Pacific about 500 miles N. of Sydney, and 12 miles to the southward of Cape Byron, discovered in 1842. For the first 20 miles of its course upward from the ocean, the Richmond runs parallel to the coast at the distance of from three to five miles from it, and the country on both sides is a mangrove swamp worthless for the purposes of man. Higher up the land begins to improve, and there is much brush land on both banks of the first quality for cultivation. Higher up still the river is found to divide itself into two streams—the main river, or South Arm, coming from the westward, and the North Arm, by far the larger of the two, from the northward. The North Arm is navigable a long way above Lismore, and a series of tributary streams or creeks fall into it. On these creeks, as well as on various others that fall into the main river below the junction, there are numerous extensive and rich cedar brushes, which afford constant and remunerative employment to a comparatively numerous population of cedar-cutters, many of whom have wives and large families, as also to various colonial vessels and their crews. It is principally as a field for the collection of cedar and other valuable timber for the colonial market that the North Arm of the Richmond, with its various creeks and tributaries, has hitherto been occupied. The land on the Richmond is too rich for sheep and gives them the foot-rot, and is therefore occupied almost exclusively as cattle stations. The Rev. W. Ridley visited the Richmond district in December 1857, and gives the following description of the scenery along the river:—"The scenery on both sides of the Richmond is truly enchanting. Close to the water's edge rises a complete wall of luxuriant foliage; fig trees, bean trees, pines, and a variety of other trees, stand thickly set and overhung with a rich drapery of creepers, presenting the forms of turrets, buttresses, festoons, and stalactites in endless variety, and bespangled with flowers and fruit. There is a purple convolvulus, wild roses, tulips, and some yellow flowers scattered high and low; and close to the water's edge a pure white lily. Cherries, figs, and mulberries overhang the water. The extensive brush land along the lower part of this river is more suitable for the culture of such produce as is expected at a future day to form the staple export of the district (cotton, sugar, maize, coffee, &c.), than the swamps higher up; and the ease with which any produce can be conveyed down by barges to shipping at the Heads will of course enhance the value of the land for such

purposes. But the vast outlay necessary in the first instance for clearing will probably postpone the occupation of the brush land until the most suitable swamps and plains have been brought into cultivation." The principal townships on this river are Lismore; Wyrallah, where there is a large saw-mill; Coraki, a rising township situated at the junction of the north and south arms of the Richmond, where there is a large ship-building yard; Woodburn, the seat of the sugar trade, where there are two large sugar-mills; and Ballina, the seaport town at the entrance of the river. The population of Lismore and vicinity is about 600, and the district is partly pastoral and agricultural, fine stock being raised, while sugar, maize, potatoes, &c., are grown, the land being well suited for cultivation. The main exports of Lismore are pine and cedar timber—of the former large quantities are exported, while maize and other colonial produce is rapidly increasing. The municipal district of Lismore was proclaimed on 4th March 1879.

RIDLEY, WILLIAM, M.A. (1819-1878) was a native of Hartford End in Essex, England, and was educated at King's College and London University. In 1850 he came with Dr. Lang to Sydney and was ordained a minister of the Presbyterian Church and appointed Professor of Greek, Latin and Hebrew in the Australian College. He then took pastoral charge at Portland Bay, Brisbane, and the Manning River; and afterwards devoted himself to missionary work amongst the aborigines. The care of his family caused him to relinquish this occupation and to come to Sydney, where he became connected with the *Empire* newspaper, and continued on that journal until its discontinuance. For the last five years of his life he was the principal editor of the *Evening News* and wrote for the *Town and Country Journal*. In 1877, at the request of the Presbyterian Synod, he acquired the Chinese language in order to take charge of the Chinese mission in Sydney. He gave much of his time to this task. Ridley was a man of extraordinary attainments as a linguist, and of a singularly pure and upright character. Whilst labouring as a missionary amongst the blacks in N.S.W. he studied their language and customs, and subsequently published a work on the Kamilaroi and other native dialects, which was printed at the expense of the Government, and is accounted of great value by ethnologists and philologists.

RINTEL, MOSES, S.J.M. (1824-1880) the first duly authorised Jewish minister in V., arrived in Sydney in 1844 where he established the Sydney Hebrew Society, of which he became the principal. In 1849 he accepted the office of minister to the newly-established Jewish Congregation of Melbourne. Circumstances compelled him to resign this charge, but he was invited to assist in the formation of a new Synagogue in East Melbourne. In 1864, mainly through his exertions, a duly constituted Beth Din, (Hebrew Court of Justice)—

the only one out of London—was established, of which he acted as chairman; and in 1868 the Chief Rabbi of Great Britain and its dependencies assigned to him the position of Senior Minister of the Melbourne Hebrew community.

RIOU, EDWARD, Lieutenant in the Royal Navy, was despatched from England in November 1790, in H.M.S. *Guardian*, with supplies of two years provision for the settlement at Sydney, together with clothing, bedding, sails and cordage for the ships, implements of agriculture and other stores. The ship arrived safely at the Cape of Good Hope where Riou took on board a quantity of live stock and a number of valuable fruit trees. Resuming her voyage on 23rd December the *Guardian* struck against an iceberg to the S. and E. of the Cape of Good Hope and was so much injured that the greater part of her valuable cargo was thrown overboard; most of the passengers and crew left her in five boats when they thought she was sinking. Riou remained with his ship but gave them despatches for the Admiralty and entreated that the country would protect and provide for his sister. Four of the boats were never heard of; the fifth crew after suffering great privations reached the Mauritius; but meanwhile the *Guardian* was fallen in with by a French frigate, towed into Table Bay, and Riou was saved to perish by a more glorious death, having been afterwards killed at the battle before Copenhagen in 1801. Nelson in his despatches styled Riou "the gallant and the good;" and Campbell has immortalised him in these terms in his famous ode on the "Battle of the Baltic."

RISDON COVE (Or **RESTDOWN**) is situated on the eastern bank of the Derwent River in T., a few miles from its mouth. It was the first settlement fixed on by Lieutenant Bowen in 1803, when sent with a detachment from Sydney to establish a penal settlement in V.D.L. The Cove was first seen and named by Hayes in 1794, and was visited by Flinders and Bass four years afterwards. When Collins arrived with his party from Port Phillip, Risdon Cove was found to be an unsuitable place for the settlement, and Sullivan's Cove, higher up the river—the site of Hobart Town—was selected instead.

RIVERINA. The name commonly given to the extensive region lying between the Murray and Darling rivers in N.S.W. of which Deniliquin is the capital. It is a purely pastoral region, and the description of it falls within the general description of the colony. Discontent with the treatment they receive from the Government at Sydney has sometimes induced the settlers to moot the question of separation from N.S.W. and annexation to V.; but nothing has ever yet come of these discussions. In V. the term "Riverina" is usually held to apply only to the district between the Murray and the Murrumbidgee, which from its geographical position, is more closely connected with that colony than with N.S.W.

ROBERTSON, SIR JOHN (1816—) is a native of Essex in England, and came to N.S.W. in 1820. The family lived for some years in Sydney where Robertson became one of Dr. Lang's first pupils, and this early relationship was by both remembered with pleasant reflections. The family removed to the Hunter River district in 1835. At the age of sixteen Robertson, having a desire to see the world, and having made good use of the opportunities offered for nautical practice on a small scale in Sydney harbour, entered on board the ship *Sovereign* and worked his way to England as one of the ship's company. Whilst in England he received an invitation from Lord Palmerston to accompany him on a visit to his country seat at Broadlands in Hampshire. He had carried home a letter from a young man, an assigned servant of his father's, to his relatives in England, who happened to be neighbours of Lord Palmerston's, and naturally wished information in reference to their banished son. Robertson was received most cordially and was asked about the affairs of the colony. He was absent for two years, and during that time visited different parts of England, Scotland and France, and then proceeded to Brazil and other parts of South America. On his return to N.S.W. he was persuaded to leave the sea, though he was in a fair way to success in that profession, and joined his father in the Northern district. He continued for many years in the management of stations and engaged in squatting and farming enterprises. He was while young called upon to undertake a duty of an important public nature on behalf of the squatters of the north. It had been reported to Governor Gipps that some of the squatters in the west had been destroying the natives by putting poison in the waterholes, and to prevent the repetition of the alleged crime Gipps refused to allow the squatters to take their cattle beyond the then limits. This was felt to be a hardship, and Robertson was deputed to wait on the Governor to represent the matter to him. He called a meeting at the Exchange in Sydney—the first squatters' meeting held in A.—at which he moved the first resolution. He had become a squatter before the commencement of the system of licenses, and held one of the first sets of licenses issued. This meeting was successful; the prohibition was withdrawn so far as the northern squatters were concerned, and on his return he received the thanks of his fellow-squatters. For several years before the introduction of responsible Government he was regarded by the settlers of the Upper Hunter and surrounding districts as the man who was marked out by his public spirit and ability as entitled to receive the expression of their confidence, so soon as the new Constitution should place them in a position to choose their representative. He first became known as a politician in the discussion of Responsible Government, National Education, and the Administration of the Lands. His views on these questions approved themselves to the minds

of his fellow-colonists in that quarter, and when the new Constitution came into operation in 1856 he was the first in the colony who received a requisition to offer himself as a candidate. In his reply—the first published by a candidate under the new Constitution—he set forth the line of action which he would pursue if elected. The chief objects which he pledged himself to pursue were,—Manhood Suffrage, Vote by Ballot, the Division of Electoral Districts on a Population Basis, the Abolition of State-aid to Religion, National Education, and Free Selection over the Public Lands of the Colony. To the attainment of these objects he devoted his best energies, and had the satisfaction of seeing all of them accomplished, having taken a prominent part in carrying all of them into effect. From the time of his first candidature until now he has been remarkable for the consistency with which he has adhered to the principles he announced at the outset of his career. He was elected for the district of Phillip, Brisbane, and Bligh. When the Ministry of the day brought forward their Land Bill, he proposed to insert clauses providing for free selection over the public lands “surveyed or unsurveyed.” This clause met so little favour that only nine Members voted with him. Upon the defeat of his amendment, he moved that the Bill be considered in Committee that day six months. The squatters now joined the advocates of free selection in opposition to the Ministers, and the Bill was thrown out. The Government brought in another Bill, with clauses increasing the rental of runs. This Bill Robertson supported; but the measure was defeated by the squatters, and Parliament was dissolved. Cowper invited Robertson to join his Ministry, and he became Minister for Lands and Works in January 1858. On 22nd February he issued regulations providing that all future pastoral leases should be made subject to whatever conditions Parliament might impose when they came to legislate on the subject; so that when legislation took place in 1861 Parliament dealt with the subject from the previous date. He next gave his assistance in carrying an Electoral Act. But before the second reading of the Bill came on, the Government were defeated on their Education Bill, and resigned in October 1859. A few weeks previously the department of Lands and Works was divided, and Robertson became Minister for Lands. The Forster Ministry succeeded; and Black, Minister for Lands, with Flood, Minister for Works, prepared a Bill the main feature of which was a limited right of selection over proclaimed agricultural areas. This measure however never came to a Parliamentary decision, as the Government was defeated on its Elective Upper House Bill, and compelled to retire by a vote of want of confidence. Cowper having retired from Parliament, Robertson was left at the head of the party in the Assembly, and was therefore called on to form an Administration, which he did in March 1860. His first business was the

introduction of his Land Bill. The main principle of the Crown Lands Alienation Bill was, on a motion by Hay, rejected by a small majority. The result was an appeal to the people on the question of “Free Selection before Survey,” or rather (according to the purport and effect of the Bill itself) “Free Selection over the Public Lands Surveyed and Unsurveyed.” The new Parliament assembled on 10th January 1861, and passed Robertson’s Land Bill; though, in order to secure the result, he himself retired from the Assembly and entered the Council as a nominee, to assist in passing the measure through the Upper House. This Parliament also passed the Act to prohibit future grants for Public Worship. In 1866 Parkes brought in his Public Schools Bill; and notwithstanding the usual opposition between the two leaders and their respective parties, Parkes received the cordial support of Robertson, who has thus taken part in the accomplishment of all the chief measures comprised in the political creed he put forth on his first appeal to the electors in 1856. In October 1868 he again became Premier and Colonial Secretary; but in January 1870 he gave up the Premiership to Cowper, himself taking the Lands department; from December 1870 to May 1872 he was Colonial Secretary in the Martin Ministry. On 9th February 1875 he formed another Ministry, in which he took the Colonial Secretary’s department; this Government lasted until March 1877. After receiving several offers of distinction, which were however declined, he was in 1877 created a K.C.M.G. On 17th August he again became Colonial Secretary; but the Government retired in December. At the general election following the agitation that prevailed in consequence of the frequent changes of government producing so small an amount of legislation, resulted in the defeat of Robertson in West Sydney, (his rival Parkes, being defeated in East Sydney;) but he was immediately chosen afterwards to represent two constituencies—Mudgee and the Bogan. When the House met, Robertson elected to take his seat for Mudgee. On the defeat of the Farnell Ministry Robertson was sent for to form a Government, but being unsuccessful he resigned his seat in the Assembly; and the Farnell Ministry attempting to continue to carry on the Government, was again defeated and Robertson joined Parkes in December 1878, in forming the present Administration (1879,) taking his seat in the Upper House as Vice-President of the Executive Council and Representative of the Government.

ROBE, FREDERICK HOLT, Governor of S.A. from October 1845 to August 1848, in succession to Sir George Grey. He is described as “a military gentleman of what is called the old school, honourable and upright, but inclined to think that everything ought always to be as it has been. He disliked all innovation, and did what he could to prevent it, much to the discontent of the young and thriving colony, which was of

necessity the scene of constant and rapid changes. He passed a very troublous time for three years, and in 1848 was heartily glad to be re-called."

ROBINSON, —, the Protector of the Aborigines in V.D.L., was in 1829 appointed to take charge of Bruné Island, where twelve natives captured in the "Black War" were confined and mixed with others who had attained to some degree of civilisation. Robinson acquired the native language and endeavoured to civilise the blacks by humane treatment and persuasion. They became strongly attached to him and called him their *marmanake* or father. On the failure of the Black War he offered to go alone and on foot to the savage tribes, explain to them that the intentions of the settlers were peaceful and offer them the friendship of the white nation. After many adventures he succeeded. By the aid of interpreters and friendly natives the aboriginal population were made to understand that it was useless for them to contend against the power of the white race, and the tragic story of murder and revenge ended in the founding of a native village at Flinders Island, where the remnant of the conquered race might find an asylum and a grave. West gives a graphic account of the dangers and intrepidity of Robinson. On one occasion he was following a tribe who had fled in the direction of the Peak of Teneriffe:—"He saw them first to the east of the Barn Bluff Mountain, and was not more than two miles distant. He hailed his people and selected a few of his friendly natives who, together with the women present at the murder of Captain Thomas, were sent to meet them. The party of Robinson were concealed by a scrub. In less than half-an-hour he heard the war-whoop and perceived that they were advancing by the rattling of their spears. This was an awful moment to their pacificator. On their approach the chief, Manalanga, leaped on his feet in great alarm, saying that the natives were coming to spear them; he urged Robinson to run, and finding he would not took up his rug and spears and went away. The rest of the allies prepared to follow him but were prevailed on by Robinson to remain. They inferred that the natives sent on the embassy of peace were either killed, or that they had joined the hostile tribe. As these advanced the friendly emissaries were unseen, being hidden by the large number of strangers who still raised their cry and approached in warlike array. At length Robinson saw his own people; he then went up to the chiefs and shook hands with them. He explained the object of his visit; distributed trinkets among them, and sat down and partook of refreshments with them. From that time they placed themselves under his control, and as they advanced towards Hobart Town, he encouraged them to make excursions, which left their own actions free and prevented suspicion and distrust. With their wives and children, this party consisted of thirty-six, and at length they were safely lodged on Swan Island. They were fine muscular men and excited

great sympathy and interest. This incident suggested to the venerable artist Duterreau the idea of a national picture; he depicts the interview, and delineates the various circumstances drawn from life with great energy and effect. Robinson is seen in expostulation with a listening chief; a woman behind him is endeavouring to pour distrust into his ear. Others are looking on in expectation or in doubt. The grouping is skilful and expressive; and this picture which has the great merit of minutely representing the attitudes and customs of the natives, will be an interesting memorial, in another age, of the most honourable passage in Tasmanian history. The results of his enterprise produced a strong impression in favour of Robinson. He had been thought rash and fanatical; his death had been predicted a hundred times; his success was attributed, half in jest and half in earnest, to some species of animal enchantment. The Government, at the suggestion of the committee, acknowledged his exertions, not only with warm eulogy but substantial reward." He received a maximum grant of land, and pensions were provided for his wife and children in case of his death. Robinson had been a carpenter at Hobart Town, and a man of indomitable courage and bravery. He lived to see the last of the Aboriginal race leave the shores of T. "His name (writes West) will be held in everlasting remembrance."

ROBINSON, SIR HERCULES GEORGE ROBERT (1824—) is a native of Ireland, and second son of Admiral Robinson. He was educated at Sandhurst, and entered the 87th regiment; but in 1846 retired from the army, and was employed under the Poor Law Board in Ireland on the public works undertaken during the famine. In 1852 he was made Chief Commissioner to inquire into the fairs and markets of Ireland; in 1854 he was made President of Montserrat, and in 1856 Lieutenant-Governor of St. Christopher in the West Indies. In 1859 he received the honour of knighthood, and was appointed Governor of Hong Kong. In 1865 he was appointed Governor of Ceylon, and in 1872 was transferred to N.S.W. In 1874 he visited Fiji, and obtained the cession of these islands to Great Britain. He was Acting Governor of them until the arrival of Sir Arthur Gordon; and in March 1879 he was appointed Governor of N.Z. Hardly had he assumed the government there than he was appointed by the Imperial Government to take the Government of the Cape of Good Hope. Robinson is an eloquent speaker, and his speeches on a variety of subjects delivered during his term of office as Governor of N.S.W. merit preservation in the annals of oratory. He possesses a powerful intellect added to great determination of character.

ROBINSON, WM. CLEAVER FRANCIS (1834—) brother of the foregoing, is the fourth son of Admiral Robinson and a native of Ireland. In 1856 he accompanied his brother to St. Kitts, and

in 1859 to Hong Kong as his Private Secretary. In 1862 he was appointed President of Montserrat. During 1865 he was Acting-Governor of Dominica. In 1866 he was made Governor of the Falkland Islands, and in 1870 of Prince Edward Island, until its incorporation with the Dominion of Canada in 1873. In November 1874 he was appointed Governor of W.A., and in 1877 Governor of the Straits Settlement.

ROBINSON'S CREEK, a beautiful stream of water in Q., was discovered by Leichhardt during his wanderings overland to Port Essington. It is a branch of the Palmtree Creek, and was named in gratitude towards J. P. Robinson for his support of the expedition.

ROCKHAMPTON, a town in Q., on the south bank of the Fitzroy River, forty-five miles from its mouth, at the head of Navigation, and about 420 miles N.W. of Brisbane. It owes its origin to the "Port Curtis rush." It is the port of shipment for a large extent of back country, and also for some of the produce of the Peak Downs copper and gold mines. It is also the starting point of the Great Northern Railway. The number of inhabitants is about 7000. The town was proclaimed a municipality on 15th December 1860. It is well supplied with water, brought from extensive lagoons some two miles distant, and pumped by steam power into an artificial reservoir at the summit of an intervening range 150 feet in height. The Fitzroy bridge, a fine structure, resting on piers with five spans of 232 feet each, connects with the north side. The gold-fields in the vicinity of Rockhampton give employment to a large number of miners. Minerals are widely diffused; gold, copper and silver deposits being now worked in various places within a radius of forty miles of the town. About four miles from Rockhampton is an establishment for meat-preserving, which employs when in full work 100 hands. Other works or factories near the town are a tannery, two soap factories, a machine boot factory, and two or three boiling-down establishments. Rockhampton is surrounded by land of good quality, especially suitable for grazing purposes. The Barcoo, Thompson, Darr, Diamantina, Hamilton and Herbert Rivers to the westward run through some of the finest pastoral country in Q. It is being rapidly stocked, and adds much to the importance of Rockhampton, the town being its natural outlet.

RODONDO ISLAND lies off the southernmost point of Wilson's Promontory in V., in Bass Straits. It was named by its discoverer, Grant, from its resemblance to a rock bearing that name well known to all seamen in the West Indies.

ROE, J. S., explorer, accompanied King in his expedition to survey the N. and N.W. coasts of the continent in 1818, and again in 1821 in King's fourth expedition. He was subsequently appointed Surveyor General of W.A., and took part in nearly every exploring expedition sent forth in that

colony. He started from York in September 1848 with a party of six persons, eleven horses and provisions for four months. In October they reached the Pallinup, the last water crossed by Eyre, and steering N.E. crossed several good streams. Then succeeded dense scrubs, dry water-courses and salt lakes, till they reached the Bremer Range. No better view could be obtained from the Fitzgerald Peaks at a thousand feet above the level of the plains. "In every direction lay spread out one vast sea of dark scrub and thicket intersected by broad belts of salt lakes and samphire marshes." A retreat to the south towards Mount Ridley showed no better country. Four days and three nights they were without water, and the flashes of the Aurora Australis added to the horrors of the scene. Still struggling to attain the Russell Mountains, cutting their way with axes through thickets fifteen feet high, they at length reached the range in lat. 33° 27' and found further progress impossible. The party returned by Esperance Bay. On the Phillips River they found extensive coal deposits, and on 2nd February returned to Perth after an exploration of 1800 miles. Roe is styled the "Father of Modern Explorers."

ROLLESTON, CHRISTOPHER (1817—) a native of Nottinghamshire in England, came to N.S.W. in 1838, and was for some years engaged in farming on the Hunter River. In 1843 he was appointed Commissioner for Crown Lands for the Darling Downs district. In 1855 he was appointed Private Secretary to Governor Dennison, and in 1856 Registrar-General of N.S.W. In this office he framed and introduced the existing system of registration. The Statistical branch of the Colonial Secretary's Department was transferred to the Registrar-General's Department in 1858, and in that year the *Statistical Register* for N.S.W. was first issued. The Registration of Deeds was transferred to his department at the same time; and in 1863 the Real Property Act was passed, and its introduction devolved upon Rolleston. In November 1864 he was appointed Auditor-General. In 1870 the present Audit Act was passed, under which the finances are now administered, the value of this measure being evidenced by the order and regularity shown in the annual accounts laid before Parliament.

ROPER, JOHN (1824—) explorer, is a native of Norfolk in England and came to N.S.W. in 1843. The following year he joined Leichhardt's expedition overland to Port Essington. On 28th June 1845 the party was attacked by the natives near the Gulf of Carpentaria, and Russell received several dangerous spear wounds, but happily survived. Gilbert the naturalist of the party was killed, and Calvert dangerously wounded. Roper discovered the river which was named after him. In 1847 he was appointed Clerk of Petty Sessions at Albury, a Magistrate in 1854, and Mayor of Albury in 1862. In 1868 he was made Inspector of Stock for the district, which office he still holds.

ROPER RIVER, a beautiful river of Q. It was discovered by Roper of Leichhardt's party during his overland journey to Port Essington. It empties its waters into the Gulf of Carpentaria opposite to Maria Island.

ROSEMARY ISLAND lies off the N.W. coast of the Continent between the Islands of Legendre and Enderby: it is one of Dampier's Archipelago. It was discovered and named by Dampier on 14th August 1699. Having anchored he found on this island a shrub resembling rosemary but without smell.

ROUS, HENRY JOHN (1795-1877) Admiral in the British Navy, was a son of the Earl of Stradbroke. He was educated at Dr. Burney's academy in Gosport, and joined H.M.S. *Repulse* as a midshipman in 1808. From this he went to the *Bacchante* and distinguished himself in several boat actions. In 1823 he obtained his first command, and in 1825 came to Sydney in the *Rainbow* and was stationed in Australian waters for four years. During this period he imported the horse Emigrant, the sire of some of the best Australian horses. In August 1829 he discovered the Richmond and the Clarence Rivers. In 1830 he went on half-pay until 1835, when he brought the *Pique* home from Quebec to Spithead after she had been on the rocks on the Labrador coast. He was for many years of the latter part of his life President of the London Jockey Club, and famous as a patron of field sports. Rous's character as a gentleman of the highest honour and integrity stood very high.

RUATARA, a native of N.Z., and an intelligent traveller. In 1805, when a lad, he shipped on board a whaler, and after many adventures reached London in 1809. He returned to Australia with the Rev. Mr. Marsden, and resided for a year with that gentleman at Parramatta, learning agriculture. From Sydney he proceeded to N.Z., which he reached after a long detention at Norfolk Island. In 1814 he again visited Sydney accompanied by Hongi; and returned with Marsden and the missionaries to N.Z., where he died a few days afterwards. He was the first native who cultivated wheat, and was instrumental in introducing Christianity and letters among his countrymen.

RUFUS RIVER, a river of N.S.W. running into the Murray below its junction with the Murrumbidgee and Darling Rivers; it is distant 240 miles from Adelaide. It was humorously named by Sturt after Mr. Macleay's (one of his party) red hair.

RUSDEN, GEORGE WILLIAM (1819—) came to N.S.W. in 1834. In 1849 he was appointed agent for National Schools, first in Port Phillip, afterwards in Moreton Bay and N.S.W. In 1851 he accepted the post of chief clerk in the Colonial Secretary's Office in V., and in 1856 was appointed Clerk of the Parliaments. In 1860 Rusden originated the fund for the Shakespeare Statue and Scholarship in the University of Melbourne. He

is the author of a work on National Education; *Moyarra*, a poem; a translation of *Les Propos of Labienus*; *The Discovery, Survey, and Settlement of Port Phillip*; *Curiosities of Colonisation*; and various other pamphlets.

RUSSELL, HENRY CHAMBERLAIN, Government Astronomer of N.S.W., is a native of the colony, born at West Maitland in March 1836. He was educated at the Grammar School of West Maitland and the Sydney University, where he graduated B.A. in 1858, took a scholarship for general proficiency and the Deas-Thomson scholarship for chemistry and physics. In January 1859 he was appointed assistant in the Sydney Observatory, and Government Astronomer in August 1870. In 1872 he was elected Fellow of the Royal Astronomical Society of London; in 1874 Fellow of the Meteorological Society of London; and in 1875 Honorary Member of the South Australian Philosophical Society, and Member of the Royal Colonial Institute of London. Under his directions an extensive set of meteorological observations has been collected from all parts of the colony, which throws much light on the climate and rainfall of A. In 1874 he organised four distinct parties for observing the transit of Venus, and obtained more photographs than were taken in any other country. The results were used with great advantage by the Astronomer Royal of England in the determination of the sun's true distance from the earth. He has published numerous papers on subjects connected with astronomy and meteorology. An unsuccessful attempt was made upon his life by means of a kind of infernal machine on the 8th September 1877.

RUSSELL, a township in N.Z., the native name of which is Kororareka. It is the capital of the Bay of Islands County and situated about 140 miles N. of Auckland. It is the principal shipping port in the north and possesses one of the finest harbours in the world, completely sheltered from every storm and wind by the numerous islands—nearly one hundred—that give the bay its appropriate name. The bay is eleven miles across and is all deep water. Vessels of any draught can go in and out in all weathers and at any state of tide. It is a port of entry and a large number of vessels use the port. Russell has been termed, from its coal deposits and exports, the Newcastle of N.Z. The Rev. S. Marsden, father of the mission in N.Z., first landed here in 1814 and found the natives numerous and warlike. His mission was a successful one. Other missionaries came, followed by a goodly number of settlers. Russell rapidly grew in importance, and in 1839 was proclaimed the capital of the colony, having a resident Governor (Hobson) who resided here from January 1840 to March 1841, a garrison, ships of war, Government buildings, a newspaper, bank and other institutions, and numbered over 2000 inhabitants. This peaceful state of things was disturbed by the native war in 1842, when the famous chief Heki

and his numerous followers devastated the district, dispersed the settlers, and caused the removal of the seat of government to Auckland, then only a native village and plantation. On the conclusion of peace the present town rose from the ashes of the previous one. It now numbers about 320 European inhabitants, but this does not give any idea of the district, which is very scattered, and there are numerous other settlements in the county, inland and on the coast. The principal one is Kawakawa, a mining town about fourteen miles up the river of the same name. The coal of the district has good steaming qualities and the shipments are very large. The seam in work at the Coal Company's mine is twelve feet in thickness, employs 120 hands when in full work, and the out-put is estimated at 6000 tons a month. Russell is the chief whaling station in the South Pacific. The American whalers call as a rule twice a year and remain about a month while taking in water and provisions. There are several whaling stations established in and about the bay, which are a source of profit to the enterprising natives and others engaged in the business. Manganese mining is also carried on near the township. The exports are coal, gum, timber, oil, wool, flax, manganese, oysters and fish. Around the town the land is poor and broken. Inland are rich plains mostly in native hands. The principal rivers falling into the bay are the Kawakawa, Waikare and Kerikeri, all of which have deep water some miles up at all times of the tide. The hills are densely wooded with the useful timbers so well known in N.Z. and the Australian Colonies. Salt is also manufactured in limited quantities.

S.

SAAVEDRA, ALVAREZ DE, Portuguese navigator, was the second European navigator who touched New Guinea, on his homeward voyage from the Moluccas in 1528, from New Spain; and from an idea that the country abounded in gold he gave it the name of *Isla del Oro*. He stayed a month and obtained provisions, but some Portuguese deserted with the only boat the ship had and were left behind. They found their way to Gilolo, and reported that Saavedra had been wrecked; but on his subsequent arrival they were tried, condemned and executed. In 1529 he sailed a second time from New Spain, and followed the coast of Papua eastwards above 500 leagues.

SALAMANCA HILL, in the district of Wimmera, V., near Mitre Lake, was ascended by Mitchell on the anniversary of the battle of Salamanca in 1836. Hence the name.

SALVATOR RIVER, in Q., was discovered by Mitchell in July 1846, and named after the celebrated Italian painter, Salvator Rosa. He writes in his journal:—"Travelling along the bank of this stream we found it flowing and full of

sparkling water to the margin. The reeds had disappeared, and we could only account for the supply of such a current in such a country at such a season by the support of many springs. We made sure of water now for the rest of our journey, and that we might say of the river, *Labitur et labetur in omne volubilis ævum*. The hills overhanging it surpassed any I had ever seen in picturesque outline. Some resembled Gothic cathedrals in ruins, others forts; other masses were perforated, and being mixed and contrasted with the flowing outlines of evergreen woods, and having a fine stream in the foreground, gave a charming appearance to the whole country. It was a discovery worthy of the toils of a pilgrimage. These beautiful recesses of unpeopled earth could no longer remain unknown. The better to mark them out on my map I gave to the valley the name of *Salvator Rosa*."

SANDY CAPE, on the east coast of Q., was so named by Cook from his having observed two large patches of white sand on it. The cape is sufficiently high to be seen at the distance of twelve leagues in clear weather.

SALE, the principal town in the Gippsland district, V., is 127 miles E.S.E. from Melbourne, with which it is connected by railway. It stands thirty-two feet above the level of the sea. It possesses a mechanics' institute with free library, an hospital, and churches for all the religious denominations. Three breweries, a flour-mill and a tannery are in operation. The population is about 3000; the district, which is a pastoral, agricultural and mining one, numbering 22,500. The town is under municipal government. Sale is the head of the Gippsland Lakes navigation. A steamer plies regularly on the lakes, and a large trade in fish has recently been opened with Melbourne. There are large tracts of rich agricultural land, much of it densely covered with scrub, and requiring capital for its clearance and preparation for tillage. About fifteen miles from Sale is the Ramahyuck Aboriginal Station, on the River Avon. It consists of thirteen cottages, missionary's house, church, school-house, and boarding-house for children, arranged so as to form three sides of a quadrangle. Arrowroot, hops and vegetables are grown here, and the first-named is a decided success. The school has a high percentage of marks, and at a recent visitation the children answered questions promptly and intelligently, and sang tunes to an harmonium accompaniment played by a native girl.

SAMUEL, SAUL (1820—) a native of London, came to N.S.W. in 1832. In 1854 he was elected to the Legislative Council for Roxburgh and Wellington. With one short interval he represented the same part of the country until 1872, being for several years Member of the Assembly for Orange. He was made Treasurer in Forster's Administration in 1859; he was also Treasurer in Cowper's Ministry in 1865, and in Robertson's

Ministry in 1868, and again in Cowper's Ministry in 1870. In 1872 having been elected for East Sydney he joined the Ministry of Parkes as Vice-President of the Executive Council. He resigned his seat in the Assembly, and was made a Member of the Legislative Council to represent the Government in that chamber. When Piddington was disabled through illness for his duties as Treasurer, Samuel undertook to discharge them. When Piddington retired from office Lloyd was appointed his successor, and Samuel took the office of Postmaster-General. In this position he had the honour of opening the new General Post-office, and on that occasion gave the citizens an entertainment memorable in the history of the country. In 1873 Samuel was specially delegated by the Government to visit Europe and America, to make arrangements for the establishment of the Pacific Mail Service. This he succeeded in doing, and was entertained at a public dinner on his return to the colony in 1874, besides having the distinction of C.M.G. conferred upon him by Her Majesty. He again in 1877 became a Member of the Parkes Ministry, in which he held the office of Postmaster-General. With Charles Cowper he represented N.S.W. at the Conference held in Melbourne in 1870, for the purpose of endeavouring to bring about a settlement of the Border Customs Duties and other matters affecting the interests of the colonies. He was also a member of the Conference held in Sydney in 1873, representing N.S.W. in conjunction with Parkes. During his absence from the colony in 1873 Samuel visited the United States and made a Postal Convention with that Government. He is the author of several measures which have become law; amongst others the Navigation Act and the Government Savings Bank Act; and has been for many years prominently connected with the mining, commercial, manufacturing and pastoral enterprises of the colony, and has contributed largely to the development of its industries.

SANDHURST, a mining township in V., more familiarly known as **BENDIGO** (a corruption and abbreviation of *Bandicoot Creek*.) It is 100 miles N.N.W. of Melbourne, and is on the main line of railway from Melbourne to Echuca. It takes rank among the leading towns—or rather cities, for it has been proclaimed one since 18th June 1871—of V., and is in fact considered to be second only to Melbourne. It is the head-quarters of a rich auriferous country, consisting principally of quartz ranges, which from their most inexhaustible character will doubtless be a source of profitable industry for many years to come. It may fairly be considered to be the premier goldfield, having since the spur given to quartz-reefing enterprise in 1872 greatly extended in every direction, and deep sinking receiving a far greater share of attention than heretofore. The discovery of rich alluvial deposits of gold in 1851 was the first cause of the population of the district, but it was not until the opening up of the quartz reefs that it began to

develop into a town of some dimensions. The main street, named Pall Mall, has on one side handsome brick and stone shops and stores, the opposite side being a reserve known as Rosalind Park. The city is lighted with gas, and supplied with water from the Victoria Water Supply, the principal reservoir being the Crusoe Reservoir, situated about six miles distant south. Besides the Crusoe there are two other large reservoirs—the Big Hill and the Spring Gully—all in connection with what is called the “Coliban scheme.” There are two recreation reserves—the Camp Reserve and the Botanical Gardens; the latter beautifully laid out and planted with choice and rare shrubs, and having a fair collection of foreign animals and birds. The industries of Sandhurst besides that of gold mining are numerous, the most important being several breweries, iron-foundries, coach-building, pottery, stone-cutting, tanning, brick and tile making works, cordial manufacture, and in addition farming and vine-growing. The wines from the Axe Creek district in the vicinity have attracted attention in the foreign markets. The district has been created a bishopric in connection with the Roman Catholic denomination, the Rev. Martin Crane, D.D., having been appointed first Bishop. The mining operations in the entire Sandhurst district give employment to 5560 miners, of whom 780 are Chinese, and to 217 steam engines, of which six are used for alluvial purposes. There are fifty-six horse puddling machines, 1260 stamp-heads, and numerous smaller appliances, the value of the whole being estimated at £454,000. Mining operations extend over 144 square miles of country, and there are 775 distinct auriferous quartz reefs. The yield of gold from the Sandhurst mines for the half-year ending 30th June 1879 was 79,040 ozs. 12 dwt. 24 grs. A company working a chlorination process here has been very successful in its treatment of pyrites tailings and the extraction of gold. Of late the area of land under cultivation has extended; wheat is the principal crop. The total population of the city is about 27,000.

SANDRIDGE, the port of Melbourne, V., is situated on Hobson's Bay, one and a-half miles S. of the city, of which it really forms a suburb. It is connected with Melbourne by the Hobson's Bay Railway, which, originally built by a private company, was bought by the Government in June 1878. The business of the town is almost entirely dependent on the shipping. There are two piers, the railway and the town pier, jutting a long way into the bay, alongside which ships of almost any tonnage can lie and be rapidly loaded or discharged, there being numerous steam cranes for that purpose. The population is about 8000. Sandridge has a sugar-refining works and a biscuit factory.

SAUNDERS, JOHN, the first Baptist minister in A., was a native of London, of which city he was a Liveryman. He was originally articled to an attorney, in which profession he remained for fourteen years. During that period he devoted

himself to the study of the Scriptures and to prepare himself for the ministry of the Gospel. Soon after his ordination as a minister of the Baptist Church he left England for N.S.W. as chaplain to a female convict ship, which arrived in Port Jackson in December 1834. During his stay in the colony Saunders was one of the earliest and most earnest advocates of total abstinence and of the formation of societies for the suppression of the liquor traffic. He returned in 1848 to England, where he died.

SAWYER, WILLIAM COLLINSON (1831-1867) first Bishop of Grafton and Armidale, was consecrated Bishop of that See in February 1867. He had only taken charge of the diocese about three months when on Sunday night, 15th March 1868, he was drowned with his son and servant in the Clarence River. After holding Divine service he had started with five others in a boat for his home. They had proceeded about two miles when a sudden gust of wind capsized the boat, and the whole six were precipitated into the river. His body was recovered on the Tuesday following. His energy, self-denial, ability, and friendly demeanour had secured to him many attached friends besides those connected with his Church. He was a man admirably qualified for the work for which he had been selected, and was universally respected and loved.

SCHANCK, CAPE, OR **DARRINGURK**, is a bold rocky promontory standing out into Bass Straits, between Port Phillip and Western Port Bay, in V. There is a small rock lying off the point of the Cape, called from its shape Pulpit Rock; on the highest portion of the Cape is a lighthouse. The Bay is known as Barker's Watering-place. It was discovered by Grant in 1800, and named by him after Admiral Schanck.

SCHNAPPER ISLAND, in Western Port Bay, V., was discovered by Grant in 1801, and named from its fancied resemblance to a schnapper's head.

SCHOMBURGK, RICHARD VON (1811—) director of the Botanic Gardens of Adelaide, S.A., is a native of Fribault in Saxony. His brother Sir Robert Schomburgk has made himself a name as a traveller, in connection with the discoveries of Alexander von Humboldt, the greatest scientific traveller of his time. Richard Schomburgk after passing through his elementary education studied botany in Berlin, and was for some time in the Royal Gardens at Potsdam. As a young man he gave practical proof of his capability under the supervision of his brother, and was his companion in some of his perilous voyages. After a series of expeditions in the pursuit of science Schomburgk returned to Germany, and being concerned in the political troubles of the day, with some difficulty and by the assistance of his friends Humboldt and Leopold von Buch, he fled with his brother Otto from his native land and embarked for Australia. They arrived at Adelaide, purchased land at Gambier River and cultivated a farm and large

vineyard which they called Buchfeld, in honour of their friend and patron. The wines of Buchfeld soon obtained a splendid reputation. But after they had been in the colony some ten years Otto Schomburgk died. On the death of Francis, Director of the Adelaide Botanic Gardens, the appointment was offered to Schomburgk and accepted in 1866. Nature had done little for the Adelaide Botanic Gardens. The site was nothing but a waste flat. The result of the management of Schomburgk is a magnificent work of art, the admiration of visitors. Since taking the management of the gardens, Schomburgk has devoted a considerable portion of his time to the task of creating a taste for floriculture amongst all classes, and to the introduction of valuable plants and seeds which he deemed likely to prove of value as articles of commerce. He has written many papers on the culture of tobacco, the sugar-cane, sericulture, flax and hemp, beet-root, hops, and many other valuable plants. So valuable in the view of the S. A. Government were the information and instructions thus given that they published several of these papers as supplements to the *Government Gazette* of that colony. Nor was Schomburgk content with giving information by means of his writings. He also gave practical proofs and lessons, and largely distributed seed amongst the farmers of S. A. Honours of all kinds have unsolicited been conferred on him. He is a Knight of the Imperial Order of the Crown; of the Order of Merit of Philippe the Magnanimous, first class; Member of the Imperial Carol. Leopold. Academy; Honorary Member of the Botanical Society, Magdeburg; of the Horticultural Society, Frankfort; of the Horticultural Society of Victoria; of the Agricultural and Horticultural Society of Adelaide; of the Chamber of Manufactures, Adelaide; also Corresponding Member of the Zoological Society, London; of the Royal Botanical Society, London; of the Botanical Society, Edinburgh; of the Geographical Society, Berlin; and of the Horticultural Society, Berlin. He holds an order and medals from the Emperor of Germany, and another order of merit from the Duke of Hesse.

SCOTCH MARTYRS (THE.) In September 1794 four gentlemen, generally known as the Scotch Martyrs—Muir, Palmer, Skirving and Margarot—arrived in the colony of N.S.W. as political prisoners; and a few months afterwards another named Gerrold was sent to bear them company. The British Government had taken alarm at the progress of what were then thought to be revolutionary doctrines, and had put into operation repressive laws which were a disgrace to any country. These five gentlemen were men of peaceable lives and most estimable characters, but were amongst the earliest victims of the terror into which the English governing classes were thrown by the French Revolution. They were transported for the crime of advocating reform. The fate of four out of five of these Scotch Martyrs was very melancholy. Gerrold died within about

a year of his landing in the colony, having never recovered from the shock his constitution had suffered when his sentence was pronounced. Three days after him Skirving also died of a broken heart. Palmer, who was a clergyman, lingered until the expiration of his sentence, but died on his homeward voyage. Muir, who had been an advocate at the Scotch bar, made his escape from the colony in a vessel called the *Otter*, and was wrecked on the west coast of America. He was saved, but suffered great hardships in reaching Mexico, from which country he obtained a passage to Europe in a Spanish frigate, and died in Paris. Margarot was the only one of the five who lived to return to his native country, which he did in 1813, after the expiration of his sentence.

SCOTT, THOMAS (1787—) was a native of Glasgow and came to N.S.W. in 1817. He had some previous experience in sugar-growing in the West Indies, and being convinced that N.S.W. would prove a good sugar country he resolved to give up his prospects in Calcutta (whither he was going) and devote himself to that industry. But not having sufficient means, after an attempt at tobacco culture, he entered the Commissariat as a Clerk. He was then invited to undertake the management of the sugar works in Tahiti. But he found that appliances were not forthcoming, and returned to Sydney. He then went to Roiatea and established sugar works there. On his return he went to Port Macquarie and established a sugar plantation near the coast. At the end of three years he obtained the first crop, but from the inefficiency of the plant supplied to him he could make but seven tons, when it gave way, and it was only after forty years delay that it has again been taken up. Scott's first attempts continued on a small scale demonstrated the capabilities of the colonies for growing the cane, and he deserves the title of "Father of the Sugar Industry in Australia."

SEA-VIEW MOUNTAIN, a mountain of N.S.W., situated between the county of Macquarie and the New England district; it is a very prominent feature in that part of the country being 6000 feet above the level of the sea, and may be considered the highest of the Cordilleras of Eastern Australia.

SEAL ISLANDS, a cluster of islands lying off the east coast of Gipps Land, V., to the westward of Rabbit Island, named by Grant, from their being covered with seals.

SELWYN, GEORGE AUGUSTUS [1809-1878] was a native of England, and educated at Eton and St. John's College, Cambridge, where he graduated Junior Optime in mathematics and Senior Optime in classics. He was tutor at Eton and curate of Windsor in 1841 when he was chosen as first Bishop of N. Z. Here whilst superintending the spiritual wants of the colonists, he sought to impart the blessings of the Gospel to the natives also, and extended his labours to the Melanesian

Islands, himself navigating his own vessel the *Southern Cross* for that purpose. He brought some youths from there, and after instruction took them back to teach their countrymen the civilisation and religion they had acquired. He established a mission school for their instruction near Auckland (afterwards removed to Norfolk Island) and found a kindred spirit to carry on this branch of his work in Bishop Patteson. In 1850 he was one of the six bishops who met in Sydney to initiate Synods in the Church of the colonies; in 1857 he obtained the division of his diocese, and in 1867 he was appointed to the Bishopric of Lichfield. His son succeeded Patteson as Bishop of Melanesia. The Rev. James Buller gives the following graphic description of Selwyn and his labours:—"Another phase of mission-life in N.Z. turned up by the advent of Bishop Selwyn in 1842. In 1838 Bishop Broughton of Sydney visited the Bay of Islands and fulfilled certain episcopal duties. The new Bishop was a young man for that office, yet not too young for the special work that was before him. He was about thirty-three years old. Of an athletic frame, a cultured mind, and apostolic zeal, he was well gifted for his position. He brought with him several clergymen and students, and took up his first abode at the Waimate. He had with him a large and valuable library; for this he fitted up a room in a spacious stone building at the Kerikeri; that was ten miles from his residence, over a rough, hilly pathway, but it was only a 'constitutional' before breakfast for the young Bishop. He was a first-class pedestrian. Few could equal him in threading forests, scaling mountains, or swimming rivers. In his palmy days he did not care to ride, even where there was a road for a horse. It is said that on one occasion when the Bishop of Newcastle was visiting him they took a short journey together. It was over a plain. Selwyn was on foot, the other on horseback. The latter, cantering forward, was brought up at the bank of a broad stream. Not knowing the ford he waited for his companion. 'Follow me,' cried Selwyn, as he dashed through the river, somewhat to the surprise of his right reverend brother. There was, I think, a slight touch of asceticism about Bishop Selwyn which longer experience rubbed off. Certainly he taxed his iron constitution to a severe degree; for a quarter of a century he laboured like an apostle. His published journals, never exceeding the truth, read almost like romance. He was willing to endure hardness. The man must be without judgment, or feeling, or both, that can withhold esteem for his work's sake, however he might differ from his views. He had been scarcely two months in the country before he set out on a visitation tour. After six months of the roughest travel, by land and sea, he returned to Auckland *en route* for the Waimate. His clothes were torn to tatters. 'My last pair of thick shoes were worn out, and my feet much blistered with walking on the stumps, which I was obliged to tie to my insteps with pieces of native flax.' Such

was the record in his journal. He thus describes his arrival at Onehunga:—‘I landed there with my faithful Maori, Rota (Lot,) who had steadily accompanied me from Kapiti, carrying my bag of gown and cassock, the only remaining article in my possession of the least value. The suit which I wore was kept sufficiently decent by much care to enable me to enter Auckland by daylight; and my last remaining pair of shoes (thin ones) were strong enough for the light and sandy walk of six miles which remained from Manukau to Auckland. At two p.m. I reached the Judge’s house by a path, avoiding the town and passing over land which I have bought for the site of the cathedral—a spot which I hope may hereafter be traversed by the feet of many bishops better shod and far less ragged than myself.’ Throughout his whole career he embodied in his own example the sentiments contained in his first charge to his clergy in 1847:—‘You have heard already the definition of the Venerable Bede, that the episcopate is a title, not of honour, but of work; and in that spirit I trust to be enabled to exercise my office. No earthly dignity, either in Church or State, can equal the moral grandeur of the leathern girdle and the raiment of camel’s hair, or the going forth without purse or scrip and yet lacking nothing.’ The Bishop’s diocese reached to latitude 33° S., but by a mistake in his letters patent it was extended to latitude 33° N. instead of S. This took in a portion of Japan. When the mistake was discovered he would not allow it to be rectified, regarding it as being God’s providence that had given him this great extent of diocese. In a little vessel, the *Undine*, less than twenty-two tons, which I believe he navigated himself, he visited many of the South Sea Islands; and so began the Melanesian mission, for the charge of which he afterwards consecrated a man as singularly gifted as he was intensely devoted to his great work—the martyred and lamented Patteson, who is now succeeded by Selwyn’s eldest son. Bishop Selwyn had a versatile genius. He neglected no part of his wide diocese. Both races were alike the objects of his care. If he had any preference it was for those who wanted it most—the natives. The Europeans sometimes complained of this. By many he was said to be imperious, ambitious, designing. I can only say that if he was imperious he was also kind; if he was ambitious it was to do good, and he was ready to divest himself of power as soon as others could be found to share authority with him; if he was designing it was not for himself but for the interests of the Church, on whose altar he laid down his gifts, his fortune and his life. By a judicious foresight he secured by gift or purchase convenient sites and valuable endowments all over the land, before they had acquired a high market price. By dint of great labour, involving more than one voyage to England, he framed and set in motion a constitution for his Church in N.Z. by which his own power was reduced to a fraction.

Moreover there was hardly a settlement however remote, a Maori village however small, or a mission station however distant, that he did not personally visit. He spared not himself. But with all that was excellent he did not escape censure. He made mistakes, for he was fallible. Plans that were somewhat visionary melted into thin air, and in some well-meant efforts to do good he was misunderstood and at times grossly misrepresented. This was especially the case during the unhappy war. He had the misfortune to incur blame from both sides. But there was no room to call in question his stern integrity, his moral courage, or his good intentions. The first outcome of his zeal was to throw the people back upon unprofitable questions. Up to that time, the converts of the two missionary societies looked on each other as belonging to one body, and held intercommunion. But unhappily this was now forbidden. This gave rise to severe strictures, and even more was said than was meet. I think no one regretted the result more than the Bishop himself. In his journal he notes with deep concern that the minds of the natives were distracted with inquiries respecting the *Hahi* and *Wetere* (the Church and Wesley;) and he must have felt that he was responsible for this. I fancy that some feeling of self-reproach was on his mind when he said to his clergy, in 1847, that the divisions of Christian men are a hindrance to the faith at all times. When I asked a N.Z. chief why he refused to become a Christian, he stretched out three fingers and said, ‘I have come to the cross-road, and I see three ways—the English, the Wesleyan, and the Roman. Each teacher says his own way is the best. I am sitting down and doubting which guide I shall follow.’ No one can deny that his exclusive pretensions did harm. But he was often condemned on mere hearsay, and never attempted a reply to his critics. I believe that many of his early mistakes were due to unavoidable inexperience. Personally he was courteous to all, and evidently wished to avoid giving offence to any. When he was leaving for England in 1867 I heard him publicly say that it was to him a matter of great satisfaction, that from the time of his first coming to N.Z. he had had no personal difference with a minister of any denomination. I know that, in one case, he deferred the ceremony of consecrating a church, where there was no resident clergyman, in order that anyone might preach in it, and more than once I had the opportunity of officiating therein. When at last the good Bishop bade farewell to N.Z. to enter on the see of Lichfield in England, all parties united to do him honour. It was to the Pan-Anglican Synod at Lambeth that he went home in 1867. He had no expectation or desire to take office in England. It was only when the Queen pressed it upon his acceptance, that he felt it his duty to yield. On his leaving Auckland for the said Synod, a great demonstration was held in Brunswick Hall. John Williamson, Superintendent of the Auckland Province, and a Wesleyan, was in the chair. The

committee invited the Rev. D. Bruce of the Presbyterian Church, and myself, as representing the Wesleyan, to take part in the proceedings. I did so with great pleasure, and was glad of such an opportunity of giving my testimony to the untiring and self-denying labours of Bishop Selwyn. When the future historian of N.Z. shall recount the names of her early benefactors that of Selwyn will not be the least among them. If Samuel Marsden was the father of the N.Z. Mission, George Augustus Selwyn was the father of the Church of England in N.Z."

SEPARATION CREEK is situated in N.A. It was discovered by Leichhardt, and named by him as it separated the basaltic from the primitive formations.

SERVICE, JAMES (1823—) came to Melbourne in 1853 and commenced business as a merchant. In 1857 he was elected Member of the Legislative Assembly for Melbourne; in 1859 was Minister for Lands and President of the Board of Land and Works, but ten months afterwards he resigned. In 1862 he resigned his seat in order to visit England, whence he returned in 1865. In 1874 he was elected for Maldon, and took office as Treasurer, which post he held until 1875. When the Berry Ministry went out of office as the result of the general election in 1879 Service became Chief Secretary. His Reform Bill being rejected by the Assembly he dissolved Parliament and appealed to the country, but was left in a minority and resigned accordingly.

SEVEN EMU RIVER, a river of N.A., discovered by Leichhardt, and named by him from the numerous flocks of emus seen there, seven of which were hunted down as he travelled eight miles along its banks. It flows into the Gulf of Carpentaria to the eastward of the Roper River.

SEYMOUR, a township in V. situated on the River Goulburn in the north-eastern district sixty-five miles N. of Melbourne by the north-eastern railway. Adjoining the shire of Seymour is the Goulburn shire, the chief town of which is Nagambie, seventeen miles from Seymour, and famed for the richness of its soil and its extensive vineyards; the two districts combined contain some 300 farmers, and promise to become a densely populated portion of the colony. The Goulburn which runs through the township is navigable for steamboats from Echuca. A brewery, two steam flour mills, saw mills, and other works are in full operation. The country along the course of the Goulburn valley is of a fertile character, and well adapted for agriculture.

SHARK'S BAY, in W.A., was discovered by Dampier on 6th August 1699, and so named from the abundance of sharks which his people found there. It is now a pearl-fishing station.

SHAW'S PEAK, is one of the largest islands of Sir James Smith's group, off the N.E. coast of the Continent; it is 1600 feet high.

SHEEHAN, JOHN (1845—) is a native of Auckland, N.Z. In 1862 he entered the legal profession and passed with credit in 1867. In 1863 he was engaged in the Waikato war. After a preliminary training in the Auckland Provincial Council he was elected to Parliament for the Rodney district in 1872. He is at present Native Minister in N.Z.

SHEIL, LAURENCE BONAVENTURE (1817-1873) third Roman Catholic Bishop of Adelaide, was a native of Wexford in Ireland, and received his education in the Franciscan Schools at Enniscorthy and at Rome. He came to the Diocese of Melbourne in 1856 and was for some time President of St. Patrick's College and subsequently Arch-Deacon of Ballarat. He was appointed Bishop of Adelaide in 1865; consecrated in August 1866, and took possession of his diocese on 14th September the same year.

SHILLINGLAW, JOHN JOSEPH (1830—) is a native of London. In 1844 he was with Admiral Washington, Hydrographer to the navy, but resigned his appointment to emigrate to V. in 1852. He was appointed Chief Clerk of the Bench at Williamstown, and in 1854 had charge of the Water Police. In 1856 he was Government Shipping Master, and remained in this office until 1869, when he retired from the Civil Service. In 1853 he first brought forward the project of a Sailors Home in Melbourne. He has contributed largely to various Home and Colonial magazines. He edited *Cast Away on the Aucklands* and a *Shipmaster's Guide*, and was proprietor and editor of the *Colonial Monthly*. He is at present engaged on a *Life of Flinders*, to which work he has devoted years of study and research. His contributions to the early history of the colonies of V. and N.S.W. are numerous and valuable, especially his *Historical Records of Port Phillip*, the documents contained in which work Shillinglaw disintombed from the archives of N.S.W. and T., which was published by the Government of V. in 1879.

SHOALHAVEN is a large agricultural, dairy and mining district in N.S.W., situated on the river of that name 110 miles from Sydney by steam to Greenwell Point, or 126 by road and rail. The sea frontage of the district is about sixty miles. The population of the district is about 9600. The district is very extensively under farms, the Messrs. Berry alone having 120,000 acres, and between 500 and 600 tenants. The haven was named by Bass from its shallowness, on his voyage of discovery through the Straits.

SHOALHAVEN RIVER, in N.S.W., rises in the district of Menaroo, in a swamp under a hill called Corumbwroo, 100 miles from Sydney; and flows into the sea at Cooloomgatta, thirty-five miles below Wollongong, passing through one of the Shoalhaven gullies. These gullies are distant twenty-six miles from Lake Bathurst. They are ravines of great depth, from 500 to 1200 feet, and of tremendous appearance.

SHORT, RYHKEN AUGUSTUS (1803—) Bishop of Adelaide, is a native of Exeter in England, and was educated at Westminster and Christchurch College, Oxford, where he took his degree of B.A. in 1823 and M.A. in 1826. In 1835 he was made Vicar of Ravensthorpe in Northamptonshire. He was appointed Bampton Lecturer in 1846, and next year was consecrated first Bishop of Adelaide. In 1858 when the Governor and others wished that the Rev. Thomas Binney might be allowed to preach in a Church of England church, Bishop Short stated that he felt compelled to refuse his permission.

SHORTLAND, LIEUT. JOHN (1739—) explorer. In 1755 he entered the Navy and saw active service in Newfoundland, the Mediterranean and the West Indies, being present at the reduction of several of the islands. In 1763 he was made a Lieutenant. During the war of American Independence he was actively employed in the Atlantic; in 1782 he commanded the transports with the 97th Regiment for the relief of Gibraltar; in 1786 he was appointed agent to the transports sent to N.S.W., and arrived with the "First Fleet" in January 1788. He left six months afterwards *via* Batavia, with the *Friendship* (abandoned October 28th,) the *Alexander*, *Borrowdale* and the *Prince of Wales*, and reached England on 29th May 1789 after a most adventurous voyage. He returned to the colony in 1792. About the middle of September 1797 the Hawkesbury River in N.S.W. was discovered by Shortland. He had been sent in pursuit of a party of prisoners who had absconded with the best boat in the colony whilst on her passage to the Hawkesbury. He was unsuccessful in his pursuit of the pirates, but more than compensated for that misfortune by the discovery of one of the finest streams of eastern A., which he named the Hunter in honour of Governor Hunter.

SHORTLAND'S BLUFF is a clifly projection situated about two miles within Point Lonsdale in the harbour of Port Phillip, V. It was named by Murray after Lieutenant Shortland.

SINNETT, FREDERICK. (1831—1866) journalist; was a son of Mrs. Percy Sinnett a well-known English authoress, and was educated for the profession of civil engineer. He came to S.A. in 1849 as engineer to the Adelaide and Port Railway Company; but the scheme was never carried out. He contributed regularly to the *Mining Journal*, edited by George Stevenson, at that time the best conducted paper in S.A. At the time of the Victoria gold discoveries in 1851 Sinnett left S.A. for Melbourne, and accepted an engagement as contributor to the *Herald*, of which paper he became eventually editor and part proprietor. About 1855 he severed his connection with that paper and became a contributor to the *Melbourne Argus*, with which journal he remained till 1859, with the exception of a short time spent in editing the *Daily News* at Geelong. About the

same date that he joined the *Argus* was commenced *Melbourne Punch*, of which journal he was one of the founders, and to the success of which his facile pen and humorous fancy contributed in great measure. In 1859 Sinnett again returned to S.A. to take the management of the Adelaide Ice Works. During his sojourn in S.A. from 1859 to 1865 he edited the *Daily Telegraph* and was Parliamentary Reporter for *Hansard*. He returned to Melbourne in 1865, where he resumed his connection with the *Argus* and was retained on the literary staff of that paper as contributor and leader-writer until within a short time of his death on 23rd November 1866. At all times from its foundation and both whilst he was in Adelaide and Melbourne he continued his contributions to *Melbourne Punch*. The *Melbourne Herald* of 24th November wrote:—"His death will be a void in the ranks of Australian journalism not readily to be filled; and his loss will long be keenly felt by a large circle of private friends by whom he was beloved for his kindness of heart and admired for his brilliancy of intellect and conversation."

SIR CHARLES HARDY'S ISLAND. A cluster of Islands, situated off the N.E. coast of the continent. They are high and rocky and may be seen five or six leagues off. They were named by King after Admiral Sir Charles Hardy.

SIR EVERARD HOME'S ISLANDS. A cluster of islands lying off the N.E. coast of the continent, extending about four miles from Cape Grenville. They were named by King after Admiral Sir Everard Home.

SIR JAMES SMITH'S GROUP. A group of ten or twelve islands, situated off the N.E. coast of the continent. The principal island contains Linne Peak. They were named by King after Sir James Smith, an eminent man of science.

SIR JOSEPH BANKS' GROUP. A group of islands in Spencer's Gulf, S.A. They consist of the islands named Winceby, Turnby, Parsney, Kirkley, Lusby, Hareby, Spilsby, Stickney, Sibsey, and Langton; and were named by Flinders after Sir Joseph Banks.

SIR WILLIAM GRANT CAPE (or **SOLICITOR CAPE**), a cape or headland in V. It is not unlike the Dedman in the English Channel; it runs a considerable way into the Straits; when to the west it appears like a large barn arched on the top with a high bluff, and next the sea resembling the gable-end of a house. It was discovered by Grant and named by him after the celebrated lawyer and Judge Advocate General of England.

SKENE, JOHN ALEXANDER (1820—) Surveyor-General of V.; arrived in the colony in 1839. He followed his profession till 1868 when he succeeded C. W. Ligar as Surveyor-General. He has a remarkable knowledge of the physical features of V. and has won distinction for his production of maps of the colony to the construction of which

he has paid special attention. His large map of the continent is by far the best that has yet appeared.

SKIRMISH POINT, the northernmost point of Moreton Bay, Q., so named by Flinders from a skirmish he had there with the natives.

SLADEN, SIR CHARLES (1816—) is an Englishman by birth and was educated at Cambridge, where he graduated in Law in 1837 as S.C.L., in 1840 LL.B., and in 1867 LL.D. (although at the time in Victoria.) He arrived in Port Phillip in 1842, and practiced as an attorney in Geelong until 1854 when he retired from business. In December of the same year he was offered by Sir Charles Hotham the post of acting Colonial Treasurer in the place of Captain Lonsdale, absent on leave. He was Treasurer in the first Ministry under the new Constitution formed by Haines in 1855, when he was elected one of the Members for Geelong. At the first general election under the new Constitution in 1857, he again sought election for Geelong, but was defeated, and was not in Parliament again till 1864 when he was elected to the Legislative Council for the Western Province. In May 1868, during a protracted political crisis, arising out of the tuck of a Customs Duties Bill to the Annual Appropriation Bill in 1865, and at last culminating in the inclusion in the Annual Appropriation Bill for 1867 of a grant of £20,000 to Lady Darling, Sladen accepted office as Chief Secretary, with Fellows as Minister for Justice and Leader in the Legislative Assembly. His Ministry only retained office until 11th July of the same year. In August the term for which he had been elected Member for the Western Province expired, and he did not seek re-election. In 1876 he was again elected without a contest for the same province. He has always taken an active part in the debates and business of the Council, and is regarded by both friends and opponents as a high-minded and able politician.

SMITH, SIR FRANCIS (1819—) is eldest son of the late Francis Smith of Campania, in T., and was educated at University College, London, where he gained the first prize in the class of Jurisprudence and the second prize in that of English Equity; graduated B.A. in 1840, and was called to the Bar at Middle Temple in May 1842. He was admitted a barrister in T. in October 1844. He was appointed Solicitor-General in 1848; nominated by Sir William Denison an *ex officio* member of the Legislative Council 1851; appointed Attorney-General in 1854, and a member of the Executive Council in 1855. On the discussion in the Legislative Council of the proposal to adopt Responsible Government in 1855, Smith declared himself unfavourable to a system which was likely to involve frequent changes of administration, as being unsuitable to a new country in which there did not exist, as in England, a sufficiently numerous class of gentlemen possessing the requisite wealth, leisure, culture and experience; and he thought

that the then existing Constitution might be so modified as to give due weight to the will of the people in the Government of the country, by restricting the nominee element in the Legislative Council to a limited number of *ex officio* members only. He was a member of the first House of Assembly and of the first Administration under the new Constitution, holding office as Attorney-General from November 1856 to February 1857; again appointed Attorney-General in April 1857, and Premier in May following. This office he held until appointed Puisne Judge of the Supreme Court in November 1860. He became Chief Justice in February 1870, and was Administrator of the Government of T. from November 1874 to January 1875.

SMITH, JOHN, is a native of Scotland, and was educated at the University of Aberdeen, where he took the degrees of M.A. and M.D. For five years he conducted the class of chemistry at Marischal College. In 1852, when Sir John Herschel, Professor Airy (Astronomer Royal,) Professor Maldon and Alfred Denison were commissioned by the Sydney University to select Professors, Dr. Smith was chosen Professor of Chemistry and Experimental Physics. He accepted the office, and during the years that have elapsed since the opening of the University he has exercised the duties of the Professorship. Early in 1853 he was appointed by the Government a member of the Board of National Education, and continued to serve on that Board till its dissolution in 1866 by the passing of the Public Schools Act. When that Act came into operation he was appointed a member of the Council of Education. He has ever since continued to fulfil the duties of that position. For twenty-six years he has been a zealous promoter of public elementary education, and for a number of years has been President of the Council of Education. He has served on numerous Government Boards and Royal Commissions, and was President of the Commission on Water Supply. He has been an active member of the Royal Society of N.S.W., and is one of its Vice-Presidents. Smith has travelled over a great part of the Australasian Colonies, and has made himself acquainted with their characteristics and resources. Since his appointment to the Professorship in the University he has twice re-visited England. On his return from these voyages he gave lectures on the scenes through which he had travelled and the historical and antiquarian topics associated with them. He was appointed a Member of the Legislative Council in 1874. He obtained from Aberdeen the honorary degree of LL.D. in 1876. He was made C.M.G. in 1877 (for services in the cause of education,) and he continues to be President of the Council of Education, having been re-elected nine times in succession.

SMITH, JOHN THOMAS (1816—78) was a native of Australia and born in Sydney. In 1837 he went to Melbourne as assistant-teacher at the

Aboriginal Station belonging to the Church of England. Subsequently he became a publican and built the Queen's Theatre, which he held as proprietor for some years. In 1842 Melbourne was incorporated a city and Smith was one of the first councillors—a position he continued to fill without intermission until his death. He held the office of Mayor of Melbourne no less than seven times, but the majority of his elections to that post took place in the earlier years of the City Council when there was not much rivalry for the distinction. During the Ballarat riots the mayoralty of Melbourne was no sinecure owing to the excitement which prevailed and the rumours flying about of intended assaults on the Treasury and banks. Smith did good service in restoring the confidence of the population by organising a system of special constables, and for his energy on the occasion he received the thanks of Governor Sir Charles Hotham. When Mayor in 1858 he was delegated by the City Council to go to England for the purpose of presenting an address of congratulation to the Queen on the occasion of the marriage of the Princess Royal to the Crown Prince of Prussia. From the establishment of constitutional government in the colony he had been a member of the Legislative Assembly. At the time of his death he was entitled to the name of Father of the Assembly, as since his first election for North Bourke in 1851 to the old nominee-elective Assembly he had never been out of Parliament. He had a seat in one Government as Minister of Mines in the Macpherson Administration in 1869. His shrewdness and good humour and knowledge of colonial life made him a useful magistrate, and for many years he was a constant attendant at the City Bench, where his delight was to talk to the persons to the suit in a private room and induce them to settle their disputes out of court. He was an official visitor at the lunatic asylums and paid assiduous attention to his duties as a member of the Central Board of Health. In the establishment of the principal charities such as the Melbourne Hospital, the Benevolent and Orphan Asylums and others, he took an active part. He also took great interest in the initiation and progress of the friendly societies, and was a leading member of several of them besides being a prominent Freemason. For many years he was Provincial Grand Master under the Irish Constitution.

SMOKY CAPE, in N.S.W., lies between Trial Bay and Korogoro Point and was named by Cook from his having there seen fires of the natives which produced a great quantity of smoke.

SMYTH, ROBERT BROUGH (1830—) is a native of England and came to V. in 1852, where he entered the Survey Department as draughtsman. Whilst acting as Director of Observatories he was appointed in 1858 secretary to the Board of Science, which position required him to take charge of the mining surveys of the colony. He was in 1860 appointed Secretary for Mines and held office

until the beginning of 1876, when he resigned his several offices under Government and went to India. He acted for some time as Chief Inspector of Mines and re-organised the Geological Survey of which he was director until his retirement from official life. He is the compiler of two works published by the Government on the *Gold Mines of Victoria* and on the *Aborigines of Victoria*; and the author of a large number of occasional papers and pamphlets on scientific subjects.

SMYTHESDALE, a mining township in V. situated in a valley through which flows Smythe's Creek, 12 miles S.W. from Ballarat and 108 miles W. by N. of Melbourne. The population of the borough numbers 750 exclusive of the miners (Chinese and European) at work in the vicinity. The district is principally a mining one, with a population of about 14,000. The mines consist principally of deep alluvial leads of considerable extent; 1447 miners were at work on 30th June 1880, the steam machinery was forty-two engines. Value of total mining plant £22,000; yearly produce of the mines 40,000 ozs. to 50,000 ozs. More attention is being given than heretofore to quartz-mining. There are eighteen square miles of ground worked and twelve reefs have been found to be auriferous.

SNODGRASS, KENNETH (1784—1853) was a native of Scotland. At an early age he entered the British Army in the 52nd Regiment; and led the "forlorn hope" at the siege of St. Sebastian. He was twice wounded during the Peninsular war, for which he received a pension. When Sir John Franklin left T., Snodgrass administered the Civil Government for a time, as he did also that of N.S.W. previous to the arrival of Sir George Gipps. He died at his residence on the Hunter River in N.S.W. in October 1853.

SOFALA, a mining township in N.S.W. on the Turon River 149 miles N.W. of Sydney and thirty miles from Bathurst N. The district in which it is situated is altogether a mining one, the workings being both alluvial and quartz; the former however are now nearly worked out. The reefs give employment to several crushing machines. The population is 644; a large number of Chinamen dwell in and around the township. Sofala was the scene of a great rush in 1851 and large quantities of gold were found there. It was named after the auriferous country in South Africa which belongs to the Portuguese and which is supposed to have been the Ophir of Scripture.

SOLANDER, DANIEL CHARLES (1736—1782) an eminent naturalist and pupil of Linnæus, was a native of Sweden and took his degree as a doctor of medicine at Upsal, and in 1760 visited England. At the request of Sir Joseph Banks he accompanied that botanist in the voyage round the world with Cook. In 1773 he was appointed under-librarian of the British Museum. He wrote a *Description of the Collection of Petrifications found in Hampshire* which had been given to the

British Museum, and *Observations on Natural History in Cook's Voyage*. He left a mass of valuable manuscripts which are now in the British Museum.

SORELL. COLONEL WILLIAM, (1775-1848) Governor of V.D.L., was a native of England. He was Colonel of the 48th regiment when in April 1817 he was appointed Governor of the settlement. He held the office until May 1824, and retired on a pension in 1825. West says of Sorell:—"His administration was successful in colonial estimation. His habits were familiar without rudeness, and his fine countenance attracted the confidence of the stranger. He was accustomed to linger about the gate of Government House chatting with the passers-by, and a slight excuse entitled the humblest ranks to prefer their solicitations. The admiration expressed by the settlers for his character was partly the result of their relative positions. He was a dispenser of Crown favours, and when compelled to refuse an immoderate suitor he could refer his request to the Governor-in-Chief. The rigour of the King's Commissioner was softened by his official worth; nor is it necessary to search for a censure amidst such concurrence of praise. The settlers to express their regard agreed to offer Sorell a testimonial of £750 value. They deprecated his recall by petition, a rare instance of popular favour; there was but one dissident. A result so unusual might, perhaps, have been successful had it not been too late."

SOUTH AUSTRALIA. I. POSITION.—The colony of S.A. as originally defined comprised that portion of the Continent situated between 132° and 141° of E. longitude, and between the Southern Ocean and 26° S. latitude amounting to nearly 300,000 square miles. Since then the boundaries have been greatly extended. In 1861 a strip of territory known as "No Man's Land," occupying 80,000 square miles and lying between the W. boundary of S.A. and the E. boundary of W.A. was added, the W. boundary of the colony being now 129° E. longitude. In 1863 a still further extent of territory was added, the Government having undertaken the task of founding a new colony in the N.; and the country from 26° S. latitude to the Indian Ocean and from 129° to 138° E. longitude was annexed for the purpose. This tract is known as the Northern Territory. S.A. was erected into a British province by Act 4 and 5 William IV. c. 95; No Man's Land was annexed by Act 24 and 25 Vic. c. 44; and the Northern Territory by Her Majesty's letters patent of 6th June 1863. The original name of the colony was only imperfectly descriptive of its position, since Port Phillip lay still more to the south and W.A. occupied a large extent of the southern portion of the continent. At present the name is positively misleading, and "Central Australia" would be much more appropriate.

II. AREA.—At first the extent of territory possessed by S.A. was about 300,000 square miles including Kangaroo Island, containing 2,500,000

acres. Its present area is 903,690 square miles or 578,361,000 acres. It is about 1850 miles in length from south to north with an extreme width of 650 miles.

III. PHYSICAL FEATURES.—S.A. has no such well-marked and easily described physical features as the eastern colonies. It has no great mountain range dividing up the country into distinct regions, no great system of river valleys, and no great geological contrasts of ancient and recent deposits. Yet it is sufficiently diversified in its outlines, having magnificent plains of fertile land, mountain ranges well wooded with giant Eucalyptus, lovely valleys, and arid plains, timberless, waterless, and desolate, yet often teeming with metallic wealth beneath the surface. The character of the interior has been sufficiently indicated in the article "Australia." A sketch of the more prominent physical features of the settled districts will suffice here. The old colony of S.A. is generally flat as compared with V. or N.S.W. A range of mountains of no great height commences at Cape Jervis on the eastern extremity of St. Vincent's Gulf, and extends northward at the back of Adelaide to the Lake Torrens country. It is called the Lofty Range near Adelaide, farther on the Barossa, the Belvidere, the Bryan, and the Flinders Ranges. The highest point does not much exceed 3000 feet. In the southern portion of the colony are Mount Gambier and other extinct volcanoes, while in the unsettled country of the Eyre Peninsula are the rugged Gawler ranges about 2000 feet high. With the exception of the Murray, which runs across the southern portion of the colony, there are no rivers of importance in S.A.; the Gawler, Torrens and other streams that flow into St. Vincent's Gulf, being very insignificant, and almost or quite dry for a large portion of the year. None of the Australian Colonies have so many large lakes as S.A.; but unfortunately none of these seem calculated to benefit the country, being either salt, or liable to be dried up, or unfitted for navigation. Lake Torrens is often a muddy swamp; Lake Gardiner, to the north of Eyre Peninsula, is an immense salt lake in a desert region, though situated 366 feet above the sea level. Lake Eyre and a cluster of smaller lakes are also salt and liable to become changed into plains of saline mud, as is the still more extensive Lake Amadeus in the centre of the continent. Lake Alexandrina, forming the mouth of the Murray, is fresh, but by dispersing the waters of that large river it renders its entrance from the ocean unnavigable. The only lakes associated with picturesque scenery and fertile country are those of the Mount Gambier region, which are situated in the craters of extinct volcanoes. One of these—the Blue Lake—is of an oval shape, surrounded by precipitous walls covered with verdure and several hundred feet high. It is 240 feet deep, and the water is of a deep blue colour. Although without any very prominent features S.A. contains a great variety of soils and

scenery. Extensive plains, comprising many millions of acres of arable land for the most part free from timber, extend from twenty miles S. of Adelaide to beyond Mount Remarkable, about 170 miles N. of the city. These plains are bounded on the eastern side by the mountain chain already described. Beyond this range to the E. and N.E. the country is broken and hilly, with much timber and a large extent of very rich land. The valley of the Murray, itself from half a mile to a mile wide, bounded by cliffs of recent shell-limestone, is a rich alluvial deposit covered in places with large gum-trees; but between this valley and the eastern boundary of the colony as well as for some distance on the west, extend vast waterless scrubs such as have already been described, till farther south we come to the rich agricultural and pastoral district of Mount Gambier. Much of the scenery is park-like and beautiful, with alternations of hill and valley presenting every variety of landscape; but large areas are sterile and uninviting, and apparently doomed to perpetual aridity and barrenness. Yet much of the scrub land is now found to be well adapted for growing wheat, and considerable tracts, once thought to be wholly unsuited to agriculture, are now returning abundant harvests.

IV. CLIMATE.—Although so far south, and therefore farther from the tropics and geographically more temperate, yet S.A. is very hot, and perhaps suffers more from excessive heat and drought during the summer months than any of the other colonies. This is no doubt largely due to the absence of a lofty mountain range to cut off the hot winds from the interior—the South Australian range having a north and south direction—and also to its coast being concave instead of convex, and therefore less open to the cool sea-breezes from the south and south-east. December, January, and February are very trying months, the thermometer often rising at Adelaide to 110° or 115° in the shade; but the rest of the year is pleasant and the winter is mild and rainy. The usual rainfall is small, only averaging twenty-two inches, but it is often as low as fifteen, and in 1869 was only thirteen and a-half inches. The wettest year was 1851 when there were thirty and a-half inches. The amount of rainfall varies greatly in different parts of the colony. In the wet year 1861, when there were twenty-four inches at Adelaide, there were only seven inches at Port Augusta at the head of Spencer's Gulf, forty-five and a-half at Mount Lofty, and fifty-five and a-half inches at Mount Barker. In the same year the thermometer rose above 90° on forty-five days at Adelaide, but only on five days at Guichen Bay in the Southern part of the colony. The variations of the barometer indicate changes of wind rather than rain. It always falls with a north-east wind and continues to fall as the wind changes to north and north-west; but whenever there is southing in the wind the barometer rises even during steady and copious rains.

V. NATURAL HISTORY.—The natural history of S.A. presents hardly any distinctive features, while in almost every department it is far poorer than the other colonies. In botany this is especially the case. It contains a mixture of eastern, western, and tropical forms—the presence of the latter being due to the proximity of the great central desert; but the eastern types abound. The northern territory has of course a wholly tropical flora, and it has produced many new species both of plants and animals; but these in almost all cases extend to one of the adjoining colonies, W.A. or Q. whose northern portions are equally tropical.

VI. GEOLOGY.—The geological structure of extra-tropical S.A. is comparatively simple. It consists of an immense formation of Tertiary sandstones and limestones extending over the whole country except where interrupted by Palaeozoic or volcanic mountains. The backbone of the colony running from Cape Jervis northwards is Silurian, and consists of sandstones, slates, and limestones, with intruding granites of diversified character. Fine red granites occur at Barossa and Port Lincoln and there are lofty granite mountains in the interior. Basalt occurs at Mount Arden, north of Port Augusta, and also farther north in the central lake country; but it is more common in the south-east near the remarkable group of extinct volcanoes in the Mount Gambier district. A little to the north in the Tertiary limestone country of the Mosquito Plains are some very curious and interesting caves, which have been thus described by the Rev. J. T. Woods in his *Geological Observations in South Australia*:—"In the midst of a swampy, sandy country, plentifully covered with stringy-bark trees, a series of caverns is found whose internal beauty is at strange variance with the wildness of the scenery around. The entrance is merely a round hole on the top of a hill, which leads to a small sloping path under a shelf of rock. Descending this for about twenty-five feet, one gets a first glimpse of the magnificence enshrined below. The observer finds himself at the entrance of a large oblong square chamber, low, but perfectly lighted by an aperture at the opposite end, and all around, above and below, the eye is bewildered by a profusion of ornaments and decorations of nature's own devising. It resembles an immense Gothic cathedral, and the numbers of half-finished stalagmites which rise from the ground, like kneeling or prostrate forms, seem worshippers in that silent and solemn place. At the farther end is an immense stalactite which appears like a support to the whole roof; not the least beautiful part of it being that it is tinted by almost every variety of colour, one side being of a delicate azure, with passages of blue, green, and pink, intermingled; and again it is snowy white, finally merging into a golden yellow. The second cave or chamber is so thickly studded with stalactites that it seems like a carefully arranged scene, which, from the interminable variety of form and magic effect of light and shade, might easily be taken to

represent some fairy palace. Very soon the cavern becomes as dark as night, and further exploration to the numerous chambers and fissures beyond has to be made by the assistance of torches. On leaving the last chamber we returned to the light: a narrow passage richly wreathed with limestone is observed on the right hand going out. Proceeding a little way down a large vaulted chamber is reached, so perfectly dark and obscure that even torches can do but faint justice to its beauty. Here, above all other portions of the caves, has nature been prodigal of the fantastic ornament with which the whole place abounds. There are pillars so finely formed and covered with such delicate trellis-work, there are droppings of lime making such scroll-work, that the eye is bewildered with the extent and variety of the adornment. It is like a palace of ice with frozen cascades and fountains all around." The Palæozoic limestones of S.A. are very rich in copper, and this metal has really determined the success of the colony. It was first discovered in the hills near Adelaide; but the most important mine, the Burra-Burra, is about ninety miles to the north. Another still more extensive deposit of copper ore is at Wollaroo, at the head of Yorke's Peninsula, and there are in all twenty-seven copper mines in the colony. Silver-lead has been found and worked near Cape Jervis, and bismuth in the mountains east of Adelaide. Gold also occurs at Echunga; but the mines are unimportant as compared with those of V. Iron is also known to exist in large quantities; but as there is no coal it has not yet been worked.

VII. POPULATION.—The population on 31st December 1879 was estimated at 136,000 males and 124,000 females—a total of 260,000. The average birth rate of 1878 was 38·22 per thousand of the population; the marriage rate is 9·47 and the death rate 15·44 per thousand. During 1879 there were registered 9902 births—5013 males, 4889 females; 3580 deaths and 2238 marriages; averaging 38·81 births per thousand of the population; 14·04 per thousand deaths and 8·77 per thousand marriages. The foregoing applies to the white population; of the aboriginal race little can be said further than that their ultimate extinction is a matter of a few years only, as whatever their numbers were originally each successive year has seen a rapid diminution and the end is not very far off. Infanticide, disease, and, more than all, strong drink have tended to this result. Some efforts have been made to ameliorate their condition, and in this work the Bishop of Brisbane (Dr. Hale) has taken a prominent part. His labours were not altogether unfruitful. In 1876 the number of natives was computed at 3953 of all ages and both sexes.

VIII. IMPORTS AND EXPORTS.—In 1838 the value of the exports did not exceed £5000; in 1869 it amounted to £2,993,035; by 1878 it had advanced to £5,355,021 or £22 0s. 3d. per head of the population. The imports which in 1869 were £2,754,770 reached £5,719,611 in 1878, or £23 10s. 3d. per

head of the population. The total value of the import and export trade increased from £5,747,805 in 1869 to £11,074,632 in 1878, the average rate per head having gone up from £32 3s. 2d. to £15 10s. 6d. For 1879 the total imports amounted to £5,014,149; the exports amounted to £4,762,727; the excess of imports over exports being £251,422. Among the staple exports were:—Wheat and flour £1,627,707; other agricultural produce £25,549; horticultural produce £38,799; dairy produce £12,006; wool £1,984,879, other animal productions £129,061; copper ore and regulus £407,587; other minerals £2162; colonial manufactures £23,796. Of the imports there were from Great Britain £2,718,788 consisting of drapery, iron-mongery, and miscellaneous manufactures. From the British possessions the imports amounted to £2,016,083. The Foreign imports amounting to £279,278 comprised tea, coffee, sugar, tobacco, timber, mineral oil, and spices. The total imports per head of the population during 1879 was £19 13s. 2d.; of the exports it was £18 13s. 5d.

IX. SHIPPING.—The shipping returns during the year 1879 were: inward entries 1092 vessels of 467,729 tons; outward entries were 1039 vessels of 465,162 tons. During the proper season several steamers specially constructed navigate the rivers Murray, Murrumbidgee, and Darling, upwards of forty steamers and fifty barges being employed in the trade.

X. INTERCOMMUNICATION.—There are under the jurisdiction of the Central Board of Main Roads 3331 miles of main roads, of which about 1140 miles were thoroughly formed and metalled at the close of 1878. The total expenditure in the construction of these roads since the year 1850 has been over £2,000,000. During the financial year 1878-79 £85,000 were expended in their maintenance. At the close of 1879 there were 559 miles of railway open for traffic constructed at a cost of £4,103,501.

XI. REVENUE.—The revenue for the year ending 30th June 1880 was £1,831,164 with a deficit balance of £61,583 from the previous year deducted made a total of £1,769,581, and the expenditure £1,853,112, leaving a deficit of £83,531. Towards the revenue the Customs contributed £510,796; rents and licences of Crown lands £92,135; postal Telegraph receipts, £130,929; railways and tramways £364,855; land sales £469,330; the remainder being made up of various miscellaneous items. The colonial debt on 30th June 1879 was £7,593,943. The revenue for 1879-80 was estimated at £1,855,587; and the expenditure at £1,854,345. With the deficit from the previous year and the unexpended balances, the total deficit on 30th June 1880 was expected to be £234,722.

XII. MANUFACTORIES.—Among the leading manufactories (according to the census of 1876) are 43 for agricultural implements, at which the majority of the reapers or snippers used in the colony are made, 3 for soap and candles, 20

for coach and carriage building, 6 for jam, 1 for meat-preserving, 4 for ship-building, 1 tweed factory, 13 clothing factories, 24 boot and shoe factories, 1 rope walk, 1 brush manufactory, 3 biscuit bakeries, 4 confectionery manufactories, 9 dried fruits, and 2 olive oil factories. A late return enumerates 25 breweries, 28 distilleries, 8 foundries, 5 gas-works, 5 potteries, 21 saw-mills, 22 tanneries, 102 wine-presses, 20 soda-water factories, 2 dye-works, 1 fuse factory, 25 brick-yards, and 1 ice-works. Flour-mills are very numerous, there being, on 31st March 1880, 117 driven by steam machinery, of the aggregate horse-power of 2291, and employing 875 hands. During 1878 458,183 gallons of wine were manufactured, of which 49,691 gallons were exported, and during 1879, 459,308 gallons were manufactured, and 46,908 exported.

XIII. MATERIAL PROGRESS.—The three sources of wealth—mineral, pastoral, and agricultural—have developed trade and commerce to an extent that appears surprising when set against the population. Remembering that the entire number of inhabitants barely exceeds a quarter of a million, the fact that the total exports and imports for 1879 amounted to nearly £10,000,000 speaks well for the general prosperity. Of the staple exports of the colony, wool, copper, and wheat hold the most prominent position. Notwithstanding the falling-off in copper, the combined value of these exports amounted in 1878 to close on £4,000,000 sterling. Comparing the returns for 1878 with those for 1868 it is found that the exports of wheat and flour have increased more than a million, and of wool more than half a million sterling. Nor is there any ground for apprehension that the limit has been reached. Of late years, through more liberal land legislation, vast areas have been brought under cultivation which a short time ago were believed unfit for the plough. As lines of railway are being constructed the produce of the interior is more quickly and economically conveyed to ports of shipment, and the boundary of agricultural settlement is receding still further from the seaboard. The colony has an extensive coastline, and the land which will ultimately prove available for cultivation is practically unlimited. Some of the foregoing remarks apply to mining pursuits. Rich and valuable mineral properties in the interior have hitherto proved comparatively valueless on account of the cost of conveying the ore to market, but the lines of railway that are being pushed on with vigour will materially lessen this drawback. With regard to pastoral pursuits the opening of the vast interior by the construction of the telegraph line to Port Darwin, the results of the researches of various exploring parties, and the construction of a transcontinental railway—the first link of which is in progress—are destined to facilitate their expansion to an extent which it is at present impossible to estimate. When it is borne in mind that the area of the colony (including the Northern

Territory) is upwards of 900,000 square miles, of which only about 1 per cent. is alienated from the Crown, and less than one-third held under pastoral leases, the undeveloped resources of the colony will be seen to justify sanguine anticipations. When regarding the progress of S.A. the initial difficulties it had to contend with and its slow growth for the first twenty years should not be forgotten. Twenty years ago the interior was comparatively unknown. What were then scattered sheep-runs are now immense stretches of waving corn. The trackless wilderness of those days is occupied by the squatter with his countless flocks and herds; it is traversed by the electric wire, and will soon be startled by the shriek of the locomotive. Then the shipping trade of the colony was confined to vessels of small capacity and for the most part limited to Port Adelaide; but now lines of magnificent ocean steamers take S.A. in their way, while up the Gulf and along the coastline outports are opened to which traffic converges and which are being continually improved. Twenty years ago there were only 264,462 acres of land under cultivation; now there are over two millions. At that time the population was 113,340; now it exceeds a quarter of a million. The revenue of the colony in 1858 was £469,637; in 1878 it was £1,592,635.

XIV. PRODUCTS.—Though nearly all the fruits and vegetables that are produced in England grow in S.A. it is principally remarkable as a wheat and grape-growing country. In some years sufficient grain has been grown to supply not only the wants of the colony and of neighbouring colonies but to export many cargoes to England, where the wheat is held in high estimation and invariably realises high prices, on account of its dryness and weight. The colony has justly been termed the Granary of A. As a wine producing country it already takes high rank and bids fair to take a much higher position. Hop-growing is attracting some attention; the olive is also being systematically cultivated and a comparatively large area is now under planting. The manufacture of preserved fruits is also carried on, as is also the drying of raisins and currants. Some attention has been given to sericulture, both the silkworm and the mulberry trees upon which it feeds have done well, but no very substantial results have been obtained though the silk produced has been pronounced by Marseilles merchants to be equal to any ever wound by them.

XV. AGRICULTURAL STATISTICS.—The extent of land under cultivation for the year ending 31st March 1880 was 2,271,058 acres. 1,458,096 were cropped with wheat, the produce being 14,260,964 bushels; hay 265,067 acres, total produce 296,141 tons; barley 15,107 acres, produce 202,166 bushels; oats 4117 acres, produce 61,818 bushels; peas 3963 acres, produce 58,547 bushels; potatoes 7320 acres, produce 27,832 tons; flax 208 acres; permanent artificial grass 21,121 acres; gardens and orchards 9148 acres; vines 4114 acres. Products: 459,308

gallons of wine, 34,240 cwt. of grapes, 699 cwt. of raisins. Live stock returns were : horses 130,052, horned cattle 266,217, sheep 6,140,396, goats 11,277, pigs 90,540, poultry 698,863. At the same date there were 35,839,818 acres enclosed, of which 33,568,760 acres were not cultivated ; 5,702,387 acres were in the hands of freeholders, and 8,477,820 acres were purchased lands. The average produce per acre of the leading crops was—wheat 7 bushels 49 lbs. per acre, hay 22 cwt., barley 13 bushels 19 lbs., oats 15 bushels 1 lb., peas 14 bushels 46 lbs., potatoes 76 cwt. The extent of land alienated during the year 1879 was 604,246 acres, of which 428,114 acres were selected under the system of deferred payments and 176,132 acres were purchased for cash. The total area of land leased for pastoral purposes in 1879 was 177,200 square miles, the annual rent of which was £47,814.

XVI. ELECTRIC TELEGRAPHS.—An extensive system of electric telegraphs is in operation, communication being had with all the leading places in the other colonies, including W.A. The South Australian portion of the telegraph line to W.A. was completed to Eucla on 16th July 1877, the total cost being £75,214. Great difficulties were experienced in erecting the section between Fowler's Bay and Eucla, owing to the extreme scarcity of feed and water, the country traversed being mostly sandy desert, and the long distances that materials had to be carted, but these obstacles were effectually overcome and the line was completed in a thoroughly substantial manner. The Western Australian line is 800 miles long and the South Australian portion, including the line from Adelaide, about 971 miles long.

XVII. EDUCATION.—Within the last few years educational affairs have been completely revolutionised, and the Public School system, which previously was the worst in the colonies, is now one of the best. The object kept steadily in view is the education up to a certain standard of every child in the colony. The standard is a low one, the only compulsory subjects being reading, writing, and arithmetic, but instruction is also given in other branches. The ages during which children are obliged to attend school are from seven to thirteen, and the rule is made imperative except as regards those who are able to show that they are being otherwise educated or have attained the standard. The Act establishing the present system was passed in 1875. Under it the public schools were placed under the charge of a Council with a permanent President, the Council being subject to the Minister of Education, who however rarely interfered except on matters of policy. This plan of administration had a three years trial, and under it a great impetus was given to the erection of new schools, the appointment and classification of competent teachers, and the weeding-out of those who might have been considered competent under the old *régime*, but were no longer regarded as suitable instructors for the youth of the colony. But the Council did not do as much as had been

expected of it, and the system of divided responsibility was condemned. In 1878 an Act was passed abolishing the Council and entrusting the entire management of the schools to the Minister, who alone is responsible to Parliament. The Secretary of the Council has been made the accountant under the new arrangement. The central department is assisted by Local Boards of Advice, who are appointed in all parts of the colony, and perform their duties without fee or reward. There are five school inspectors, each of whom has a certain district apportioned to him. About a year and a-half ago the compulsory powers of the Act were brought into operation, and school visitors were appointed to wait on the parents and induce them to send their children to school. There are now a superintendent and seven school visitors. Uniform fees of 4d. per week for children under seven years of age and 6d. for older children are charged in all schools ; but in cases where the parents are too poor to pay for the education of their children that duty is taken upon itself by the State. During 1878 the fees paid by parents amounted to £16,717 and by the State to £770. The education given is entirely secular, though the teacher is allowed to read the Bible before school hours if the parents of his scholars wish him to do so. Large grants have been made by the Legislature for school buildings, teachers' salaries, &c., in order to aid in the development of a thorough and comprehensive system. To foster and encourage higher education, there is an annual grant from the public funds of five per cent. on all private contributions, and also an endowment of 50,000 acres of land. In connection with the schools six exhibitions of the annual value of £30, tenable for three years, are offered ; also three University scholarships of the annual value of £50, tenable for three years. The number of schools in operation on 31st December 1878 is stated at 310. Of these 234 were public schools and the remainder provisional. The attendance during the year was 31,230 in the public and 3261 in the provisional schools ; the average daily attendance was 16,755, being a proportion of 72·67 per cent. of the roll attendance. The number of head teachers was 230, and the total number engaged in teaching 699. The total expenditure for 1878, including payment for buildings, was £152,718 10s. 2d. The cost to the State of each child under instruction was £1 10s. 0½d. ; the cost of each child in average attendance, £3 1s. 10d. A University is established, towards the building and endowment of which a well-known colonist, Captain Hughes, contributed £20,000 and Thomas Elder £20,000. It is under the control of a Council, of whom the Bishop is the Chancellor, and is provided with a complete staff of professors. Its degrees rank with those of any other University. The students are lodged in a handsome building which cost £25,000 in its erection. In connection with the Church of England there is the collegiate school of St. Peter's, which is endowed and has

several scholarships and exhibitions attached to it. The curriculum is similar to that of the public schools of Great Britain. In connection with the Wesleyan body is the Prince Alfred College. Five scholarships are annually competed for, the two highest being of the value of £15 15s.

XIX.—GOVERNMENT AND LEGISLATION.—The privilege of Constitutional Government was not conferred on S.A. until many years after the foundation of the colony. Its affairs were originally under the control of a Board of Commissioners resident in London, represented in the colony by a Commissioner of Public Lands. The powers given to the Board by Act of Parliament in 1834 were to borrow money to carry on the Government of the colony, and to defray the cost of transporting emigrants. The Board had but a brief existence. The Act provided that a form of local Government should be granted to the province as soon as its population reached 50,000 persons, but it was some years before this had been effected. The Commissioners did not at first find their task one easy of accomplishment. In order to assist them in their endeavour to found the colony the South Australian Company was formed, mainly through the exertions of George Fife Angas, who relinquished his post of Commissioner and became Chairman of the Company. Under the operations of this Association the work of colonisation proceeded, and from the appointment of Captain John Hindmarsh as Governor in 1836 until the year 1851 the work of local legislation was carried on by the Governor and a Legislative Council, consisting of four non-official members, all appointed by the Governor. In 1851 the first Constitution was granted to the province. A new Legislative Council was authorised, which was to consist of twenty-four members, one-third to be nominated by the Crown, and two-thirds to be elected by the people every five years. Members of this Council were required to possess freehold property of not less than £200 annual or £2000 total value. Voting was based on a small property or household qualification, and persons holding property in more than one district were allowed to vote for members in each district in which their property was situated. This Council however had no control over the land revenue, which was expended by the authority of the Governor alone. The new Council was no sooner formed than the colonists began to agitate for Responsible Government in its entirety, and in 1856 the present Constitution Act was passed, and having received the Royal sanction was proclaimed in the colony in October of that year. By this Act the Government is vested in a Governor and two Houses of Parliament. The Parliament is triennial, and the sessions are generally held annually. The two Houses are called respectively the Legislative Council and the House of Assembly. For electing members to the former the whole province is one electoral district. A member must be thirty years of age, and have resided in the colony for

three years. Electors for the Legislative Council must be twenty-one years of age, and have a freehold estate of £50 value, or a leasehold of £20 annual value with three years unexpired, or must occupy a dwelling-house of £20 annual value. There are eighteen members of the Legislative Council, one-third of whom retire at the end of every fourth year. This House cannot be dissolved by the Governor. The House of Assembly at first consisted of thirty-six members, elected by seventeen districts, two of which returned only one member, while Adelaide returned six. In 1861 a redistribution of seats was made, based on population. The colony was divided into eighteen districts, each electing two members. In the session of 1874 a further alteration was made, by which the colony was divided into twenty-two electoral districts, three returning three members each, one returning one, and the remainder two each, so that the Parliament now consists of forty-six members. Under the present Constitution Act all persons qualified to vote are eligible to become members of the Assembly, which is elected by manhood suffrage, the only requirements being that the voter shall be twenty-one years of age, that his name shall have been on the electoral-roll six months, and that he be untainted with felony. Aliens not naturalised are incapable of voting; but all that is required to become a naturalised subject is to take an oath of allegiance and to pay a small fee. All elections are conducted by ballot. Judges, ministers of religion, and aliens who have not lived five years in the colony are ineligible for election to either House. The Executive Government is, as in England, dependent on Parliamentary majorities. The Governor is the President of the Executive Council. Members accepting office in the Administration are not required to go to their constituencies for re-election. The Government first appointed under the present Constitution Act consisted of five Ministers, who were all required to be members of the Legislature. Recently a sixth Minister has been added, and the Ministry is now composed of the Chief Secretary, Attorney-General, Treasurer, Commissioner of Crown Lands and Immigration, Commissioner of Public Works, and Minister of Education. Any member of the Legislature renders his seat vacant by accepting any office of emolument under the Crown excepting those abovementioned. All the affairs of the colony, including the management of the Crown lands, the proceeds of which have been placed entirely at the disposal of the colonists, are under the control of the two Houses of the Legislature. Each House is vested with equal powers, with the exception that the Legislative Council cannot originate any measure for appropriating any part of the revenue, or for imposing, altering, or repealing any rate, tax, duty or impost. The financial affairs are dealt with by the Assembly, and the only part taken in the matter by the Council is the consideration of such measures as are described above after they have been passed by the

Assembly. Several taxation bills have been vetoed by the Council in the exercise of this power. The public expenditure is entirely regulated by the House of Assembly, in whose hands rests the power of making and unmaking Ministries.

XX. REAL PROPERTY ACT.—This measure, of which S.A. may justly feel proud, inaugurated a new and simple mode of conveyancing which swept away the heavy expenses and evils attendant on the old system of transferring real property. The author of the measure, which came into force in 1858, was R. R. Torrens, afterwards Registrar-General. The principles of the Act are thus set forth by a Commission appointed to enquire into its provisions and working:—"The objects of the Real Property Act are to give security and simplicity to all dealings with land, by providing that the title shall depend upon registration, that all interests shall be capable of appearing or being protected upon the face of the registry, and that a registered title or interest shall never be affected by any claim or charge which is not registered. By this system every one who acquires any estate or interest in land, upon being registered as owner thereof, obtains a title absolutely secure as against every one whose claim does not appear upon the registry; and the two elements of simplicity and security as regards the acquisition of land appear to be effectually attained." All land alienated from the Crown since 1858 is declared to be under the Real Property Act; and land acquired before that date may be brought under its operation on application after certain precautionary public notices have been given. Several amendments, found necessary by experience, have been made in the Act, and a certain amount of protection is now definitely given to equities arising in connection with properties; but the main principle has always been successfully maintained, and the value of property brought under the Act amounts to several millions sterling. The fees on transfers are small, and transactions under the Act are so simple as rarely to call for the intervention of a solicitor. Where a block of land is subdivided separate certificates of title are issued by the department for each allotment, and the greatest care is taken in defining the measurements and boundaries. Thus sources of error or opportunities for fraud seldom occur, and costly "abstracts of title" are unknown. In fact, the title embodied in the certificate issued from the Lands Titles Office is to all intents and purposes indefeasible. The South Australian Act slightly altered has been adopted by all the Australian Colonies.

HISTORY.—I. *Flinders' Discoveries*.—When Flinders returned to England in 1800 the charts of the new discoveries, which Arrowsmith pronounced the most perfect that had come before him, were published, and a plan proposed to Sir Joseph Banks for completing the investigation of the coasts of Terra Australis was approved by him and Earl Spencer, First Lord of the Admiralty. In February 1801 Flinders was promoted to the

rank of commander, and appointed to the *Investigator* sloop. A proof of the popularity of his character and the adventurous spirit of the British sailor was given, when eleven men being required to complete his crew, out of three hundred seamen on board the Vice-Admiral's ship *Zealand*, two hundred and fifty volunteered. On 18th July he sailed from Spithead, furnished with a passport from the French Government, which was granted after precedents of similar protection afforded to La Pérouse and to Cook by the respective authorities in France and England. Among the gentlemen who accompanied the expedition was William Westall the landscape-painter. A passport was also applied for by the French and granted by the English Government to Captain Baudin, who was said to be going round the world on a voyage of discovery. In November 1801 Flinders sighted the coast of A., and proceeded to examine the coast-line hitherto unexplored. In the course of his investigations he discovered and surveyed King George's Sound, on which the settlement of Swan River was planted in 1829. Sailing slowly eastwards along the barren coast which is now traversed by the electric wire connecting South and Western Australia, Flinders in January 1802 reached and duly named the Great Australian Bight, Fowler's Bay, Smoky Bay, Streaky Bay, Anxious Bay, Coffin's Bay, and other physical features, all of which are still beyond the principal settlements of S.A. His first important discovery was the magnificent harbour of Port Lincoln, which, to use the words of one of the French navigators who subsequently visited it, is "worthy to rival Port Jackson and is one of the finest harbours of the world." Owing to the nature of the land around it the founders of S.A. were unable to fix on Port Lincoln as the principal port of the colony. Proceeding northwards up what proved to be Spencer's Gulf, Flinders was extremely disappointed at the appearance of the land forming the western boundary of the inlet at the head of which now stands Port Augusta—the sea terminus of a railway line the first link in an iron road to span the continent from north to south. Coming back towards the ocean along the low-lying coast of Yorke's Peninsula—the site of the famous Wallaroo and Moonta and other rich copper mines, and which besides skirts an important agricultural territory—the appearance of the country was still barren and forbidding. Having got safely out of Spencer's Gulf the corner of Yorke's Peninsula was turned, and being then overtaken by a storm he found Nepean Bay a harbour of refuge, and the island of which it is a prominent feature was named Kangaroo Island after the numerous kangaroos or wallabys discovered in great numbers on it. From this place Mount Lofty, the highest eminence in the range which forms a background to the Adelaide plains, was sighted, and a visit to the mainland disclosed the richness and beauty of the country that surrounds what is now the capital of S.A. Passing

out through Backstairs Passage lying between the main coast line and Kangaroo Island the *Investigator* sailed into Encounter Bay, so named because of the meeting with the French vessel of discovery *Géographe* under Captain Baudin, with whom, notwithstanding the hostile terms on which the English and French nations then stood, Flinders exchanged friendly greetings. Recording this meeting, Flinders notes in his diary:—"The situation of the *Investigator* when I hove to for the purpose of speaking Captain Baudin was 35° 40' S. and 138° 58' E. At the above situation, the discoveries by Captain Baudin upon the S. coast have their termination to the W., as mine in the *Investigator* have to the eastward; yet Monsieur Peron, naturalist to the French expedition, has laid a claim for his nation to the discovery of all parts between Western Port, in Bass Straits and Nuyts Archipelago; and this part of N.S.W. is called Terre Napoléon; my Kangaroo Island which they openly adopted in the expedition, has been converted into L'Isle Decrés; Spencer's Gulf is named Golfe Bonaparte; the Gulf of St. Vincent, Golfe Josephine; and so on along the whole coast to Cape Nuyts, not even the smallest island being without some similar stamp of French discovery." Freycinet, first-lieutenant of the *Géographe*, said, subsequently, at the house of Governor King, to Flinders, "Captain, if we had not been kept so long picking up shells and catching butterflies at V.D.L., you would not have discovered the south coast before us." "I believe (adds Flinders,) M. Peron wrote from overruling authority, and that it smote him to the heart." Proceeding onwards, Flinders noted that remarkable saltwater channel which runs a short distance inland along a large part of the south-eastern coast—the Coorong—and, passing Lacepede Bay, Guichen Bay and other inlets now well known, sighted the mountains already referred to as having been discovered by Grant. Thence he continued his voyage along the coastline that bounds the adjoining colony of V.

II. *Sturt's Explorations*.—Thus far the exploration of the sea boundary was accomplished. The information thus acquired was useful but the examinations made necessarily failed to give any real idea of the value of this part of Australia. So mistaken was the opinion held of it that in 1822 it was stated by a Captain of His Majesty's Navy, who read a paper before the Philosophical Society of N.S.W., that "The south coast of Australia is barren and in every respect useless and unfavourable for colonisation." For Sturt was reserved the discovery that the character of this part of the continent was not by any means so bad as had been made out. Sturt was an ardent believer in the theory held in the early days of N.S.W. that the rivers of Australia terminated in a vast inland lake. Determined to put his theory to the test, and having already discovered the Darling River, he made up his mind to trace it to the point where its waters were emptied. In 1830 with a small

party in two boats Sturt found his way from the Murrumbidgee into the Murray, and traced the latter river to its mouth in Encounter Bay. The journey was made under difficulties that would have appalled men of ordinary mettle; but this brave man and his trusty followers proceeded undaunted, suffering from want of food, in constant danger from natives, and wearied with work until the discovery was complete, and then gradually made their way back up-stream, arriving in Sydney after an absence of six months. There is no doubt that Sturt was disappointed with the country through which he passed, and particularly with the discovery that the mouth of the Murray was not easily navigable. But that he was not altogether unfavourably impressed is shown by these few words which we quote from his own records:—"Hurried as my view of it was my eye never fell on a country of more promising aspect or of more favourable position than that which occupies the space between the Lake (Alexandrina) and the Ranges of St. Vincent's Gulf, and continuing northerly stretches away without any visible boundary." Governor Darling who had dispatched Sturt on his expedition, afterwards sent Captain Barker by sea to St. Vincent's Gulf; and one who accompanied that party writes—"The soil was rich, there was abundance of the finest pasturage, no lack of fresh water;" and then becoming poetical in his enthusiasm he remarks that "it was a spot in whose valleys the exile might hope to build for himself and for his family a peaceful and prosperous retreat."

III. *Colonisation*.—About 1829 Edward Gibbon Wakefield, an advanced political economist for those days, had thought out a system of colonisation which he maintained was the only true one possessing the elements of stability and success. His system was based on two principles—in all cases to sell the land for a fair and reasonable value, and to devote the proceeds to the introduction of labour from the Mother Country. He maintained that the worst thing that could happen to a new country was to give the land away in large blocks; and he found a striking illustration of this in the history of W.A. where grants of land of 20,000 or 50,000 acres had been made to favoured individuals, but they had turned out to be utterly worthless. Wakefield's theory, with its really ingenious theory and really desirable aims—good wages, large profits, and complete civilisation—took the active world by storm; and no sooner was the serious business of carrying the Reform Bill completed than a society was formed for carrying it into practical effect. The extraordinary success with which this theory was received at Home, although opposed by every intelligent colonist, may be traced to the skilful manner in which it combined the interests and conciliated the prejudices of the legislative as well as the executive class. The capitalist for the first time saw himself painted as an injured victim, and

presented with a new field for ample profits; the ratepayer was charmed at the idea of getting rid of an unlimited number of paupers; the educated gentleman hoped to live on his £20,000 with all the state, dignity, and luxury, physical and intellectual, that a landed estate of £100,000 confers in England or Scotland. The adventurous of the middle class dwelt on the charms of distinction which would be open to them in a new colony; while to ardent politicians and essayists, who in 1830 were for the most part deeply dissatisfied with the ancient English institutions, the idea of becoming founders and modellers of a model commonwealth was truly delightful. Even the Government was eventually conciliated by the prospect of additional patronage which a new colony presented. In 1831 Major Bacon, a fellow-soldier in the Spanish Legion with Colonel Wakefield, brother to the theorist, appears to have opened negotiations at the Colonial Office, then under Lord Goderich, for establishing a chartered colony in some part of A.; and in 1832 these negotiations had so far progressed that a provisional committee of the S.A. Land Company had been formed, with Colonel Torrens, one of the proprietors of the *Globe* newspaper, as its chairman, with a proposed capital of £50,000. In a letter dated 9th July 1832 Torrens transmitted a draft of the charter suggested by his committee, and drawn under the instructions of Wakefield. On perusing this draft Lord Goderich curtly closed the negotiation, on the ground that "it would virtually transfer to the company the sovereignty of a vast unexplored territory; that it would encroach upon the limits of the existing colonies of N.S.W. and W.A.; that the charter would invest the company with powers of legislation, of erecting courts, of appointing judges, of raising and commanding militia; that all the powers of the company involving in their practical effects the sovereign dominion of the whole territory would be transferred to a popular assembly which would be to erect within the British monarchy a government purely republican; and that the company would be receivers of large sums of money for the due application of which they do not propose to give any specific security." When the promoters offered to modify their plan they were informed "that the views entertained by the proposed company are not sufficiently precise and determined to lead his lordship to apprehend that any advantage will arise from confining a correspondence that has for some time been going on." In 1833 another association was formed and the chairman, W. W. Whitmore, M.P., opened negotiations with the Earl of Derby, then Under Secretary for the Colonies. He proposed to found a colony on the site where it was eventually planted, to sell land at 5s. an acre ("this will ensure the concentration of settlers in proportion to the price at which land is sold,") and devote the proceeds to the conveyance of young pauper labourers of both

sexes in equal numbers. The company to have a million acres at 5s. an acre. "On this land they will perform such works as they may deem expedient, with a view to attract population thereto, while Government will sell in an entirely unimproved state the land not purchased by the company to any individuals desirous of purchasing it." This association, which contemplated fame and patronage rather than profit, included George Grote, the eminent historian of Greece; William Hutt, afterwards Governor of W.A.; Henry Bulwer, afterwards Ambassador and K.C.B.; Colonel Torrens; H. G. Ward, afterwards Governor of the Ionian Islands and K.C.B.; J. A. Roebuck; Sir William Molesworth; Benjamin Hawes, afterwards Colonial Under-Secretary; and Edward Strutt, Chief Commissioner of Railways. This negotiation also failed. Gibbon Wakefield's charter was not approved. While approving of the plan of colonisation suggested as regarded the disposal of land, Secretary Stanley insisted that the government of the colony should be left in the hands of the Crown until such time as it was able to govern itself. After receiving this communication the S.A. Association decided to continue their operations for the purpose of forming a Crown colony, provided that by Act of Parliament provision were made for the permanent establishment of the mode of disposing of waste land, and of the purchase-money of such land devised by Gibbon Wakefield. Before the negotiation was concluded Secretary Stanley resigned. Spring Rice (afterwards Lord Monteagle) became Secretary for the Colonies. Under his administration an act was passed in the session of 1834 substantially embodying the terms agreed upon with Secretary Stanley by which the province of S.A. was established, the minimum price of land fixed at 12s. an acre, and the business of colonisation was placed in the hands of a body of commissioners. Lord Aberdeen having become Secretary for the Colonies, eight commissioners were selected from the members of the S.A. Association and gazetted in May 1835; Torrens being appointed chairman, because, as he stated in his letter of application, he had "more knowledge of the object and principles of the proposed colony than any of the other gentlemen willing to act." It is important to note that although the Colonial Office refused to permit the foundation of a chartered colony in which the government and responsibility would have been in the hands of the colonisers, from first to last the personal friends and pupils of Wakefield had the sole control of every arrangement and the selection of every officer, and that every step was taken under the advice of Wakefield who was a constant attendant at the rooms of the association. The commissioners first offered the post of Governor to the distinguished General, Charles James Napier; but on being refused a small body of troops as police, and power to draw on the British Government for money in case of need, he

declined the dangerous honour, observing with wise prescience, "While sufficient security exists for the supply of labour in the colony, and even *forces* that supply, there does not appear to be any security that the supply of capital will be sufficient to employ that labour." Thus S.A. lost an active Governor, and India obtained a great General. Of two Governors subsequently appointed, one was compelled to overdraw £400,000, and the next obtained a company of soldiers in lieu of an expensive police. The commissioners then selected as Governor Captain Hindmarsh, R.N., a distinguished naval-officer, Governor of Heligoland, and Colonel Light as chief officer of the survey department; Fisher as resident commissioner; Robert Gouger, editor of the *Letter from Sydney* and secretary of the S.A. Association, as colonial secretary—in all seventeen appointments, including two attorneys, and an unsuccessful merchant, "who had been found useful to the commission in selling land and raising money." The parties selected seem to have been studiously chosen for their innocence of all colonial, official and agricultural experience. While the political steps for founding the model colony were progressing, means for agitating the public mind in favour of emigration on the new principle, to the unknown territory selected by the S.A. Association had not been neglected. The theory propounded in the *Letter from Sydney* had been repeated and enlarged on in a work called *England and America*, and in a multitude of pamphlets, reviews in newspapers, speeches and lectures. The active world began to believe that a political philosopher's stone had been discovered. A newspaper, the *South Australian Gazette*, was published in London, with the view of being transplanted to the new colony as soon as a hut could be found for its reception; while the most influential daily and weekly organs re-echoed the statements and conclusions which received the admiring assent of all parties. Anything in the shape of opposition, or even doubtful criticism, from persons of colonial experience, was greeted with the utmost degree of scorn and contempt. They were hissed down, unheard, as the most stupid or jealously envious of mortals. The friends of Wakefield's theory had from the first taken it for granted that nothing but the basest motives could induce any one to hesitate in accepting their panacea for colonial ills, and they had the same advantage in attacking the Colonial Office that a quack has in ridiculing a practitioner of the old school. A small book, published in 1834, entitled *The New British Province of South Australia* with an account of the Principles, Objects, Plan, and Prospects of the colony, one of scores of the same tendency which appeared about the same time, is a favourable and temperate specimen and the literary agitation which Wakefield perfected, if he did not invent. This work, adorned with maps, a picture of a bay, with palm trees and an emu, commences with an extract from one of

Archbishop Whately's speeches, which was then received with enthusiasm.—"A colony so founded would fairly represent English society; every new comer would have his own class to fall into, and to whatever class he belonged he would find its relation to the others, and the support derived from the others much the same as in the parent country. There would be little more revolting to the feelings of an emigrant than if he had merely shifted his residence from Sussex to Cumberland or Devonshire." And then, after devoting many pages to disparaging all other colonies and systems of colonisation, and promising a supply of labour and a state of refinement equal to that of an old colony, a considerable space is devoted to a description of the proposed country, particularly of Kangaroo Island, and its resources, with a list of probable exports. Seldom have more errors been propagated in so few pages, in so formal, so positive and so pompous a manner. The means of communication promised by the sea-coast remains unused to this hour, and Kangaroo Island is still a solitary waste. A day in Adelaide at any time from the founding of the city downwards would show how absurd were the following premisses:—"The price of land will take out the labourers free of cost to their employer, and will enable him to retain their services. It will be the first colony combining plenty of labour and plenty of land. The large produce of industry, divided in the shape of high profits and high wages, will not only make living high, but will cause the interest of money to be high, and will thus enable persons owning money, without engaging in any work, to obtain much larger and more effective incomes than their property yields in England; and will furnish a demand for such persons as surveyors, architects, engineers, clerks, teachers, lawyers, and clergymen." These were the inducements held out with eminent success to tempt men unfit for the toil of early colonisation to emigrate to a colony which was to be founded, not by slow degrees, but complete. The land was to be sold in England at such a fixed price as would, by preventing labourers from becoming landowners "too soon," preserve a "hired labour price," and secure high profits on good wages. The proceeds of the land sold were to be applied to supplying labourers with free passages, and thus a complete section of all the ranks and classes composing the parent State was to be transplanted, full grown, to the antipodes. In the commencement the commissioners found difficulty in selling the quantity of land, and raising a sufficient amount of the loan of £200,000, at ten per cent. authorised by the Government. But eventually these difficulties were overcome by the active assistance of G. F. Angas and John Wright, banker. Angas resigned his post as commissioner, and formed the S.A. Company, which commenced operations by purchasing a large quantity of land from the commissioners with certain special privileges. A sum of £30,000 completed the preliminary financial operations and

the first part of the colonising career of S.A. commenced. The company, which had obtained special privileges in consideration of their large and early purchase, lost no time in sending out a pioneer expedition with emigrants and officers to make preparations for carrying on every kind of pursuit considered likely to be profitable in a colony—farming, sheep-feeding, banking, building and whaling. After an experience of some years the company found reason to adopt the more profitable position of absentee landholders and land jobbers. Colonel Light was despatched by the commissioners in March 1836 with a surveying staff and a few emigrants; and when he arrived at the appointed rendezvous in Nepean Bay on 19th August he found three vessels of the S.A. Company, which had brought a body of emigrants who were settled on Kangaroo Island; and in November the *Africaine* arrived with the Colonial Secretary, a banking association and a newspaper. In July Captain Hindmarsh, the Governor, sailed from London in the *Buffalo*, a vessel of war, with a number of emigrants. All this was done before the commissioners had received any report as to the suitability of the district selected for supporting emigrants. Kangaroo Island, which had figured largely in prospectuses and speeches, was found to be unfit for colonisation, after time and money had been wasted by emigrants and the company in building and clearing. Colonel Light landed in the Gulf of St. Vincent, and after a survey fixed upon the site of the present city of Adelaide for the capital, and the present Port Adelaide for its harbour. It was then a narrow, rather shallow, creek, leading out of St. Vincent's Gulf. The landing was in a mangrove swamp, seven miles from the intended capital. Wharves, deep dredging, a solid road, and other improvements, have transformed the mangrove creek into a good harbour, not inconveniently distant from the capital, with which it is united by a railway. Governor Hindmarsh arrived on 28th December 1836; read his commission under a gum tree, in presence of about 200 emigrants and officials; and then, looking round, felt extremely dissatisfied with the selection made by the Resident Commissioner and the Surveyor-General. That he should have been dissatisfied with a selection which placed the capital in a picturesque but hot valley far from a port, and without the use of a navigable river, and that he should as a sailor have been forcibly impressed with the fearful cost of landing and conveying cargoes to the interior from such a harbour is not extraordinary; nevertheless experience has proved that the site was as good as any that could have been chosen, and art has corrected the defects of nature. Hindmarsh attempted to change the site of Adelaide. Differences of a serious character arose between him and the Resident Commissioner—the colony became divided into two parties, one of which supported the Governor and the other the Resident Commissioner. Both parties were greatly to blame.

Lord Glenelg settled the question by acceding to the request of the commissioners and recalling Hindmarsh. In the sequel the site of the capital to which Hindmarsh had objected was retained and almost all the officials, from whom he had experienced most vexatious and insolent opposition, were found either incompetent or corrupt and dismissed by his successor. The most serious evils that befel the S.A. colonists arose from the precipitancy with which emigrants were sent out before the Surveyor-General had reported whether the country was fit for settlement and before any preparation had been made, by roads, wharves, barracks, conveyances, surveys and importation of live stock, for employing or feeding emigrants. To replace Hindmarsh the commissioners recommended and secured the appointment of Lieut-Colonel George Gawler. At the same time Gawler was also made resident commissioner—*vice* Fisher dismissed—and thus united in his own person all the administrative powers of the colony. In order to obtain money to commence operations, before the colony had been surveyed or even settled, the commissioners issued "preliminary orders" as a bonus to the first purchasers and colonists at £72 12s. each, which entitled the purchaser to select, in a rotation settled by lottery, 120 acres of country land and one acre in the intended capital of the intended colony. This capital city before discovery or survey was settled by the commissioners to consist of 1200 acres or nearly nine square miles. As soon as the capital, Adelaide, had been selected and mapped the holders of preliminary orders forming the first body of colonists selected their sections, and the whole surplus was put up for auction to the colonists "as a reward for their enterprise," and sold at an average rate of £2 per acre. Thus, more than ten times the space that has ever been required was turned into and perpetually dedicated to building land. From that moment the great object of the first colonists became to magnify and sell to future colonists their building land in Adelaide. No crop was so profitable as land left in a state of nature, but called and sold for a street. The first operation having been performed, by which the future site of what was intended to be a great city had been transferred into the hands of a few persons, chiefly consisting of the friends of the commissioners and the officials of the S.A. Company, the next was to sell as much land as possible in England by giving English purchasers a decided advantage over those who, nevertheless intending to emigrate, declined to buy a pig in a poke. Accordingly land orders were issued at £80 each, which entitled the holder to select eighty acres of country land in the order dictated by the date of payment. Thus, when any particularly desirable plot of land was brought into the market, a speculation arose to discover and purchase the oldest "order" in the colony. A class of Adelaide brokers arose who dealt in and professed to put a value on these "scrip," according to their respective dates,

Sometimes an emigrant who had been months in the colony would be superseded by the holder of the land order of an absentee sent at the latest moment by ship letter. On one occasion the supposed discovery of a lead mine under an eighty-acre section sent up the earliest-dated order to a premium of £500. After all there was no lead mine; but the lucky purchaser being in command of the market made use of a later order, and reserved his £500 prize for future use. After five days of the week had been consumed by those who purchased "land orders" in England in selecting the best sections, on the sixth the colonising emigrant who had preferred seeing before investing, or the frugal labourer who had saved enough to work for himself on his own land, was allowed to take his pick of the refuse. Such parties were required to send in a sealed tender. A person tendering for several adjoining sections had the preference over a person tendering for a single section. Thus, in every way the cultivating colonist was discouraged and land-jobbing speculation invited. That no element of confusion might be wanting in the land arrangements of the model colony the commissioners devised, and Wakefield approved, the "special survey system," which enabled them to raise large sums of money, by offering special privileges to capitalists; and it proved most effective in England. Under this system a capitalist was entitled to have 15,000 acres surveyed in any part of the province on condition that he purchased not less than 4000 acres at £1 an acre. In S.A. there is a great scarcity of water, and good cultivable land lies only in patches surrounded by other land which is at best only fit for pasture. By judicious management the purchaser of a special survey could command all the water, and all the pastoral advantages of 15,000 acres, by purchasing 4000; the remainder, 11,000 acres, being useless to anyone else, fell naturally in his occupation at an average of 5s. 4d. an acre. To increase the mischief, purchasers of special surveys were permitted to establish secondary towns in addition to Adelaide, which was twenty times too large for the population; while the staff of surveyors were continually interrupted in their regular work, to the great injury of cultivating emigrants, in order to make these special surveys, at an expense often exceeding the total value of the purchase-money. In a very short time all the good land in the neighbourhood of Adelaide was monopolised by the absentee capitalists and proprietors of the S.A. Company. In a word, the whole system discouraged the proper pursuits of colonists, and propagated a spirit of land-jobbing which, by its apparent profits, very soon infected the neighbouring colonies and deceived the merchants, the legislature, and the colonial department of Great Britain. At an epoch in the existence of an infant state, when the first settlers ought to consist of a few gardeners, a few shepherds, a few farmers, and a few mechanics, with half-a-dozen men of superior attainments and

energy, and plenty of sheep and cattle, and when a village with a wharf was all the town needed, S.A. had nine square miles of building land, a bank, two newspapers, and a population of speculative gentlemen. In England, paragraphs carefully culled from S.A. land sellers' newspapers were circulated as accompaniments to advertisements in the English press, with the lectures and speeches of well-paid agents of the S.A. interest, combined to raise the colonising speculations and movements to fever pitch about the time that Colonel Gawler anchored in St. Vincent's Gulf.

IV. *Governor Gawler*.—Colonel Gawler arrived in S.A. on 13th October 1838, and was recalled in May 1841. Under his administration the colony attained the highest state of external prosperity; the population quadrupled, the port was filled with ships bringing imports and emigrants; public buildings, shops, mansions, and paved roads were constructed on land which four years previously had been a desert; wharves and warehouses on a swampy creek, which was converted into a convenient port; ornamental gardens were laid out, farms were cultivated, live stock was imported by thousands, the interior was explored, and the whole colony rendered more familiarly and favourably known to the intellectual portion of the British community than any other colony. But on the other hand, the land sales ceased, capital and labour emigrated, insolvency was universal, and the colony loaded with public and private debt, collapsed more rapidly than it had risen. The powerful party whose pecuniary interests as colonising philosophers were concerned in upholding the system on which S.A. was founded attributed the rise of the colony to the merits of their system, and its fall to the extravagance of Gawler. A slight examination shows that it was what is called the extravagance of Gawler which caused those sales of land, that export of emigrants, that speculation in building lots and houses, which was supposed to be prosperity. If a million sterling had been at the disposal of the Governor at the time when, to speak commercially, the Government stopped payment, the mania for land-buying might have been continued some time longer, but it must have stopped sooner or later, because the purchasers and sellers were producing nothing; and no amount of imported population and capital could have made the colony produce enough to pay for its consumption until time had been given to raise some staple article saleable in a foreign market. Wool cannot be produced, like calico or cloth, by steam power; for agricultural produce there was no foreign demand worth mentioning; the existence of mineral wealth was not suspected. When Gawler resigned his office into the hands of his successor, S.A. was in debt about £400,000, on account of the Government; the private debts of the colonists to English merchants were at least as much more. The utmost extent

of excess in Gawler's expenditure was £20,000, or five per cent. on the expenses. It always takes a considerable time to inoculate the English people with new ideas. About the time that Hindmarsh was recalled and Gawler sailed, the fruits of skilful agitation began to be reaped by the S.A. Commissioners. No unfavourable accounts of the new colony were allowed to appear in any organ of influence; flourishing reports of the beauty, the fertility, and the commercial importance of the new city were industriously circulated. Torrens, in lectures he delivered, stated and believed that the situation of the city of Adelaide would give it the same importance with respect to the valley of the Murray that New Orleans holds with respect to the valley of the Mississippi; the Murray, which in 1851 had not yet been navigated by anything beyond a whaleboat, and which a range of lofty mountains divides from Adelaide! An influential agent in the South Australian interest not only produced a magnificently-coloured plan of the new city, divided into streets and squares, but by a further stroke of imagination anchored a 400-ton ship in the Torrens opposite Government House—the River Torrens being a chain of pools in which the most desperate suicide would ordinarily have difficulty in drowning himself, and across which a child may generally step dry-shod! Thus land was sold, and emigrants were shipped off before the commissioners had time to receive further accounts from their new and trusted Governor and commissioner. Gawler being an amiable, enthusiastic, simple-minded, yet ambitious man, was dazzled with the idea of becoming the founder of a great, civilised, self-supporting community. He accepted the theories of Wakefield as immutable truths, and the calculations of the commissioners as the emanations of the highest financial ability. Confiding in the private assurances of the commissioners, he was cruelly deceived. Under the original plan of the colony the commissioners had calculated that an annual sum of £10,000, over and above any revenue to be derived from customs or local taxation, would be sufficient to defray all the governmental expenses of S.A. This calculation was founded on what they hoped to be able to raise, and not on the necessities of the case. In order to make it fit they fixed on an arbitrary number of officials at arbitrary salaries. The statements made in a despatch written by Gawler immediately after his arrival show that if he had been less zealous to carry out the views of the commissioners, and more cautious about his own personal interests, he would have at once brought the progress of colonisation to a stand-still, strictly followed his written instructions, and retired with his private fortune uninjured to his own profession. He found the treasury empty—the accounts in confusion. £12,000, being £2000 more than the whole amount authorised to be drawn for in England in the year, had been drawn in the first six months; a large expense was required for the

support of emigrants sick of fever and dysentery; provisions, wages and house rent were enormously high; custom-houses, police-stations, a gaol, and offices for transaction of public business were urgently required; a police establishment at colonial wages in the absence of a military force was indispensable; the commissioners in their calculations had omitted to provide for a post-master, a sheriff, or a gaoler—for letters, debtors, or criminals; the surveys were seriously in arrear; the head of the staff and all his attendants had resigned; the late Resident Commissioner and Accountant-general, the Colonial Treasurer, and several other officers were found insubordinate, irregular in their accounts, and grossly inefficient; it was necessary to supersede two of them peremptorily—almost immediately; all officials were dissatisfied with low salaries in the face of the high prices of provisions, house rent, &c. The Governor himself, with Mrs. Gawler, his children, private secretary, and servants were compelled to occupy a small hut and expend £1800 a year whilst receiving a salary of £800. With this imperfect machinery, and an empty treasury, a population of some four or five thousand souls, partly encamped on the site of the city of Adelaide and partly dispersed in pastoral pursuits over a tract of country one hundred miles long by forty miles broad, instead of being, according to the theories of the commissioners, concentrated on ten square miles engaged in reproducing English agriculture, had to be governed, customs dues and debts had to be levied, criminals imprisoned, and aborigines repressed. As to the prospects of the colony and the character of pursuits of the colonists, the inspector of the Australasian Bank at Sydney wrote to his directors in October 1848, about the time Gawler landed:—"I venture to express my fears that the price received for the sale of land will be found insufficient to pay for the transplantation and government of emigrants; and unless funds be provided by the British Government it will be impossible to provide for the administration of police and law. There appears also to have been a great want of experience and decision in directing the energies of the colonists to that source from which alone they can hope to rise to wealth or prevent themselves from sinking into poverty until an article of export be produced in considerable quantity; as otherwise the funds of the colonists must be expended in paying for articles of import and luxuries considered as necessities of life. Wool is the only article of export that can be produced, and on this subject the colonists seem as supine as they have been eager to purchase town allotments and build houses, giving the place what seems to me a false appearance of commercial prosperity. Had it been left to me I should have delayed establishing a branch bank until I could be sure there were at least 100,000 sheep in the settlement, and that provision was made for the efficient administration of the law." The new Governor,

full of colonising enthusiasm and innocent of colonial or commercial experience, was dazzled by the building activity which had excited the serious apprehensions of the experienced bank manager. He found a large body of educated and intelligent men, who had encamped on the site of the city of Adelaide, all hopeful, active, speculating, dealing with each other and with each party of newly-arrived emigrants, full of magnificent plans for every sort of investment, in markets, warehouses, arcades, ship-building and whaling. A bit of painted board nailed to a tree created a Wakefield, a Torrens, an Angas, or Whitmore-street. All the notabilities of the S.A. interest were thus immortalised. Each speculator having so large a space to deal with, endeavoured to draw the tide of trade or fashion into his own locality, and thus, instead of one compact village, as near as possible to the port, tents, wooden huts, pisé huts, wooden houses imported from England, shops of slabs, brick, and stone, and elegant cottages, surrounded by iron rails, were scattered over a vast park of 1130 acres. Those who had not been able to secure town lots at prices to their mind proceeded into the suburbs, where at one time, with the aid of surveyors' pegged lines, not less than thirty villages were founded for sale to those who could not afford to give the city price; others were building mansions, laying out pleasure grounds, and even contemplating deer parks. The climate was delightful, the valley of the Torrens fertile; and emigrants of capital poured in, burning to commence realising the golden dreams they had enjoyed during a three months voyage. Gawler was carried away by the stream. The very confusion in which he found public business, the inefficiency of all the officers selected by the commissioners, the backward state of the surveys, were to a certain extent an encouragement, because he sanguinely contemplated that if so much had been done under no system or the worst possible system of administration, when no accounts were kept—when the Governor and the Resident Commissioner held rival public meetings, and the Colonial Secretary and Colonial Treasurer fought in the streets—how much more might be done under an orderly, regular Government such as he lost no time in establishing? He proceeded to supersede the incompetent officials, to bring all the Government business into a regular form, to press on the surveys, and to make proper arrangements for the reception of the emigrants into barracks and the numerous sick of ship-fever and dysentery into an hospital. In order to obtain a revenue from customs dues, to keep down illicit distillation and protect the public from criminals, it was necessary, as Colonel Napier had foreseen, to raise a police. As labourers were worth from 10s. to 15s. a day and indifferent horses cost £50 each this was an expensive affair, but by giving a tasteful uniform and making the appointment rather honourable he succeeded in obtaining a highly respectable body of men,

including some poor gentlemen, at 5s. a day. The port on Gawler's arrival was a narrow swamp, through which for seven miles emigrants dragged their luggage and merchandise. Under his arrangements a road was constructed, and wharves and warehouses erected. He built a Government House of no extravagant pretensions, but which nevertheless cost from the price of labour and materials, £20,000; and he also built custom-houses, police-stations, and other public buildings, which were indispensable for transacting public business. He expended a large sum in protecting and endeavouring to civilise the aborigines. He contributed to two expeditions which were unsuccessfully made by Eyre in search of tracts of fertile country. To every charitable claim his purse was open; while his hospitalities were on a liberal scale. The result of his measures was to give an extraordinary impetus to the apparent prosperity of the colony. The brilliant reports of public and private buildings in progress, building land sold at £500 and even £1000 an acre, of balls, fêtes, pic-nics, horticultural shows, reproduced in England, tempted men of fortune to emigrate, capitalists to invest and merchants and manufacturers to forward goods of all kinds on credit. Port Adelaide was crowded with shipping which discharged living and dead cargoes and departed in ballast. When 14,000 colonists had arrived, in the fourth year after the foundation, scarcely a vestige of an export had been produced. The land sales and the custom-house receipts rose to enormous amounts. In the midst of a career of infatuation by which some money lenders realised fortunes and hundreds were entirely ruined, there were men of considerable fortune who endeavoured to realise the Utopia they had been taught to dream of in England and introduce the comforts and the scientific cultivation of an English country gentleman as sketched in Wakefield's letter from Sydney. These gentlemen purchased what in English eyes appeared considerable tracts of land; loaded ships with furniture, with curious, useless agricultural implements, with live stock of choice breeds; brought domestic servants, labourers, and even tenants, and landed intent on making, according to the cry of the hour, the "desert blossom like the rose." The example of one gentleman will exemplify the case of scores of his class, although less wealthy, who sank and died without notice in other colonies or in England. He possessed an English estate which brought him in about £1000 a year. Fascinated by Gibbon Wakefield's writings he sold his estate, and landed in S.A. with an extensive land order, built a house of no great size or comfort at a vast expense, fenced in a farm, and began to cultivate; but the cheap labour promised in the commissioners' pamphlets was no more forthcoming than the roads. He soon found that he was sowing shillings to reap halfpence. After spending a great deal of capital he gave up farming in disgust, and went to live in Adelaide; there,

thrown constantly among the company of speculators, having a considerable balance at his banker's, he was inclined to do as everybody did, and speculate. He lost everything, at middle age returned home with his family penniless, and, after living a few years dependent on the bounty of his relations, died broken-hearted, a victim of the "sufficient price" delusion. Among the successful there were scarcely any of the head-working, white-handed class, but a number of hard-working, frugal men, who, landing without a penny, accumulated enough by labour to purchase a good eighty-acre section, and there, by growing vegetables and wheat, rearing pigs and poultry, with the help of their wives and families, thrived steadily, and made money, in spite of the system which was intended to retain them for an indefinite time as labourers at some three shillings a day. These people often derived considerable advantage from sections of land adjoining their own being the property of absentees. On these sections they were able to pasture their live stock without expense. Where labourers could not afford to buy a whole section they clubbed together and divided one; for free men will have land whenever agriculture is the only manufacture, and no protective laws can prevent them. It was these cottier farmers and a few sheep squatters who saved the colony from being totally abandoned when the inevitable crisis came. A Scotch gentleman of ancient lineage and no fortune afforded an instance of what may be done in a colony by industrious hard work, with the help of a large family, without that capital which, according to theorists, it is indispensable that a landowner should possess. He arrived in the colony very early, the owner of a single eighty-acre section, with twelve children, one half of whom were stout well-grown lads and lasses: his whole property consisting of a little furniture, a few Highland implements, a gun or two, a very little ready money, and several barrels of oatmeal and biscuit. His section had been selected for him previous to his arrival. It lay on the other side of a steep range of hills, over which no road had then been made, ten miles from the town. He lost no time and spent no money in refreshing or relaxing in Adelaide; he found out a fellow-countryman who lent him a team of oxen, dragged his goods over the hills to his land, and encamped the first night on the ground, under a few blankets and canvass spread on the brush. The next and successive days the family worked at cutting trees; there was timber plenty for building a house. This house, situated on the slope of a hill, consisted of one long, low, wooden room, surrounded by a dry ditch to drain off the rain, and divided into partitions by blankets. The river lay below; any water needed was fetched in a bucket by one of the young ladies. A garden, in which all manner of vegetables, including tobacco and water melons, soon grew, was laid out almost as soon as the house; an early investment was made in poultry, they requiring

no other food than the grasshoppers and grass-seeds on the waste land round. Until the poultry gave a crop of eggs and chickens the guns of the lads supplied plenty of quail, ducks, and parrots. In due time a crop of maize, of wheat, and of oats was got in. Before the barrels of oatmeal were exhausted, eggs, chickens, potatoes, kale, and maize, afforded ample sustenance, and something to send to market. Labour cost nothing, fuel nothing, rent nothing, keeping up appearances nothing; no one dressed on week days in broad-cloth, except the head of the house. First a few goats, and then a cow, eventually a fair herd of stock were accumulated. Butter and vegetables found their way to Adelaide; and while the kid-glove gentry were ruining themselves, the bare-legged boys of the Highland gentleman were independent, if not rich. It is certain that every shilling taken from industrious settlers like this Scotch family under pretence of supplying labour, was money unprofitably invested, as it would have fructified more rapidly in their own hard hands. A lady who landed at Port Adelaide a few months after the Governor, in a letter describes the then "dreary appearance of the shores; the anchoring of the ship in a narrow creek where, as far as the eye could reach, a mangrove swamp extended; disembarking from a small boat into the arms of long shoremen upon a damp mudbank under a persecuting assault of mosquitoes." On this mudbank lay heaps of goods of all descriptions half covered with sand and saturated with salt water, broken chests of tea and barrels of flour, cases of hardware, furniture of all kinds, pianos and empty plate-chests, ploughs and thrashing-machines. A little further at the commencement of the "muddy track which led to Adelaide, bullock-drays stood ready to hire for conveying our baggage. The lowest charge for a load was £10. All along the side of the track were strewn baggage and broken conveyances, abandoned in despair by their owners. We stopped at a small public-house to get a little refreshment. For a cup of tea, with brown sugar, bread, and oily butter full of insects, we paid 4s. 6d. each. The butter seemed spread with a thumb. Our troubles partly vanished when we reached the beautiful site of Adelaide, where it almost seemed as if a large party of ladies and gentlemen playing at gipsying had encamped. This was the third removal of some who had pitched tents on Kangaroo Island, then built huts in Holdfast Bay, and finally took up their abode in the city of Adelaide. Several times, before the small, bright green, highly ornamented wooden summer house which had been engaged for us, our carriage had like to have been upset over stumps and logs. Every one we met seemed in the highest spirits; and it was more like a walk in Kensington Gardens than in a colony scarcely two years old." This contemporary description affords a key to much that is singular and contradictory in the early accounts of the foundation of S.A. There was a charm

about the gipsy encampment of Adelaide, with its wild speculation, perpetual excitement, liberal hospitality and charity, constant succession of new faces, splendid luxuries and curious shifts, to which the survivors look back with the feelings of a mariner to the months he spent with jolly companions on a desert island, the difference being that in the one case the shipwreck preceded, and in the other followed the jollification. Gawler held a little court, which was graced by the uniforms of the officers of the volunteer corps, a corps which consisted of some two dozen officers, from a cornet to a brigade-major, and four or five privates. There were courtiers, too, and ladies in plumes; there were fashionables and exclusives held to be the *crème de la crème*; there was an aristocracy composed of the principal officials; there were balls, to be invited to which great manœuvres were practised. It was a life like that of one of the little courts of Germany with more heartiness, in consequence of the constant arrival of friends from England. The town lots of Adelaide formed the great *rouge-et-noir* table. The climate rendered out-of-door life delightful, the imaginary streets swarmed with well-dressed crowds; so much really good society, so many fashionable men, had never before been found in a colony; everyone fancied himself the hero of a great enterprise, and enjoyed all the pleasures of gambling, while dreaming that he was helping to found an empire. In the morning the men dashed about on horses, in dog-carts, barouches and four-in-hands, which cost fabulous sums, in search of eligible sections and sites for villages. In the evenings grand dinners were given in tents and huts, where champagne and every luxury that could be preserved in a tin case abounded; fashionable dance music and the songs of Rossini and Donizetti resounded from the cottages of the "great world;" and at cock-crow beaux in beards and white waistcoats, "half savage, half soft," might be met picking their way, in the thinnest, shiniest boots, through the dust or mud of a projected crescent or arcade. There was scandal written and spoken; political intrigue; a court party and an opposition, with each a newspaper; and everybody flattered everybody else that building, dining, dancing, drinking, writing and speechifying "was doing the heroic work of colonisation." Young men of spirit were not satisfied to retire into the bush and look after a flock of sheep while it was possible to buy a section of land at £1 an acre, give it a fine name as a village site, sell the same thing at £10 an acre, for a bill the bank would discount, and live in style at the Southern Cross Hotel; for when a man had made such a speculation he could not and did not do less than invite a party of new-made friends to celebrate his good fortune by a dinner, a ball, or a picnic, with a few cases of champagne imported by the merchant on credit. At this period a romantic air was infused into the simplest transactions. For instance, in the old colony exploring expeditions

had been undertaken either by a government surveyor who marched out from some remote station without any special demonstration, or by a squatter who, with a friend or two, a stockman, and perhaps a couple of black boys, all on horseback, set out as quickly as possible to find new pastures for his stock. In S.A. they managed things very differently. Eyre having undertaken to explore the interior of the province, on the day appointed for his setting out a grand entertainment was given, over which the Governor presided. At the close of an affecting speech a band of young ladies clothed in white garments marched up the room and presented, amid the cheers of the men and the sobs of the women, a banner which they worked to be planted on the limits of his proposed discovery. Eyre's journey and a second expedition proved the hopeless barrenness of a great part of the province. He afterwards became Lieutenant-Governor of the settlement of Nelson in N.Z. During the administration of Gawler important assistance was afforded to the colonists by the arrival of the overlanders who, led by love of adventure and hope of gain, found their way from the bush of N.S.W. and Port Phillip across inhospitable deserts, over precipitous hills, through dense forests, rivers, and swamps, and in spite of tribes of fiercely hostile savages, brought flocks of sheep and mobs of cattle and horses to the South Australians at a time when butchers' meat was rising to famine price, when a good pair of bullocks could earn £60 a week in working from the port to the city, and horses which had arrived from V.D.L. after a long voyage of alternate calms and adverse winds, mere skeletons covered with sores, were sold as a favour at £100 each. The overlanders saved the colony from total abandonment during the first crash of insolvency. The strength of Australia is in her pastures; sheep to the Australian, before the discovery of copper and gold, were what the pine-tree was to the Highland laird, who on his death-bed said to his son, "Jock, be aye putting in a tree; it will be growing while ye are sleeping." The natural pastures and the climate grow the wool, and men can be shepherds who have neither strength to fell timber, nor power or skill to plough, to sow or thrash. Besides, a pack of wool is always worth cash, while a bushel of wheat may be worth ten shillings one year and nothing the next; in the worst of times ewes go on breeding and increasing, while a field allowed to go out of cultivation under an Australian climate, after devouring all the capital spent on reclamation, very soon becomes as much waste as before the plough turned the first furrow. The overlanders who brought these invaluable animals were many of them men of education; the enormous profits reaped by the first parties, in spite of the loss of both men and beasts by drought and skirmishes with the blacks, made the overland route a favourite adventure with the young bushmen. They brought with them, as well as live stock,

"old hands," who taught the cockneys how to fell a tree and make a fence, and sometimes gave the Gawler police a good deal of trouble. The gentlemen overlancers affected a banditti style of hair and costume. They rode blood or half-bred Arab horses, wore broad-brimmed sombreros trimmed with fur and eagle plumes, scarlet flannel shirts, broad belts filled with pistols, knives, and tomahawks, tremendous beards and moustachios. They generally encamped and let their stock refresh about 100 miles from Adelaide, and then rode on to strike a bargain with their anxious customers. Before the journey became a matter of course, the arrival of a band of these banditti-looking gentlemen created quite a sensation—something like the arrival of a party of successful buccaneers in a quiet seaport, with a cargo to sell, in old Dampier's time. In a few days the stock was sold; the overland garments were exchanged for the most fashionable costume which the best Hindley-street tailor could supply; and with hair brushed, oiled, and arranged after Raphael or Vandyke, the overlander proceeded to spend freely the money he had so hardly gained, and, as one of the lions of the place, to cast into the shade the smooth political economists and model colonists fresh from London. New arrivals from England, fortunate enough to be admitted to the delightful evening parties given by a lady of the "highest ton," the leader of the Adelaidean fashion, were astonished when, to fill up basso in an Italian piece, she called on a huge man with brown hands, brown face, and a flowing beard, magnificently attired, in whom they recognised the individual they had met the day before in a torn flannel jersey, with a short black pipe in his mouth. The overlancers included every rank, from the emancipist to the first-class Oxford man. By the end of 1840 they had introduced nearly 50,000 sheep into the colony, and taught the wiser colonists the necessity of looking to pastoral pursuits for the safe investment of capital. The trade of turning wild land worth a few shillings an acre into building sections, to be sold at from four or five pounds to one thousand pounds an acre, by the simple expedient of a few pegs and a coloured plan, was too good to be monopolised by S.A. The Government and private speculators followed the ingenious example in N.S.W. and Port Phillip; while in England a dozen schemes were started under the patronage of names as respectable as those who patronised the South American mines of 1824, for colonising N.Z., the Chatham Islands, New Caledonia, the Falkland Islands, and other countries having the advantage of being very distant and almost unknown; all to be divided into "town, suburban and country lots," to be sold in England at a "sufficient price." The competition of these new bubbles, home and colonial, diverted the attention of intending colonists from S.A., where the high price of town lots left but small margin for profits or premiums. Besides, in those epochs of speculative frenzy which periodically

recur in England, unknown schemes have a certain advantage. About the end of the second year of Gawler's administration, the resources of S.A. as an investment for capital were partly known, while, as nothing was known about the resources of N.Z., not even whether there was any available land there at all, it became an excellent and fashionable subject for speculation. Gawler piteously complained in some of his despatches of the misrepresentations of rival colonists, and of parties who, after a very partial inspection of the port and coast, had departed, exclaiming, "All is barren!" But the fact was, that the capitalists who had landed found no advantageous opening for the investment of capital; town lots had been driven up to an enormous premium; the cultivation of land did not pay, and has never paid the employer of labour on a large scale in any new country. Wool-growing and other pastoral pursuits were more profitable in Port Phillip and the new districts of N.S.W.; besides, under the forcing system enough land, supposing it all fertile, had been sold to support a population of 200,000. The population of the colony was 15,000, of whom 8000 were settled in Adelaide gambling with each other. As for the labourers they were partly employed in waiting and working for the white-handed emigrants who had come out under Wakefield's advice "to labour with their heads, not with their hands," and who therefore required more work done for them than old-fashioned colonists who were not ashamed to mend their own tools or carry their own packages, and partly in executing works for the Government and for the S.A. Company. A considerable number were in the hospital and others were working at such sham labour tests as drawing fallen timber from the park to be used for fuel in the Government offices. It had been found impracticable then, as in all subsequent attempts, to carry out the scheme of obtaining recruits for free passages "exclusively of young married couples not exceeding twenty-four years of age." The parties charged with supplying the quota of labourers required for the ships so recklessly despatched to S.A. completed the number by a percentage who from age, feebleness, or unfitness for colonial labour became almost immediately chargeable on the Government. All who were shipped, if able to work, claimed under their shipping order a minimum of five shillings a day. When more houses had been built than could be let—when the capital, of which a large portion was exported for the importation of labour which it was impossible to employ profitably, began to grow scarce—the price of land orders fell, and the rate of wages. Then the frugal labourers began to retire from service, to settle down on purchased sections, and combine to purchase and divide sections of eighty acres, to the disgust of the hired-labour and sufficient-price theorists. In England the large draughts of the Governor, in conjunction with the falling-off in land sales, had driven the commissioners to endeavour without success to negotiate

the remainder of the loan authorised by their two Acts of Parliament, and then to apply for assistance from the Treasury, which was in the first instance granted to a limited extent. In the colony Gawler was travelling down a declivity, and could not arrest his course. When he found the commissioners could no longer meet his bills he drew upon the Treasury for the expenses of government. The first bills were met; but eventually a series of draughts, to the amount of £69,000, were dishonoured. The commissioners, who had been perfectly content with Gawler as long as the public continued to purchase land, fell upon him like a herd upon a stricken deer, repudiated acts to which they had given tacit approval, and tried to throw the failure due to their absurd plan and improvident conduct on "the Governor's extravagance." He was recalled abruptly and left to hear of the dishonour of his bills by a circuitous private source. The commissioners themselves were soon after dismissed. When the news of the dishonour of the Governor's bills reached the colony the bubble burst, land became unsaleable, insolvency all but universal followed, from which the banks, from early private intelligence, were able to protect themselves. The chief sufferers were English merchants, shippers, and manufacturers. The colonial speculators had long been trading on fictitious capital. A certain number of colonists of fortune were reduced to absolute beggary. A rapid re-emigration of capital and labour took place. Many labourers were thrown on the Government for support. The price of food, rent, and wages fell rapidly. Adelaide became almost a deserted village. The only persons busy were officials whom the commissioners had forgotten to appoint, viz. the sheriff and his officers engaged in pursuing beggared debtors, and the Judge of the Insolvent Court, by whom they were rapidly "whitewashed." Gawler retired, after having sacrificed a considerable private fortune to his faith in an impracticable system, and became the scapegoat for the errors of the colonising theorists in London. But his hospitality, his charity, his truthfulness, his genuine kindness of heart, rendered him respected and beloved in S.A., especially among the working classes. He was succeeded by Captain Grey who, happening to be in London at the time Gawler was recalled, and able to afford the Colonial Office some information about the colony, received and accepted the office of Governor. From that day it has been the endeavour of the theorists to charge to the extravagance of Gawler the inevitable result of an attempt to plant a colony without the preparations dictated by common prudence—to regulate the flow of capital and labour—and to raise revenue and profits from the application of capital and labour to unproductive works. The commissioners sent shiploads of colonists, where had they been wise they would have sent sheep.

V. *Governor Grey*.—When Gawler retired land became unsaleable, emigrants ceased to arrive, and of those who were in the colony a large per centage

re-emigrated to colonies where there were more cattle and fewer town lots. The population of Adelaide diminished in twelve months to the extent of 4000 souls. The price of everything fell fifty per cent.; whole streets of Gouger's and Stephens's cottages stood empty; the S.A. merchants who had paid their English creditors in the Insolvent Court ceased to be trusted with speculative shipments; the police horses were turned to graze on the beautiful gardens constructed by Gawler on the banks of the Torrens; Government House, late the scene of the Vice-royal entertainments, was closed; the little world of Adelaide recovered its senses and lost some of its conceit; and the sober and industrious were able to survey and take stock of the true position of the colony. The raw materials of colonisation had been provided, a road had been constructed from the port, others toward the interior had been marked out and made practicable. Land suitable for cultivation had been discovered, surveyed, and handed over to land purchasers, who had now no temptation to stay in town if they meant to remain in the colony; labourers were willing to take reasonable wages, or ready to set to work for themselves with hearty good will; and what was most satisfactory of all, live stock by importation, by overland, and by natural increase, afforded an ample supply of meat at reasonable prices, with a certain and increasing quantity of wool and tallow for exportation. Impoverished gentry were now happy to fall back from imported fresh salmon, or ducks and green peas in tin cases at fifty per cent. above the Piccadilly tariff, upon native poultry, at almost nominal prices. During the land mania geese imported from V.D.L. sold at 12s. 6d. each, fowls 5s. a head, and everything else in proportion. In 1842 country people used to drive a cart filled with live poultry, fowls, ducks, geese, turkeys, in fair condition, covered over with a sheet, and sell the whole lot at from fourteen to sixteen shillings. Under the bountiful, genial climate of S.A. actual want was unknown and industry produced immediate results. Grey's task was easy. The famine or speculative prices of labour and provisions had fallen to reasonable rates, the emigration of paupers had ceased, and with the immigration the cost of maintaining the infirm, the sick, and the lazy. The unhired were set to work at such bare wages as induced them to seek private employers as soon as possible; the surveys were carried on steadily without pressure, and without exorbitant expenses for stores and hire of drays; and the police expenses were partly superseded by the arrival of a company of soldiers granted to Grey, although indignantly refused to Napier. With these reductions of expenditure, and power to draw upon the Home Government for a limited sum, Grey was still unable, in homely phrase, to make both ends meet; but the colony survived and vegetated in a sort of obscurity, which contrasted painfully with the brilliancy of its early, brief, blooming hothouse career. In the meantime

the model colonists were not idle in England. On 7th July 1840 the colonisation commissioners for S.A. brought under the notice of the Colonial Secretary (Lord J. Russell) the embarrassed state of the finances of the colony; and in August they reported that the revenue of the colony did not much exceed £20,000 per annum, and the current expenditure had risen to £140,000. Under these circumstances the Secretary of State, by letter dated 5th November 1840, undertook to guarantee a loan of £120,000 to be raised by the commissioners; but negotiations to raise this loan failed. In the same year the original commissioners were dismissed. In February 1841 a select committee of the House of Commons was appointed to consider the South Australian acts and the actual condition of the colony. The inquiry lasted until 10th June. A long array of witnesses were called on behalf of the Colonial Office and the S.A. interest. Personal and documentary evidence proved in the clearest manner that the Colonial Office had given every reasonable assistance to the commissioners and were in no manner responsible for the blunders of the commissioners or the commissioners' agents. The S.A. interest, including non-resident purchasers of vast tracts of land and Gibbon Wakefield and his disciples, were examined at great length, but not a single representative or settler from any of the colonies whose interests were likely to be affected by the decisions of the committee was called. The case for S.A. was "got up and worked," in railway phrase, by Wakefield and Torrens, and all the colonial evidence was made to fit their peculiar views. The committee made two reports. In the first, on 9th March 1840, they stated "that at the present moment the sales by the colonisation commissioners of land in the colony are suspended, emigration has ceased since the month of August, the bills drawn by the Governor have been protested, the estimated amount of such bills already due and in progress is £97,000, the amount due to parties in England for services performed is £56,000; the debt from the revenue to the emigration fund is £56,000; making a total deficiency of about £210,000." In the second report they entered into the history of the colony in detail, in the course of which they said—"With regard to Colonel Gawler, it is impossible to doubt that when he entered on the duties of his office, they were in a state of the greatest confusion, and that the difficulties he had to contend with were most embarrassing; that shortly after his arrival in the colony he represented these circumstances, and gave the commissioners reason to expect a considerable excess of expenditure above what had been provided; that among those witnesses who have most decidedly pronounced his expenditure excessive, none have been able to point out any specific items which could have been reduced without great public inconvenience, while the chief item of expenditure, incurred on account of the government house and public offices, was one that the late board

had authorised. The commissioners had originally set apart a sum of £10,000 annually over and above the revenue, out of which they intended that all the ordinary expenditure should be defrayed. It is now calculated that after spending the whole local revenue and providing otherwise for the charge of surveys, which has hitherto been defrayed by drafts upon the commissioners, and without making any allowance for public works there will still remain to be provided for an annual deficit of about £40,000." But the committee, as experience proved, were more correct in their statement of facts than fortunate and sagacious in proposing a remedy. Having unsuspectingly received all Gibbon Wakefield's assumptions and assertions as incontrovertible economical truths they proceeded to recommend by resolutions, amongst other things, that all land be sold by auction at a minimum upset price, except special surveys of 20,000 acres; that "the minimum price of land in S.A. may safely be raised above the present amount of £1 an acre; and that in fixing such amount it is desirable to keep in view the principle of maintaining such an amount as may tend to remedy the evils arising out of a too great facility of obtaining landed property, and a consequently disproportionate supply of labour and exorbitant rate of wages." At that time the committee were firmly convinced that they could regulate the rate of wages by the price of land; and Lord Howick (afterward Colonial Secretary as Earl Grey) then a pupil of Wakefield's, moved as an amendment to the above-quoted resolution, "That one minimum price for land in all the Australian Colonies ought to be established, and that this price ought not to be lower than £2 per acre, and that it ought to be progressively increased until it is found that the great scarcity of labour now complained of in these colonies no longer exists." The fallacy of these assumptions has been rendered as patent as another favourite assumption of the same period—that the price of corn in England regulated the rate of wages. Ten years' experience proved that the highest rate of wages may exist in the face of a price of land so high as to exclude all but a very small number of purchasers; and in that ten years the Home Government, in the face of a ruinous rate of wages, were unable, although willing, to raise the price of land in Australia. The sale of land ceased, except in the immediate neighbourhood of towns, in choice situations, and where mines were supposed to exist. But in 1841 colonial opinions were treated with contempt. Lord Stanley and Lord Grey, dazzled by the land purchases of speculators in N.S.W., Port Phillip and S.A. fancied that the Government had an inexhaustible treasure for emigration and patronage in the waste lands of every colony in the British dominions, from the Sugar Loaf Hills of N.Z. to the wild wintry moors of the Falkland Islands. Two acts brought in and carried by Lord Stanley, Colonial Secretary in the session of

1842, embodied the recommendations of the committee and arranged for the future government of S.A. By one a minimum price of £1 an acre, with sale by auction, except in the case of special surveys of 20,000 acres, was imposed on all the Australian Colonies, including V.D.L. Against this act the colonists, who were never consulted, never ceased to protest. By the other act S.A. was transferred from the management of commissioners to the Colonial Office, and its debts were arranged in the following manner:—The whole debt amounted to £405,433; of this, £155,000, which had been granted by Parliament in 1841 for passing exigencies was made a free gift; £45,936, of which £17,646 had been incurred by Governor Grey in maintaining unemployed emigrants was to be paid by the Treasury; and the remainder was converted into debentures, partly guaranteed by the Government and partly charged on the colonial revenues. It may be convenient to state here that renewed sales of land, after the discovery of copper mines, paid off the greater part of these debts, with interest, between 1845 and 1849, with the exception of the £155,000. On the passing of this Act S.A. sank into obscurity, and in spite of the vigorous efforts of the company, which found itself in possession of large tracts of land that could neither be sold nor let to rent-paying tenants, ceased to attract the attention of emigrants. Great bankers and capitalists who had been induced to purchase lots of land wrote them out in their books as value *nil*. So late as 1850 there were parties in the city of London who had forgotten that they held some thousand acres in S.A. until reminded by an application to purchase from returned colonists. In very rare cases had the investment in rural land at £1 an acre turned out profitable. Dover, the quietest and least enterprising of towns, contributed by public subscription, in 1837-8, one emigrant to S.A. The fortunate man no sooner arrived, with nothing to lose than, carried away by enthusiasm and the persuasions of the Colonial Secretary, he became the purchaser of a thousand acres of land, and boldly drew upon two of the gentlemen who had charitably sent him out, advising them of the favour he had done them and promising to remit in due course the title-deeds. The good Doverians on the arrival of the tremendous bill, held a consultation, learned the total ruin that would fall on the drawer if it were returned protested, wishing too not to have the one Dover emigrant disgraced, and perhaps a little dazzled by the brilliant reports of fortunes daily realised in Australian land, made a round robin of £100 apiece, met the bill, in due course received the grant, and from that time forward never heard a word of the emigrant or the land. The following figures will show the results of the self-supporting, sufficient-price colony:—

REVENUE AND EXPENDITURE.

Government Expenditure.		Revenue.	
In 1840	... £169,966	...	£30,199 11 1

Government Expenditure.		Revenue.	
In 1841	... £104,471	...	£26,720 15 11
1842	... 54,444	...	22,074 4 6
1843	... 29,842	...	24,142 1 2

STATISTICAL SUMMARY OF SEVEN YEARS OF THE SOUTH AUSTRALIAN COMMISSION.

South Australian Act, 4 and 5 Wm. IV., cap.			
95, Royal Assent	1834
Commissioners Gazetted	...	5th May,	1835
Colonel Light & Surveying Staff	...	March,	1836
Governor Hindmarsh and first party of Emigrants sailed	...	30th July,	1836
Governor Gawler	1838
Area of Adelaide, $\frac{1}{2}$ miles N.E. to S.W., 4 miles N.W. to S.E., 700 acres, 432 acres.			
Population 8000	1839
Port opened	...	17th May,	1840
Governor Gawler recalled	1841

	Acres.	£	s.	d.	Emigrants Landed.
1835 Land sold	58,995	at 35,417	5	0	...
1836 "	1,680	" 1,378	0	0	941
1837 "	3,120	" 3,140	0	0	1,279
1838 "	37,960	" 37,960	0	0	1,938

	157,291	£133,431	5	0	15,030
Shipping, 1839—190; Ships tonnage, 40,000.					

ACRES IN CULTIVATION.			
Year.	No. of Proprietors.	Acres.	
1840	2503
1841	6722
1842	...	873	19,790
1843	...	1300	28,690
In 1844 the sheep in S.A. were about 400,000			
" Cattle	30,000
" Horses	2000
In 1840, writs from S.A. sheriff's office			
1844, only	10
1842, fiats of insolvency	37
1844	10

Thus it appears that between 1837 and 1840, 15,000 inhabitants who were importing provisions at the rate of £200,000 per annum only cultivated 2000 acres; but in three years after they had abandoned land-gambling, and lost all credit in the English market, they had 28,000 acres in cultivation, of which 23,000 were in wheat, and the number of landed proprietors had nearly doubled. But the result of this industry proved that, although much misery would have been saved the colony had agriculture occupied the colonists instead of land-gambling, still agriculture could not be carried on with profit with hired labour in the colony, for in 1843-4 wheat fell to 3s. 6d. and even 2s. 6d. a bushel, with wages at least 3s. a day; while V.D.L. with better soil and climate for wheat growing, and cheaper labour, could not afford to grow wheat for less than 4s. or 5s. a bushel. In fact the South Australians found

themselves in possession of 200,000 bushels of wheat which was absolutely unsaleable although of admirable quality ; and in June 1845, after exporting 200,000 bushels, chiefly sold at a loss, a surplus of 156,000 bushels remained. Of wool there were only 5000 bales to export in 1843. Port Phillip, colonised with sheep and shepherds at the time that model colonists were forwarded to Port Adelaide in thousands, exported 9000 bales in 1841 ; and in 1843 enjoyed exports to the amount of £307,000 without a shilling of debt, against S.A. exports of £46,000 and £400,000 debt. In 1843 the results of the erroneous system on which S.A. was colonised began to disappear. The ruined capitalists were forgotten, so too were the debts due to the Home Government and home creditors. Those who had been able to weather the storm of insolvency and keep a few sheep had retired towards the interior : there dispersed, they were able to live cheaply, to carry on their business with little hired labour, and to look forward with confidence to an annual income from the clip of wool, and annual increase of wealth by the natural increase of their flocks. Thus in 1843 S.A., formed with so much preparation, the subject of so much printing, colonised by a superior class, forced forward by an enormous expenditure of public and private capital, instead of presenting a picture of a contented population, divided into capitalists and labourers engaged in scientific agriculture, owed all its exports to dispersion after the manner of neighbouring colonies, whose "barbarous manners" had been so much contemned, and presented a picture of cottier farmers, vegetating in obscurity, content to live with few comforts, without rent or taxes. Some squatted on land the property of absentees, many more as tenants not paying any rent, whom the landlords were glad to retain in order to keep their land in condition. The tenants of the company were in this state. Looking back at the condition of S.A. after it had ceased to attract the importation of capital, there can be no doubt that if it had been as far from the old ports of the colonies as Swan River, and out of the reach of expeditions of overlanders, it would have sunk even to a lower ebb than W.A. When land-jobbing had been exhausted, and all the schemes hatched in England for employing capital had been tried and found wanting, an accident revealed to the colonists the existence of a treasure which even the sanguine promoters of the colony had never suspected or suggested. They had placed coals, marble, slate, and precious stones among the probable exports ; but copper and lead had not entered into their calculations. In 1841 a little lead ore was discovered and sent to England. In 1843 Mr. Dutton, the brother of a gentleman of some means, but who had himself been compelled by the general depression to accept the situation of sheep overseer, accidentally discovered, and in partnership with Captain Bagot became the purchaser of the eighty-acre

section which included the Kapunda mine. Other mines were subsequently discovered but the great event, the turning-point of the fortunes of S.A., was the discovery of the Burra Burra mine, which alone furnished for five years more than four-fifths of the S.A. exports. The discovery of the Kapunda Mine set all the colony hunting for mineral outcrops ; the residue of the land jobbers took up the geologist's hammer ; but by a singular fortune the investigations of Mengs, a practised geologist, were fruitless, while a mine of wealth was turned up by the wheel of a bullock-dray. In 1845 the existence of a remarkable and promising outcrop on the Burra Hills became well known in the colony—rumours on the subject had been afloat in 1840. In order to secure the whole district without the unlimited competition, application was made to the Governor for a special survey of 20,000 acres. At the same time a party of speculators arrived from Sydney intent on securing the great prize if possible. The survey was ordered, a day and hour was fixed for the payment of the £20,000, the Governor decided not to accept bills of the local bank or anything but cash. Cash in 1845 was a scarce commodity in Adelaide although corn was plentiful. The retailers and all not within a certain indescribable line were dubbed the "snobs," the officials and self-elected aristocracy the "nobs." To raise the £20,000 a union between the nob and snobs became indispensable, but even that was not enough, for there was scarcely so much gold in the possession of all the colonists, and the Sydney speculators were waiting ready to bear off the prize. On the last day of payment a hunt for gold was commenced by half-a-dozen men of good credit. Cash-boxes in hand they traversed the streets and suburbs of Adelaide, offering with ample security a handsome premium for sovereigns. On that day many secret hoards were dug out ; husbands learned that prudent wives had unknown stores, and old women were tempted to draw their £1 and £2 from old stockings. Almost at the last minute the money was collected, counted, and paid, and the richest copper-mine in the world rewarded the long-sufferings of the South Australians, and awakened all their old spirit. The purchase effected, the class spirit, which forms so absurd an element in the English character, broke out, and a division of the 20,000 acres was decided on. The toss-up of a coin gave the "snobs" the first choice ; they took 10,000 acres, to which they gave a native name, the Burra Burra. The nob named their 10,000 acres the Princess Royal. The outcroppings on the hills of the Princess Royal were magnificent ; nevertheless in 1850 their £50 scrip was not saleable at £12. The history of this mine is the history of the commercial progress of S.A. Farms, land sales, emigration, wharves, warehouses, projected railways, imports, rents, wages, have all rested on the yield of the Burra Burra. The Government was vested in the Governor and Commander-in-Chief, assisted by an Executive

and Legislative Council composed of the Governor, the Colonial Secretary, the Advocate-General, the Surveyor-General and the Assistant Commissioner, to whom were subsequently added four nominees from among the non-official colonists. Of the progress of S.A. subsequent to the discovery of the mines and the dissolution of the commission the following figures will afford some idea:—The exports of the year ending April 1850 amounted to £453,668 12s. Of this sum £11,212 was in wheat, £20,279 in flour, £63,729 in copper in ingots, £211,361 in copper ore, £8188 in tallow, and £113,259 in wool. The imports for the same period were £887,423, part of the excess arising from imports of railway and mining machinery and other productive investments. In the same year 64,728 acres were in cultivation—wheat 41,807 acres, potatoes 1780, gardens 1370, vineyards 282, hay 13,000. The population was 63,900 of which 7000 were Germans. Live stock—Cattle 100,000, sheep 1,200,000, horses 6000. The total failure of the Wakefield theory of colonisation, and the beneficial effects of Grey's vigorous policy in repairing the effect of that failure, are thus described by a resident colonist of that time:—"To the colony this reduction in the expenditure was for a time necessarily full of trial. It may well be likened to a young fruit tree, which had been allowed to shoot up with straggling branches of luxuriant growth, but barren of fruit. The careful gardener saw that to make it produce fruit, it was absolutely necessary to apply the pruning knife with an unsparing though kindly hand. Stripped of its gaudy and unprofitable branches, the spectator looked with pity and contempt upon the bare stump that was left; he, not knowing the power left in the roots, thought the poor tree ruined by such treatment, and was inclined to think ill of the gardener for his reckless destruction of the leafy branches. But behold that self-same tree once more, the resources concentrated in its healthy roots, in time throw forth branches as luxuriant as ever, covered with smiling blossoms and golden fruit, whilst the gardener, to whom this result appeared as a matter of course, now received praise for his foresight from him who at first felt inclined to censure him." Even so it was when Grey was leaving S.A. to conduct the still more difficult administration of N.Z., which was also a colony based on the Wakefield system, and the history of whose settlement had been no less disastrous. On the occasion of his departure, a deputation of the colonists waited on him and gratefully thanked him for inaugurating a new and prosperous era, by his able, zealous, and diligent administration, not forgetting the cares, anxieties, and responsibilities, in his conscientious discharge of the functions of a Governor and a worthy delegate of sovereign power. Of Grey's administration Marcus says:—"Grey began his administration by the display of those high qualities of prudence, firmness, and decision which he subsequently exhibited at the Cape and

in N.Z. He commenced a policy of retrenchment, which, as a matter of course, exposed him to a great deal of obloquy and misrepresentation. The wages of those employed by the Government were cut down to the lowest point; and this forced the labour, which was far too much concentrated in the city, into the hands of private employers. The effect of this wholesome action was soon seen. Working men who had been hanging about the city went into the country, and the land was brought under cultivation. One important improvement in the government of the colony was made at the time Grey became Governor. The commissioners were dispensed with, and the Home Government undertook the direct management of the colony. A new direction was given to the industry of the colonists; and when they became convinced that their success lay in subduing the earth, in cultivating the soil, and in pastoral pursuits, a new impulse was given to their energies. The necessaries of life became cheap; and although money was not too plentiful, beef, mutton, and flour were cheap, and there was neither want nor complaining amongst the people. Grey's administration will always be remembered with satisfaction and gratitude. He first inspired the people with a feeling of self-reliance, and taught them to live within their means." He held office from May 1841 till October 1845, and was succeeded by Governor Robe.

VI. *The Copper Discoveries.*—The discovery of copper in S.A. was but the precursor of the still more important gold discovery in N.S.W., which led to a complete revolution in the destinies of Australia, forming a new and permanent era in the annals of her history. From a sparse population scattered over the pasture lands, shunning the rocky regions in their selection of spots for farms and agricultural pursuits the colonists were changed into a mining community, concentrating round the metalliferous strata they had discovered and forming centres of population on localities hitherto neglected because barren. To this cause must be ascribed in a great measure the length of time that elapsed before the mineral wealth of the country was discovered. Those who had come to settle on the lands looked for fertile soil and good pasture; moreover, few if any of the English immigrants and capitalists knew much about mineral ores. They followed their flocks over plains and valleys from sunrise to sunset, avoiding the rocky places, and if perchance a shepherd saw a stone more curious than usual he would probably pick it up and throw it away as only a plaything, although it might have led to the discovery of the metallic riches of this inexhaustible region of mines. The first discovery of its metalliferous resources may be attributed to the German immigrants who form an important section of the inhabitants. The first body of these people were religious refugees from Prussia, belonging to the Evangelical Lutheran persuasion, who had expatriated themselves from their beloved Fatherland

on account of persecution. They arrived at the end of 1838 in two ships, one of which, the *Zebra*, was commanded by Captain Hahn, who behaved with so much kindness to his passengers on the voyage that the settlement formed by them was named Hahndorf, now one of the prettiest and most flourishing towns in the country, about fourteen miles S.E. from Adelaide across the Mount Lofty range. In the lap of those mountains these persecuted believers worshipped God in the wilderness under the care of their spiritual pastor, the Rev. Mr. Kavel; thankful to their Maker for the religious liberty they possessed in that free though far-off land. To those who visited that simple industrious community in the early days of S.A. nothing was more striking than the condition of this noble-hearted pastor and his God-fearing, law-abiding flock. While the people in Adelaide were rebelling against the authorities or living in riot and dissipation, those in Hahndorf obeyed their minister as children their father, without the interference of any legal authority in their few disputes, and the greatest punishment was a rebuke from the pulpit after divine service. And while the improvident immigrants were wasting their substance in buying imported provisions and strong drinks, these abstemious people grew their own food and supplied the Adelaide market with garden and dairy produce. Hahndorf, with its little primitive church and the trim gardens of the inhabitants, appeared then an oasis of industry and piety to the traveller coming from the desert plain and riot of Adelaide. Among these German immigrants were some men who had worked in the mines of their native country, and consequently had a knowledge of minerals and metalliferous rocks. As they frequently crossed the rocky mountains on their way to and from Adelaide with their produce they naturally cast inquisitive glances at them. In this way some were led to explore the sides of Mount Lofty, which slopes up from the plain to a height of 2334 feet, and the result was that near its base pieces of lead ore (*galena*) were found. Whether these indications of the metalliferous nature of the rocks induced one of their number to devote his time to the pursuit, or whether the accounts transmitted by these people to their friends in Germany prompted an experienced mineralogist to emigrate is not certain, but the fact that a German named Mengs was engaged in mineralogical explorations as early as the latter part of 1839 shows that they were alive to something of the kind, and he even publicly affirmed his conviction that there was abundance of mineral wealth in the colony. His opinions were pooh-poohed by the land-jobbers and speculators, who were too busy with their bubble paper-system to heed the substantial indications of metallic treasure. However, some more acute than their neighbours purchased a section where these specimens of lead ore were most abundant, and sent to England in 1841 a quantity for analysis. The returns were most favourable as

some of the ore (*Argentiferous Galena*) was found to contain silver. They raised two or three tons, but the times were so bad, and they being without means to prosecute the working of this mine it was left in abeyance for better days. No doubt this discovery of lead caused many of the people living in the interior to look about them in hopes that some more valuable metal might be found. Many brilliant specimens of iron pyrites were picked up in this way, in expectation that the nobler metals might be part of the ore, but these only proved the great extent of iron ore in the country. This could not be profitably worked without coal, capital, and cheap labour; none of which they had. Other discoveries of silver-lead have since been made, but none have proved of a permanently remunerative character. The ores have yielded as much as from fifty-five to seventy-five per cent. of lead, and from fifty-five to sixty-five ounces of silver to the ton, but have not been found profitable to smelt, and the industry has been abandoned for many years. In 1842 the first discovery of copper was made at the Kapunda Station, about forty miles north-west of Adelaide, occupied by Captain Bagot. One day he sent his overseer, Dutton, to search for a number of sheep which had strayed into the bush. After spending some time in fruitless efforts, Dutton ascended a small hill in order to have a more extensive view of the country, but still he saw nothing of the lost sheep. On turning to descend, his attention was attracted by a bright green rock jutting from the earth. It seemed to him peculiar, so he broke a small piece off and carried it down to Bagot's house, where he and the Captain examined the specimen, and came to the conclusion that it consisted of the mineral malachite, containing copper in combination with water and carbonic dioxide. They let no one know of the discovery, but proceeded to apply for the land in the usual manner, without breathing a word as to their purpose. The section of eighty acres was advertised for a month, and then put up to auction; but as no one was anxious for this barren piece of ground, they had no competitors, and the land fell to them for the price of eighty pounds. As soon as they became possessed of it they threw off all appearance of mystery, and commenced operations. During the first year the mines yielded £4000; during the next £10,000; and for several years they continued to enrich the two proprietors, until each had realised a handsome fortune, when the land was bought by an English company. When it was fully ascertained beyond a doubt that the despised stony ridges contained so much wealth, there was a general search for copper and lead mines, and those who had previously laughed at the suggestion, were the most zealous with their hammers among the rocks. Toiling up hill and down dale with heavy bags of stones, in their anxiety to hit upon malachite or green carbonate, they heeded neither the scorching sun, the hot blast, nor the cold rains. Some were lucky, but the mass of explorers were unsuccessful,

Others less honest strewed specimens of good ore in places where none was to be found, and claimed the rewards offered by a mining association. Of course the land where these were found rose to fabulous prices. The Kapunda proprietors had bought their lot at the upset price of £1 per acre, although it was kept open for one month after selection, and might have been pounced on by the holder of a land order of previous date. At length a report was spread that a rich lode of copper had been discovered by the accidental turning up of a specimen by the wheel of a bullock dray at a place called Burra Burra, about 100 miles north of Adelaide. The land on which these were discovered had not yet been sold by the Government, and in great haste a company was formed to purchase it. This company consisted of the merchants, professional men and officials of Adelaide; but a rival company was immediately started, consisting of shopkeepers and tradesmen, together with the farmers of the country districts. The former always maintained a haughty air, and soon came to be known throughout the colony as the "nobs;" while they, in their turn, fixed on their rivals the nick-name of the "snobs." For a week or two the jealousies of the companies ran high, but they were soon forced to make a temporary union; for according to the land-laws of the colony, if any one wished to buy a piece of land, he had to apply for it and have it advertised for a month; it was then put up for auction, and he who offered the highest price became the purchaser. But a month was a long time to wait, and it was rumoured that a number of speculators were on their way from Sydney to offer a large sum for the land, as soon as it should be put up at auction. It was therefore necessary to take immediate action. There was another regulation in the land-laws, according to which, if a person applied for 20,000 acres, and paid down £20,000 in cash, he became at once the proprietor of the land. The "nobs" determined to avail themselves of this arrangement; but when they put their money together, they found they had not enough to pay so large a sum. They therefore asked the "snobs" to join them, on the understanding that after the land had been purchased the two companies would make a fair division. By uniting their funds they raised the required amount and proceeded with great exultation to lodge the money. But part of it was in the form of bills on the Adelaide banks, and as the Governor refused to accept anything but cash the companies were almost in despair, until a few active members hunted up their friends in Adelaide and succeeded in borrowing the number of sovereigns required to make up the deficiency. The money was paid into the Treasury, the two companies were the possessors of the land, and the Sydney speculators arrived a few days too late. Now came the division of the 20,000 acres. A line was drawn across the middle, a coin was tossed up to decide which of the two should have the first choice, and fortune

favoured the "snobs," who selected the northern half, called by the natives Burra Burra. To the southern part the "nobs" gave the name of "Princess Royal." The companies soon began operations; but though the two districts appeared on the surface to be of almost equal riches, yet on being laid open the Princess Royal was soon found to be in reality poor, while the Burra Burra mines provided fortunes for each of the fortunate "snobs." During the three years after their discovery they yielded copper to the value of £700,000. Miners were brought from England and a town of about 5000 inhabitants rapidly sprang into existence. The houses of the Cornish miners were of a peculiar kind. A creek runs through the district, with high and precipitous banks of solid rock; and into the face of these cliffs the miners cut large chambers to serve for dwellings; holes bored through the rock, and emerging upon the surface of the ground above, formed the chimneys, which were capped by small beer barrels instead of chimney-pots. The fronts of the houses were of weatherboard, in which doors were left; and for two miles along each side these primitive dwellings looked out upon the almost dry bed of the creek, which formed the main street of the village. Here the miners dwelt for years, until the waters rose one night into a foaming flood, which destroyed the houses and swept away several of their inhabitants. In 1845 Burra Burra was a lonely moor; in 1850 it was bustling with men, and noisy with the sounds of engines and pumps, and forges. Acres of land were covered with the company's warehouses and offices, and the handsome residences of its officers; behind these there rose great mounds of blue, green, and dark-red ores of copper, worth enormous sums of money. Along the roads 800 teams, each consisting of eight bullocks, passed constantly to and fro, while scores of ships were employed in conveying the ore to England. From this great activity the whole community could not but derive the utmost benefit, and for a time S.A. had every prospect of taking the foremost place among the colonies. The discovery of the Burra Burra gave a vivid impulse to mineral exploration, and in 1850 not less than thirty-nine mining adventures were before the colonial and British public, in various stages of progress, most of which depended on English capital for their working. Nearly all, according to the reports of the promoters, "only needed the expenditure of a little more capital to become most flourishing investments." Not one, with the exception of the Burra Burra, had ever paid a public dividend; and when the gold discoveries brought them all to a stand-still by the abstraction of labour, several new schemes were being urged on the attention of English capitalists. At that time the following mines, in addition to nearly sixty other schemes which had never gone beyond a prospectus, were in the market at a discount:—The Wheal Gawler silver lead was the first mine discovered in the province; opened in 1841;

abandoned, and re-opened by a company without success; nevertheless the directors in 1850 boasted their good prospects. The Adelaide Mining Company, near Montacute, "with a capital of £1000; the Australian Mining Company with an English capital of £400,000, and a special survey of Reedy Creek, forty-six miles from Adelaide, other lots at Tungkillo and at Kapunda," founded in 1845—the outlay had been enormous—no dividends; the Barossa Mining Company with a capital of £30,000, formed in England, with a view of prosecuting mineral explorations on the property of G. F. T. Angas; the Glen Osmond, another English Company, with a capital of £30,000, founded in 1845; the Port Lincoln, with a capital of £10,000; the Mount Remarkable, with a capital of £25,000 in 1846; the North Kapunda, a capital of £22,200 in 1846; the Paringa, capital £20,000 in 1845; the Port Lincoln capital £4000 in 1848; the Princess Royal, capital £20,000 in 1845; this was the unlucky half of the Burra Burra. By March 1848 the original £5 shares in the Burra Burra mine had advanced to £150; a sixth and seventh dividend of £10 each in June and September raised the prices to £200 and £210 for cash. A fall afterwards took place in consequence of the depreciation of the value of copper in Europe. But an important discovery was made of a valuable lode in the thirty-fathom level leading from Kingston to Graham's shaft. The lode was cut four fathoms below the water level, was solid, and from ten to eleven feet wide, composed of a compact green carbonate or malachite, producing upwards of 40 per cent. of copper. The lode was described as clearly defined, in easy working order, and dipping well into the mine. In the half-year ending 30th September 1848, 10,163 tons were raised, making a sum total for the ore raised during the first three years' working of the mine of 33,386 tons, equal to upwards of 10,000 tons of fine copper ore (at £70 per ton) £700,000. In the latter part of 1848 the miners struck for higher wages. The workings of the mine were suspended from November until February 1849. In March the miners resumed work. Further important discoveries were made—one of a lode in the thirty-fathom level southwest from Graham's shaft, consisting of red oxide and malachite in great abundance; and the other of a lode two fathoms wide, yielding malachite of high produce. Only two pitches were set on these lodes, and twelve men produced in the first week eighty tons of the richest ores. In 1850 the £10 quarterly dividends were regularly paid. Up till 1876 the total amount paid in dividends was £782,320; the total yield of copper was about £4,000,000 sterling. An English and Australian Copper Company, which has been long associated with this mine, owns fine smelting works at Port Adelaide. Of late the yield of the Burra Burra has diminished, and although some four or five years ago an attempt was made to utilise the low-class ores that had formerly been rejected, and expensive machinery was procured for the purpose,

the mine succumbed to the blow struck at the copper trade by the depreciation of prices and at present it exists only in name. The Burra Burra discovery, great as it was, falls into the shade when compared with the more marvellous discovery of the Wallaroo Mines, on Yorke's Peninsula, in 1860. A shepherd employed at W. W. Hughes's station found a specimen on the run some time about the beginning of that year. At once a private company was established, and within a year the mine was being worked. For two years success seemed doubtful, but the proprietors were amply rewarded at the end of that period for their enterprise. For the first five years the average output was somewhat under 8000 tons, but it increased rapidly, and in 1869 had risen to 26,000 tons per annum, at which it remained for over five years. During the last year or two the low price of copper has rendered it necessary to reduce the output, and in 1878 the proprietors desisted from bringing ore to the surface, and contented themselves with merely developing the mine. Ultimately they found it expedient to leave this work off partially, and the operations are now principally confined to keeping the levels free of water. In the neighbourhood of this mine is a flourishing township, which it has called into existence, but which is not entirely dependent on the mining industry, as it is in close proximity to a rich agricultural district. Some seven miles from the property, and connected with it by tramway at Port Wallaroo, are the smelting works established by the proprietors of the Wallaroo Mines, which are the largest and most complete in A. In 1861 a still more valuable discovery than even the Wallaroo Mines was made by another shepherd at a spot distant eleven miles from them. This property is situated about two miles from the coast, and is known all over the world as the Moonta. At the expiration of twenty months from its opening 8000 tons of ore had been raised, and dividends paid amounting to £64,000. The average yearly return of the mine until the depreciation of the copper market checked the output was 18,200 tons of ore, of the average value of £197,270. The total quantity of ore raised to March 1879 was 328,123 tons; and there was paid in dividends £1,024,000. The mine gave employment for many years to over 1500 persons. The Moonta continues to be worked, although operations have been discontinued at nearly all the other mines; but the production of ore has been very much reduced, and as a consequence comparatively few men are now employed. The latest reports on the condition of the property are favourable, and there is little doubt that when copper mining revives the Moonta will yield as large profits to its shareholders as it has done in the past. Since the first mine was discovered the total value of the copper, copper ore and regulus exported from the colony up to the end of 1878 was £15,754,680, and of other minerals £293,185.

VII. *Governor Robe*.—In October 1845 Grey was succeeded by Lieutenant-Colonel F. H. Robe, who held office till August 1848. Of Robe's personal character and administration Marcus states :—"He was a man of very different stamp from his predecessor. He was a respectable, honourable, upright English Tory. All his prepossessions and traditions were on the side of authority, which his military training had deepened and intensified. He looked with something of contempt, which he took no pains to disguise, at the Liberal tendencies of the handful of people he had been sent to govern in the Queen's name. He tried to govern by a small clique of men who had but little sympathy with the bulk of the colonists. The poor Governor lived in hot water during the whole of his administration. The colonists refused to be treated as children; and as he did not respect their rights, they paid no attention to his feelings. He was very weary of his office before he was relieved by the Home Government."

VIII. *Governor Young*.—Sir H. E. F. Young succeeded Robe in August 1848. His personal character and policy were in all respects the reverse of those of his predecessor. Young sought by every means in his power to encourage the ceaseless activity of the people. His failing was an injudicious zeal for too rapid progress. In his desire to open up the Murray to navigation he wasted large sums of money in schemes that proved altogether useless. He made an effort to remove the bar at the mouth of the river, but fresh deposits of sand were constantly being brought down by the current and lashed up into a new bar by the waves that rolled ceaselessly in from the Southern Ocean. He spent about £20,000 in trying to construct a harbour called Port Elliot, near the entrance to the Murray; but there are now only a few surf-beaten stones to indicate the scene of this fruitless attempt. He offered a bonus of £4000 to the first person who should ascend the Murray in an iron steamer as far as the River Darling. Cadell made the effort and succeeded. He obtained the reward, but it was not enough to pay his heavy expenses; and when he endeavoured afterwards to carry on a trade by transporting wool to the sea in flat-bottomed steamers, he found that the traffic on the river was not sufficiently great to repay his heavy outlay, and in a short time he was almost ruined. The attempt was premature; and though in after years the navigation of the Murray was successfully carried on, yet at this time it led to nothing but loss. The gold discoveries in N.S.W. and V. in 1851 gave a serious check to the prosperity of the colony. A large proportion of the adult population abandoned their occupations in town, at the mines, and on the farms and pastures, for the goldfields of Ballarat, Mount Alexander and Bendigo, within six months. The majority were married men with families; they considered that it was only a temporary removal and that they should return soon to spend their earnings

in their own colony. A large proportion being practical miners they considered that they were best able to work the gold diggings. The result was just as they calculated. The Cornish and German miners were quite at home in their new operations, and it was in a great measure to their superior skill and knowledge of mining that the deep-sinking and quartz-crushing at Ballarat came to such perfection. While others were wasting their time and means upon barren ground these men were rarely mistaken, and struck the richest lodes in the mines. When they were successful in "making their pile" they returned to S.A. and spent their rich gains liberally. The Government with a judgment that does them credit never attempted to throw any obstacle in the way of this migration. On the contrary, they appointed an efficient officer to strike through the country by the shortest route to the goldfields, making wells and bridges by the way, so that an easy communication could be kept up to and fro. This had the desired effect, many returned who otherwise would have remained away. Meanwhile the copper-mines were with difficulty worked for want of men; the fields were uncultivated, the sheep untended, and the colony experienced a short period of rapid decline. However the results obtained on the goldfields by most of these fortune-seekers were hardly to be compared with the steady yield of the fertile cornfields and rich copper-mines of S.A., and most of those who had thus abandoned the colony returned in a short time to their families and their former employments. Governor Young adroitly turned the discovery of gold to the advantage of his own colony by establishing an escort between Ballarat and Adelaide; and as this was remarkably well equipped, many of the diggers preferred to send their gold by this route rather than to Melbourne, thus giving to S.A. some of the advantages of a gold-producing country. The crowds of people rushing to the goldfields had carried with them nearly all the coin of the colony; and the banks, although they had plenty of rough gold, were yet unable, from scarcity of coined money, to meet the demands upon them. In this emergency Young took the extreme step of instituting a new currency, consisting of gold cast into small bars or ingots; and although afterwards mildly censured by the Home Government for exceeding his powers, yet he could justly assert that this measure had saved the colony from serious disaster. By this time the colony had a Legislative Council, preparatory to the constitution of an elected parliament on the same basis as those in the neighbouring colonies. That body promptly aided the Government in their measures to maintain the prosperity of the country during this emergency, by passing resolutions offering a reward of £1000 to the first discoverer of gold within the territory of S.A. in sufficient quantity to become a valuable export: in the event of success the auriferous ground was to be rented at the rate of ten shillings per acre in

advance in leases not exceeding fourteen years. These resolutions were assented to by Governor Young and immediately carried into effect, which partially assisted in checking the migration. In hopes of securing the reward numbers roamed through the country "prospecting" for gold, and there were scientific grounds for success, as the Mount Lofty range trends in a general north and south direction over five or six degrees of latitude, bearing out the principle laid down by geologists that all gold-bearing mountains trend along the meridian lines. Several alleged discoveries were soon reported; but when the officers appointed to examine them reached the places they pronounced the reports to be attempts to mislead the Government and public, and that the particles of gold first produced were not the natural deposits of the soil. The government explorers however succeeded in January 1852 in finding some genuine specks of gold near the Onkaparinga River, at its embouchure some twenty miles south of Adelaide, but the discovery was considered not of sufficient importance to render necessary the issuing of licences to dig. Six months after this a spot was found sufficiently promising for the issue of these at Echunga, a pastoral station about twenty miles south-east from Adelaide. For several months a number of diggers ventured their time and means in digging for the precious metal, but their labours were so poorly rewarded that most of them soon left for the V. goldfields, while the Government, seeing that it was not found in paying quantities, did not consider themselves warranted in giving the reward, as the resolution had a proviso that there should be "*bonâ fide* raised and produced from the said tract or field within two months of the date of the issue of the same licences an amount in gold equal in value to not less than £10,000." From time to time further explorations were made by the government officers and private individuals, who succeeded in discovering indications of auriferous ground, but on close examination and a large expenditure of time and means none proved sufficiently remunerative to attract either people from their ordinary industrial pursuits, or the practised miners from the rich eastern goldfields. This went on for twelve years without any spot being found richer than Echunga. At last the Government invited Hargreaves in 1864 to survey the northern as well as the southern parts of the colony, hoping that the first discoverer of gold in N.S.W. might be as fortunate in S.A. After a careful examination of many promising localities during half a year, for which he was handsomely remunerated, he brought his abortive labours to a close in June 1864. From that time the search for gold has been abandoned. The want of a remunerative gold-field, although in one sense retarding the expansion of the colony, benefited the colonists in another way by fixing their attention on the productions and fertility of the soil. While every branch of agriculture progressed satisfactorily from year to year, the new

source of profit derived from the vintage at once exhibited the numerous resources of the colony and the enterprise of the South Australian colonists. The attention of the farmers was first drawn to planting vineyards by the splendid grapes grown on the few vines brought from Germany by the Hahndorf colonists. Their size and flavour were fully appreciated in the Adelaide market, where they brought a good price for the consumption of the table. Some of these Germans had been acquainted with wine production in their own country, and it was natural for them to try and produce some of their favourite beverage, if only to remind themselves of the famous Rhine wines. So many of these industrious settlers began to extend their little vineyards and to press the grape in the simplest manner; they found that they produced a wine not much inferior to the light wines of Germany and France. Their English fellow-colonists soon followed their example, prompted by the fact that the best ground for a vineyard was the least suitable for growing cereals, consequently they profited by what was otherwise waste land. At first the kinds of grape they cultivated were chiefly for the table, but the supply increased so far beyond the demand that their value was reduced below the cost of production; they therefore turned their attention to the growth of the choicest wine-grapes. Already the colonists of N.S.W. had shown that good wine could be produced in localities corresponding to those in S.A., and James Macarthur had produced a wine at the Great Exhibition of 1851 nearly equal in strength and flavour to the rich Hungarian Tokay. With these facts before them the planting of vineyards was prosecuted with great energy, until there was scarcely a farm in the colony without its vineyard and wine-press, and when flour and wheat barely remunerated the farmer for his outlay he supplemented his income by a few hogsheads of wine sold in Adelaide. In that city merchants conversant with the quality of these growths pronounced them to be superior to the best Catawba wines in Sydney, and to compare favourably with Sauterne, Chablis, Maçon and other favourite wines of Europe. Indeed they surpassed these white and red light wines, as they possessed greater body from being the pure juice of the grape, unadulterated and unsophisticated by any artificial means. Some soils and localities were found to produce better wines than others. These were selected by the wine merchants, some of whom went into the vating of wines extensively, classifying the growths according to the grape from which they were produced, or the locality of the vineyard; one merchant called several sorts after his own name. Other branches of agriculture progressed steadily during the period subsequent to the gold discovery. As the cultivation of wheat was almost abandoned in V. that colony proved the best market for flour and grain, enriching the farmers beyond their most sanguine expectations. As the Government found that without a continuous stream of

well-selected emigrants from the mother country the working power of the population could not be maintained, a large portion of the revenue was voted to pay for their passages. During the five years 1853-7, 38,457 persons were added to the population by immigration, of whom 33,420 were introduced at the public expense. In 1862 the population numbered 135,329, composed of 69,608 males and 65,721 females. In this respect S.A. showed the least disproportion of the sexes among the whole Australian Colonies. Governor Young was transferred to T. in December 1854. A short interregnum took place, and in June 1855 Sir R. G. Macdonnell arrived to take the reins of Government.

IX. *Governor Macdonnell.*—Macdonnell was a man of considerable ability and great energy of character. More than any Governor who had preceded him he came into close contact with the colonists as a whole. He had a pleasant manner, tact, and warm sympathy with all the interests of the colony, public and private. He was exceedingly popular during the whole of his administration, and left the colony amidst the regrets of those who knew him. During his rule Constitutional Government was established, with two branches of Legislature, both elective. The colony made rapid progress materially; railways were formed and roads were improved, so as quite to change the character of inland travelling for hundreds of miles; the coast was lighted; numerous buildings were erected, amongst which were a new hospital, Parliament House, a new Government House, Government offices, mounted police barracks, town hall, literary institute and free library, and post-office; telegraphic communication was opened with all the leading towns and neighbouring colonies; a large extent of country was surveyed, river navigation was opened up, the city of Adelaide was supplied with water, and the Far North was explored by Stuart, Goyder, Freeling, Babbage, Macdonnell (the Governor himself,) Warburton and others. The proclamation of the Constitution was made on 24th October 1856, the elections for the two Houses of Legislature taking place in March of the following year; the session of the first Parliament began on 22nd April, the first responsible Ministry having Finnis for Chief Secretary. In 1858 S.A. took the lead in a reform which is now being adopted by nearly all the civilised nations of the world. According to English law, each time an estate was transferred from one person to another, a deed had to be made out for the purpose; and if changes in its ownership had been frequent, it would be held by the last purchaser in virtue of a long series of documents. Now if any one wished to buy a piece of land, he was obliged for safety to examine all the preceding deeds in order to be quite certain that they were valid; even then if he bought the land, and another person, for any reason whatever, laid claim to it, the owner had to prove the validity of

each of a long series of documents, going back perhaps for centuries. A flaw in any one of these would give rise to a contest which could be settled only after a very tedious investigation; and thus arose the long and ruinous chancery suits which were the disgrace of English law. When a man's title to his estate was disputed, it often happened that he had to spend a fortune and waste half a lifetime in protracted litigation before all the antecedent deeds could be proved correct. Torrens had his attention drawn to this unsatisfactory state of things by the ruin of one of his relatives in a Chancery suit. He thought long and carefully over a scheme to prevent the occurrence of such injustice, and drafted a bill for a new method of transferring property. He proposed to lay this before the S.A. Parliament, but his friends discouraged him by declaring it was impossible to make so sweeping a change; and the lawyers actively opposed any innovation. But Torrens brought forward the bill; its simplicity and justice commended themselves to the people and to the House of Assembly, and it was carried by a large majority. According to the new scheme all transferences of land were to be registered in a public office called the Lands Titles Office, the purchaser's name was to be recorded and a certificate of title given to him; after this his right to the property was indisputable. If his possession was challenged he had simply to go to the Lands Titles Office and produce his certificate to the officer in charge, who could turn to the register and at once decide the question of ownership. After this no dispute was possible. Torrens was appointed first registrar of the office, and soon made the new system a great success; it is now adopted in all the other colonies of Australia. It was recently introduced into Ireland, and a system of a somewhat similar nature is now at work in Great Britain. Sinnett thus sums up the material progress made by the colony during Macdonnell's administration:—"The history of the last six years in S.A. has been the history of steady industrial and political progress. The introduction of the new constitution has been the most remarkable event of this epoch, and the change thus produced will elsewhere be found described in detail. It is over the whole face of the country that the history of this period has been written. Roads have been improved and bridges formed, so as quite to change the character of inland travelling for hundreds of miles from Adelaide; surveys for railways have been carried on to a large extent; the railway of eight and a quarter miles to the port in one direction, and the N. line to Kapunda (fifty-two miles) in another direction, has been opened; telegraphic lines throughout the country have been established, as well as telegraphic communication with Sydney and Melbourne; the city of Adelaide has been supplied with water; a large extent of country has been surveyed for purchase in sections; the coast has been lighted where

necessary; numerous buildings for public purposes have been constructed by the Executive, including a new hospital, Parliament house, Government house, Government offices, mounted police barracks, and the Institute with its free library; the Murray has been navigated as far as Albury, and the first steamer taken a considerable distance up the Darling by Captain Cadell, with whom were Sir Richard Macdonnell and four others. Nearer home the new mining district of Wallaroo on Yorke's Peninsula has been discovered and fairly tested, so that what was two years ago a sheep run now exhibits townships, mines, and all the customary adjuncts, including the commencement of a railway and a system of drainage. Further from Adelaide, the far north has been explored by Stuart, Goyder, Major Freeling, Babbage, Sir Richard Macdonnell, Major Warburton and others."

X. *Land Legislation*.—Sir Charles Wentworth Dilke, in his *Greater Britain*, describes S.A. as "The widest of all British colonies, and nearly as large as English Hindostan." Very early in the history of the colony land was taken up in what were then considered very remote districts for pastoral pursuits, including the breeding of sheep and cattle. The settlement of the country in this way was closely connected with that daring exploration for which the colony has obtained a high and deserved reputation. The beginning of this industry was simple and unpretentious. Young men with just capital sufficient to purchase a few hundreds or thousands of sheep, a dozen horses, a year or two's rations, and to hire a shepherd or two, sallied out into what was then a *terra incognita* to seek their fortune. They settled on suitable country, erected a rude hut, and thus laid the foundation of their fortunes. The life at first was a hard and rough one, involving many privations; but it was not altogether without its compensating pleasures. There was plenty of work, and that of itself keeps life from stagnating. There was the pleasure of seeing the flocks and herds increase. The lambing season brings a pressure of work which requires the best energies of all hands on the station. Shearing too is always a scene of busy activity, and getting the wool to the market before roads were known taxed the ingenuity of the cleverest of the "squatters." The squatter's life in the beginning was not without a spice of danger, which required continual vigilance and activity to guard against, and a brave heart and a strong arm to meet when it actually came. In those days the natives were enemies not to be despised, and before they learnt to fear or trust the white man they were not slow to resent his intrusion upon their hunting grounds. They plundered his huts, killed his sheep and cattle, and sometimes attacked himself or his shepherds. He had therefore to be always on the watch to protect himself and his property. The aborigines had been accustomed to kill for food all the indigenous animals found in their country, and it

was hard to teach them that they had no right to touch the sheep and cattle of the squatter. They learned this in the end by a rough and bitter kind of experience; but in the early days of squatting they were a constant dread and annoyance to the settler. As the flocks increased the squatter had to push out into new country, and runs were extended farther and farther inland. Leases of wide stretches of country comprehending in some cases hundreds of square miles were granted on a mere nominal payment, and many of the squatters grew rich rapidly. All pastoral leases are held with the condition that whenever the land is required for agricultural purposes the squatter must turn out on receiving six months notice—he being paid for the substantial improvements made on his run. The squatter is therefore the pioneer of the agriculturist. When the land is wanted for agriculture he has to retire farther into the interior. Many of the wealthiest men in the colony at the present time, and several who have returned to spend their fortunes and to end their days in the old country, began thus in a very humble way. Some of them went out with a few hundreds or thousands of sheep and lived far from the abodes of men for years, only occasionally visiting Adelaide to purchase rations or dispose of their wool: and some did not even do that but trusted all to agents in town. Others were only shepherds, and by saving their earnings—there were neither temptations nor means of spending them at first—they got a few sheep together and were eventually enabled to take up a small run for themselves; and the first start made, in many cases success came rapidly. Shepherds who knew all about the management of sheep made good squatters; they went on increasing their flocks and taking up new country, and their wealth increased in geometrical ratio. They lived in the quietest possible way—spending but a mere fraction of their income. Many of them made large fortunes—handed over the hard work of the station to their sons and retired to enjoy their well-earned leisure. A few years ago the leases which the squatters had held on exceedingly low terms were subjected to a new valuation on their renewal. The Surveyor-General, G. W. Goyder, a highly competent man, was appointed valuator, and he performed this onerous and unpleasant duty with great impartiality. His increased valuations astonished some of the squatters and made them indignant; but he was supported by public opinion throughout the colony and the result showed that the oppressed squatters, as they represented themselves, were very well able to pay the increased assessment. Unfortunately for the squatters, the valuations were succeeded by two years of drought which tried the lessees severely, and under which some of them fell poor and almost hopeless. Some of them fell from the drought, but those who were able to live over the bad times became wealthier than ever. At present the pastoral interest is in a highly prosperous state. When the first colonists

arrived the country was parched up, the ground hard baked and apparently unworkable. For some time the early settlers were content to sit down with the conviction that agriculture on such a soil and with such a climate was impossible. A great deal of suffering resulted from this false inference. The most important of all the necessities of life had to be imported at a ruinous cost from T., and flour was actually sold in Adelaide at £100 per ton. Some daring colonists however thought they would try whether wheat could not be produced on the Adelaide plains. The land was tilled, the seed deposited, and the result anxiously looked for. Happily wheat-growing became a success from the beginning. For a long time agriculture was confined within a radius of about twenty miles round Adelaide, and some persons asserted that beyond that radius agriculture was impossible. These persons however proved to be false prophets. During the harvest of 1875, country 150 miles and more to the north of the metropolis, without the cultivation necessary in England, produced splendid wheat averaging from fifteen to eighteen bushels to the acre. Along the whole distance from Adelaide to these northern areas the land is covered with industrious and prosperous farmers. One principle on which the colony was started was the sale of Crown lands at a price not under one pound per acre, the proceeds from the sale to be devoted to the introduction of immigrants. This principle however was soon modified, and a large portion of the money obtained for the lands was devoted to the construction of roads and other public works, and subsequently to meeting the claims of the National Debt. The minimum price of one pound per acre has been strenuously adhered to. Waste lands, as the unsold Government lands are called, divided into hundreds, and subdivided into sections of about eighty acres each, were offered at auction at the upset price of one pound. Competition often ran up the price much beyond this amount, and hard-working farmers had but little chance in competition with mere speculators, who bought the land at a price which the farmer could not afford to give in cash, and subsequently let it to him at a good rental, with a right of purchase at twice or three times the amount of what it had originally cost. On the fall of the hammer, twenty per cent. of the purchase-money had to be paid down, and the remainder in one month from the sale. Lands that had been offered at auction and passed the hammer could be taken up at any time at one pound per acre. Several attempts were made to alter the whole system of the land laws, which had been worked so as to benefit only a very small class of speculators at the expense of the agriculturists. The average price per acre which the Government had received for the large territory alienated from the Crown was under 25s., but the price to the farmer, who had in many instances to purchase second-hand, was 50s. or 60s., or more—the difference between the two prices going into

the hands of the speculators, for the accommodation they gave to the agriculturists who had no money. Objectionable as the system was many farmers grew under it, and several speculators have done both themselves and the farmers good by rendering assistance to poor men who wanted to get on the land. It was felt however that the Government might do for moneyless farmers what the speculators had been doing, and might do it on much more reasonable terms. Instead of demanding cash, it was resolved to sell the lands on credit, with deferred payments, taking sufficient precautions of course that the land so disposed of should be occupied and cultivated. After great consideration a measure was at last carried through the Legislature for this purpose, and became law. It is known as "Strangways' Act," but has been set aside for one more liberal and better adapted to the requirements of the smaller capitalists. Under the Land Act of 1872 (amended in 1874) the whole of the waste lands of the colony south of the 26th parallel of S. latitude forms one area, from which, as fast as it is surveyed and declared open to the public, intending purchasers can make their selections. There is no selection before survey, but an efficient staff of survey officers is always at work surveying the land as fast as it is required. Hundreds of thousands of acres are always open for selection, and the work of the surveyors is still going forward. All waste lands other than township and suburban have a fixed value put on them by the Commissioner of Crown Lands, not less than £1 per acre. In improved or reclaimed lands the cost per acre of the improvements and reclamation is added to the upset price of £1 per acre. Those lands which have been open for selection, or which have been offered at auction and neither selected nor sold, may at the end of five years be offered for sale in blocks of not more than 3000 acres, on lease for ten years at an annual rental of not less than 6d. per acre, with a right of purchase at any time during the currency of the lease at £1 per acre.

XI. *Governor Daly*.—In March 1862 Sir Richard Macdonnell was succeeded by Sir Dominic Daly, a man of great official experience, an excellent administrator, and a very popular Governor. He was accessible to all classes of the community, and identified himself with everything likely to promote the welfare of the colonists. He died in the colony on 19th February 1868, and was deeply mourned by all classes, whose esteem he had won by his urbanity and hospitality. During his administration the colony was visited by H.R.H. the Duke of Edinburgh. In the interregnum between Sir Dominic's death and the arrival of his successor, the Government was administered by Lieutenant-Colonel Hamley, senior officer in command of Her Majesty's forces in the colony at the time. In 1864 the Northern Territory was added to the colony, and from Adelaide an expedition was despatched by sea to the shores of Van Diemen's Gulf, in order to form a new settlement.

After many difficulties, caused chiefly by the disputes between the first Government Resident or Superintendent, and the officers under him, a branch colony was successfully founded at Port Darwin, opposite to Melville Island. In 1869 the representations of Charles Todd led to the formation of the British-Australian Telegraph Company, which engaged to lay a submarine cable from Singapore to Van Diemen's Gulf, and the S.A. Government pledged itself to connect Port Darwin with Adelaide by an overland line, and undertook to have the work finished by the 1st of January 1872. Todd was appointed superintendent, and divided the whole length into three sections, reserving the central portion for his own immediate direction, and entrusting the sections at the two ends to contractors. It was a daring undertaking for so young a colony. For thirteen hundred miles the line would have to be carried through country which had never been before traversed by any white man but Stuart's party. Great tracts of this land were utterly destitute of trees, and all the posts required for the line had to be carted through rocky deserts and over treacherous sand hills. Todd had, with wonderful skill and energy, completed his difficult portion of the task, and the part nearest to Adelaide had also been finished before the time agreed upon; but it fared differently with those who had undertaken to construct the northern section. Their horses died, their provisions failed, and the whole attempt proved a miserable collapse. The Government sent a party to the north in order to make a fresh effort. Wells were dug at intervals along the route, and great teams of bullocks were employed to carry the necessary provisions and materials to the stations; and yet in spite of every precaution the result was a failure. Meanwhile the cable had been laid, and the first message sent from Port Darwin to England announced that the overland telegraph was not nearly finished. The 1st January 1872 being now close at hand, Mr. Todd was hastily sent to complete the work. But the time agreed upon had expired before he had even made a commencement, and the company threatened to sue the Government for damages, on account of the losses sustained by its failure to perform its share of the contract. For the next eight months the work was energetically carried forward; Todd rode all along the line to see that its construction was satisfactory throughout. He was at Central Mount Stuart in the month of August, when the two ends of the wire were joined, and the first telegraphic message flashed across the Australian Continent. But meantime a flaw had occurred in the submarine cable, and it was not until October that communication was established with England. On the second day of that month, the Lord Mayor of London, standing at one end of the line, sent his hearty congratulations through 12,500 miles of wire to the Mayor of Adelaide, who conversed with him at the other extremity. The whole work was undertaken

and accomplished within two years; and all the colonies are now reaping the greatest benefits from this enterprising effort. Another undertaking of a similar character has been completed by the efforts of both S. and W.A.; along the barren coast on which Eyre so nearly perished there stretches a long line of posts, which carry a telegraph line from Perth to Adelaide.

XII. *From 1869 till 1880.*—Sir James Fergusson was appointed Governor in February 1869. He had held office as Under-Secretary for India and the Home Department, and for several years represented Ayrshire in the House of Commons. He was liberal in all his personal dealings with the colony, a man of ability, a clear thinker and an effective speaker. He was regarded as an intelligent and high-minded gentleman, who maintained the dignity of his responsible position and creditably represented Her Majesty by his liberal administration. The establishment of telegraphic communication between Australia and Europe was carried out during his term of office; his efforts to aid in the accomplishment of this work were fully recognised; and shortly after its completion he was promoted to the governorship of N.Z. in 1873. In the interval between his departure and the arrival of his successor the administration was in the hands of the Chief Justice, Sir R. D. Hanson, whose long residence in the colony and thorough acquaintance with its public affairs and history eminently qualified him for the position he temporarily occupied. Sir Anthony Musgrave, K.C.M.G., late of Natal, was sworn in as Governor on 9th June 1873. He was succeeded in March 1877 by Sir William Cairns; his tenure of office was very brief, as ill-health necessitated his resignation a few weeks after being sworn in. The present Governor, Sir William Francis Drummond Jervois, took the oaths of office on 2nd October 1877. He is one of the ablest and most useful rulers the colony has had, and has made himself very popular with the colonists. The condition of S.A. is still of a satisfactory character, though the continued depression of the copper industry and the cessation of work at most of the mines is having a detrimental effect on some parts. As the granary of the Australias, the colony can always command to some extent the elements of prosperity.

SOUTHLAND, a former province of N.Z. When Otago was settled, the advantage of opening up the southern portion of the province, in which there were large tracts of splendid land both clear and timbered, was early recognised, and sites for the towns of Campbelltown and Invercargill being fixed, the country was surveyed, and very soon a large number of sections were bought and settlers located thereon. Complaints were made by the inhabitants that this outlying district was not receiving its due share of attention from the authorities; and a memorial, in terms of "The New Provinces Act 1858," was presented to the central Government, requesting that the district might be detached from Otago and erected into

a new province. This was granted, and in 1861 the Province of Southland was created, with an area of 2,300,000 acres. Embarrassments however so accumulated on the little province, that in 1870 it was found advisable to reunite it to Otago.

SPECTACLE ISLAND, an island lying adjacent to Frederick Hendrik Bay in T., so named because of its resembling a pair of spectacles in shape, with an archway through the centre.

SPENCER'S GULF, in S.A., is a wide inlet of the sea running in a N. direction into the main land from the sea at about the middle of the coast of the colony. Its W. shore is the Port Lincoln District and its E. is the W. coast of Yorke's Peninsula. The N. part of the gulf is shallow, and has many sandy flats dry at low water. At the head of the gulf is the township and harbour of Port Augusta and on its E. side are Ports Wallaroo, Peri and Ferguson. On its S.W. coast is Port Lincoln. The entrance to this gulf is from forty-five to forty-eight miles wide between Cape Spencer and Cape Catastrophe, its E. and W. heads, but this space is partly occupied by clusters of islands, of which Thistle Island, near the W. shore, is the largest. Another cluster lying near to the W. is called the Gambier Isles. With respect to the tides in the gulf, it has been remarked as somewhat singular that at Port Lincoln there is only one tidal flood in twenty-four hours, whereas in all other parts of the gulf there are two. It was named by Flinders after Earl Spencer.

SQUATTER. The word is formed from the verb "to squat," and is used both in England and the United States of America to designate a person who settles on land—whether belonging to another person or to the State—to which he has no title. Webster adds to the definition, "without pretence of title." The term was applied in England to the gipsies and other wandering tribes who roamed over the country, taking temporary possession of commons and waste lands whereon to pitch their tents. In the United States its application was always obvious. As respects Australian pastoral settlers, the name is a self-assumed one. In the early days of N.S.W. the pioneers of settlement, as they took possession of their runs by rule of thumb and without the leave of any authority, they called themselves "squatters," and their homesteads "stations." Afterwards when the government staff of officials was strong enough to carry out the regulations these runs were defined, and their occupants received licenses to depasture live stock, by paying ten pounds for 4000 sheep or 400 head of cattle, so that they were "grazier" tenants of the Crown and "stockholders." But they preferred their own cognomen and have retained it to the present day; and the most aristocratic title an Australian colonist aspires to is that of "squatter." A writer in the *Edinburgh Review* for October 1863, in an article on Queensland, states that the term was "originally applied to a class of men—Donald Beans of the antipodes—who, chiefly

escaped convicts and outlaws, dwelt on the outskirts of the runs of the more legitimate pastoral tenants of the Crown, and committed depredations on their sheep and cattle, thus accumulating flocks and herds of their own. When these tenants of the Crown lost their early popularity, the term was transferred to themselves, and gradually crept into the phraseology of colonial legislative enactments." The writer proceeds to give a brief historical account of the rise and progress of pastoral settlement in Australia. Referring to the old penal system he says:—"Each Governor generally succeeded in bringing out in his own ship a few of his family adherents or more humble fellow townsmen. Yet though a free passage and various other encouragements were offered to all such persons, and though those who availed themselves of them rapidly rose to affluence, still the distance, then immense—a ship seldom making the voyage in less than six months—and above all, the black pall of crime which hung over the new settlement in European eyes, made the number of these free settlers exceedingly limited. About the year 1821, however, Australian society began to be supplied from a widely different source. Unexpected discoveries in exploration were then opening large tracts in the more inland districts, scantily supplied with trees, but bearing natural crops of luxuriant and most nutritious grasses. On these sheep were found to thrive wonderfully, and even to improve in their wool. The great salubrity of the climate, with perhaps the Arcadian beauty of the scenery—the failure in inducing agricultural labourers to emigrate to Australia—and the little prospect there was of a near market for perishable agricultural produce, pointed out these plains as naturally suitable for sheepwalks; and into sheepwalks the Colonial Executive, under the guidance of Governor Brisbane, made an effort to turn them. A statement of their advantages was drawn up and sent home, free use of lands proportioned in extent to the amounts of real and available capital to be used in stocking them, being offered to all intending sheep-farmers. The minimum sum was fixed at £500, sufficient proof of the possession of which was to be the sole condition of the transfer of 'a run,' or sheep-station. Small as the sum was, it fixed, at an early period, the respectability of the class which availed itself of the offer. Officers retiring from the army and navy, younger sons of wealthy and even titled families, university graduates who had not yet selected professions, with a sprinkling of those already dissatisfied with the professions they had selected, flocked into Sydney, and began to compose chiefly the new pastoral tenants of the Crown—the term squatter being then wholly unknown. The Colonial Government made no deduction from their capital for the use of the lands, nor was any rent charged until a later period; but the lands were still to be Crown lands, merely placed in the temporary possession of the tenant, until needed for other public purposes.

In other words, the Colonial Executive 'let the grass,' and made no charge for the use of it. A few years afterwards, this movement received a great and somewhat novel accession of strength. Among the plentiful crop of joint-stock companies which distinguished the first quarter of the present century, there was one started in 1825, under the name of the Australian Agricultural and Wool-growing Company, which received a grant of a million of acres, in the immediate neighbourhood of Sydney, from the Imperial Government, and commenced operations under other and very attractive circumstances. These operations necessitated, in the first instance, the purchase of a large quantity of stock; and the demand arising unexpectedly among a small community forced up the price of cattle and sheep to a most preposterous amount. Sheep which in ordinary years—such was the rapidity of their multiplication—were worth little more than the couple of pounds of wool on their backs, suddenly rose to five guineas a head, and the prices of horses and working bullocks received a proportional increase. Nevertheless the manager and his agents, undaunted by such difficulties, purchased all that came in their way. Though settlement in the interior was still slow, the seaport of Sydney had already risen to the proportions of a large and flourishing city, and the calculations put forward by the new company were now more minutely examined by its inhabitants. If shareholders residing at the other side of the globe could find profit from an outlay at first appearance so extravagant, it was not unreasonable to suppose that a private capitalist superintending his own affairs might obtain equally favourable returns. A sheep and cattle mania seized the whole population of N.S.W. The citizens of Sydney walked about with their pockets stuffed with samples of colonial wools. Barristers, doctors, and even clergymen, fought in the cattle markets for the possession of a tottering calf or a broken-kneed horse. Sheep became as valuable as Dutch tulips, and sheep-farming took the position of Roman usury. To possess 'a run' became the essential qualification of every one aspiring to the rank of an Australian gentleman. Nor, owing to the overwhelming pressure upon him, was the Governor long able to maintain the proposed condition of £500. From £500 it gradually dwindled to the more vague condition of 'sufficient capital;' from sufficient capital it fell to the still more vague condition of 'respectability.' It was loudly complained that Government officers and the personal friends of the Governor each possessed several runs in various separate districts; while the Governor himself was subjected to insult and even violence in the public streets, from rejected claimants for land. The gambling too quickly extended from the sheep and cattle to the runs. Every available territory was soon appropriated, and the scene of each new discovery in exploration was overrun as quickly as it became known. With occasional interruptions from drought,

disease, overtrading in paper currency, &c., the new sheep-farmers met with a success scarcely to be expected from the early rashness of their speculations. Sheep multiplied wonderfully; their wool was eagerly sought in Europe, and fetched the highest price in the market; and the nature of the country rendered necessary no preliminary, and very little current, expense. Indeed we may learn somewhat of the profits of this pursuit from one of the earliest debates in the Parliament of Q. On a motion to raise the Governor's salary from £2500, as originally proposed by the Secretary of State, to £4000, a member observed that '£2500 a-year was only equal to the income of a second-rate squatter.' The new class too which thus so rapidly overran the Australian Colonies was composed of men of considerable energy and intelligence, untiring in their efforts to forward their interests, and ever ready and willing to fight their own battles against the landless classes which were now beginning to grow on Australian soil. But, above all, their education naturally brought them to form an overwhelming portion, if not the whole, of each of the various 'nominee' councils and legislative assemblies which assisted the Colonial Governors up to the formation of Australian representative constitutions in later years. The rapid growth of so powerful a class, practically holding every known territory, necessitated the issue of various 'squattling regulations' from time to time. By these the squatter was to hold his run under a yearly licence; he was to be limited to the possession of one single run proportioned in extent to the number of his stock—a regulation however which was notoriously set at nought, many persons holding several runs in various districts, and all runs being vastly larger than the amount of stock on them absolutely required. He was also to pay a yearly license-fee of £10—a merely nominal sum, as in many instances it did not amount to the title of a farthing per acre. Indeed the liberality with which the public domain was appropriated to this, the only landholding class, was extravagant in the extreme. It was asserted that ten acres were necessary to the support of each sheep; and though it has since been abundantly demonstrated that sheep can thrive on less than one acre per head, yet instances were rare indeed in which the squatter had not a very ample margin for the future multiplication of his flocks. When it is borne in mind that the squatter numbers his sheep by fifties and even hundreds of thousands, some idea may be formed of the vast principalities passing under the humble appellation of 'runs.' Yet the squatters were by no means satisfied with their many advantages, and their efforts with the Imperial Government to obtain more firm possession of the public domain were unceasing. They complained that their tenure was insecure; that they were denied the ordinary advantages of traders and capitalists in pledging their holdings as security in the purchase of stock, the raising of loans, and other means of improving the

position of themselves and the Australian Colonies—that they had no inducement to execute various desirable improvements on their runs—and that they were even debarred from developing the agricultural and mineral resources of the land. These arguments, skilfully and persistently urged, were not without their effect on the Home Government, and at length, in 1846, resulted, to the astonishment of the Australian Colonies and somewhat to the surprise of the squatters themselves, in the famous Orders in Council. These Orders may be summed up in two most important concessions to the squatters. Their tenure from year to year was to be changed into Crown leases of fourteen years duration, renewable at the option of the Colonial Governors—which meant, of course, their own option; and they were to possess a pre-emptive right entitling them to purchase the fee-simple of the whole or any portion of their runs at the fixed price of £1 per acre. It is almost unnecessary to draw attention to the immense importance of these changes. Virtually they handed over the Australian Colonies to a mere handful of gentlemen farmers. Yet the Home Government was not without its show of argument against the charge of a too ready compliance. Wool had become the staple commodity of the Australian Colonies, and wool-growers were, beyond dispute, the leading and most successful class of colonists. Commissions (unfortunately for the argument, appointed by squatters and composed of squatters) had pronounced the Australian lands unfit for any other purpose, ‘and not worth the smallest coin in the realm per acre.’ It was, too, carefully kept from the knowledge of the British Ministers that the claims of the squatters had already begun to excite strong indignation among their fellow-colonists, whom they hemmed in within a few towns, and whose want of success they turned into a very plausible argument in their own favour. But, above all, the gold, which was to mark a new era in the world’s settlement, still lay undisturbed in the Californian millstream. Yet we cannot but think that even then the Australian Colonies promised a brighter future than the Home Government thus marked out for them. So certainly it appeared to the Australian Governors, who received these Orders in Council with dismay, and hesitated from month to month ere they issued the fourteen years leases which their tenure imposed upon them. Indeed these leases have never been issued up to the present day (1863,) though the terms of the orders leave no doubt but that the squatters were legally entitled to them. More mature reflection and personal inquiry convinced the Governors that their issue, without any sufficient provision for the growing wants of the agricultural and small-farmer class, would raise a storm of opposition, if not an actual rebellion, throughout their vice-royalties; and while they temporised with the squatters, and expostulated, in a necessarily tedious correspondence, with the Home Government, the Californian discoveries of

1849 took place, and were followed by Hargreaves’ announcement of gold on Bathurst Plains. Of the thousands who daily poured into the ports of Sydney and Melbourne—most indeed to dig for gold, but all with some ulterior hope of obtaining that desire of the human breast, a freehold home—few were prepared for the astounding discovery that the whole of the Australian Colonies were held in firm possession by the squatters and their flocks. The discovery, when it was made, was not without imminent danger to the peace and order of that portion of the British Empire; though it is no small proof of the fitness of the Australian colonists for their most liberal powers of self-government, that the long and tedious struggle on which they then entered has been conducted on strictly constitutional principles. Gold-digging, though not unprofitable during its earlier years, was soon found to be a laborious and peculiarly comfortless employment. Thousands of diggers, who had saved some two or three hundred pounds apiece at the mines, sought to purchase farms and to become permanent colonists. But there was no land to be had. Many left the shores of Australia, and obtained what they sought under the more fortunate land laws of the United States of America. Many drank themselves to death. Many listened to the windy orators who harangued them from every stump and market place, and overlooked bad grammar and worse logic in a keen sense of their own injury. The efforts of the various new representative Colonial Parliaments were incessant to remedy so unsatisfactory a state of things. Land bill after land bill was introduced, discussed and quashed. Ministry after Ministry took the helm, and abandoned it in despair. The ‘squattening members’ in the House (whose constituencies consisted of little more than themselves and their shepherds) insisted on the fulfilment of ‘their rights;’ the anti-squatters insisted that hanging was too good for them. It is almost incredible that the fourteen years originally named in the Orders in Council dragged their slow length along without one single land bill for the sale and settlement of the waste lands of the colonies making its way successfully through any one of the new Colonial Parliaments. In the meantime the various Executives did almost nothing, hoping that each proposed measure would confer on them more ample powers. The original land regulations did indeed enable the Governor to enter on a squatter’s run *for public purposes*; and this provision was made use of in the construction of roads and townships, and, though to a much more limited extent, in the proclamation of building and suburban allotments opened for public sale. Miserable as was the dribble of land which this occasionally brought into the market, its benefits were much restricted. The squatter could always avail himself of his pre-emptive right if he had the money. And where the land came into the market the Government were strictly obliged to sell by auction at an upset price not lower than £1 per acre. Practically

therefore pre-emptive right, competition, and the extreme hesitation with which Government availed itself of a provision by no means clearly worded (and indeed pressing most unequally on individual squatters,) raised the price of building and suburban allotments to extravagant amounts, and all but excluded small farms and country homesteads from the soil. The position of the Australian colonists during those years, more especially as regards the great centres of population assembled on the various gold-fields of N.S.W. and V., was most unsatisfactory. In a country practically boundless in its supply of excellent land, the gold-fields digger, shopkeeper or mechanic could not obtain the smallest patch to cultivate a few vegetables for himself or his family, and if his horse strayed a few yards from his tent it was impounded by the neighbouring squatter. But indeed these evils were not by any means restricted to more crowded localities, but spread themselves throughout the whole of the Australian Colonies. And to confine ourselves more particularly to the Colony of Q., we extract the following remarks of Dr. Lang, suggested during a visit made to some of its districts most favoured by nature no longer ago than 1856. They will serve to show that these evils had already extended themselves to territories whose vast extent would seem to set all land difficulties at defiance:—'One should have thought that, with so numerous a population as there has been for so many years past on the Lower Richmond and North Arm, some interest would have been taken by a paternal Government (that of N.S.W., Q. being then its Moreton Bay dependency) in their welfare and some efforts made for their social advancement. Here were hundreds of people, many of them earning for years together from £5 to £7 a week, and not a few of them with wives and children, leading a sort of vagabond life, like gipsies, in this naturally rich district. Surely in such circumstances the first duty of a government would have been to provide these people with the first requisite of civilisation—a home—by laying off townships for them in suitable localities, and holding out to them the opportunity of purchasing town and suburban allotments, and of thereby settling themselves as reputable and industrious citizens, bringing up their families like a civilised Christian people. A surveyor might have done all this in a few months, and his surveys of particular towns and villages might easily have been wrought into a more general survey at any time thereafter. What then will be thought of the absentee Government of the Richmond River district when I state it as a positive fact that up to the period of my visit to the Richmond River, in the month of August 1856, there had never been one town or suburban allotment sold on the river? Land for purchase had been applied for, both by squatters under their pre-emptive rights and by the better class of cedar-cutters for many years past; but to no purpose. Not one town

allotment was sold, not one acre of land was measured for years and years in succession! And what has been the consequence? Why hundreds of people who would gladly have purchased town allotments and built good houses for their families if they could, and hundreds of others who would have purchased small portions of land to rear a few head of cattle or a horse or two for their households, were denied every opportunity of doing so, and as their only resource in the circumstances, were driven perforce to the public-house to expend their earnings there in riotous dissipation and to reduce their wives and families to misery and ruin. Cases of this kind—of cedar-cutters who had saved up one, two, three, and even five hundred pounds, and who in a fit of desperation had spent the whole of it in the public-house—were mentioned to me as having been of frequent occurrence; and a respectable inhabitant of the district mentioned to me the case of a person who had saved up eight hundred pounds in this way and had spent the whole of it at one bout of frenzied dissipation simply because he could get no opportunity of purchasing even a town allotment in the district, and because the squatter on whose run he had erected his hut had been threatening to dispossess him as a trespasser.' We are happy to state that owing to more improved land regulations, to which we shall presently revert, no less than four townships have been thrown open within this district on the Lower Richmond, and under a more healthy system we may naturally expect it to assume those evidences of progress so favourably described by Sir George Bowen in his late visit to the Darling Downs. Indeed, more generally, our task in thus sketching this curious episode in the history of Australian colonisation would be but an ungracious one were we not also able to add the steps which are now being taken to bring the squatterelement within more moderate bounds, and to facilitate the more permanent settlement of all classes on the lands. To the Parliament of Q. is due the merit of having first carried a Land Bill successfully through its several stages. The Land Act or rather Acts (for the whole subject affecting the occupation and purchase of Crown Lands is dealt with in four separate measures,) received the royal assent in September 1860. And as the example of Q. was soon followed by similar measures of the other Australian Parliaments, it may not be uninteresting to examine the position of 'the Land Question,' at the present moment throughout the Australian continent. It will be borne in mind that all Acts of the parent Colony of N.S.W. are in force throughout each Australian Colony until repealed by its own Parliament; and also that under the Constitution granted to each of these colonies, the Crown transferred all ownership in the soil to the colonists themselves. In using the term 'Crown Lands,' therefore, we apply the shortest as hitherto the more general name to all Australian soil undiscovered, lying absolutely waste, or

occupied by squatters, in contradistinction to all portions of the public domain already sold or otherwise alienated to private individuals. We may also state that while the extreme squatter party demanded the complete fulfilment of the Orders in Council, the extreme opposite party of anti-squatters insisted on the right of all colonists to free selection from Crown lands prior to their actual survey by the Government at a fixed price per acre. These remarks may enable the reader to see with what success the several colonies have now endeavoured to steer a mean course between two parties which for some years comprehended almost every Australian colonist. The chief features of the Queensland Acts may be thus summed up:—The Orders in Council are repealed. All land open for purchase must be previously surveyed and delineated on the public maps of the colony. The auction system, with its upset price of £1 per acre, is still allowed to be in force. But—and here is the distinguishing feature of these regulations—from the auction system are excluded certain agricultural reserves which the Government is to proclaim in all suitable places at its discretion, with a guarantee however that half the extent of each reserve shall be continuously kept in excess of the demand; such reserves being of course proclaimed over runs, waste lands, and generally wheresoever population may show a tendency to extend itself. On these reserves the intending settler may purchase farms of from forty to 320 acres at a fixed price of £1 per acre; the purchaser of each farm being allowed to rent a contiguous allotment of three times its extent at 6d. per acre, with right to purchase such allotment at £1 per acre within five years. In general therefore the agricultural farmer can rent land at something equivalent to 5s. per acre, and purchase it at £1 per acre. Subject to these chances of dispossession, the squatters are thus dealt with. Squatters actually in occupation shall obtain leases of five years duration, at a yearly rent to be fixed by valuation. Where such valuation is objected to, the vacated run is to be let to the highest bidder at public auction, the new lessee paying over (through the medium of the treasury) to the out-going occupant the value of all actual and real improvements, under Government appraisal. Squatters taking up new runs in outlying or unexplored districts, are to be allowed leases of fourteen years duration. These new runs are not to be less than twenty-five square miles, nor greater than 100 square miles in extent, and they are to be subjected to the yearly rent of 10s. per square mile (640 acres) for the first four years, with a slight increase during the succeeding years. As a strong counterbalance however the squatters lose all power of pre-emptive right, which is now wholly abolished within the colony of Queensland. Besides these provisions for the agricultural classes, each immigrant, unless arriving at the expense of the colony, receives a land order entitling him

to a free grant of thirty acres. British soldiers and sailors are also entitled to land orders of fifty acres apiece; and commissioned officers of the British army and navy continue to receive the same remission (one-third) of purchase-money originally established under the old colony of N.S.W., but since abolished in it and its other offshoots. The neighbouring colonies of N.S.W. and V. succeeded in passing nearly similar Acts shortly afterwards. The colony of S.A. had, with her foundation, introduced a somewhat more liberal land system; while the exodus which took place from her territories during the earlier period of the gold discoveries relieved her from all pressure for some years. More lately, the large tracts thrown open within her boundaries by recent explorations have given a very considerable impetus to squatting pursuits; and the S.A. squatter still continues, to a great extent, to enjoy—with the free consent of his fellow-colonists—the easy regulations of the old colony of N.S.W. ere “Free Selection before Survey” came to be agitated by its landless classes. The colony of W.A. however stands alone for its rigid maintenance of the squatting system in all its early arrogance, and this huge wilderness, with an area of a million square miles, and its handful of squatters and their convict stockmen, still continues to be locked up to all intending purchasers. To sum up then the present position of the land question throughout the whole of these colonies:—The upset price of land has been maintained at £1 per acre throughout the whole continent. The auction system has been abolished throughout N.S.W., V., and practically in Q.; and the intending purchaser is subject to no competition. In these colonies a supply of agricultural land, probably sufficient for several years to come, is now placed in the market. The tendency of legislation has been (1) to exact from the squatters a return in the shape of rent or assessment on stock more commensurate with the value of their runs; and (2) to confer on them a security of tenure increasing with their distance from the chief centres of population. Both these elements are conducing to the occupancy of large tracts of more distant and unexplored country by this class of settlers; and generally the termination of this long strife appears to have given a very considerable stimulus to squatting pursuits, while relieving the more crowded districts of their pressure.”

ST. ARNAUD, a mining township in V., 158 miles N.W. of Melbourne, with which it is connected by railway. The district is a mining, pastoral and agricultural one, the workings being principally quartz. The alluvial ground is estimated to cover an area of seven square miles, and the reefs to number seventy. Silver has also been found in the locality, and considerable quantities have been raised. To the N.W. of the town large tracts of some of the finest agricultural lands in the colony are to be met with, immense areas of

which have been selected and occupied, and a favourable report is given of farming operations and the appearance of the district generally. Wheat has been largely grown, but droughts seriously affected the crops. St. Arnaud came into note as a goldfield during the Crimean war, and was named after the celebrated French General St. Arnaud.

ST. GEORGE'S HEAD is the most easterly point of Sussex Haven in N.S.W., and was so named by Cook from the circumstance of his having first seen it on St. George's Day in the year 1770.

ST. JULIAN, CHARLES JAMES HERBERT (1819-1874) journalist, was a native of France, and came to S.A. in 1837. Two years after he went to Sydney, and became connected with the *Australian Chronicle*, and subsequently with the *Commercial Journal*, afterwards known as the *Free Press*. In 1843 he joined the *Sydney Morning Herald*, but left it in 1847 to join E. J. Hawksley in the *Sydney Chronicle*. In 1849 he again joined the *Herald*, and remained with it as law reporter until 1872, when he received the appointment of Chief Justice of Fiji from King Thakombau. He had been for some years previously consul for Fiji in Sydney. He died at Levuka in November 1874. He was the author of several works, of which the most noteworthy was a treatise on the Municipal Law of N.S.W.

ST. VINCENT'S GULF, in S.A., on which Adelaide stands, is a deep indentation of the sea running in a north direction in to the mainland. The harbour known as Port Wakefield lies at its head, and on its east shore are Ports Gawler, Adelaide, Willunga, Noarlunga, and Rapid Bay. The gulf is formed between the east shore of Yorke's Peninsula and a range of moderately-elevated hills which extend to the northward, in continuation of those over Cape Jervis. The breadth of its entrance is nearly thirteen leagues. The gulf was discovered by Flinders in 1802, and named by him after Admiral the Earl of St. Vincent. When Colonel Light in 1836 found the site of Kingscote in Kangaroo Island (the Arcadian El Dorado of the London prospectuses) unfit for colonisation, after time and money had been wasted by the immigrants and the company in building and clearing, he landed in St. Vincent's Gulf and explored a creek or estuary of the sea seven miles inland, from which, on a large fertile plain bounded on the east by the Mount Lofty Range, and on the banks of a small river named after Torrens, he fixed the site of the capital.

STANDISH, FREDERIC CHARLES (1824—) is a native of Lancashire, England, and was educated at Prior Park College, and then entered the Royal Military Academy, Woolwich. He obtained a commission in the Royal Artillery, in which he served for nine years, and retired with the rank of Captain. He came to V. in 1852, and was appointed to the Government service in

1854, as Assistant Commissioner of Gold-fields at Sandhurst. He was afterwards Chinese Protector till 1858. He was appointed Chief Commissioner of Police on the resignation of Captain Macmahon in 1860, and held the office till 1880, when he resigned. Standish was in 1861 installed District Grand Master of the Freemasons of V. under the English constitution.

STANTON, GEORGE HENRY, first Bishop of Northern Q., was educated at Magdalen Hall, Oxford, and took his degree of B.A. in 1859 and M.A. in 1862. He laboured as curate at Maidstone, and afterwards in London. In 1867 he was made Rector of Holborn. He was consecrated Bishop of Northern Q. in June 1878, and took charge of his diocese in May 1879.

STATION PEAK, a prominent hill on the western shore of Port Phillip Bay 1154 feet high. It was ascended and named by Flinders on 28th April 1802. The native name is Wurdí Youang. From the top of this hill there is a splendid view of the entire extent of Port Phillip Bay.

STAWELL, SIR WILLIAM FOSTER (1815—) Chief Justice of V., is a native of the County Cork, Ireland, and was educated at Trinity College, Dublin. He studied law in London under the celebrated Chitty and the learned George Long, and was called to the English Bar in 1839. In 1842 he came to V. and commenced the practice of his profession. On the separation of Port Phillip from N.S.W. Stawell was appointed Attorney-General of the first nominee Ministry, with Barry as Solicitor-General, and continued to hold that office until the introduction of responsible government in 1855. He then retired with the rest of the Haines Ministry, but returned with them as Attorney-General on their re-appointment by Sir Charles Hotham. In 1857, on the retirement of Sir William A'Beckett, Stawell became Chief Justice. He was chairman of the Royal Society of V. when Ambrose Kyte placed in his hands the donation of £1000 towards the expenses of an expedition to the Gulf of Carpentaria. In 1881, on the death of Sir Redmond Barry, Stawell was elected Chancellor of the University of Melbourne. He was knighted on his elevation to the judicial bench, and has on two occasions filled the office of Acting-Governor of the Colony, once after the departure of Viscount Canterbury in 1873, and again during the absence in Europe of Sir George Bowen in 1875. Stawell is held in universal esteem for his great legal abilities, his elevation of character, energy of mind, and unbending impartiality of judgment. During his tenure of the office of Chief Justice he has laboured earnestly and unceasingly so to improve the system of penal and prison discipline that it may aid towards the reclamation of the criminal, and also to the extinction of crime in the colony. His labours as judge have been unremitting from the first, with the exception of a two years holiday in Europe from 1873-5. In the course of that tour

he made careful and minute inquiries into the working of the penal and prison systems of various European countries.

STAWELL, formerly Pleasant Creek, a mining township in V., 176 miles W. of Melbourne, with which it is connected by railway. Gold was first discovered here in May 1853 by a shepherd named William McLachlan. The great rush however did not take place till July 1857. An immense number of miners then found their way to the creek, and throughout the two following years it was worked with great success by from 20,000 to 30,000 men. Very rich yields of gold were discovered during that period, and more "piles" were then made on Pleasant Creek than on any other known rush. Its celebrity and progressive prosperity are mainly due to the enterprise of Edmund and William Grant, who were the first to open up its rich quartz-reefs, which have been proved to be payable at great depths. The four deepest progressive mines in the colony are here: these are the Magdala, 2396 feet, the Newington, 1940 feet, the Prince Patrick, 1830 feet, and the South Scotchman, 1262 feet. The richest mine in V. is reputed to be that of the Pleasant Creek Cross Company, 1220 feet in depth. From this claim alone from January 1870 to the middle of 1875 the dividends declared amounted to £467,242 1s. 9d. The Oriental claim has also yielded large returns. In June 1878, 300 lbs. troy weight of stone procured from the 1160-foot level produced 343 ounces of gold, equivalent to 2561 ounces to the ton. The yield of gold from the quartz mines, and their permanent character, cause the constant employment of a large body of miners and numerous others, and ensure a market for the produce of a large agricultural population which during the last seven years has settled on the lands in the surrounding district. About 13,436 acres are under cultivation in the district, of which wheat and oats absorb nearly one half, 3196 acres being under hay, 378 under artificial grass, and 242 in vines. Vine culture is reported to have given satisfactory results. The land generally is a stiff poor clay heavily timbered. Late mining returns show machinery and other appliances of the estimated value of £156,359. The auriferous ground is estimated to cover an area of twenty-seven square miles. Stawell is a very well laid out town, and contains several handsome churches and other public buildings. It is named after Chief Justice Stawell.

STENHOUSE, NICOL DRYSDALE (1803-76) the "Mæcenæ of Australian literature," for many years occupied a prominent position in the legal, scientific and literary circles of N.S.W. He was a patron of literature and the arts, and many experienced his kindly encouragement. He had been clerk to the celebrated Sir William Hamilton when the latter was practising as an advocate in the Court of Sessions at Edinburgh, and was afterwards enrolled as an attorney. Stenhouse was a correspondent and intimate friend of Thomas

De Quincy, and a pupil of Professors Pillans, Dunbar, and Brunton. He was for about forty-six years in N.S.W., during which time he was engaged in extensive practice as an attorney. At an election of officers of the University, the last that occurred before his death, Stenhouse was, on the motion of Dr. Badham, admitted as an Examiner in the faculty of Law and made a member of the Senate. For many years he evinced deep interest in the Sydney Mechanics School of Arts, as its President, in which position he succeeded Dr. Woolley. The strongest friendship existed between these two literary brethren. He was well known as a scholar and fosterer of colonial literature, and his published works show great power and refined taste, as well as a profound acquaintance with classical, German, and English literature. He was one of the first appointed trustees of the Sydney Free Public Library, and was the proprietor of a splendid private library of the rarest and choicest works.

STEPHEN, SIR ALFRED (1802—) Lieutenant-Governor and ex-Chief Justice of N.S.W., is the fourth son of Mr. Justice Stephen, judge of the Supreme Court of N.S.W., who died in Sydney in 1833. He was born in the West Indies, and received his education in England. In 1815 he accompanied his father, then Solicitor-General of the Leeward Islands, to the West Indies. They landed at Barbadoes in June, and visited all the islands westward of Barbadoes to St. Thomas. In 1817 Colonel Thomson, President of the Council of St. Christopher, called on all above sixteen to serve in the militia formed under his command for the defence of the island, and Stephen was appointed second lieutenant in the Corps of Fusiliers. He returned to England and studied for the Bar, first as pupil of Sergeant Stephen and then of Sir James Stephen. In November 1823 he was called to the Bar at Lincoln's Inn, and commenced practice as an equity draftsman. In 1824 he came to V.D.L. In April 1825 he was appointed Crown-Solicitor and Solicitor-General; and in April 1832, whilst on his passage to England with his family, was gazetted Attorney-General of the colony. He entered on the duties of that office in the following year, and held it until 1838. In April 1839 Sir George Gipps appointed him to a vacant judgeship in N.S.W.; and in October 1844, on the death of Sir James Dowling, he became Chief Justice. In August 1846 he was knighted, in recognition of his services. In 1856, on the initiation of Parliamentary Government, he was appointed President of the Legislative Council, but he resigned this post the following year, and in 1858 his seat also. In 1862 he was made a C.B. On the departure of Earl Belmore in February 1872, Stephen was Administrator of the Government until the arrival of Sir Hercules Robinson. In 1873 he resigned the Chief Justiceship. He was made K.C.M.G. in 1874, and Lieutenant-Governor of N.S.W. in 1875, this latter appointment having been decided by the Home Government

in consequence of a claim to that office having been made by Sir James Martin as Chief Justice on the departure of Sir Hercules Robinson for Fiji. In March the same year Stephen was appointed to a seat in the Legislative Council. This seat he resigned in March 1879, in consequence of having entered on his duties as Acting-Governor, consequent on the departure of Sir Hercules Robinson. He has been for many years a member of the Council of Education, and has always been distinguished by his advocacy and support of benevolent and charitable institutions. Stephen throughout his career as a judge has always been noted for his indefatigable diligence and zeal in the discharge of his duties, by his strict impartiality of judgment, and his perfect courtesy of manners.

STEPHEN, SIR GEORGE (1794-1880) brother of the foregoing, was born at St. Kitts, one of the West Indian Islands, where his father, James Stephen, held at the time a Government appointment. James Stephen was an able and distinguished writer, and is credited with being the real author of the celebrated Orders in Council. He was for some time member of Parliament for Tralee, and afterwards for East Grimstead. He received the appointment of a master in Chancery, an office which he held for twenty years. George Stephen received a careful education, and was sent to the University of Cambridge. In an autobiography published by him for the use of his relatives he relates one or two interesting incidents of his school career. He was prematurely flogged through the Eton Latin and Greek grammars in a way, he remarks, that would now be regarded as cruel and scandalous. While at the private school of Mr. Greaves, at Clapham Common, he became acquainted with Macaulay, who was many years younger than himself, and that school acquaintance continued to the end of life. His opinion of Macaulay is interesting, though its justice may perhaps be doubted. Macaulay, he states, was destitute as a boy of all the fire of sentiment, though memory supplied him with its language; he was almost an alien from those who ought to have been his companions, and never associated in their games, much less in their wild frolics when school hours were over. This coldness of temperament marked him in all his intercourse with the world. As an orator his coldness and formality prevented his obtaining the highest success, though the "political essays" which he delivered on the Reform Bill were a brilliant exhibition of talent. These views are at variance with the character of Lord Macaulay as set forth in the biography written by his nephew. George Stephen was intended originally for the medical department of the army, when—England at the time being engaged with the terrible struggle with Napoleon—occupation was certain and promotion rapid. With this view he was at the age of fifteen placed under the instruction of James Briggs, a skilful anatomist. He remained in this occupation for

about three years, when his education in this direction was stopped. The crushing defeat sustained by Napoleon at Leipsic opened out a prospect of peace, and hundreds of young men on the medical staff of the army were thrown out of employment. James Stephen therefore altered his plans concerning his son, and sent him to Cambridge with the view of becoming a physician. He was, he states in his autobiography, successful in obtaining all the college prizes with one exception, but he learned nothing else except the art of riding and hunting, and of inventing mischief for the special service of the under-graduates. His father coming to the conclusion that he wanted steadiness to acquire successfully the gravity becoming a physician, removed him from college, and entered him in the office of Mr. Freshfield, the solicitor of the Bank of England, to study the law. He served his five years apprenticeship, and then commenced to practise for himself. George Stephen was concerned in an indirect manner with the trial of Queen Caroline. He was selected, though only five-and-twenty years of age, to collect on the continent evidence of the Queen's conduct during the last six months of her connection with Bergami, so as to carry the inquiry then proceeding in the House of Lords down to her arrival in England. The inquiry was adjourned for a time, and for a month he was incessantly engaged on this work. He followed the route previously taken by the Queen, and made it his habit at every hotel to occupy while there the same apartments that had been occupied by the Queen. Stephen was naturally from his connection with the case a firm believer in the guilt of the Queen. He states that the evidence he obtained was perfectly consistent with all that had been given in the House of Lords, and the facts were so gross that the Government thought it impossible to enter publicly on them. It will be from his connection with the anti-slavery agitation, in which he took a prominent part, that Stephen will be principally remembered. His father had for years been actively engaged in the same work, and the son was naturally induced to take a warm interest in the matter. He became intimate with Zachary Macaulay, Wilberforce and other eminent men who displayed their zeal in this cause. With Wilberforce he was connected by family ties, his father having married as his second wife the sister of Wilberforce—Mrs. Clarke, widow of a clergyman. The slave trade, as far as regarded the legitimate shipment of slaves from Africa to the British Colonies, was abolished in the year 1807, and through the activity of Brougham a still stronger measure was passed in 1811, when slave-trading was declared to be felonious. Slavery however still existed in the British Colonies, and it was in the abolition of this remnant of England's participation in the trade that Stephen was actively engaged. There were many societies existing at the time having for their avowed object slave emancipation, of which the Anti-slavery Society in London was the principal. Wilberforce,

Clarkson, Z. Macaulay, and James Stephen were the leading spirits in the movement, but they were growing old, and in 1824 Wilberforce resigned the lead of the party into the hands of Sir Fowell Buxton. During 1826 facts were brought to light concerning slavery in the Mauritius which justified Buxton in demanding an enquiry, and the House of Commons acceded to the motion. Stephen was appointed to conduct this inquiry, and immediately entered on the work. The 56th Regiment, which had been stationed in the Mauritius, had returned to England, and from the evidence given by the men sufficient was elicited to satisfy the Government of the truth of the charges. Commissioners were despatched to the Mauritius to prosecute the inquiry there, and in the meantime Stephen examined all the witnesses that could be discovered in England. The number of slaves in the Mauritius was, on the average, 60,000, and proof was obtained that this number had been replaced three times by the Seychelles trade since the colony came into the possession of England. The Mauritius inquiry lasted for some time, and eventually terminated in the emancipation of every slave who could establish the date of his arrival to be subsequent to the surrender of the colony. Eventually all slaves were emancipated by the abolition of slavery in the British dominions. About this time Stephen became acquainted with O'Connell, from whom he desired to learn some lessons in the art of political agitation. Concerned at the slow progress of the movement for the emancipation of the slaves, he wished to organise a national agitation on the subject. He prepared an anti-slavery creed, laying down the principle that "to uphold slavery was a crime before God, and that every Christian was called upon to aid in its suppression." He submitted his scheme to the Anti-Slavery Committee hoping to obtain their adoption of it, but to his great disappointment they decided that the proposal was too radical in its character to be expedient in the then temper of the public and would tend to alienate much of the Parliamentary support on which they relied. He received help however from an unexpected quarter. He was invited by Mr. Cropper of Liverpool to dine with him and some friends, and to give a further explanation of the scheme. The company comprised about twenty Quakers, to whom he again explained his proposals. Cropper asked him what he intended to do. "I shall go on to the end," he replied, "and do my best to carry it through if I can raise £1000." "All right," was immediately exclaimed by everyone round the table, and was followed by a subscription of £500 from Cropper and £250 from Joseph Sturge. Such was the commencement of the Agency Committee, and thus supported Stephen was enabled to carry out his plan, which proved successful beyond his hopes. Popular excitement was aroused, and when the bill dealing with the subject of slavery was brought before Parliament an anti-slavery petition with 187,000

signatures, obtained in less than ten days, was presented. Warned by the exhibitions of public feeling the West Indian party changed their policy and offered to withdraw their opposition to the measure on payment of £20,000,000 to the planters and their mortgagees. The views of Stephen as the representative of the Agency party were asked, and he was given to understand that his answer would determine the fate of the bill, as except on those terms a majority was hopeless. He felt himself to be in an embarrassing position, for according to the views he had circulated, the proposal amounted to a purchase of negro liberty, and therefore to an absolute abandonment of principle, but under stress of circumstances he decided to accept the compromise on condition that the bill should contain an absolute prohibition of all slavery in the British dominions for ever. This was conceded, the bill passed, and received the Royal assent. Stephen received the honour of knighthood in 1838 in recognition of his services in the cause of negro emancipation. For some years he practised in London as a solicitor, but afterwards felt an inclination to join the higher branch of the profession. The rules then in force required that for two years previously to the call to the bar he should abstain from all remunerative occupation of a professional character, and in 1847 he quitted London, and resided in the country for the two years. He was thus not called until June 1849, making him junior at the bar to his eldest son, who had been called a few months previously. He practised for about five years at Liverpool and at the Northern Circuit, and his experience in bankruptcy law soon gained him the lead in that business. Two of his sons had previously migrated to V., and the bankruptcy business having fallen off in Liverpool, Stephen determined to join them. In 1855 he and his family came to Melbourne, a step which he says in his autobiography he never ceased to regret. He practised as a barrister, for the most part in the Insolvency Court, and was appointed a Queen's Counsel. In 1866 he acted for a short time as Commissioner of Insolvent Estates at Geelong. He was elected first President of the Melbourne Chess Club, founded in August 1866. Stephen was a prolific writer, and some of his productions attained more than momentary success. He was the author of *Adventures of a Gentleman in Search of a Horse*, a work intended to illustrate in an amusing form the operation of the laws relating to horse warranty. The book ran through as many as six editions. He published several pamphlets on legal subjects, and also a work entitled *Life of Christ*.

STEPHEN, JAMES WILBERFORCE (1822—) jurist, is a son of the foregoing and a native of England, and was educated at the University of Cambridge, where he graduated fourth Wrangler in 1846, and shortly afterwards took his degree of M.A. After leaving college he studied for the bar, and was called in 1848. He came to V. in

1854, and obtained a very large practice as an equity barrister. In 1871 he was elected member of the Assembly for St. Kilda, and shortly afterwards became Attorney-General in the Francis Ministry. He framed and carried the Act for establishing the existing system of free education. In 1872, on the retirement of Mr. Justice Williams, he was raised to the bench as Judge of the Supreme Court.

STEPHENS, T. B. (1819—1877) journalist, was a native of Rochdale, in England, and came to Sydney in 1849, but removed a few years afterwards to Brisbane. About the time of the separation of Q. from N.S.W. Stephens became proprietor of the *Brisbane Courier*, the oldest newspaper in the colony, and held it until 1869, when it passed into the hands of a company, of which he was a shareholder. Stephens' connection with the *Courier* terminated about 1873, when the property was sold to the present proprietors. The achievement however on which he most prided himself in the work of journalism, and in the success of which he took the deepest personal interest, was the establishment of the *Queenslander*. For a number of years he wrote a considerable portion of the leading matter of this journal. Stephens was elected an alderman of Brisbane soon after the town became a municipality, and held the office for several years. In 1862 he was elected mayor. He represented South Brisbane in the Legislative Assembly of Q. from the time of separation until his retirement from public life.

STEWART ISLAND (native name Rakiura,) is a small island belonging to N.Z. lying to the south of the Southern Island, from which it is separated by Foveaux Strait. It is of irregular form, about thirty miles long by twenty-five miles broad, and contains an area of about 1000 square miles. It is mountainous and well wooded with valuable timber trees. It has also several good harbours, and there are many fertile valleys. It was originally uninhabited, but is now occupied by a few whalers and sealers, with some natives and their half-breed descendants. The seas around swarm with fish, and there are said to be large deposits of iron-sand equal to that of Taranaki.

STIRLING, SIR JAMES (1791-1868) navigator, was a native of Lanarkshire in Scotland, and entered the navy at an early age. He served throughout the war against France, and commanded H.M.S. *Brazen* in the American war of 1812. Subsequently he was engaged in the survey of the coast of Australia, and was the first to cross the Monaro plains in N.S.W. He was sent from Sydney by Governor Darling in 1827 in command of H.M.S. *Success* to survey the western coast of the continent, and to select a suitable site for a penal settlement at some place on the banks of the Swan River. A report had got abroad that the French Government were about to take possession of the western portion of Australia, and the expedition was designed to forestall

that purpose. The *Success* dropped anchor on 6th March, and the next day two boats crews well armed were sent to explore the river. Stirling commanded the exploring party, and was accompanied by Mr. Frazer, colonial botanist. Their report on the capabilities of the region, made to Governor Darling on the return of the *Success* to Sydney, induced him to recommend to the Home Government that a settlement should be formed there. The despatch containing this recommendation was taken to England by Stirling. It was resolved to act on the suggestion, and Stirling was appointed first Governor of the settlement, with a grant of 100,000 acres of land for his services in surveying and exploring. Accordingly H.M.S. *Challenger*, commanded by Captain Fremantle, was despatched from London in 1829, and was followed by the *Parmelia*, commanded by Stirling. When Fremantle arrived at Swan River he found that a nearer view of the country was far from realising the expectations formed by those who had viewed it merely from the open sea. He began to have forebodings, but it was too late; the ships containing eight hundred of the first settlers were already close at hand; and on 1st June, after narrowly escaping shipwreck on the reefs along the shore, Stirling landed with his little band on the wilderness of Garden Island. Here in this temporary abode the colonists remained for several months, sheltering themselves in fragile tents or in brushwood huts from the rough blasts and the rains that beat in from the winter storms of the Indian Ocean. Exploring parties set out from time to time to examine the adjoining mainland; but however fair it seemed from a distance, they found it to be merely a sandy region covered with dense and scrubby thickets. The only port was at Fremantle, where there was but little shelter from the storms of the open ocean; and the only place suitable for a town was several miles up the Swan River, where the waters expand into broad but shallow lagoons. Here the colonists determined to build their city, to which they gave the name of Perth; but the site was not favourable to enterprise, an impassable bar stretched across the mouth of the river, which was therefore inaccessible to vessels. The goods of the colonists had to be landed on an exposed beach at Fremantle and then carried overland through miles of sand and scrub. In 1830 about a thousand new immigrants arrived; and towards the end of this year the colonists succeeded in settling down in their new homes at Perth. The work of exploration was at once proceeded with, Stirling himself taking a leading part in the expeditions. From circumstances which the Governor was powerless to control, the settlement proved a disastrous failure. Stirling left the colony in September 1832 for the purpose of rendering an account of the causes of the failure to the Home Government, which he appears to have done satisfactorily for himself, as he received the honour of knighthood. He was absent

two years, during which the 'Government of the settlement devolved on Captain Irwin of the 63rd Regiment, in the first year, and Captain Daniel of the 21st Regiment, in the second. Stirling returned in August 1834, and infused new vigour into the colonists by surmounting the errors committed in the early proceedings of the settlement. But for him the colony would have been abandoned; and it made satisfactory progress during his further tenure of office, when he again left in 1838. On his return to England, Stirling resumed his profession, and was commander-in-chief of the fleet in China during the Russian war. In 1852 he held for a short time the post of a Lord of the Admiralty.

STONY DESERT is the name given to the vast tract of perfectly level desert, without a tree, a blade of grass, or the slightest sign of vegetation, crossed by Sturt in 1845, and by Burke and Wills in 1860. It is described by Sturt as a stony desert, into which the sand-hills abut like cliffs upon the ocean. The ground is strewn as thickly as possible with rounded fragments of quartz and sandstone, just like a shingle beach. This tract however has been found by subsequent explorations to consist of dotted patches, or a series of plains rather than one vast desert, and is not all equally strewn with stones or destitute of vegetation. Howitt found in 1862 a part where it was not more than seventeen miles wide, of which eight miles only were bad travelling, and all more or less grassed. These patches of stony desert appear only dotted here and there amidst the plains for a considerable distance N., S. and W. of the Barcoo River. Many theories have been advanced to account for these singular tracts of sterile desert; the favourite one is that they are the remains left by some long continued current of water flowing through the centre of the continent. The Rev. J. E. T. Woods, however, gives it as his opinion that they are the remains of a decomposed highly ferruginous tertiary sandstone which abounds in other parts of the continent. Where the strata contained a great deal of iron, they formed siliceous concretions which resisted decomposition, while the rest of the rock fell away. Or it may have been that the strata itself was composed in places of a sandstone breccia like that found on the N. coast, where each ferruginous nodule is glazed round with quartz. The red sand is certainly derived from a ferruginous sandstone, and if it be asked how the ridges should be so high and uneven, and the plains so low and flat, he answers that when the strata decomposed, the lighter portions drifted away into ridges, leaving the heavier remains scattered below on the plains. The impression which prevailed for so long a time that the whole extent of the interior of the continent was a desert of this description has been completely dissipated by the researches of recent explorers. Ernest Favenc reports that fat cattle now find their way to Sydney and Melbourne from the scorched plains and bare

hot sandhills that turned back the veteran Sturt. Did Sturt allow himself to be daunted by illusory or exaggerated dangers, or has the aspect of the country changed since his time? Neither. Other and more recent explorers have confirmed the accuracy of his statements; and the severe hardships undergone by Giles, Warburton and Forrest in their gallant expeditions offered the strongest possible testimony to the truth of the early explorer's descriptions of the intense aridity of the soil and climate. But it is now ascertained that the regions of the interior which it has been the custom to designate deserts are only deserts by comparison with the fertile and fruitful fringe of country lying on each side of the coast ranges. The central plain of A. it now appears has been as wonderfully fitted by nature to sustain animal life as other seemingly desolate areas of the earth's surface have been. Every bush and shrub, nay, almost every tree is edible; and the long months of drought that would shrivel the coast grasses into dry dust make no impression on the hardy shrubs of the great plain; while such are their fattening properties that stock subsisting on them can travel long distances in and out to water without losing flesh as they would do under different conditions. According to Favenc the only real desert is that which strictly speaking is no desert at all because it is covered with permanent vegetation; that is to say, with the treacherous and useless spinifex, intermingled with shady baubinia trees and bright-looking desert-apple trees. Yet even these may be transitional forms of plant-life which are preparing the soil out of which they grow for higher and better kinds of flora. Sturt's stony desert was nothing of this kind, but consisted of a long stretch of downs covered with limestone nodules and dry plains upon which the grass had perished from long-continued dry weather; and the explorers were too inexperienced in this description of country to properly appreciate the shrubs and herbage which supplied the place of grass. "There is," writes Favenc, "actually no desert country in the interior excepting spinifex country; that is, if we accept the term 'desert' as meaning country unfit to support animal life. There are flooded plains subject to inundation that during a great portion of the year are barren; that is to say, the grass that grows on them is of a kind that will not last longer than a few months; but these cannot come under the denomination 'desert,' as the watercourses that intersect them generally contain plenty of feed about their banks, and the plains themselves terminate in higher country, carrying grass, bushes, &c., all the year round." Hence what was formerly condemned as hopelessly dry country is now affording pasturage to thousands of sheep, and the only question that arises is that which is pertinently asked by Favenc: Will country subject to such long and constant periods of dry weather stand the drain upon it caused by close stocking; and, if any of the

vegetation disappears, will other growth take its place? This must depend, to a considerable extent, on the possibility of storing the annual rainfall or of finding a subterranean supply of water, and if we are to be guided by analogy, it may be confidently anticipated that beneath the great central plain of A., as beneath other depressions of the earth's surface, exhibiting similar geological, climatic, and meteorological conditions, will be found large deposits of the precious fluid. The heavy tropical rains of the interior, which often suffice to transform extensive plains into wide-spreading lakes, do not disappear by evaporation exclusively, except in the case of those clay-pans which offer an impermeable surface to the water. Wherever the soil is arenaceous, or otherwise porous, there must be a large amount of infiltration going on, and where this is the case, the water would descend until it reached an impenetrable stratum, where it would form a reservoir or flow off in the direction of the trend of the underlying rock. At present nothing is known of the sources of those streams—from which living fish have been brought up—that are met with at considerable depths by miners in different parts of this colony. One thing only is certain, that they are of such a magnitude and force as to necessitate expensive pumping power to keep them from flooding the shafts and adits; and they not merely provoke inquiry as to their origin, but suggest plausible hypotheses concerning the hidden and undeveloped water supply of the continent, and encourage the hope that this may one day enable enterprise to make even "the desert" bloom like a garden.

STORM BAY, a harbour in T., the principal portion of which is included between the land extending from Cape Pillar to the entrance of the Derwent and Bruné Island, between which and the S.E. part of the main land is D'Entrecasteaux Channel, where there is a passage for large vessels. Storm Bay contains several islands, and has excellent holding ground, but is not well sheltered from the winds and tides of the ocean.

STOUT, ROBERT (1845—) jurist, is a native of the Shetland Isles in Scotland. He came to N.Z. in 1863, and was engaged for some time as second master in the Dunedin Grammar School. In 1867 he began the study of the law, and was articled in 1868. He was a constant contributor to the press, and edited for three years a weekly journal in Otago. He was admitted a barrister in July 1871; and was elected to the General Assembly in 1875 for Caversham, and in 1876 for Dunedin. In 1878 he was appointed Attorney-General.

STOW, THOMAS QUINTON (1801—1862) was a native of England, and at an early age adopted the ministerial profession. For some years he studied at the Missionary College, Gosport, under the direction of Dr. Bogue. His first pastoral charge was at Huntingdon in Hertfordshire, whence he removed to Halstead in Essex, where he laboured with much success for many

years, respected for his ability and consistency, and beloved for his kindness. In 1837 Stow was sent out by the Colonial Missionary Society to the newly-established colony of S.A. At first he preached in a tent brought with him from England, and pitched in the park lands. The first church was an unpretending building of pine and reeds, partly erected by Stow's own hands, which stood in North Terrace. This was the first religious edifice built in S.A. In 1840 the Independent Church in Freeman-street was opened for worship, and there Stow laboured with much devotedness and success for several years, until he was seized by severe illness, and a successor (the Rev. C. W. Evan.) was obtained. Though prevented from regular official duties, he still continued to serve the churches of his denomination, and whilst fulfilling a temporary engagement in Sydney he was overtaken by his last and fatal attack of illness. He died on 19th July 1862 at the house of John Fairfax in Sydney. Stow was universally beloved and respected, a true patriot, an urbane gentleman, a faithful minister, and a kind friend.

STOW, JEFFERSON PICKMAN (1830—) journalist, son of the foregoing, came to S.A. with his father in 1837. In 1864 he went to the Northern Territory, and was one of the brave little party that purchased a small boat, which they named the *Forlorn Hope*, and in which they accomplished a perilous voyage around the West Coast and back to S.A. Stow published an interesting account of this expedition, and shortly afterwards joined the staff of the *S.A. Advertiser*, of which he was appointed editor in 1876.

STOW, RANDOLPH ISHAM (1829-1878) jurist, son of the Rev. T. Q. Stow, came with his father to S.A. in 1837. He studied law, and continued the practice of his profession as solicitor for many years. He was elected to the Legislative Assembly as member for West Torrens in 1861, and became Attorney-General in the Reynolds Ministry, and subsequently in the Waterhouse, Ayres and Blythe Ministries. He was raised to the Judicial Bench in 1875.

STRZELECKI, COUNT PAUL E., explorer, a distinguished Polish refugee who emigrated to Australia in 1831 in consequence of the oppression practised by the Russians on his native land. He was noted in his own country for his proficiency in the practical sciences, especially geology and mineralogy. Immediately succeeding the explorations of Sir Thomas Mitchell, Count Strzelecki entered on an examination of the Great Dividing Range and its branches, which extended over several years, and entailed an immense amount of labour and hardship. The various summits of the chain within the two colonies of N.S.W. and V.D.L. were named by him; their heights ascertained; their mountain streams traced; the geology and mineralogy, the terrestrial magnetism, the climate, the fossil and existing *fauna*, the fossil and existing *flora*, the state and prospects

of agriculture; the physical, moral, and social condition of the aborigines investigated; and the whole of this vast district was brought within a geological map of great scientific value. We have now to follow him into what has not unfairly been called the garden of Australia Felix. The Great Dividing Range runs from north to south of the east coast and buries itself in the Southern Ocean at Wilson's Promontory. Before however reaching Wilson's Promontory it throws off a spur which traverses the whole of Victoria from east to west, and on these slopes the rich goldfields of Sandhurst, Ballarat, Mount Alexander, the Ovens, Omeo, McIvor, and several others now cluster. Coming down this spur, and on the slope of it, opposite to that traversed by Mitchell, Strzelecki found himself within a beautiful district whose existence had not been even suspected. Enclosed between the sea and the snow-clad summits of this alpine barrier, sheltered by it from the hot blasts of the interior, and watered by numerous unfailing streams fed from its snows, a large district not many degrees from the tropics possesses an almost English climate. Tourists from Melbourne and Sydney are loud in their praises of the Arcadian beauty of Gippsland. Its lowlands are interspersed with some splendid lakes; while its rivers, navigable for sixty and eighty miles from their junction with the lakes, are the finest and most valuable within the Australian Colonies. Flowers in endless variety and of great beauty form a wide-spread carpet. The tall fern trees with their gigantic leaves droop into natural bell-shape tents. A hundred deep pellucid streams display the crystal quartz and sharp clean sand and gravel which compose their beds. Everywhere the traveller comes upon opening glades leading up to the ranges and clothed with many varieties of flowering heaths and acacias. Nor is the soil less profitable than gay. All the productions of a temperate climate attain to absolute luxuriance there. Gippsland, under a proper system of cultivation, might in a few years become the granary of Australia. From this garden however Strzelecki was obliged to make a hasty retreat, and found himself almost hopelessly entangled in the dense hedge which forms its north-west boundary. With provisions running short, and suffering from the fatigues of their previous labours, the Count and his men attempted to reach Melbourne by a short cut across the ranges. The skirts of these ranges are closed with a dense and almost impenetrable scrub. They had to abandon their packhorses, and all the botanical and geological specimens collected on the way. For twenty-two days they literally cut their way through the scrub, seldom advancing more than two miles a day, and being in a state of complete starvation. Their clothes were torn piecemeal away, and their flesh lacerated by the sharp, lancet-like brambles of the scrub, was exposed to the keen air of these snow-crowned ranges. With difficulty Strzelecki and his men reached Melbourne, but the horses,

with all his valuable collections, were never recovered. In his report of this expedition to Sir George Gipps occurs the first official notice of the discovery of gold. It stands thus among an enumeration of the mineralogical specimens collected in the district, in the report dated 1839, the dispatch of Gipps to the Secretary of State for the Colonies, with which it was forwarded, bearing date 1840:—"Gold.—An auriferous sulphuret of iron, partly decomposed, yielding a very small quantity or proportion of gold, sufficient to attest its presence." Thus was lying, for twelve years, entombed among the Parliamentary papers, that important discovery which was to effect such changes in the Australian Colonies, until at length, in 1851, another Governor of N.S.W., taught by the prosperity of California, consented to make more publicly known Hargreaves' fresh discoveries of gold. But to Strzelecki the first discovery on the spot was unquestionably due in 1839; which was corroborated by Sir Roderick Murchison's scientific precognitions in 1846 and 1848. In 1839, in the district of Wellington, Strzelecki had discovered gold-bearing quartz, specimens of which he sent to Berlin for analysis; he exhibited some to James Macarthur and other gentlemen, and mentioned to Governor Gipps the existence of a gold-field in the Bathurst district; but he was requested not to make the matter generally known, for fear of the serious consequences which, considering the condition and population of the colony, were to be apprehended from the fact being likely to arouse the cupidity of the prisoners and labourers. He subsequently published his work—though without mentioning it (in fulfilment of his promise) his actual discovery of gold in the Bathurst district—entitled *A Physical Description of New South Wales and Van Diemen's Land*, accompanied by maps, sections, and specimens of rocks, the examination of which in London, and subsequent comparison with analogous evidence from the Ural Mountains, led to the scientific conclusion that gold existed, and probably abounded, in certain districts of A. Strzelecki returned to Europe in 1846, and died in London in 1878.

STRZELECKI RANGE, a range of mountains in the district of Western Port, V., to the southward of the Great Swamp. It was discovered and named by the explorer.

STUART, ALEXANDER (1825—) is a native of Scotland, and was educated at the Edinburgh Academy and Edinburgh University. In 1851 he came to N.S.W. In 1874 he was elected member of the Assembly for East Sydney. In 1876 he accepted office as Colonial Treasurer in the Robertson Ministry, and retired with his party in 1877.

STUART, JOHN MACDOUALL, explorer, a native of Scotland, came to S.A. in 1839. The first who ever crossed the Australian Continent were Burke and Wills; but for several years before they set out, another traveller had, with

wonderful perseverance, repeatedly attempted this feat. John Macdouall Stuart served as draughtsman in Sturt's expedition to the Stony Desert in 1844, and had been well trained in that school of adversity and sufferings. Up till 1858 the Colony of S.A. was still little more than the Adelaide district in an immense and unknown wilderness. At length, in 1858, Stuart made some discoveries of great importance to the colonists. Penetrating to the west of Lake Torrens, with one white man and a native—who treacherously deserted them—he came upon an extensive district of country abounding in natural springs, and clothed with the kangaroo grass so highly prized by the Australian flockowners. For this discovery the Government presented him with a large tract of land within the district. Next year the S.A. Government offered £2000 as a reward to the first person who should succeed in crossing the continent from south to north, and Stuart set out from Adelaide to attempt the exploit. With only two men he travelled to the north towards Van Diemen's Gulf, and penetrated much further than Sturt had done in 1844. The party had commenced their exploration on 1st March from Chambers' Creek and journeyed in the direction of the centre of the Continent. On 22nd April Stuart found from his observations of the sun that he was encamped in the very centre of A. On a high mount about two miles to the northward he planted the British flag, naming the spot Central Mount Stuart. The country around the central station was found to be of a very different character from what had been supposed. Instead of a great desert the land was well grassed, rich and fertile, with an abundance of water—as fine a country, wrote Stuart, “as a man would wish to possess.” Beyond the centre however the difficulties of the party commenced. Stuart made three efforts to reach the coast by a north-west course, and each time was driven back on the centre by dense belts of scrub and scarcity of water, both men and horses suffering severely from illness and fatigue. A north-west passage to the sea was at length abandoned and the party attempted to reach the coast by a north-east course from the centre. On this course they were attacked by savages and obliged to retire to Adelaide. Stuart had arrived in a district already marked by the routes of Gregory, Stokes and Leichhardt. The attack by the natives occurred in June 1860, when the exploring expedition under Burke and Wills was still in Melbourne. On the first day of the year 1861 Stuart again started from Adelaide with a party of twelve men under his command for the purpose of actually reaching the sea-coast. And now the two expeditions were in the field. Burke's expedition had left Melbourne in August 1860, but Burke and Wills did not start from Cooper's Creek on their journey to the Gulf of Carpentaria until 14th December, just a fortnight before Stuart left Chambers' Creek. The two routes through Central Australia are pretty parallel—the distance of Cooper's Creek from Chambers' Creek

about 300 miles being mainly adhered to. On this occasion Stuart found no difficulty in making good his former route, and was able to advance nearly two degrees beyond its extremity. The continuation of his former route also opened up some fine country. This fine country however towards the north was backed by belts of dense scrub, and from it attempts were made in no less than fourteen directions to force a passage to the coast. In June 1861 the task was abandoned; while in February Burke and Wills had actually visited the shores of the Gulf of Carpentaria by a more easterly and entirely independent course. But a third attempt made the following year was completely successful. Stuart started from Adelaide with an excellent party fitted out at the expense of the Government, consisting of himself in command; W. Kekwick, second; F. G. Waterhouse, naturalist; F. W. Thring, third officer; W. P. Auld, assistant; S. King, J. Billiat, J. Frew, H. Nash and J. McGorgery. They pushed on from the terminus of Stuart's former journey, and on the whole the difficulties were fewer than they anticipated. On 10th July 1862 they struck the Adelaide River, and Stuart then knew that his triumph was near. In his journal he writes:—“July 24. Started twenty minutes to eight o'clock, course north. I have taken this course in order to make the sea-coast as soon as possible, which I suppose to be distant about eight and a-half miles; by this I hope to avoid the marsh. I shall travel along the beach to the north of the Adelaide. I did not inform any of the party except Thring and Auld that I was so near the sea, as I wished to give them a surprise on reaching it. . . . At eight and a-half miles came up in a broad valley of black alluvial soil, covered with long grass; from this I can hear the wash of the sea. . . . Stopped the horses to clear the way whilst I advanced a few yards on to the beach, and was delighted and gratified to behold the water of the Indian Ocean in Van Diemen's Gulf, before the party with the horses knew anything of its proximity. Thring who rode in advance of me called out ‘The sea!’ which so took them all by surprise that he had to repeat the call before they understood what was meant; hearing which they immediately gave three long and hearty cheers. . . . Thus have I through the instrumentality of Divine Providence been led to accomplish the great object of the expedition, and to take the whole party through as witnesses to the fact, and through one of the finest countries man would wish to pass—good to the coast and with a stream of running water close to the sea.” This was Stuart's sixth journey. The return journey was very severe, owing to many of the waterholes having dried up, and on several occasions they suffered much from thirst. Stuart was attacked by scurvy, which induced almost total blindness. On 18th December Stuart arrived at Adelaide, and received the reward of £2000 from the S.A. Government, and shortly afterwards the Royal Geographical Society awarded him their gold medal and

a watch. His triumphal entry into Adelaide took place on the very day when Howitt's mournful party entered that city bearing the remains of Burke and Wills on their way to Melbourne. Hærcus writes of Stuart's discoveries:—"It is impossible to over-estimate the value of Stuart's last and crowning expedition. It threw daylight upon a country of which little or nothing was previously known; it showed that it was possible to cross this country, and in ordinary seasons to find water at easy distances; and it led to the commencement of the great work of the transcontinental telegraph line, which has brought the whole of the Australias into daily communication with the old world. Stuart was rewarded by the Government and the Parliament for the magnificent work he had accomplished; and full of honours he returned to the old country to end his days. But he did not live long to enjoy his honours and rewards. The hardships he suffered told eventually even on his iron constitution. His name however is imperishably connected with exploration in Australia. He led the way which it is comparatively easy now to follow. He was the pioneer in a land which had never before been trodden by the foot of a white man; and to-day there are thriving cattle-stations where a dozen years ago Stuart urged his weary way amidst the unbroken stillness of Nature, when it was doubtful whether he would succeed or lie down in the desert to die." He died in England in June 1869.

STURT, CHARLES (18—1869) the greatest of all the Australian explorers.

I. *First Journey*.—In 1828 it was resolved by the Government of N.S.W. to send an expedition to take up the task of exploration on the swamps of the Macquarie. The leader chosen by Governor Darling for this expedition was Captain Charles Sturt, an officer of the 39th Regiment, then stationed in Sydney. Hamilton Hume was selected to accompany Sturt on this expedition. The other members of the party were McLeod, an army surgeon, two soldiers of the 39th Regiment and eight prisoners of the Crown. The animals were thirteen horses, and two draught and eight pack bullocks. The expedition left Sydney on 10th September 1828. They reached the Macquarie and sailed down it to the point marked on Oxley's chart—to find that all trace of sea or lake had disappeared! The channel which had promised so well, without any change in its breadth or depth, ceased altogether, and while the explorers were yet lost in astonishment at so abrupt a termination, the boat grounded. The reeds were still there, but the whole country beyond, as far as the party could travel, contained not a drop of water. Abandoning all hope of taking up the Macquarie again, Sturt struck into a more northern course, and on 4th February 1829 came upon the Darling, a river far exceeding in size the Lachlan or the Macquarie. From a sloping bank on which his party stood, stretched, some forty feet below them, a magnificent stream, seventy or eighty yards broad,

evidently very deep, and literally covered with pelicans and other wild fowl. Eagerly the men, parched under an almost tropical sun, and after several days toil, rushed down its green bank to taste its waters. "Nor shall I ever forget," wrote Sturt, "the cry of amazement that followed their doing so, or the looks of terror and disappointment with which they called out to inform me that the water was so salt as to be unfit to drink." Lower down they found that the Darling received a tributary, which Sturt named New Year's Creek. It was afterwards named the Bogan, by which name it was known by the natives. They traced it up for sixty miles, and then proceeded towards the Castlereagh. Sturt's discovery of the Darling proved the mistaken nature of the opinions that the Castlereagh, the Macquarie, and other north-western rivers were tributaries of the Brisbane, and found their outlet in Moreton Bay. The party retraced their steps to Sydney to announce their great discovery.

II. *Second Journey*.—It was not quite so certain now that there was an inland sea. Many abandoned the theory altogether. Yet how was a district, larger than Spain and Portugal put together, drained? Every settler could tell of the mighty floods which had swept away his sheep, his cattle, his farmyards, and not seldom his farm servants and shepherds. Where did these mighty floods go to or how were they carried off? The freshwater streams had been found to disappear altogether after a short course inland. The Darling, which was quite large enough for a main drain, was salt. Yet whole seas went somewhere, for Oxley's sea had disappeared before Sturt could overtake it. Nothing was to be discovered by following the course of the ordinary sluggish freshwater streams. Creeping through a vast extent of level country, more like canals than rivers, they were stopped by the first impediment that came in their way. Sturt could trace their cessation to nothing stronger than a bank of more than ordinary stiff soil. To solve the mystery it was necessary to follow the course of some more impetuous stream. The Australian Alps lying to the south of the settlement supplied such a stream. A thousand rills fed by its snows joined themselves into one impetuous torrent and dashed down a steep and rocky channel. No ordinary impediment was likely to stop the Murrumbidgee, and Sturt determined to trace its stream whither it might lead. The settlers who had already secured its green banks reported that it made directly for the interior and showed no signs of abated strength. They would have followed its course themselves but that it exhibited unmistakable symptoms of leaving behind it the rich fertility which marked its early progress. In 1829 Sturt started on a journey with which may be said to commence the history of the Australian Colonies. He was accompanied by George Macleay and a party of men. Striking the Murrumbidgee at Yass Plains, about 200 miles from Sydney, he proceeded along

its banks with a large and well equipped party. The stream continued to gain in breadth and body of water, but all appearance of fertility was fast disappearing from its course. In little more than a week after its departure from Yass Plains the expedition found itself in an absolute desert. The drays loaded with provisions and other necessities had caused immense labour to the men from the shifting sandy nature of the soil and the dense patches of scrub which grew down to the water's edge; but now neither horses nor men could bring them any further. Yet a stream so impetuous in its course was not to be abandoned. A friend, who still held fast to the theory of an inland sea, had prevailed on the leader of the expedition to add the timbers of an old whaleboat, which had already seen service at the South Pole, to his equipments on leaving Sydney. They were nailed together, and a small raft, capable of carrying a few bags of flour, was constructed from the fallen timber on the river's bank. Half a dozen picked men were retained. The remainder, with the drays, were sent back to Sydney. And next morning at break of day this small boat's crew dropped down the stream bound for that mysterious and unknown interior which the European and the savage of the coast alike regarded with curiosity and awe. The Murrumbidgee is composed of alternate deep and broad reaches of water and steep rapids. In these rapids the stream, contracted within a narrow channel, hurries through a dark and gloomy gorge, deep down between frowning and precipitous rocks, hid from the sun by dense overhanging woods. Successive ages had almost choked up these sunless chasms with fallen trees, whose branches pointing up stream threatened to rip up the boat. On the seventh day of the voyage from one of these sunless rapids the boat unexpectedly shot out into a broad and noble river, the Murray, running at right angles to its tributary, the Murrumbidgee. In a country singularly deficient and uncertain in its means of communication by water, they had discovered a river not unworthy to be classed with the greatest watercourses of Europe, and doubtless owing its broad stream to the unfailing snows of the Australian Alps. Wherever the Murray might lead them, at least it solved a very important portion of their inquiry. It was certainly the main artery of N.S.W. "I directed," says Sturt, "the Union Jack to be hoisted, and giving way to our satisfaction we all stood up in the boat and gave three distinct cheers." More safely the whaleboat now dropped down the even tide of the Murray, and on the thirty-third day of the voyage on its stream the banks retired on each side and then were lost in the distance. The explorers found themselves floating on the bosom of an extensive lake, becoming slightly brackish as they advanced, while over its waters was borne the distant thunder of the great Southern Ocean. To this was given the name of Lake Alexandrina, and Sturt's observations showed him that he had cut

off the south-eastern corner of the continent. Indeed Lake Alexandrina is separated from the Southern Ocean merely by a narrow bar of shifting sand. The shores of the lake were clothed with green pastures and the whole surrounding country seemed excellently adapted for agriculture—a want beginning to be severely felt by the colonists of N.S.W., who were already getting their wheat and potatoes from V.D.L. and even from N.Z. But time permitted only a hasty view of these new discoveries. The explorers had a long and weary row up stream before them. They were already on famine allowance and even famine allowance would last them only on condition that they rowed up the stream in the same number of days in which they had rowed down. This they accomplished after great exertion and suffering, prolonging their journey into each night until they had reached their former camping-ground. When relieved from Sydney they had divided their last morsel of food, and owing to privation and incessant toiling at the oar symptoms of insanity had already appeared among the men. Wheat lands and fresh waters had been the two wants of N.S.W. If they were not now brought to the very door they were at all events near enough to relieve the colonists from serious apprehensions. Flocks and herds had increased with extraordinary rapidity, and all the available districts had already been taken possession of. Whether flocks and herds could be driven to the shores of the Southern Ocean was indeed questioned, for Sturt reported portions of the bank of the Murray to be little better than a desert. But a new class of men known as "overlanders" now appeared. The loud stockwhip of the overlander resounded through these dark woods. Many thousands of horned hoofs daily thundered over its banks or plunged into its tide to cut off some tedious bend of the river. Down the Murray poured the overflowing flocks and herds of N.S.W., and spread themselves over the new pastures round Lake Alexandrina. The fame of the new settlement reached Europe, and the English and the German immigrant were soon sowing their wheat fields and tending their vines on the shores of Spencer's Gulf. In a few years more the district was erected into an independent colony under the title of South Australia, and the foundations were laid of the present City of Adelaide.

III. *Third Journey*.—The narrative takes us back to the City of Adelaide, now hemmed in by Eyre's gloomy Lake Torrens and the terrible South Coast which he had just traversed. The settlers of the Adelaide district had abandoned all hope of finding an outlet to the west. What was the nature of the great interior which lay to the north of them was now the most important inquiry. Sturt had been the most successful of Australian explorers; and he was chosen to settle this question for them. In 1844 he started from Adelaide with a strong and well-equipped party, consisting

of sixteen men; the officers of the expedition being Poole, as second in command and surveyor, Macdougall Stuart as draughtsman, and Brown as surgeon. Desirous to escape from the meshes of Lake Torrens he left that district on his left hand, and passed up the Murray and the Darling, merely making a descent at intervals on the Torrens Basin, to ascertain the existence of an eastern arm. Leaving the Darling, which was taking him too much out of his northern course, at its junction with a small tributary, called by the natives the Williorara (the Menindie of the expedition under Burke and Wills,) he endeavoured to pass up the Williorara. But its waters quickly failed him, and pasture was becoming daily more scarce. The expedition had started in winter, so as by help of the spring showers to push to the north. The sun was beginning to dry up the pools, and no time was to be lost. By means of forced marches Sturt and his men passed over a very inhospitable tract of country and reached as high as lat. $29\frac{1}{2}^{\circ}$, when they unexpectedly came upon a picturesque spot, well watered and supplied with food for the cattle. To this was given the name of the Rocky Glen Dépôt; and here Sturt determined to allow both men and horses to recruit for some time, while he explored the country beyond, for the purpose of selecting the most safe northern route. With dismay he gradually ascertained that no northern route was to be found. The Rocky Glen ceased as suddenly towards the north as it had opened, and the country beyond became an absolute desert. In vain Sturt and the officers under his command followed the course of every creek, and made long and harassing excursions into the district around. Neither water nor pasture was to be found beyond the Rocky Glen. Retreat too was cut off. The summer's sun had dried up every pond and creek which had supplied them on their line of march, and six months imprisonment in the Rocky Glen Dépôt became certain. For six months no rain fell. The violence of the sun became insupportable. To escape from its rays a large underground chamber was excavated, to which the men retired during the heat of the day. Gradually the surrounding desert closed in on them. The whole vegetation of the Rocky Glen became mere snuff, and was carried away by the hot blast. Nothing was left but the naked rocks and the pool of water on which their lives depended. Day by day it, too, yielded to the fury of the sun. "Under its effects," wrote Sturt, "every screw in our boxes had been drawn, and the horn handles of our instruments, as well as of our combs, were split in fine laminae. The lead dropped out of our pencils; our signal rockets were entirely spoiled; our hair, as well as the wool on the sheep, ceased to grow; and our nails had become as brittle as glass." Scurvy now attacked the whole party. Some of the men would be unable to proceed with the expedition, and Poole was dying. In this condition, the winter months came slowly round, and the first refreshing shower

fell. The way was again open, and it might be possible to save Poole. A litter of boughs and dried leaves was already prepared, and with Poole six of the men endeavoured to make a retreat on Adelaide. But the winter had been too long in coming. Poole died a few hours after his attendants had quitted the camp, and his body was brought back just as Sturt and the remainder of the expedition were about to start on their northern course. His companions raised a rude pyramid of stones on a neighbouring hill to mark the place of his interment; and Mount Poole is all that is left to tell of the weary days spent in the Rocky Glen Dépôt. "That rude structure," writes Sturt, "looks over his lonely grave, and will stand for ages, as a record of all we suffered in the dreary regions to which we were so long confined." About fifty miles further on a fresh halting place was discovered, and called Park Dépôt. Accompanied by Brown and three men, Sturt started from Park Dépôt, bearing right down on the centre of the continent. In a short time the country assumed all the appearance of a desert. Neither grass nor water was any longer visible, and the eye rested on nothing, to the brink of the horizon, but reddish-brown sand. Gradually as they advanced, this sand swelled into long parallel ridges, running from east to west and rising higher and higher, until at length the explorers found themselves toiling over a very ocean of solid billows, some fifty or sixty feet high, and succeeding each other in endless uniformity. At the distance of about 200 miles from Park Dépôt, this singular country came to an abrupt termination, and the explorers stood before what is now known as Sturt's Stony Desert. The parallel sand ridges, running from east to west, were suddenly chopped off at right angles, and in their stead stretched an immense level plain, uninterrupted all round the horizon from south to north, and thickly strewn with small fragments of quartz, firmly packed together, and rounded as if waterworn. Neither herb nor shrub protruded through the firmly-wedged quartz fragments. No sound or movement could be heard or seen all round them, and the dray wheels and hoofs of the horses left not the least impression on the surface of the plain. All that could attract or sustain animal or vegetable life nature seemed to have rigidly excluded from this scene of desolation. Thus the sun went down, and Sturt and his men encamped for the night in the Stony Desert. With the morning the party was again under weigh; and at the distance of about thirty miles from its commencement the Stony Desert was found to come to an equally abrupt termination. An immense plain of clay, or dried mud, lay before them, entirely destitute of vegetation. No water could be found, and the earth, cracked by the heat of the sun, abounded in immense fissures, which were avoided only by extreme watchfulness and care. Still maintaining their original course, the party arrived at the termination of this plain also, and found the tall sand

ridges re-appear, precisely as they had left them on the eastern shore of the Stony Desert. Again the explorers toiled over this solid ocean of red billows—an ocean seen as it were under the glare of some great conflagration, lashed into waves running mountains high, and then suddenly frozen all round from centre to horizon. At length a small creek appeared ahead and revived the hopes of the party. It received the name of Eyre's Creek. It contained some good water and communicated sufficient fertility to its neighbourhood to furnish a meal for the horses. On following it down however it soon died out on the desert, leaving merely a few incrustations of salt, and leading to a country as destitute of vegetation as that they had already traversed. They were now more than 400 miles from Park Dépôt; and with the exception of Eyre's Creek, some fifty miles behind, had nothing in the intermediate region to fall back upon. They had advanced 200 miles beyond the Stony Desert, without meeting any indication of a permanent change in the nature of the country. Both men and horses were so weak that any further advance would greatly endanger their retreat. Under these circumstances Sturt decided to fall back on Eyre's Creek, and by its assistance to regain the Dépôt. The party regained the main expedition with considerable difficulty, and in a most exhausted condition. Having taken some short rest at Park Dépôt, Sturt again started with Stuart and two men. After some days travelling, the explorers were agreeably surprised by increasing signs of fertility, and they came upon the banks of a fine creek flowing through an extensive and picturesque tract of pastoral country. This is Cooper's Creek, so sadly associated with the melancholy fate of Burke and Wills. Returning to their original course, after some examination of the district, they were soon again toiling over a sea of red sand ridges, exactly similar to those met with in the first excursion. At the end of another week's travelling, the Stony Desert again appeared in all its awful stillness. For half-an-hour Sturt sat on the summit of one of those quartz-clad hills sweeping the horizon with his telescope, hoping to find some encouragement to advance. But no change in the nature of the country could be detected. Reluctantly the horses' heads were turned, and the most protracted effort yet witnessed to reach the centre of the continent was finally abandoned. The party hastened to throw themselves back on Cooper's Creek, some 200 miles distant, and the nearest halting-place. It was a journey for life or death. The horses that refused to proceed were abandoned on the way. When a horse fell, his light baggage was hastily distributed among the rest, and the retreat continued. Uninterruptedly, night and day, they retreated. At night one of the men went before them with a lantern; and thus assisted in their course over the vast sand ridges and through the unbroken solitude of the Stony Desert, the explorers safely reached Cooper's Creek. Over these regions the hot winds blew

with unusual violence. On the morning of their arrival a hot wind began to blow, and towards midday raged with great fury. The leaves of the trees along the creek became crisp in a few moments, and fell like a snow shower around them. The wastes of sand ridges from which they had just escaped seemed a very ocean. The crests of the sand billows were cut off and whirled on high in thick spray. Blinding torrents of fine sand, driven before the wind, were poured over the Cooper's Creek district, smarting and blistering the feverish skin. Towards the horizon sea and sky were mingled in one red mass. Every living thing turned from the glow. An all-pervading relaxation seized man and beast. The horses were unable to bear the weight of their own heads. Propped against trees, and turned from the hot winds, they let their heads fall to the ground, as if the muscles of the neck had been severed. A thermometer, graduated to 127°, burst from the excessive heat, though placed in the fork of a large tree. In all probability had this tempest overtaken the party in the desert they would have all perished. Passing through Cooper's Creek district, Sturt with his men again joined the main expedition at Park Dépôt, greatly weakened by sickness, and scarcely capable of any further exertion. On the following day he found himself unable to walk. In a day or two more his muscles became rigid and his limbs contracted. Gradually also his skin blackened. The least movement put him to torture, and he was reduced to a state of perfect prostration. But Park Dépôt was many hundreds of miles from Adelaide, and an immediate retreat was now necessary. Already another summer had come round, and the sun was drying up all the pools and watercourses on the way. It was doubtful indeed whether the way was still open. Brown proposed to go and ascertain, lest the expedition should be again caught in the desert. Unless Flood's Creek, about 150 miles nearer Adelaide, contained sufficient water it would be dangerous to move the expedition; and Brown determined to learn the condition of Flood's Creek. The hide of a bullock was sewn together, so as to form a water-tight bag. This filled with water was placed on the way some seventy miles in advance, and on the following morning Brown started with a light spring cart containing about thirty gallons of water. By this contrivance he was enabled to supply himself and his horse with water half way on his journey, without encroaching on the store which he carried with him. Anxiously the men watched for his return. On his report depended another six months imprisonment in Rocky Glen Dépôt, and both officers and men recalled Rocky Glen Dépôt with horror. On the eighth day they came to Sturt's tent to tell him that Brown had appeared in sight, and in a few minutes he stood before him. "Well, Brown," said he, "what news? Is it to be good or bad?" "There is still water in the creek," he answered, "but that is all I can say. What there

is as black as ink ; and we must make haste, for in a week it will be all gone." A bed of leaves was placed in one of the carts, into which Sturt was lifted and the whole expedition commenced its retreat from Central Australia. Flood's Creek was safely reached, and it enabled them to push on to the Murray. The news was carried down the Murray that Sturt, now nineteen months absent and supposed dead, was returning. The settlers along its banks hastened to place their carriages at the service of himself and his exhausted men. Under the light of an Australian moon they again passed the clustering vines and golden wheat-fields which surrounded Adelaide. Exactly six months after their departure Sturt returned to Sydney to his well-won triumph. Charles Sturt died at Cheltenham England, on 16th June 1869. It was well said of him—"He never strove for what the vulgarly-ambitious call fame ; he was a most modest, simple-minded and retiring gentleman ; and the world passed him by, shouting out praises to more boisterous heroes and worthies of a rougher cast. Brave as a paladin, gentle as a girl, this man went into the wilderness, and by his genius and valour laid the foundation of a new English State which is rapidly growing into greatness. Had he won an Indian battle—no matter whether by his own strategy or by the sheer dogged courage of his troops—he would have received a peerage. He discovered the River Murray—the Australian Nile—he opened up the whole interior of A. to English settlement and enterprise ; and he dies untitled, undecorated, unrewarded, a simple gentleman retired from the army, like a hundred others who doze away the quiet evening of their lives at a provincial watering-place."

STOKES, J. L., Commander in the Royal Navy, accompanied Wickham in the expedition of the *Beagle* in 1837 to explore and survey such portions of the northern coast of the continent as were left by Flinders and King, and especially the space between Cape York and the southern shores of New Guinea. When Wickham retired through ill-health in March 1841, the command devolved on Stokes, who continued the survey until 1843. The surveys of the *Beagle* were followed up in the *Fly* by Captain Blackwood, between the years 1842 and 1845. Wickham and Stokes twice circumnavigated Australia, and discovered and explored the Fitzroy, the Adelaide, the Victoria, the Albert and the Flinders Rivers. Blackwood accomplished a minute survey of the unexplored portion of the Great Barrier Reef and the eastern part of Torres Straits, besides 140 miles of the south coast of New Guinea.

SUDDS AND THOMPSON. These names are connected with the early history of N.S.W. Two soldiers of the 57th Regiment in 1826, thinking the lot of prisoners preferable to their own, committed a felony by stealing a piece of cloth from a shop in George-street, Sydney, for the purpose of getting themselves convicted, hoping

thus to escape the irksomeness of military service. They were convicted and sentenced to seven years transportation to one of the northern settlements of N.S.W. This of course was just what they wanted and expected. But Governor Darling, fearing the consequences of such an example, determined to take the men out of the custody of the civil power and punish them in a manner calculated to deter others from committing offences of a similar kind. In pursuance of a general order which he issued, they were taken from the custody of the gaoler, brought back to the Barrack Square in Sydney, and in the presence of the assembled military it was announced that their sentence had been changed to seven years hard labour in irons on the roads, and that at the expiration of that period of punishment they were to be returned to their regiment. They were then stripped of their uniforms, and having been dressed in prison clothes, iron collars with long projecting spikes were riveted round their necks, and fetters and chains on their legs. They were then marched off to the gaol, with the band playing the Rogue's March. Sudds was a well-conducted man, but Thompson's character was not so good, and it is believed that it was owing to his evil advice that Sudds engaged in the scheme. Sudds took ill and was taken to the hospital, where he died. Thompson alone survived. "The projecting irons," says Thompson, "would not allow me to stretch at full length on my back—I could only sleep on my back and sides by contracting my legs. I could not stand upright with the irons on—the chains were too short—Sudds' collar was too small for his neck." It was endeavoured to account for Sudds' death by attributing it to dropsy. A medical examination disclosed no disease. The irons were not to be found when the public inquiry took place. Wentworth drew up a formal impeachment against the Governor, and repeated attempts were made to bring the matter before the House of Commons. When at length, years afterwards (in 1835) a committee was granted, the charges fell through for want of evidence. Darling was declared honourably acquitted, and immediately afterwards was knighted. The best his apologists can say in his defence is that he erred with good intentions.

SUGAR-GROWING IN AUSTRALIA.—The first attempt at sugar-growing in Australia was made in N.S.W. in 1824. Six hundred acres at Port Macquarie were planted with canes by order of the Governor, under the superintendence of Thomas Scott ; and it was stated that the sugar and rum produced repaid the Government for the outlay. Lang however states that it had been alleged that the sugar manufactured from the canes was characterised by a degree of acidity, which indicated the necessity of resorting to a still lower latitude, in order to develop the saccharine principle of the plant with complete success. Lang when visiting the Clarence River District in 1856 heard that a French gentleman, M. Adam, from the Isle of Bourbon and the Mauritius, had purchased

an estate of about 350 acres of land, on a freshwater creek communicating with the river, a few miles from Grafton, on which he had for some time been forming a sugar plantation. "I rode out with a friend," he continues, "during my stay, to ascertain what success was likely to attend his interesting labours. I found M. Adam and his two sons, one of whom had been one of my fellow-passengers from Sydney, on the plantation; and he showed me his canes, of which he had a considerable extent growing, and which were then ready for cutting. They were larger considerably, he observed—that is, of greater diameter—and would yield more saccharine matter than those of the Mauritius and Reunion. He had been somewhat doubtful of his success the previous year; but he was then quite confident as to the result. He told me his canes would yield four tons of sugar to the acre, and that a hundred acres of such produce would ensure him a return of £12,000 a year. As I have always regarded the production of sugar and cotton by European free labour—an operation which, from all I have myself seen and heard, I believe to be perfectly practicable—as one of the most important achievements of the future for our wronged and oppressed humanity, I was naturally greatly interested in M. Adam's undertaking, and I cordially wished him all success." In 1863 only two acres of canes were under cultivation in N.S.W. The industry was not in favour with the settlers; there was a prejudice against it; and it was not until 1867 that a marked change in public opinion with reference to this subject began to be manifested. Since then the settlers on the eastern rivers, from the Manning upwards, have engaged in the industry with energy and success. In 1867 there were about 116 acres of cane crushed, and 17,786 pounds of sugar made; in 1868, 646 acres of cane were crushed, and 134,740 pounds of sugar made; in 1869, 2548 acres were crushed, and 3,264,824 pounds of sugar made; in March 1870 there were 3917 acres under cane. The area in 1880 was 3675 acres, and the yield 6,342,896 pounds of sugar. The Colonial Sugar Refining Company have three powerful mills at work, each capable of crushing from four to four and a-half acres of cane per day. A small area (about twenty-six acres,) is devoted to the growth of sorghum and imphée.

Queensland.—The official report on the Q. exhibits in the Melbourne International Exhibition of 1880 states:—"The suitability of the soil in many parts of the colony, and its tropical and semi-tropical climate, directed the attention of the colonists at an early period of its history to the growth of sugar cane as a promising industry. As far back as 1862, an experimental patch of twenty acres is noticed in the official records, planted in the neighbourhood of Brisbane. The experiment gave good hope of success, and the attention of cultivators was attracted by it. Regular plantations were formed in the Brisbane district, and near Maryborough, which in 1865 returned 316

and 112 acres respectively under cane. Experimental patches were tried elsewhere, some in places where the industry has not since taken root. But in that year twenty acres were tried near Mackay, a locality which to-day is the main centre of sugar cultivation. The industry showed signs of vitality and the Legislature encouraged it by granting land on easy terms to sugar cultivators. In the year 1866 sugar mills first appear in the official returns; two in the Brisbane district, one on the Mary River. As a consequence there is an actual recorded production in the statistics of 1867 to the amount of 338 tons of sugar and 13,509 gallons of rum. The cautious hesitation with which the new industry was at first regarded began now to be thrown aside. Planters sought for cheap coloured labourers, it being considered that the constant petty work which had to be performed in the sweltering heat that prevails between the tall rows of cane would be too trying for the constitution of Europeans. South Sea Islanders were accordingly brought to the colony, and the trade in kanaka "recruits" (as they are called) became so considerable that the Legislature passed an enactment to check the abuses which had sprung up in connection with it. In the year 1868, the recorded production of the plantations amounted to 619 tons of sugar and 35,599 gallons of rum; in 1869, 5165 acres of land were put under cane. By 1871 the production of sugar had reached 3762 tons, of rum 112,979 gallons, and the staple was exported to the value of £16,262. It was also recorded that 55 sugar mills were in existence. The progress was rapid. In the next year, 1872, ten more mills were added to the number, the production of sugar was 6266 tons, of rum 161,473 gallons, and the export had reached a value of £36,803. But the industry was about to receive a check. The hesitation with which its first introduction had been received yielded to a headlong rush of cultivators eager to share the fortune it seemed to promise. Farmers in some districts abandoned every other kind of cultivation and planted cane right up to the walls of their cottages. On the Mary particularly, the settlers threw themselves entirely into the new cultivation. It appeared to them to be exempt from the limitations that bound every other kind of agriculture. The cane was planted in newly cleared land, by making holes in the unbroken surface and laying the "sets" in them to grow. Very little weeding was done, and the cane, left almost to itself, grew luxuriantly and apparently free from any disease. And while the small settlers went on in apparent confidence that the ordinary laws of nature would be suspended in favour of sugar growers, the planters and millowners proceeded in many cases on a not much wiser plan. Money was borrowed for the purchase of expensive plant, on a scale and on terms which no industry however profitable would justify. The money was

expended also with very little knowledge; almost any man who had lived on a plantation in the older sugar-producing colonies obtained ready employment from the Queensland sugar growers, and was entrusted with the direction of work that sometimes involved large expenditure. In reality it was a continuation of the experiment of sugar growing on a large scale and in a costly manner. The relations between millowners, who in all cases had plantations of their own, and the neighbouring farmers who looked to them for the disposal of their cane became also very unsatisfactory. Both parties had rushed into the enterprise with a vague confidence that it would come out right, and it failed to do so. Quarrels and misunderstandings arose between the two and there appeared to be a strong probability of a reaction. And to add to the difficulties of cane growers a new disease made its appearance among the cane. Up to that time one variety, the Bourbon, had mainly been grown. It was a large, rather soft cane, that grew freely and yielded great quantities of juice. But exposed in the southern districts to the rather violent variations of our subtropical climate and cultivated in the rough and ready manner described it succumbed in many places to the attack of a kind of rust which entirely puzzled the cane growers and defied any attempt at cure. The lesson was a sharp one but the industry had become too firmly rooted to be overthrown. A number of speculative men who had overstrained their means in order to embark in it had to succumb, but cane growers found a way out of their difficulties. The practical experience gained during the years in which cane growing had actually been carried on in Q. served to put the industry on a sound footing. There were plenty of men by that time who had learned the business in the actual field, and sugar mill, and on Q. soil. The cultivation of the cane was better understood, and although the introduction of new varieties of it did not actually banish rust from the fields, it at least served to reduce it from an evil of the first magnitude to the rank of one of those minor difficulties which all cultivators have to encounter and overcome. Continual progress was made in the art of manufacturing sugar, till it equalled in appearance and value the best production of Mauritius and the West Indies. The progress of the industry has since been very satisfactory. In 1877 the number of acres actually put under crop was 15,220, and there were 12,243 tons of sugar and 196,662 gallons of rum manufactured. The production, it must be remembered, is confined to the higher grades of sugar, so that the average value of the product is high. In the year mentioned the value of sugar exported was £180,668. Of that amount the value of raw sugar—almost entirely of the highest grades—was £133,297, that of refined sugar £47,371. In 1878, a year of general drought, the export of sugar was valued at £119,018 and of rum £6,208;

in 1879 the value was £275,769 and £10,453. To these values must of course be added the amount consumed in the colony itself. The export of sugar for the years 1878 and 1879 averaged a value of a little over £12,000. In a carefully compiled report on the sugar industry of Q., published by H. Ling Roth, he calculates the average local consumption of sugar and molasses at 92'13 per head of population, which was in 1879 about 220,000 souls. In the same work the crop of 1879 is estimated at about 18,200 tons of sugar, and the probable output for this year 1880 at about 21,000 tons. The sugar industry of the colony is now firmly established. Its main centres are the Pioneer River, of which the port is Mackay, the Mary River with Maryborough as the port, and the rivers emptying into Moreton Bay. Of these the relative importance can be seen by the following division of the 1879 crops, which is given in the work already quoted at 9500 tons for Mackay, 5750 tons for Maryborough and 2200 tons for Brisbane. Sugar is also grown on the Herbert River near Cardwell, and the yield for last year was estimated at about 750 tons. The industry is about to be established on the lower Burnett near Bundaberg. But it is in the far north that the most promising development of sugar cultivation seems likely to take place. A pioneer party are now at work on a splendid piece of country on the Johnstone River near Mourilyan Harbour, north of Cardwell. It is calculated that in this locality there are 300,000 acres of good sugar land watered by several navigable rivers, and near to an excellent harbour. Cane is being grown on a small scale near Cairns, and is found to thrive. But the sugar lands on the Q. coast must amount to many million acres. Even in the established centres of the industry only a fraction of the available soil has yet been broken up for cane. At Mackay where the greatest progress has been made, there are only about 12,000 acres actually cultivated, and it is estimated that there are at least 70,000 acres of good sugar land untouched. Not only is a particular kind of soil needed, but many other additions must be present before a settler can profitably grow sugar cane. No apparatus has yet been brought into actual use which gives satisfactory results on a small scale, and extensive sugar factories can only be erected by settlers having the command of a good deal of capital. Cane also is a bulky crop and cannot be profitably carted any great distance to a mill. Its cultivation therefore was at first confined to the banks of rivers where punts could ply between the mills and the cane fields. The difficulty of carriage is now being overcome by the use of tramways, but they also are expensive works. In short, cane growing has hitherto been an industry which only capitalists have been able to engage with a hope of profit. Even under this restriction it has made and is making great progress. There is however some prospect that by the establishment of central factories and the introduction of a proper system

of co-operation between grower and manufacturer, cane growing will again be widely attempted by small farmers. If this should happen, and there is no valid reason why an arrangement successful in other sugar producing countries should not succeed in Q., a great stimulus will be given to an industry which even now is fast rising in importance and which promises to add enormously to the future wealth of the colony."

SULLIVAN'S COVE, a beautiful inlet near the mouth of the Derwent River in T., and the site on which Hobart is situated. It was discovered by Bass and Flinders in 1798, and was named by Collins in honour of John Sullivan, Under-Secretary for the Colonies. This fine and perfectly land-locked harbour is everywhere deep, even close in shore, where there are four or five fathoms of water, and which according to the Admiralty chart deepens to ten or twelve in the stream. The harbour and also the great inlet by which it is approached, namely Storm Bay, is without rock, shoal, or impediment of any kind whatever to navigation, unless the Iron Pot rock be taken as an exception to this statement; but as this rock lies very close in shore, and is moreover guarded by its own lighthouse, it is rather an advantage than otherwise to the mariner.

SUMMERS, CHARLES (1828—1878) sculptor, was a native of England, and at an early period of his life adopted the profession. He took several prizes at the exhibitions of the Royal Academy in London, including the silver medal for modelling. He came to V. about 1855, and followed his profession in Melbourne till 1866, when he returned to Europe. He executed the design and casting for the bronze statue to commemorate the Burke and Wills expedition, which stands in Collins-street, Melbourne. The work is universally admitted to be one of great originality of design and artistic merit. He also executed the four statues of the Queen, Prince Albert, and the Prince and Princess of Wales, which were presented by W. J. Clarke to the National Gallery in Melbourne, and also a fine bust of Sir Redmond Barry. Summers died in Rome, where he had been settled for many years.

SURVILLE, CAPTAIN DE, French navigator. When Cook's ship, the *Endeavour*, on his first voyage, was working out of Doubtless Bay in the North Island of N.Z. another vessel was sailing in, and neither navigator was aware of the other's vicinity. The new visitor was the *St. Jean Baptiste*, a French vessel, commanded by Captain De Surville. He had been despatched from France on a secret expedition, fitted out at great expense, from which extraordinary results were anticipated. He sailed from Pondicherry on 2nd June 1769. His vessel, of several hundred tons burthen, carried twenty-six twelve-pounders and six smaller guns. After many adventures and making some important discoveries he arrived at N.Z. and cast anchor in Doubtless Bay on 16th December 1769. The

Frenchmen immediately landed at Mangonui where they were received by crowds of natives, who were delighted at the confidence reposed in them; and in return supplied the strangers with food and water. One day a storm arose whilst a party of invalids were endeavouring to reach the ship from the shore; being driven back the sick were detained by the inclemency of the weather for two days in the house of a chief named Naginoui, and by his people were fed and carefully attended. When the storm had subsided one of the ship's boats was missing, and De Surville, without any evidence of their so doing, believed that the New Zealanders had stolen it. Under the guise of friendship, he invited Naginoui on board, accused him of the theft, and put him in irons. Not satisfied with this treacherous revenge, he burned the village where his sick had found an asylum in the hour of need, and carried the chief away a prisoner from his native land. Naginoui did not survive his capture long; he pined for the land and children he would never again behold, and died of a broken heart eighty days after his seizure. All hopes of finding the new El Dorado having now been dispelled, De Surville left N.Z. on 1st January 1770. Death and disease made sad havoc of his crew. The remainder were hardly able, even with the assistance of the officers, to handle the sails. Their only hope was to reach some European settlement to save the survivors. In April they arrived at Callao in Peru. Anxious for an interview with the Spanish governor to solicit the assistance he so much needed, De Surville put off in a boat and was drowned in the surf, eleven days after the death of Naginoui.

SUTHERLAND, JOHN (1816—) is a native of Scotland. He came to Sydney in 1838. In April 1857, on the restoration of the City Council after the period of the Commissioners, he was elected Alderman, and held that office for many years. In 1861 he was chosen Mayor of Sydney. At the general election in November 1860 he became a candidate for the electorate of Paddington, and was returned by that constituency, which he has ever since represented. When Robertson formed his Ministry in October 1868 he offered Sutherland the position of Secretary for Public Works; he accepted the office, remaining in that Government for nearly two years. When Parkes formed his Administration in 1872 he offered the same position to Sutherland, who again became Secretary for Public Works. He was appointed for the third time Minister for the same department in the Farnell Ministry of 1877-8.

SUTHERLAND POINT, a point of land situated on the shores of Botany Bay, N.S.W., was the first spot of land ever cleared in A. It was named after Forby Sutherland, a seaman in Cook's fleet, whose death was the first amongst British subjects that occurred in the Australian waters, and who was buried there.

SUTTON, SIR J. H. MANNERS (1814-1877) Viscount Canterbury, was Governor of V. from August 1866 to March 1873. He had previously held the office of Governor of New Brunswick and of Trinidad in the West Indies. He was appointed to V. on the recall of Darling, and when he arrived in the colony the "Darling dead-lock" was at its most critical stage. The circumstances were therefore unfavourable to the new Governor, and they were not improved through the attempt made by the Sladen Ministry to carry on the Government in the face of a vote of want of confidence carried by the Assembly. The Governor did not disguise the fact that his sympathies were entirely with the Minority Ministry. He gained popularity, however, by his courteous manners and lavish hospitality, when the political troubles passed over. He had the honour of entertaining the Duke of Edinburgh on his first visit to V. in 1867. The administration of Viscount Canterbury—a title to which he succeeded in 1869 on the death of his elder brother—was not marked by any later incident of special importance; and he took his departure from the colony amidst the respect and regret of the population.

SUTTOR, G. The name of G. Sutter is associated with an incident in the history of the colony during the revolt against Bligh, which is thus narrated by Flanagan: "Certain proceedings which show how incompatible with the enjoyment of complete freedom is the condition of a penal settlement occurred about this time. In November 1808, in pursuance of a colonial regulation, a general order was issued announcing that the 'settlers and every other description of persons occupying or cultivating grounds either by grant, lease, rental, or permission, were to attend and be mustered by the Lieutenant-Governor' at the times and places specified in the order. The regulation in compliance with which this order was issued, although in itself sufficiently objectionable in the eyes of free men, had not hitherto been resisted. The people of the colony were already however beginning to outgrow those measures which were originally framed for a community nearly altogether destitute of the elements of civil liberty. The recent revolution in the government too, afforded a pretext for the disobedience of an order already hateful to many on its own account. On the day appointed for the muster a few of the settlers failed to make their appearance at the appointed places, and to send in an account of their stock as prescribed. Among these were Martin Mason, a person who, arriving in the colony as surgeon of a merchant ship, was appointed assistant-surgeon and a magistrate, both which offices he lost through misconduct; G. Suttor, A. M'Dougall, J. Smith, and John Hillus, settlers. Mason, who alleged as his reason for not attending the muster that he had been oppressively dealt with by the Government, was punished by a month's imprisonment; M'Dougall, Smith, and Hillus were similarly disposed of, the

last-mentioned giving as a reason for his non-attendance, that he had taken the oath of allegiance to Governor Bligh. Suttor, who assigned a similar reason, added that it was highly disagreeable to his feelings to comply with the order, and he was sent before the criminal court. On 15th December, Suttor was arraigned on an indictment charging him with having directed to the Lieutenant-Governor, a letter containing certain contumelious expressions, with intent to bring into contempt His Honour's authority. Having been called upon to plead, he replied that 'he denied the legality of the court; his allegiance was due to Governor Bligh, and Governor Bligh alone; and every drop of blood in his veins prevented him from ever acknowledging the legality of that court. They might do with him as they thought proper.' Persisting in his refusal to plead, he was held to be guilty, and was sentenced to six months' imprisonment and to pay a nominal fine. Had these proceedings occurred a few months previously, when Major Johnston was at the head of the Government, the adherence of Suttor and the others to the fallen fortunes of Bligh might have been deemed worthy of admiration, even by those who did not concur in their views. The authority which they resisted, however, was that of the duly-appointed Lieutenant-Governor, and this fact deprives their resistance of the appearance of heroism which otherwise it would possess."

SUTTOR, FRANCIS BATHURST (1839—) is a native of Bathurst, N.S.W., and was educated at the King's School, Parramatta. He was elected Member for Bathurst in 1875, and in 1877 became Minister for Justice and Public Instruction in the Parkes Administration, retiring in the same year with the Ministry. He took the same department in the Parkes Government on the retirement of the Farnell Ministry in December 1878.

SUTTOR, WILLIAM HENRY (1834—) is a native of N.S.W., and eldest son of W. H. Suttor, a settler who distinguished himself by his courageous conduct in the suppression of the revolt of the convicts at Bathurst in September 1830. W. H. Suttor, junior, was elected Member of the Assembly for the district of East Macquarie at the general election in January 1875. The same district had been previously represented for some years by his father, and also by his uncle, J. B. Suttor. He was again elected in 1877, and took office as Minister for Mines on the formation of the Farnell Administration in December 1877, which office he held till the resignation of that Ministry in December 1878. He was appointed in January 1879 a Commissioner of the International Exhibition.

SWAN ISLAND, a narrow strip of land, one and a-half miles long, in Banks Strait, to the north of Cape Portland, in T.

SWAN RIVER, in W.A. on which Perth, the capital stands, was discovered and named by Vlaming in 1697. He found there the black swan

and brought specimens of it with him to Europe. The first settlement on the western coast of the continent was made here in 1829, and the name "Swan River Settlement" was the one by which W.A. was first and for a long time known. The river flows into Melville Harbour. The following description of it is given by the Rev. G. C. Nicolay :—"The first land usually made by vessels on the W. coast of A. is Rottnest (*i.e.*, Rat-nest) island. This is of irregular shape, having its greatest length on the transverse axis, from W. to E., *i.e.*, from Cape Vlaming to Port Phillip, seven and a-half miles in length, and being from Port Parker to North Point two and a-half miles in breadth ; it is ten miles from the coast. The W. point forms a small peninsula ; and on the E. there are lagoons from which salt is extracted by native aboriginal convicts, who are confined on the island. Their prison, the superintendent's house and other buildings have been erected, and a small farm is cultivated by them. There is also on the E. side, on the shore of Thomson's Bay, a marine residence for the Governor of the Colony. A lighthouse stands on a hill 154 feet high, the lantern being 211 feet above the sea and the light visible twenty-one miles. To the S. of the island in a line on the main axis of elevation, two miles from its eastern extremity, a series of rocks and reefs extends for seven miles to Carnac, a rocky islet, and is continued from thence for two miles to Garden Island, which has its greatest length of five and a-half miles to within one mile of John's Point to the N. of Cape Peron, from which the mainland is continuous to the E. and N., thus forming apparently an extensive and sheltered harbour seventeen miles in length from N. to S. The southern portion, Cockburn Sound, is indeed a spacious basin eight miles long by three and a-half wide, having seven fathoms water within less than a cable's length of the E. shore, but it is rendered inaccessible from the N. by Parmelia bank stretching from Woodman's Point to Carnac, which although it affords protection from that quarter has only one and a-half fathoms water on its crest. To the N. of this Owen's Anchorage has four fathoms water close to the shore, but this is again covered to the N. by Success bank, which however has a channel between it and the Stragglers to the W. with three and a-quarter fathoms. The entrances between the reefs into these anchorages from the sea are narrow, tortuous and difficult, which makes them at present inaccessible to large vessels in bad weather. The entrance between Garden Island and John's Point is barred by the S. flats with only about one and a-half fathoms water on the crest. The N. Channel has been recommended by the Admiralty Surveyor as affording entrance to the largest vessels if properly lighted and buoyed and with the removal of one rock. The Challenger passage however he entirely condemns. Owen's Anchorage and Cockburn Sound are however resorted to by vessels drawing sixteen feet when detained during winter months at Fremantle ; the latter, besides its extensive area

of some twenty-eight square miles with from nine to twelve fathoms water, having the snug anchorage of Careening Cove at the S.E. point of Garden Island, three-quarters of a mile in width and with five fathoms close to the N. shore ; and Mangles Bay to the S. one mile and a-half broad, with seven fathoms within less than half a cable's length of the shore. Between Rottnest and the main are Gage's Roads, but the reefs which extend to the N. from Carnac on the line to Rottnest limit their breadth to five miles from thence to the shoal water on the coast ; they are from nine to thirteen fathoms deep and are a safe anchorage for vessels excepting, possibly, in very strong gales from the N., and with the sounds and harbours to the S. naturally appertain to the embouchure of the Swan. The river itself however is only about 400 yards wide at the mouth which was closed all but a very narrow channel to the south under Arthur's Head by a reef until a similar channel was opened under Rous' Head to the north. As these are seldom accessible to vessels drawing more than six feet, and as the rise of the tide does not commonly exceed eighteen inches, the trade of the port at Fremantle has at present to be carried on by means of lighters which either discharge their cargoes from vessels in the roads, at the jetty, or take them up the river to Perth and Guildford. Outward-bound vessels have to be loaded in the same manner. For the first two miles the river is narrow, and for the most part shallow, ledges of rock projecting into it from the shores on which sandbanks have been formed ; but beyond it opens into a series of broad lake-like reaches for some eleven miles to the narrows above Perth, which should perhaps be considered more properly the real mouth of the river. Perth water is nearly landlocked and shallow, but from thence to Rocky Bay there are some eight square miles of water, a large portion of which is deep, carrying a channel of six fathoms, affording access to a coastline of twenty-five miles. The country about these waters has an undulating surface of limestone, the greatest elevations of which do not much exceed 250 feet. It has been for the most part covered with large timber trees, of which however but few remain. Perth Water forms a pretty lake, on the west of which Mount Eliza rises about 180 feet in a steep escarpment ; it is about one mile and a half in length, and a mile in breadth. Perth, the capital of the colony, is built on its north bank. Below Perth Water the Canning, a small river rising in the face of the Darling Range, has its outlet in Melville Water. It is navigable for boats and barges for some twelve miles, and affords means for taking the timber brought down by tramway to Perth or to Fremantle for shipment. Above the islands to the east of Perth Water the river has a tortuous course, forming a succession of broad reaches to the confluence of the Helena, a small stream from the east, above which it bends to the east round the town of Guildford, and thence, ascending the stream northward to Ellen's Brook,

a distance of about twenty miles direct from Perth which drains the base of the range to the north, whence the valley trends north-east to Toodyay, where it is joined by the Avon from the south-east. This is indeed the main river, but had been so named at York before its connection with the Swan was known. The lateral valley of the Avon and its affluent the Dale from the south extend about sixty miles in a direct line, and the main river about fifty miles from Toodyay to Perth. The upper basins of the river present, as is usual in W.A., chains of pools, for the most part formed in rock, connected only in times of flood by water, at others by deposits of sand. Granite is largely developed in the surface of the hills about the Avon valley, which is one of the most fertile, as well as beautiful, parts of the colony. Throughout the whole course of the river the flats on the banks are very rich with springs of fresh water from the drainage of the ground above them; some are still uncultivated, but it is occupied nearly throughout its entire length, the land having been taken up in the early days of the colony. The banks have been throughout well wooded, and are so now in many places."

SWEERS ISLAND, an island in the Gulf of Carpentaria, separated from Bentinck Island by Investigator Roads. It is very woody, and there is a hill about 150 feet high named Mount Inspection. A township named Carnarvon, after the Earl of Carnarvon, Secretary of State for the Colonies, was founded here in 1865, with Landsborough the explorer as superintendent. At one time the population was considerable, but it now consists only of the Custom House officials and their families.

SYDNEY, the capital and seat of Government of N.S.W. and also the parent city of Australia. It is situated on the southern shore of Port Jackson—named after Sir George Jackson, Secretary to the Lords of the Admiralty. The situation of the city is unrivalled in the world for picturesque beauty. Lang rises into poetry when describing it:—"The city of Sydney is beautifully situated on Sydney Cove, one of the numerous and romantic inlets of Port Jackson, about seven miles from the entrance of the harbour. The heads of Port Jackson, or the headlands at the mouth of the harbour, constitute one of the grandest and most interesting features in the natural scenery of the country. To a person approaching the land from the eastward, the coast presents an apparently unbroken line of lofty, precipitous, sand-stone cliffs, along the base of which the big waves of the vast Pacific Ocean dash fearfully when the wind blows strongly from the south-eastward; causing dense volumes of spray and whitish vapour to ascend to the summits of the highest cliffs all along the coast. The entrance is designated, at a considerable distance at sea, by the light house, or Macquarie Tower—a circular building of cut stone surmounted by a lantern with a

revolving light situated on the South Head; but no opening of any kind can be perceived till you come close in with the land. At a small distance from the Heads however an opening is at length perceived in the iron-bound coast; and the idea you naturally form of it is, that the cliffs on either side have been violently rent asunder by some mighty convulsion of nature, to afford a passage for vessels into some place of security. The entrance at the Heads is about a mile and three quarters wide; but the height of the cliffs and the idea of boundlessness which the ocean scenery has previously impressed upon the mind make it appear much narrower. On getting round Middle Head, a point of land stretching out from the northern side of the harbour, and completely concealing the opening from the eye of an observer at a few miles distance at sea, the scene surpasses description. You immediately find yourself on the bosom of a large lake, extending to a great distance in a westerly direction, with innumerable coves or inlets stretching inland to the right and left; some presenting sandy beaches and grassy lawns; others lined with a barrier of grey rocks cast in the most fantastic moulds, and surmounted in all directions with outlandish but most beautiful shrubbery. Many of the best localities on the shores of Port Jackson, between Sydney and the Heads, are in the hands of private proprietors; and the richly and endlessly diversified beauties of nature, which they uniformly exhibit, are in some instances enhanced by the manner in which they appear contrasted with the tasteful habitations of men. Several neat cottages have been erected by the pilots of Sydney, on a sandy beach immediately behind the South Head, called Watson's Bay. On the opposite side of the harbour, an inlet leading to the northward conducts to Spring Cove, which is now the quarantine station, immediately behind the North Head. A little nearer the city is the mansion of Vacluse, and somewhat nearer still is the handsome villa of Point Piper. On Woolloomoolloo Hill, an elevated projection of the land, situated between Woolloomoolloo and Elizabeth Bays, about a mile from Sydney on the south side of the harbour, a series of handsome villas have been erected, chiefly of cut stone, the view of which from the water is highly interesting and enlivening; and on the opposite side of the harbour, or what is called the North Shore, handsome cottages have also been erected, in many commanding situations, besides wharves and stores belonging to merchants in Sydney. The poet Campbell speaks of "The long isles of Sydney Cove;" but there happen to be no isles of any kind in that particular inlet. The only islands in the harbour are Sharks Island, a small island near Point Piper, towards the Heads; Garden Island, a highly picturesque and beautiful wooded island at the entrance of Woolloomoolloo Bay, and Cockatoo Island, a few miles farther up the harbour, to the westward of the city. There was a remarkable rock or islet however which from time immemorial

had occupied a prominent position in the harbour in the approach to Sydney, about two miles from the city, and which formed a striking object in the field of view from all the surrounding heights; consisting as it did of a vast mass of grey weather-beaten sandstone rock rising perpendicularly to a considerable elevation from the deep water. It was known by the name of Pinchgut, from having been the place of temporary banishment for some evil-doer, shortly after the original settlement of the colony, who had been condemned to live on it for a certain number of days on very reduced rations. This natural ornament of the harbour, however, which no art could have equalled, which had stood like a sentinel keeping watch upon the harbour for thousands of years, has at length been destroyed by the folly of man; some official Goth or Hun, who must surely have had the organ of destructiveness largely developed, having persuaded the Government to quarry down the rock nearly to the water's edge, with the view of its being converted into a battery for the protection of the colony. The city, which received its name in honour of Lord Viscount Sydney, who first suggested the idea of establishing a colony in N.S.W., and who was Principal Secretary of State for the Colonies at the time when the territory was taken possession of for Great Britain, was originally confined to the immediate neighbourhood of the cove of the same name, which extends only a short distance inland in a southerly direction from the main harbour. At the entrance of the cove there are two forts on the extremities of the two ridges that form its eastern and western shores—the one called Dawes Battery and the other Fort Macquarie. At the head of the cove these ridges attain a considerable elevation; and on their sloping sides and towering summits, as well as in the valley between, the city of Sydney now extends at least two miles from Dawes Battery to the southward, the ridges gradually subsiding till the ground becomes nearly a dead level. The principal streets run in a northerly and southerly direction, parallel to that of the ridges, and are crossed nearly at right angles by other streets, that terminate in a second and much more extensive cove to the westward, called Cockle Bay or Darling Harbour. In short, there can scarcely be imagined a finer situation for a large mercantile city; and it is deeply to be regretted that so little advantage was taken, in the earlier years of the colony of its admirable locality, and so little attention evinced in laying down a proper plan for its gradual extension. It seems indeed as if the Genius of Incapacity had seated himself in the chair of state in Australia from the very first, and extended his baneful influence to everything under the Australian sun. The last of the British colonies in America planted previous to the American war was that of Georgia, founded by the celebrated General Oglethorpe in the year 1732, that is fifty-six years before the next great colonising effort was made by Great Britain in founding the colony of N.S.W. But while

admirable foresight and a singularly correct judgment were evinced by Oglethorpe in forming plans of the principal cities of his colony, which have been acted on with incalculable benefit to the inhabitants to the present day—broad streets intersecting each other at right angles, with the carriage-way flanked on either side with ornamental and umbrageous trees, and spacious squares disposed at proper intervals all over the city—everything of this kind in the very capital of Australia was left to mere chance and accident; and the result has been that one of the finest sites in the world for a great metropolitan city has in great measure been irrecoverably spoiled, either through the utter want of ordinary foresight on the part of the Imperial Authorities in not sending out the proper officers for such a work, or in the utter unfitness of those to whom it was entrusted. Government House occupies a magnificent situation overlooking the harbour to the eastward of Sydney Cove, and forms a fine object on the left in passing up the harbour to the city. It was erected in 1837 and the following years from the plans of E. Blore, architect, at a cost of £25,000. It was first occupied by Governor Gipps in 1845. To those who are addicted to botanical researches, or to those who like myself merely delight to contemplate the wonderful works of God without being very inquisitive about the genus and species of each, the Botanic Garden and the romantic walks of the Government Domain in the immediate neighbourhood of Sydney cannot fail to afford a never-failing source of far higher gratification. To wander alone on serpentine walks traced with the utmost taste along the margin of beautifully romantic bays, and through woodland scenes untraversed so lately save by the naked savage and the solitary kangaroo; to behold innumerable shrubs of innumerable species, each of which would grace the choicest spots in the garden of a European prince, growing wildly and luxuriantly, and shedding their beautiful flowers unregarded; to sit on the summit of a grey rock overhanging the silent waters of Port Jackson, while the glorious sun descends behind the distant mountains to the westward and pours forth a deluge of light on rock and wood and water;—in such scenes, when the poet asks, "O Solitude, where are thy charms?" one is almost tempted to reply, "Here! here!" The principal walks in the Government Domain were planned by Mrs. Macquarie, and formed under her immediate superintendence. Various others have been added since, and the gardens generally greatly improved. The South Head Road runs along what the colonists would call "the dividing range" between Botany Bay and Port Jackson; and the series of views, which it successively presents, is as interesting and diversified as can well be imagined. On reaching the highest land on the line, the vast Pacific—the broad highway to England—stretches far and wide in front; while the roar of its breakers, as they dash incessantly on the shores of

Bundy Bay, a small inlet to the southward of the Heads, is heard almost under foot. To the right, the noble inlet of Botany Bay, with its white sandy beach and its dark-looking heads—standing erect like two negro sentinels—is seen at a moderate distance, athwart a series of swamps and sand-hills, the picture of absolute sterility. To the left, the harbour of Port Jackson, with its hundred arms, appears like a series of highland lakes, changing their aspect, and assuming more and more interesting forms at every step; while the North Head, now seen towering in solitary grandeur, seems like the ruins of some vast fortress built in the ages of fable, to guard the entrance of the harbour. In the rear, the city of Sydney, covered no longer as of yore, with a thin transparent cloud of whitish smoke, curling slowly upwards from its numerous wood fires, but with a regular blackish cloud from the smoke of Newcastle coal, like that which overshadows most English towns, occupies a considerable portion of the field of vision; while the Blue Mountains in the distance stretch along the western horizon, and terminate the view. The light-house on the South Head is about seven miles from Sydney; but the usual termination of the afternoon's drive is on the summit of a hill called Belle Vue, about four miles from the town, the carriages generally making a circular sweep on the top of the hill, and returning to town in nearly the same order as they left it. A ride or drive across the sand-hills and barren swamps intervening between Sydney and Botany Bay, is a favourite pleasure excursion for the inhabitants of the colonial capital. The country around the bay is flat and uninteresting; and the bay is generally shallow for a great distance from the shore." There are some features of the city of Sydney which bear a striking resemblance to an English town. Some of the streets are narrow, tortuous, and without any pretensions to modern architecture. The houses have what is best described by the term "an old-fashioned look," although of late years much of this has been done away with and the older portions of the town pulled down to make way for more modern structures. Some of the business premises recently erected in Pitt-street, in George-street, in Bridge-street, in York-street and Wynyard-square are capacious, elegant, and rank in a high order of architectural merit. The principal streets are laid out to the cardinal points of the compass and intersect each other at right angles. They are designated George, Pitt, Market, King and Hunter, the leading one being the first-named, which starts from the water's edge Dawes Point and runs completely through the city into the country, being called George-street West, when it passes beyond the railway station. The length of streetage in all is about 130 miles, and the number of houses 19,000. The greatest length of the city is $3\frac{3}{4}$ miles north and south, and breadth $2\frac{1}{2}$ miles east and west, the total area being about 2000 acres. The modern public buildings of Sydney as well as the warehouses,

banks, and churches, are for the most part elegantly designed and substantially erected edifices. The city and suburbs abound in sand-stone, which is easily quarried, capable of being worked into the most ornate designs at little expense, hardens on exposure to the weather and is of a substantial nature. The Sydney University which is built of this stone in the Gothic style of the 15th century, is an elegant building. The great hall is described by Anthony Trollope in the following words: "I think no one will dispute the assertion when I say that the college hall is the finest chamber in the colonies; If I were to say that no college, either at Oxford or Cambridge, possesses so fine a one, I might perhaps be contradicted. I certainly remember none of which the proportions are so good." Its dimensions are 135 feet long, 45 feet wide, and 73 feet high. The building is on a gentle acclivity, and commands a magnificent view; it has a frontage of nearly 400 feet. The two affiliated colleges, St. Paul's and St. John's (R.C.) are of the Gothic of the 14th century, and the whole of the University buildings are surrounded by a large park to which the public have access. St. Andrew's Cathedral, the foundation of which was first laid in July 1819 has been pulled down and re-erected thrice; now it is a very handsome building with two towers, and also belongs to the Gothic of the 14th century. It is provided with a fine organ. The Jewish Synagogue, which was completed in 1878, belonging to the Byzantine Order of Architecture, is also an elegant edifice. The new buildings for Government offices—the Colonial Secretary's and Public Works forming one lofty massive building facing Macquarie and Bridge-streets, and the Crown Lands Offices fronting Bridge-street—are specimens of the skill of the architect which are rarely surpassed for elegance and comprehensiveness of construction. Then there are St. Mary's Cathedral (R.C.) which, after being twice burned, is now in process of re-erection on grander proportions than ever, its projected dimensions being 350 feet long, width within transepts 118 feet, width of nave and aisles 74 feet, height about 90 feet; a central tower will be 120 feet high, and two towers with spires at the southern end will rise to an altitude of 260 feet. Other places of worship are:—St. Patrick's (R.C.), St. George's, St. John's, St. Philip's, one of the oldest in Sydney, though the present structure is not altogether the original building, and St. James's, the old Cathedral Church opened in January 1822. Besides these there are about 120 other ecclesiastical buildings, some of which would not suffer much by comparison with the edifices of older countries. Government House, which belongs to the Tudor style, is delightfully situated and overlooks Farm Cove or Man-of-War Bay. The building is surrounded by the domain and botanical garden and is a delightful place for a vice-regal residence. It is overtopped by "The Garden Palace," where the first International Exhibition of Australia was inaugurated

on 17th September 1879. This immense building commands from its dome and its balconies a view of the grand scenery which meets the eye at every point in and around the metropolis of N.S.W. The Exhibition was open a little over six months, during which time it was visited by 1,045,898 persons, the receipts amounting to £45,000. The largest attendance on one day was on 26th January 1880 (Separation Day) when 27,500 visitors thronged its courts. To the Exhibition of 1851 in Hyde Park the number of visitors was 6,170,000; so the percentage of visitors to population was very much larger, being about 150 to 22½. The Banks also are imposing buildings and may be said to belong to the Florentine, Roman, Italian and Greek orders of architecture; they comprise—the N. S. Wales, Commercial, Australian Joint-Stock, City, English and Scottish, Australasian, the London Chartered, the Oriental and the Mercantile Banks. In addition to these the Bank of New Zealand has very creditable premises, and the Queensland National Bank has premises in Pitt-street. All these, as well as the Savings Bank, would reflect credit on many of the towns in the mother country. The Exchange buildings are also admired for their beauty and substance of construction. They belong to the Roman Corinthian order. Among other commercial buildings which attract the attention of visitors are the offices of the Australian Mutual Provident Society, the *Sydney Morning Herald* office, which is replete with all the appliances of the best London offices, the paper being printed on a Walter machine, similar to that in use in the London *Times* office. The *Sydney Mail*, published and printed in the same building, is a weekly illustrated journal of a superior character. The structure where the *Town and Country Journal* and the *Evening News* are issued is a roomy one, with elegant front. The *Town and Country Journal* office is fitted with one of the Victory printing and folding machines, the only one in N.S.W., which folds as it prints. This machine is capable of printing and folding 20,000 four-page copies per hour, or 10,000 eight-pages, and was introduced by the late Samuel Bennett to meet the growing circulation of the *Town and Country Journal*. Another Victory has been added for the *Evening News*. The buildings of the *Sydney Daily Telegraph* at the corner of Barrack and York Streets are also substantial and well-designed. There are also magnificent warehouses occupied by importers and manufacturers. The Post-office is of the Venetian and Florentine Italian order; it is an imposing edifice, colonnaded on two sides, and described as well adapted for its purpose. It is built of Pyrmont stone, the colonnade being formed of pillars of polished grey granite. It was opened in September 1874. The Town Hall is of great size, with a tower 200 feet high, and an architectural ornament to the city; a hall to be used for public entertainments forms part of the design, 132 feet long by 62 feet wide, and 66 feet high. The museum on the eastern side

of the city overlooking Hyde Park is a fine structure, with a bold Grecian front, and is extensively patronised, some 100,000 persons visiting it annually. The Treasury is a very good building, of the usual freestone; the Colonial Secretary's office on the opposite side of the street is one of the most elegant in Australia. In the same street is the Crown Lands Office, an elegant addition to the other architectural structures of the city. Then there is the Exhibition building—in the Paxtonian style—which has been found admirably adapted for local exhibitions—Prince Alfred Hospital, the new Guildhall in Castlereagh-street, the Protestant Hall, the Parliament Houses, Custom House, the Mint, and others which though not of elegant design remind one of the days when George III. was King and Colonel Macquarie Governor. Turning to the private residences, many of them have been erected at enormous expense and are surrounded with pleasure grounds and gardens, which with the natural beauty of the scenery lends them a charm denied to those of other places. The public traffic of the city and suburbs is carried on by hansom cabs, omnibuses and hackney carriages. American omnibuses afford communication with the extremities of the city and the suburbs, and the water communication between the city and its transmarine suburbs, Balmain, North Shore, and other localities is maintained by numerous steam ferryboats which ply at frequent intervals during the day till midnight. Street cars convey parcels and passengers from the Redfern railway terminus to the heart of the city in King-street. The streets are lighted with gas at a cost of upwards of £7154 per annum to the corporation. Sydney has spacious markets in its main thoroughfare, Elizabeth-street and George-street; and they are usually well-stocked with fruits and vegetables of every kind. There are three theatres—the Royal, the Queen's and the Opera House. Notwithstanding the distance from the great centre of high civilisation, Sydney is not only well supported with theatrical stars of all kinds but with English and Italian opera singers. Besides the theatres, the Guild Hall, the Masonic Hall, Protestant Hall, and the Temperance Hall are used as places of public entertainment. Although Sydney has few reserves answering to the shrubberied squares of most of the large towns of Great Britain, it has excellent park lands and gardens within its boundaries, easily accessible to the citizens. Hyde Park is a beautiful plateau of forty acres, nearly in the centre of the city, with a statue to "Albert the Good" and another one to Captain Cook. The Domain, a charming expanse of park land of 138 acres, is on the north-eastern side of Sydney, surrounding the pretty inlet called Farm Cove. Near the main entrance is an excellent bronze statue of Sir Richard Bourke, by Westmacott. The Botanical Gardens embrace thirty-eight acres, and are considered as among the finest in the colonies; as in addition to the immense collection of exotics from every clime,

the locality is one of great beauty, the grounds encircling the waters of Farm Cove, where the men-of-war belonging to the Australian station are anchored. Here in the Inner Domain, adjoining the Botanical Garden, is situated "The Garden Palace" which was used for the International Exhibition, as already observed. More recently-formed preserves are Prince Alfred Park, eighteen acres, and Belmore Park in the south, ten acres, and a tract of 600 acres on the south-east side named Moore Park. Adjoining the latter ground is the Metropolitan racecourse (Randwick,) which has an area of about 202 acres. The course is about one and a quarter mile in circumference and is considered the best running ground in the southern hemisphere. In addition to the above reserves there are others of a less extensive area in different parts of the suburbs. The Circular Quay at the head of Sydney Cove has a length of 1300 feet available for the largest vessels. The Government are expending a large sum of money in extending the wharfage accommodation, which will add much to the convenience of shipping and improve the appearance of the quay. The Australasian Steam Navigation Company have expended large sums of money in making offices, wharves, and warehouses on Circular Quay, and a part of the shipping business of this extensive association is now carried on there as also that of the P. and O. The vessels of the Orient Line discharge at Circular Quay, and the mail steamers of the P. and O. Company berth at the wharf. Woolloomooloo Wharf to the east is 1200 feet long and was constructed at a cost of £26,000, a large tract of valuable land being reclaimed, the water is however too shallow and unsuited for large sea-going shipping. The eastern side of Darling Harbour which skirts the western side of the city has its frontage entirely occupied with wharves and quays. Here several steam companies have their stations, and the gas company its large works. On the north from Miller's Point to Dawes Point (which includes all one end of the city) and thence round the largest headland of the port, the waterside is also fully taken up by commercial premises with the exception of the site at Dawes Point on which there is a battery. The floating dock offers facility for vessels not exceeding 160 feet in length and from 500 to 600 tons burden. The Fitzroy Dry Dock at Cockatoo Island, some few miles to the west of the city, is a Government establishment and was originally intended for the repair and overhauling of vessels of the Royal Navy. Vessels of the largest capacity can be taken in without difficulty, its dimensions being—length 450 feet, width 60 feet, depth of water over sill 21 feet. The establishment is provided with the largest, most powerful, and recently improved kinds of machinery. Other dock works are those of Mort and Co., at Waterview Bay. The dock is 409 feet long, with an entrance 68 feet wide, and a depth of water over the sill of 19 feet 6 inches. It is fitted with

patent keel blocks. It is partly cut out of the rock, and partly built up compactly with stone masonry. This dock has taken in vessels of the largest size visiting the port, including the *Chimborazo*. The workshops cover a large area, with a bay frontage of 1500 feet, employing when in full work 700 hands. A substantial patent slip is also here available for vessels of 1000 tons. The Australian Steam Navigation Company have very extensive works, with most of the modern appliances for shipbuilding and repairing, on the western shore of Darling harbour. The slip attached to the works can be used for vessels of 1500 tons burthen, and can take up two steamers at the same time. There have been constructed at these works several steam vessels. The large fleet of the company gives constant employment to the establishment, it being kept in efficient order and thorough repair. For some time past steps have been taken to place the city in a state of defence, and batteries carrying Armstrong guns of large calibre now protect it in a great measure from attacks from a hostile fleet. These defences have been still further augmented under Colonel Scratchley's designs, which were adopted by the Government. The conformation of the shores affords the best facilities for the erection of fortifications, and seawards there is nothing to prevent the city being made practically impregnable. A military road now connects all the forts on the northern side of the harbour. Even now it would be a difficult matter for any ship to run the gauntlet of the numerous guns that could be brought to bear upon it even before entering the Heads. A torpedo corps has been established, and an electric light apparatus placed at the South Heads, which will throw a light a radius of fifteen miles. The trade of Sydney is considerable, and gives employment to a large fleet of steamers. It is the headquarters of the Australian Steam Navigation Company, the Pacific mail steamers, the E. and A. steamers, the P. and O. steamers, the vessels of the Orient line, and others; besides there are always four or five men-of-war anchored in the harbour. During the year 1879 the number of British and foreign vessels which entered Port Jackson was 1288—614 sailing and 674 steam. The aggregate tonnage was 759,980 tons. The population of the city proper is estimated at 110,603; of the suburbs 90,226. The water supply of the city is obtained from the Botany and Lachlan swamps; but arrangements are being made for a more effective and superior supply of water. The number of houses in the city and suburbs was estimated in August 1879 as 28,000. In 1879 the annual value of rateable property was £1,037,000 at 2s. in the pound; revenue, £108,237 15s. 5d.; estimated extent of roads and streets, 100 miles; number of ratepayers, 18,062. The public vehicles are under the control of a body called the Metropolitan Transit Company. The charitable institutions of the capital are numerous, and are partly supported at the expense of Government, aided by private benevolence.

Some of the leading institutions are the Infirmary in Macquarie-street, the Prince Alfred Memorial Hospital, the Good Samaritan Institution, Sydney Female Refuge, the Shaftesbury Reformatory, the St. Vincent Hospital, the Benevolent Asylum, and the Children's Asylum at Randwick. The suburbs of Sydney comprise Balmain, on the opposite side of Darling Harbour; the Glebe, adjoining the city, on the south-west; Newtown, Warrickville, Redfern, Waterloo, all to the south; Paddington, on the east; Concord on the south-west; St. George and St. Leonard's on the north shore of the harbour. Each of these is an independent municipality, and there are other places within a radius of ten miles, and usually considered as suburban to the metropolis. Sydney is the seat of an Anglican Bishop and a Roman Catholic Archbishop, both metropolitans. The city is under municipal government, being divided into eight wards, named respectively Bourke, Brisbane, Cook, Denison, Fitzroy, Gipps, Macquarie, and Phillip, some of which return two aldermen and others three, and for Parliamentary purposes is divided into three districts, viz., East, West, and South Sydney, each returning four members. It has a fine School of Arts in Pitt-street, with a library of about 30,000 volumes. A commodious hall is attached which is a popular place for holding entertainments. A Technological College with laboratory is now connected with the institution. The Public Library in Bent-street is largely patronised, and now open on Sundays. To this library is now attached a lending branch. Numerous factories are in full work. There are thirty-two clothing factories, employing from 50 to 400 hands each. There are two large steam joinery establishments, the larger of which has 250 men and boys in their employ. The coach factories are also extensive, and splendid cloths are turned out at Vicar's Tweed Mill. There are also several large foundries and engineering works in which large castings and every description of mechanical appliances are turned out, even up to locomotive engines for the government railways. The geological formation of Sydney is sandstone, overlying part of an immense carboniferous deposit extending from beyond Newcastle to Jervis Bay. Borings for coal have been made and great depth reached, but no practical results have followed as yet.

HISTORY.—The early history of Sydney is in fact that of the settlement at Port Jackson, which forms the first chapter in the history of N.S.W. The growth of the city was the growth of the colony until the discovery of the passage across the Blue Mountains. The ceremony of taking possession of the colony was performed by Governor Phillip on 26th January 1788. The 7th February was the day set apart for the proclamation of the King's warrant for establishing a regular form of government in the new settlement, which was made with all due ceremony by the Governor. On a space previously cleared the

whole population were assembled, the military drawn up under arms, the prisoners stationed apart, and around the Governor those who were appointed to hold the principal offices in the new British settlement. The Royal Commission establishing a regular form of government on the coast of N.S.W. was read by David Collins, the Judge Advocate. By this instrument Arthur Phillip was constituted Captain-General and Governor-in-Chief over the territory called New South Wales (thus named by Captain Cook,) including all the islands adjacent thereto. The office of Lieutenant-Governor was conferred on Major Ross of the Marines. The Act of Parliament establishing the Courts of Judicature was also read, and lastly the patents under the Great Seal. This was the foundation of the city of Sydney. By the end of June some progress had been made towards the formation of a town. Lines were traced out which distinguished the principal street terminated by the Governor's house and the Criminal Court. Other streets were marked out as the sites for houses as the town came to be enlarged. A temporary barrack had been erected. The huts were composed some of the soft wood of the cabbage palm, others of upright posts wattled with twigs and plastered with clay. The want of lime, for the making of which no suitable material could be discovered, prevented the erection of stone houses. One of the most substantial buildings was the hospital, erected at the west side of the town. A small observatory was set up by Lieutenant Dawes on the point of land forming the western boundary of Sydney Cove, for the purpose of observing the movements of an expected comet. A farm of about nine acres was cleared in the vicinity of the Cove, next to the town in an easterly direction—the spot now partially occupied by the Botanical Gardens—and was sown with corn of various kinds. While the buildings were proceeding (in March) an emu, seven feet four inches in height, was shot in the streets. A proposal was made on the 4th June, the anniversary of King George the Third's birthday, to change the name of the city to Albion, but was not adopted. Rushcutter's Bay was named by persons frequenting it to cut rushes for stable use instead of straw. Two men so employed were speared by the natives at the spot, in May. The inhabitants of the rising city suffered great privations from want of provisions for the first two years, their whole stock of horned cattle, four cows and two bulls, having escaped into the bush. A farm was established at Parramatta, and named Rose Hill. In December the keel of the first vessel built in the colony was laid. She was designed for conveying provisions to Parramatta, and was called the *Rose Hill* Packet. A prisoner, James Daley, at this time asserted that he had found gold on the land between the settlement and the bay, and was severely punished for deceit. The month of July in the following year (1789) was made remarkable by the discovery of the Hawkesbury. The joy with which this discovery

was hailed soon disappeared before the anxiety consequent on a succession of misfortunes. Sickness prostrated as many as 500 persons at one time. In July 1790 the Governor laid down the lines of a regular town. The principal street extended one mile from the landing place, and ran in a westerly direction. Its width was 200 feet, and on either side huts were to be erected capable of containing ten persons each. The dwellings were to be at the distance of sixty feet from each other, and garden ground for each was allotted at the rear. The month of February 1791 was marked by excessive heat and hot winds; the thermometer usually standing at 105°. Immense numbers of birds, flying foxes, and other animals, were killed by the heat in the surrounding district. In November of the same year the work of hewing out the tanks for water-supply was commenced. In February 1792 eight men of the corps of Royal Marines received grants of land in the neighbourhood of the town, and established themselves as settlers. During the first half of this year scarcity of provisions amounting to famine prevailed, only partially relieved from time to time by the arrival of transports with supplies. This year the first free immigrant, a German named Schäffer, obtained a grant of land. He had come out to cultivate tobacco. His grant of fifty acres in the town of Sydney was surrendered for twenty gallons of rum in 1807. Had he retained it for a few years he could have sold it for at least £100,000. In 1793 3470 acres of land had been transferred to settlers, and 1012 acres were under cultivation for the Government. Transports arrived with free citizens, agriculturists, farm implements and seed. An American vessel, sent down from Rhode Island by her speculative owners with miscellaneous cargo, opened the first trade with a foreign nation. In August the first church was built. It was made of wattle and daub, and cost £40. The erection of this building was due to Mr. Johnson, the Church of England chaplain to the First Fleet. This gentleman was the first to introduce the orange tree at Kissing Point. When on 11th December 1792 Phillip took leave of the city which he had founded, he had the satisfaction to leave behind him a prosperous people and an honoured name. In March 1793 two Spanish vessels, the *Descovierta* and *Atrevida*, arrived in Port Jackson from Manilla. Their object was to take scientific observations. They calculated the longitude of Sydney as being 151° 18' 18" E. from Greenwich, and the latitude 33° 51' 28" S. An extraordinary phenomenon was about this time observed in the heavens near Sydney. At dusk, in the N.W., there was visible a brilliant meteor, having the appearance of a ray of forked lightning, which continued visible for about a quarter of an hour. In 1795 Governor Hunter ordered a general numbering of the population of Sydney, Parramatta and the Hawkesbury. In November the first printing press was set up, and George Howe printed the "Acts and Orders" of the Governor. In December

1795 the first civil action was tried in Sydney. It arose out of the shooting of a hog belonging to Mr. Boston by a soldier, for trespassing. On Boston remonstrating the soldier struck him with a loaded musket. Damages of £500 were claimed by Boston, and the Court awarded him forty shillings. The decision was sustained on appeal to the Governor. On 16th January 1796 the first dramatic performance took place under Sparrow's management. The play was *The Revenge*, and the cast included six male and female performers. In February a military riot occurred, when the cottage of one Bangham, a carpenter, was burnt down by the soldiery. Amongst the deaths of this year were those of Henry Brewer, Provost-Marshal of the settlement, and Richard Hodson, an officer of the N.S.W. corps. The first licenses to sell spirits were issued by the Governor, the period included in them being twelve months. In May, D'Arcy Wentworth was appointed assistant-surgeon to the settlement. Two American vessels, one from Rhode Island and one from Boston brought down provisions and merchandise, which were eagerly purchased. Police arrangements were perfected, and a log prison was erected. The next year saw the first windmill, and a strong bridge was built over the Duck River. Thomas Smith was appointed Provost-Marshal, and Thomas Moore Master Boat-builder. A log prison was erected this year "to the great annoyance of the worthless." At the close of 1797 there were 300 native-born children in Sydney, one-half of whom were attending school. In May 1798 four families of free settlers arrived, and were lodged on ground in the vicinity of the town at the expense of the Government. Towards the end of the year the church was burned to the ground by the act of an incendiary. The first emancipist, Stephenson, a man of good character, died. The half-moon battery at the eastern point of the Cove was completed in December and mounted with guns brought out by the First Fleet. Early in 1799 the wooden gaol was burned down, and a stone building to supply its place was commenced. The intelligence of Nelson's victory at the Nile was brought by a vessel from the Cape of Good Hope, and the fact was proclaimed amidst public rejoicings. Two Spanish ships captured by whalers off the coast of Peru were brought into the harbour, and were declared by the Court of Vice-Admiralty to be a war-prize. Great storms of rain occurred in Sydney in June, causing much damage, and putting back the progress of the town by at least twelve months. Great distress occurred in consequence for some months. In August the erection of a second battery for the defence of the harbour was completed, and a third battery was erected on Garden Island. At the beginning of 1800 an import duty was imposed on spirits, wine, and beer; the revenue derived from this source being applied to the building of the gaol. Rumours of meditated revolt amongst the Irish prisoners led to the formation of the Sydney and Parramatta Loyal

Associated Corps, each of fifty volunteers. Intelligence of the union between Great Britain and Ireland was received in June 1801, and the event was celebrated by the hoisting of the new union flag at Sydney, and the remission of the sentences of some of the political prisoners. At this time the circulating currency was of a very miscellaneous kind, embracing guineas, gold johannes, ducats, mohurs, pagodas, dollars, rupees, Dutch guilders, English shillings, and copper ounces. On Saturday, 5th March 1803, the first number of the *Sydney Gazette*, the official organ, was issued. It consisted of four small pages printed on inferior paper in type very much defaced. In March 1806 a flood in the Hawkesbury caused great distress through the destruction of the farmers' produce, and a committee was formed in Sydney to supervise the consumption of bread. Food rose to famine prices, flour being half-a-crown a pound, and the two-pound loaf was five shillings. The intelligence of Nelson's great victory at Trafalgar was received with great rejoicing. In August Bligh arrived, and the troubles which marked his entire period of rule began. The details do not require to be repeated here. The troubles ended on the day the colony had completed the twentieth year of its existence (26th January 1808.) In May 1809 another flood on the Hawkesbury threatened the Sydney people with another famine. In August Archdeacon Cowper arrived, with the appointment of assistant chaplain—the fourth clergyman who had come to the colony. In December Governor Macquarie arrived. He was an enthusiast for improvement. The town of Sydney first occupied his attention. Its disorganised and irregular condition he saw to be utterly inconsistent with a well-ordered and permanent state of society. He divided the town into five districts, and in each erected a watch-house, where a police guard was stationed. He named the several streets and established regulations for preserving regularity in the erection of houses, and drew up rules for the regulation of the markets. The ordinances of religious attention to Divine worship and a due observance of the Sabbath next attracted his attention. Previous to this time it would seem that but little difference was made between the Sabbath and other days of the week; for besides prohibiting manual labour on the seventh day he issued an order that on Sundays public houses should be closed from ten in the morning till half-past twelve o'clock in the day. That no class of the community might have an excuse for neglecting the offices of religion he at once enlarged the church and otherwise increased the accommodation for those who attended Divine worship. He ordered that every Sunday at a fixed hour all the convicts in the Government service should be mustered in the market place in their best apparel, and thence marched to church, attended by the principal superintendent; and the more effectually to enforce this regulation he inspected in person the men so assembled. The

administration of justice was not forgotten. A court of civil judicature, to be held during the first month of each quarter of the year was established; and two magistrates, the Judge-Advocate and another, were constituted a court for the recovery of small debts. In November 1811 the first horse-races held in the colony took place at Sydney, the sports continuing three days. In October 1812 the foundation of the General Hospital was laid. The general aspect of the city at this period is thus sketched by a vigorous writer:—"A thriving town had grown up on the shores of Port Jackson. The Governor's house was of stone. The judge and a few Government officers had houses of brick, but the main portion of the inhabitants were content with plastered logs and shingled roofs. Yet the people of Sydney felt no small pride in their town. They would have liked a little more land for their few sheep and cows. But the flocks on which they relied roamed through far different pastures. When the season came round they sailed away down the Great Southern Ocean, and came back laden with black oil and sperm. Their harbour was the finest in the world, sending its arms in among their cottages and town gardens, and capable of containing the whole British navy; their long huts were bathed in everlasting sunshine; and business was good. From the sparkling waters of the bay to the Blue Mountains behind, all was bustle and activity. Whalers from Europe and America refitting, immigrants landing, new houses building, and vineyards and orange-groves creeping round the bay. Such as it was, it comprehended all the English in A. Through those Blue Mountains no man could find a way to the boundless regions which lay beyond. Rewards were offered for the discovery of a mere sheep track. The more adventurous citizens risked life and limb—not always without fatal results—in clambering up and down their craggy sides, and peeping into their black fissures. Three gentlemen, Lieutenant Lawson of the 104th Regiment, with Messrs. Blaxland and Wentworth, led an expedition into the mountains, which was very successful, for at length the long-sought pass was discovered. In 1813 Mr. Evans, a Government surveyor, also found himself, after repeated attempts, on the other side of the Blue Mountains, and with care and great labour retraced his steps to Sydney. Immediately the pent-up flocks and herds of the colonists poured themselves out over Bathurst Plains and the western districts of N.S.W.; and the people of Sydney began to desert their town gardens for sheep-feeding and wool-growing." In July 1816 the foundation of the South Head lighthouse was laid. In December a meeting was held to establish the Bank of N.S.W. The next three years were uneventful for the inhabitants of the rising city. In 1819 an orphan school for male children was opened in Sydney; Hyde Park Barracks was completed; the foundations of the Supreme Court buildings were laid,

and the N.S.W. Savings Bank was instituted. Early in 1820 the foundation of the Georgian Public School was laid; and a meeting was held to devise measures for the erection of a Roman Catholic Church. At the criminal sessions, held in March 1821, twenty-five men were sentenced to death. In November the foundation-stone of St. Mary's (R.C.) Cathedral—the first church of that denomination in Australia—was laid by the Governor. On 1st December, at a grand review in Hyde Park, Governor Macquarie read his farewell address to the colonists, and announced the appointment of Sir Thomas Brisbane as his successor. The Sydney Philosophical Society was instituted this year. The Riley Estate, containing 100 acres now included within the city, was purchased in May 1822 by Mrs. Ann Riley for £2200. The Agricultural Society and Sydney Institution were founded the same year. In 1826 the first Scotch Church was opened; and the Chamber of Commerce was founded. In this year the mania of joint-stock companies occurred in England, and its effects were felt in the colony in an eager desire to enter into speculations in stock. "The soldier unbuckled his belt to become a keeper of sheep, and the priest forsook his altar to become a herdsman of cattle." A drought of three years ensued, a financial crash followed, and the value of cattle fell from pounds to shillings. In September the aqueduct for supplying Sydney with water from the Botany swamp was commenced. In 1830 the Sydney College was founded, superseding the Sydney Free Grammar School. The new institution was established by a company with a capital of £10,000. The foundation of the College buildings was laid in Hyde Park by Chief Justice Forbes on 26th January. The arrival of Governor Bourke was celebrated with much rejoicing and a general illumination of the town on 2nd December 1831. The first steam vessel set afloat in Port Jackson—the *Sophia Jane* of 256 tons—arrived from England this year, brought out by Lieutenant Biddulph of the Royal Navy, one of her owners. The steamer plied between Sydney and Newcastle. The Government Domain was for the first time thrown open to the public the same year. In 1832 the Australian College was opened. In 1833 the Mechanics School of Arts was formed; the Australian Steam Navigation Board was appointed; and the Port of Sydney was declared a free port by order of the Lords Commissioners of the Admiralty; under this privilege vessels of foreign nations were allowed to land and warehouse cargoes for exportation. In 1834 the estate of Woolloomooloo, the property of Sir James Dowling, was laid out in streets. Victoria-street was so named after Queen Victoria, Brougham-street after Lord Brougham, Dowling-street after himself, and Forbes-street after Sir Francis Forbes. Some land sold in Sydney at the rate of £10,000 per acre. The Proprietary Sydney College was opened under the superintendence of W. T. Cape in 1835. On 13th April 1836 the

Sydney Gas Light Company was established; and the same year the Australian Museum. A great fall of snow occurred near Sydney, known as "Snowy Monday," on 28th June 1837. The aqueduct from Botany to Sydney, which was commenced in 1827, was completed in 1837. The length of the tunnel was 12,000 feet, its average depth five, and its width four feet. The total cost of the aqueduct was £22,000. The work was done entirely by prison labour, which was estimated to be two-thirds less than free labour. The Victoria Theatre was opened on 17th March 1838. The same year the Sydney Botanic Gardens were thrown open to the public. The first show of the Floral and Horticultural Society took place on 19th September; and the foundation stone of Christ Church was laid 1st January 1840. The foundation stone of Trinity Church was laid on 23rd June. Gas was first used for lighting the shops, and the Company gave a brilliant illumination on Church Hill on the occasion, 24th May 1841. The city was lighted with gas for the first time on 26th January 1842. The 11th April of that year was observed as a public holiday, to celebrate the unveiling of the statue to Sir Richard Bourke. The same year the bill for incorporating Sydney passed the Legislature. In November the first municipal elections took place. The first aldermen chosen were:—Robert Owen, John Hosking, George Allen, Thomas Broughton, Francis Mitchell, and J. R. Wilshire. Hosking was elected mayor. On 24th May 1843 Government House was first occupied and specially fitted up for the celebration of Her Majesty's birthday. Great distress prevailed in Sydney amongst the working classes for want of employment this year. £1000 was voted by the Council for the purpose of sending a portion of the unemployed into the interior. The first peal of bells heard in Australia ushered in the new year from the tower of St. Mary's (R.C. Cathedral) on 1st January 1844. The foundation stone of the first Bethel Chapel was laid on 24th April. The first meeting of the subscribers to the Sydney Dispensary after its extension as an infirmary, when Drs. Macfarlane and Fullerton were elected the first physicians, and Nathan and McCrae the first surgeons of that institution, was held on 26th March 1845. The first anti-transportation meeting was held in Sydney on 22nd October 1846, Charles Cowper presiding. Towards the latter part of 1848 the first ship load of Chinese immigrants arrived. A great anti-transportation demonstration took place at the Victoria Theatre in March 1849, the Mayor presiding. Amongst the speakers were Robert Lowe, Charles Cowper, and Dean McEncroe. In June the ship *Harkaway* arrived with 212 male prisoners on board—and another grand demonstration took place. A deputation was appointed to wait on Governor Fitzroy to remonstrate, and were received with haughty coldness and premeditated incivility. In 1849 a select committee of the Legislative Council was appointed to inquire into the working

of the corporation of Sydney, the efficiency of which had long been doubted, while its proceedings were conducted on the part of the councilmen in such a manner as to excite the contempt of the citizens. Those who were still favourable to the corporation attributed its unsuccessful working, 1st, to the cumbersome machinery by which it had been surrounded, including the numbers of its members, which was said to be too large; 2nd, the absence of legitimate endowments. The committee reported "that whatever might be the defects of the machinery, and how inadequate soever the means of the corporation, these were but secondary and minor defects, compared with the gross and palpable misconduct of the corporation itself, which had neither used ordinary care in collecting, ordinary fairness in expending, nor ordinary diligence in improving its revenues, and that, while to give additional endowment to such a body would be manifestly improper, to allow it to remain in its present position would be to declare that the citizens should derive as little benefit as possible for the sums they contributed. The committee was perfectly satisfied, from the evidence they had taken, that the body had entirely lost the confidence of the citizens, and was regarded as an impediment to the improvements of the city." They proceeded to add however, having reference to the demand so often made from responsible governments, that "they did not think the failure of the corporation could fairly be urged against the colony as a proof of its unfitness for representative government. It was the existence of representative assemblies that was fatal to the successful working of corporations. Under arbitrary governments they enlisted those ardent spirits whose energies had no other vent; under free governments the higher order of public men were employed elsewhere, and municipal politics lost their attraction. Among the causes of failure mentioned by the committee was the practice of creating Aldermen Justices of the Peace, by which a spurious ambition was generated, and men sought a seat in the City Council not to devote themselves to business but to become Magistrates. The manner in which the Council performed its business was also highly objectionable. Their discussions were prolix and disorderly; their proceedings dilatory and inconsistent; epithets of the most offensive nature and even oaths were employed in their deliberations; and they indulged in debates on the most trivial matters, such as reception of a petition or a point of order, which were almost interminable. The consequence was that their business fell into arrear; it was very difficult to know when the Council would arrive at a decision, and when they decided how long they would adhere to it. The committee concluded by recommending—1st, That the Acts of Council incorporating the citizens of Sydney should be repealed; 2nd, That an Act should be passed appointing three commissioners in whom should be vested all the powers at present

exercised by the Corporation; 3rd, That the local revenues then vested in the Corporation should be vested in those commissioners; and 4th, That a uniform rate for the purposes of civic improvements should be imposed by Act of Council. A series of resolutions for abolishing the Corporation were subsequently introduced by Lowe, but were negatived by a majority of fifteen to six. An amendment, moved by George Robert Nichols, to the effect that it was the opinion of the Council that the Corporation ought to be amended but not abolished was adopted, and the Government were left to pursue whatever measures might seem to them desirable on the matter. The year 1849 was signalised by Wentworth's bringing in and carrying through the Legislature the Bill for the founding of the University of Sydney. The Bill incorporating the Sydney Railway Company was also passed about the same time. The intelligence of the discovery of gold in California reached Sydney early in the year, and by June about 300 persons had left the colony for that country. The exodus subsequently grew to very large proportions, and the value of the property in the city was considerably depreciated in consequence. In July 1850 the first sod of the Sydney and Goulburn Railway was turned by the Governor's daughter, Mrs. Keith Stuart, in the presence of about 10,000 spectators. The terminus of the proposed line was in Parramatta-street. A great indignation meeting to denounce the conduct of Governor Fitzroy in reference to the Transportation Question was held about the same time at the Circular Quay. A second meeting of a similar character was held in the Barrack Square in September, when 6000 persons were present. In December the Act granting responsible government to the colony arrived. In May 1851 the announcement of Hargreaves' discovery of gold caused a rush of the population from Sydney which almost depopulated it of the male adults. A great meeting to petition the Queen for the dismissal of Earl Grey from her councils was held in July. A duel was fought between Sir Thomas Mitchell and Stuart Alexander Donaldson in September, fortunately without serious result. In 1852 Port Jackson became a free port by an Act abolishing harbour dues, entry and clearance fees, and lighthouse and water police dues. In October of that year the Sydney University was instituted. The inaugural addresses were delivered by Sir Charles Nicholson, Vice-Provost, and Rev. John Woolley, the Principal. The first members of the Senate were:—Provost: A. J. Hamilton, M.A.; Vice-Provost: Sir Charles Nicholson; Fellows: Rev. W. B. Boyce, Edward Broadhurst, B.A., John Bayley Darvall, M.A., Stuart A. Donaldson, Right Rev. C. H. Davis, D.D., Alfred Denison, M.A., J. Macarthur, F. L. S. Merewether, B.A., Bartholomew O'Brien, M.D., J. H. Plunkett, M.A., Justice Therry, E. Deas-Thomson, and William Charles Wentworth. The first Chancellor was Sir Charles Nicholson, 1854. In 1853 an Act was passed abolishing the Municipal

Corporation of Sydney, substituting in its stead three paid commissioners to carry out the works necessary for draining the city and supplying it with water. The commissioners commenced their duties in January 1854. The foundation-stone of the Sydney Exchange was laid by Governor Fitzroy in 1853; and the works for the defence of the harbour were commenced at Pinchgut (now Fort Denison,) Lady Macquarie's Chair, and other places in the harbour. Dr. Cuthill, a gentleman noted for his philanthropy, was shot by a lunatic towards the middle of 1854. The following year the railway to Parramatta was opened; the Mint was opened in May; and in the same month Bishop Barker arrived as successor to Bishop Broughton. In 1857 an Act for the re-establishment of the Corporation was passed. The population of the city was shown by the census to be 81,327 souls, including the suburbs. On 21st August of that year occurred the wreck of the *Dunbar*, and a short time after that of the *Catharine Adamson*. The Exchange was opened by Governor Denison on 30th December. About the middle of 1858 occurred the rush to Port Curtis, with disastrous results to many of the eager goldseekers. On 29th October communication by means of the electric wire was completed between Sydney, Melbourne and Adelaide. For several years succeeding the annals of the city are comparatively uneventful. In April 1868 the foundation-stone of the Town Hall was laid by the Duke of Edinburgh. The foundation-stone of the Protestant Hall was laid by Bishop Barker in November 1875. In that year the Municipal Council was unable to meet its liabilities, and half of the employes were discharged. The Government advanced £10,000. The following year the estate of the Corporation was sequestrated by order of the Chief Commissioner of Insolvency. A similar event happened in 1879, and the Government again came to the assistance of the Corporation. The foundation stone of the new Crown Lands Office was laid by T. Garrett, Minister of Lands, in October 1878. The details of the Sydney International Exhibition of 1879 have already been given. The Mayors of Sydney have been in succession as follows:—John Hosking, 1843; J. R. Wilshire, 1844; George Allen, 1845; Henry McDermott, 1846; Thomas Broughton, 1847; J. F. Josephson, 1848; Edward Flood, 1849; George Hill, 1850; William Thurlow, 1851-2; Daniel Egan, 1853; Council abrogated and Commissioners in office, 1854, -55, -56; Corporation again established—George Thornton, 1857; John Williams, 1858; George Smith, 1859; James Murphy, 1860; John Sutherland, 1861; James Outley, 1862; Thomas Spence, 1863; William Speer, 1864; John Woods, 1865; John Sutton, 1866; Charles Moore, 1867-9; Walter Renny (from March) 1869; Walter Renny, 1870; Michael Chapman, 1871-2; James Merriman, 1873 and 1877-8; Benjamin Palmer, 1875-6; C. J. Roberts, 1879.

T

TAMAR RIVER, in T., empties itself into Port Dalrymple. Launceston is situated on this river. The North and South Esk, two fine streams, unite at Launceston and fall into the Tamar about thirty miles from its mouth. The valley through which the Tamar flows is narrow, with sides steep and woody, in some places the reaches are wide, and the hills recede. George Town is situated on this river, about four miles from its mouth. It was discovered by Bass and Flinders in 1798, and named by Colonel Paterson in 1806.

TAMBAROORA, a mining township in N.S.W. situated on the Tambaroora Creek, 168 miles N.W. of Sydney, twenty-five miles W. from Sofala. The district is hilly, and is principally taken up for gold-mining, the workings being both alluvial and quartz. The country is clay-slate with quartz veins, and including Hill End, has been one of the richest gold-reefing districts in A. It has been a gold-field since 1851. But though large quantities of gold have been obtained, the early promise of the locality has not been fulfilled. The town is situated on a rugged table-land, through which the water-courses have cut deep channels. Population was about 1000, and with vicinity 3265, but it has fallen off considerably.

TAMWORTH, an agricultural township in N.S.W. 251 miles N. of Sydney, situated on the Peel and Cockburn Rivers. It stands on low ground surrounded by a range of undulating mountains, in the midst of a fine pastoral, agricultural and mining district, and is gradually growing into importance as these interests become developed. The principal goldfields in the neighbourhood are at Bowling Alley Point (28 miles,) Nundle (37,) Hanging Rock near Barraba (60,) and at Bingera (110 miles.) Near the latter place diamonds in large quantities have been obtained. The town of Tamworth was incorporated on 17th March 1876. A large area of land in the vicinity of Tamworth is held by the Peel River Land and Mineral Company. This land comprising about 300,000 acres, was originally purchased for £500,000, and large sums of money have been spent in improving it. A considerable township exists on the Company's side of the river, and lots amounting to nearly 500 acres have been alienated for building and other purposes at moderate rates. The population is about 4,000.

TAIERI, an extensive agricultural district in N.Z., lying about six miles S. of Dunedin, mostly occupied by Scotch farmers. There are several mines of lignite in the district, which are worked to advantage. In the neighbourhood of Taieri is Mosgiel, where extensive woollen factories are at work. Population of district about 5000.

TARANAKI, a province of N.Z., which takes its name from the lofty, snow-clad mountain called by Europeans "Egmont," and by the natives "Taranaki." According to Native tradition, a

great chief named Turi, who came from Hawaiiiki in a canoe named *Aotea*, gave names to all the rivers and mountains in this part of the country. From the same source we also learn that the principal tribe of this district came from the same place in a canoe called *Tokomaru*, commanded by a chief named Manaia, who was compelled to flee from his native country on account of a murder which he had committed. Members of this tribe state that when their ancestors arrived in Taranaki they found it inhabited by an unwarlike race whom they easily subdued. How long ago this happened they cannot tell; but from the names of their ancestors, which some of them have committed to memory, and from the many traces of ancient fortifications upon the hills, it was probably some hundreds of years.

HISTORY.—The history of this people is one of incessant warfare. The warlike spirit of the race reached its height shortly after the introduction of firearms in 1820. In the fierce intertribal struggles that took place in the twelve years following that event, the tribe of the Taranaki district was broken, thousands of its warriors slain, and many of its people taken into captivity and reduced to slavery. The first Europeans who beheld Taranaki were probably Tasman and his companions, in December 1642. On 10th January 1772, Cook first sighted the mountain which he named "Egmont," in honour of the Earl bearing that title. On the 10th February 1772, Marion du Fresne made the land here and named the mountain "Le Pic Mascarin" after his ship. From this time to 1839 Taranaki was occasionally visited by whalers, some of whom established a station at the Sugar Loaf Islands. In 1831, when the Waikatos, under their great chief Te Wherowhero, made their memorable descent on the district to punish the Ngatiawa for having assisted the fighting chief Rauparaha—and also because Kaeaea, one of their chiefs had, in a preceding war, crucified the Waikato chief Taiporutu in the gateway of his pa, after taking the pa at Pukerangiora, and killing and devouring several hundreds of its occupants—they proceeded to attack Ngamotu Pa, near the Sugar Loaves. This was garrisoned by 350 Ngatiawa, under their chief Warepori, and six English whalers and traders, whose names have been preserved by the Maoris. These were Barrett, Love, Oliver, Wright, Akers, and Phillips. The besieged, armed with muskets and four small merchant-ship guns, made such a heroic defence that the Waikatos at last retreated with great loss; but after the victory, the Ngamotu defenders, with the other natives of the district, fled to the south, leaving the country almost entirely without inhabitants. On 29th April 1834 the barque *Harriet*, Captain Hall commander, bound from Sydney to Port Underwood, with a whaling party under a man named Guard, ran ashore on the coast of Taranaki proper, a little to the south of Cape Egmont. For six days the shipwrecked sailors were treated as friends, but on the seventh day a quarrel arose, in

which twelve sailors and twenty-five natives were slain, and Guard, his wife, two children, and ten seamen were made prisoners. Guard and several sailors were allowed to depart on promising to return with powder as a ransom for the others, and he proceeded to N.S.W. Arrived there Guard prevailed on the Governor to send H.M.S. *Alligator*, Captain Lambert, with a company of the 50th Regiment, to Taranaki, with the object of rescuing the prisoners. Two villages were destroyed, many of the natives slain, and the women, children, and other captives were recovered. Among the stores of the *Harriet* was a quantity of soap: this was taken from the vessel by the natives, baked in their ovens, and eaten by the Maoris (who were totally ignorant of its nature,) with what result to them may be more easily imagined than described. In the year 1839 a company was formed in England, called the Plymouth Company, the object of which was the establishment of a colony in N.Z. It was a joint-stock association, which invested £10,000 in the purchase of 50,000 acres of land from the N.Z.C. Colonel Wakefield, acting for the company in 1839 found many fugitives from Taranaki on the shores of Cook Strait, and from them he purchased the land of their fathers, from which they had been driven, and to which the dread of their victorious foes prevented their return. About the end of the same year the company's naturalist, Ernst Dieffenbach, proceeded to Taranaki. He found a handful of wretched natives there living stealthily on obscure plantations hidden deep in the recesses of the forest, while the rest of the beautiful country was completely desolate. He travelled for miles without meeting a single person, and seeing no trace of man except some deserted plantations. While there he investigated the geology, botany, and natural history of the place, and succeeded in scaling the lofty mountain. He also, in conjunction with an agent of the company, succeeded in purchasing from the few natives in possession their rights in the soil. In February 1841 Mr. Carrington, the company's surveyor, having previously explored the coast for a site for the new settlement, and fixed on the Taranaki district, in January of the same year arrived, accompanied by his staff, and the survey of the district was commenced. On 31st March of that year, the barque *William Bryon* arrived with the first batch of immigrants. This vessel was followed by the *Amelia Thompson*, which arrived on 3rd September, and by her tender, a small vessel destined for coasting, called the *Regina*, which was unfortunately wrecked on the Taranaki beach shortly after her arrival. The *Oriental* arrived on 7th November, 1841, and the *Timandara* on 2nd February, 1842, and these were followed at intervals by the *Blenheim* and *Essex*. The immigrants were from the English western counties—Cornwall, Devon, Dorset, and Hants; they numbered nearly 2000, and were selected so carefully with regard to character, that for many years crime was almost unknown in the

Province. The majority were agricultural labourers and miners, but there were some tradesmen and professional men. The first work performed was the erection of huts to live in; these were chiefly constructed of the broad rush of the country, after the fashion of the natives, and were thatched with sedge. Every able-bodied man was engaged in making roads, constructing bridges, and cutting lines through the fern and forest lands. When the immigrants landed the few natives who greeted them were miserable and dejected. Many of them at times were absolutely naked. After a while, gaining confidence, they came out of their hiding-places in the forest, and from distant places on the coast, in order to see the white man, to marvel at his works, to trade with him, in fish, firewood, and potatoes, and to share in the blankets and other things which had been promised in payment for the land. The first unpleasantness between the races arose through a quantity of goods which had been promised not being forthcoming. To rectify this the Chief Surveyor, Carrington, wrote to Colonel Wakefield, and that gentleman despatched the schooner *Jewess*, freighted with the promised articles. The vessel was unfortunately wrecked in the Strait, and the natives never received the goods, but they accepted the intention for the deed. After this affair had been thus amicably settled, the great chief of the Waikato tribe, who had conquered the tribes of Taranaki, sent a subordinate chief named Te Kaka (*Anglicè* the Parrot) with 200 men to claim the land by right of conquest. This claim was satisfied by Governor Hobson paying the chief £150 in money, two horses, two saddles, two bridles, and 100 red blankets. A part of the bargain made with the natives was, that one-tenth of the purchased land should be returned to them when it was surveyed; and in order to expedite their civilisation, it was judged prudent to give them their reserves in the midst of the lands selected by the Europeans. As soon as the surveys were completed, the immigrants began to take up their allotments, to build, and cultivate. A village was soon formed on a beautiful and level tract of land, about six miles from the township of New Plymouth. Scarcely had this been done, when a number of slaves, the original owners of the district, were set at liberty through the entreaties of Rev. John Whitely, a Wesleyan missionary, who has since fallen by the hands of those to whose welfare he devoted his life. These manumitted slaves, who of course had not received any part of the payment for the land, became insolent and tyrannical, and demanded that the land should be given up to them. At length a Commissioner, Mr. Spain, was sent by the Home Government to investigate their claims. He decided against them and made an award in favour of the N.Z. Company; but discontent still prevailing—being if anything rather increased by this decision—Governor Fitzroy reversed the award of the Imperial Commissioner, declared all the Europeans trespassers for the time being, and

gave back all the country lands to the natives with the understanding however that on the extinction of the native title, by purchase or otherwise, the dispossessed settlers should re-enter on their original selections. This was a great blow to the settlement; many settlers left, and further to reduce it, the Governor induced many of the Cornish miners to go to the Government settlement at Auckland to work a newly-discovered mine yielding copper and manganese. Some of the best settlers were compelled to go into the heavily-timbered lands and hew out for themselves farms with the axe, while thousands of acres of fine open land were left a barren and totally unproductive waste. The land was given back to the natives in 1844, and during the succeeding ten years a few small blocks were repurchased at great expense and in the face of much opposition. Then a land league was formed the outcome of which was the great war of 1860. There were however a few things that tended to cheer the pioneers of the settlement in the midst of their severe struggles. The country was very healthy—the year would pass without a single death occurring in the community. The earth also yielded abundantly—wheat chipped in with a mattock returned rich harvests of golden grain. Mills were erected and quantities of fine flour exported. Grass also flourished; Dutch white clover sprang up in all directions; and butter soon became an article of export. Poultry became plentiful, and the bee produced great quantities of honey. The settler found comfort, and if his farm brought little cash to his pocket, he was amply supplied by it with all the necessaries of life, and was cheered by seeing the daisy, primrose and other British flowers, and all the fruits of his native land flourish in luxuriance round his cottage.

GENERAL DESCRIPTION.—Situated on the west coast of the North Island, between the 38th and 40th parallels of south latitude, with a population of about 5400, the Province of Taranaki contains, in proportion to its area, a greater extent of land suitable for cultivation than any other province in the colony; while its bracing yet genial atmosphere and the noted salubrity of its climate, point it out as one of the most eligible settlements for intending emigrants. Geologically, Taranaki is a volcanic country. The underlying formation is a bluish marl of the older tertiary series; but except for about twenty miles of the northern part of the province, it is overlaid by a great mass of trachytic rock. This is covered with a deposit of yellow earth, consisting of ferruginous volcanic tufa of varying depth, but sometimes extending to ninety feet. In this tufa occurs the titanic iron sand, which is likely very speedily to be utilised and to become a considerable source of wealth to the province. In addition to the peak of Taranaki or Mount Egmont, which rises to the height of 8270 feet, there are two considerable mountain ranges of a picturesque character, also

the cone-like Sugar Loaf Peak and Islands, and many ridges and small detached hills, which are composed of trachytic rock or trachytic breccia. Where the marl rises to the surface, the land is adapted to the production of European fruits. The vine and the apple-tree thrive well upon it. On the volcanic soils, grapes, root crops, wheat to some extent, and the peach-tree flourish. The area of the province is 2,137,000 acres, and of this at least two-thirds or about 1,500,000 acres is good agricultural land, suitable for settlement. There are only 175,000 acres in the hands of settlers. The balance is still in the hands of the General Government and the natives; the portion at the disposal of the provincial authorities being insignificant in quantity. The most noticeable features of the country are these: Taking the coast line it will be found that the central portion of the province, from New Plymouth to the Kaipokonui stream is circular in form, so much so that if one leg of a gigantic pair of compasses were placed on Mount Egmont, and a semicircle were described with a radius of fifteen miles, it would aptly delineate the coast for a distance of forty-five miles. For the greater part of this distance the land—which on the coast line is low and rocky to within a few miles of Cape Egmont, while from that point it rises and presents, as an ocean front, an unbroken line of cliffs averaging 100 feet in height—rises gradually inland in the direction of the mountain, and is divided at intervals by valleys, most of them containing rivers or streams, running more or less in a direct line from the mountain to the coast. Between these valleys are plateaux, generally very level, and the soil consists of a rich, black, vegetable mould, from nine to eighteen inches in thickness, overlying the volcanic tufa. From New Plymouth the coast trends in a north-easterly direction to the Waitara River for a distance of about eleven miles. The land here is less divided by gullies, and the soil is of the richest description—much of the same character as that between New Plymouth and Kaipokonui. North of the Waitara, the coast line runs for ten miles in an easterly direction to the Urenui River, and thence again in a north-easterly direction for about twenty-five miles to the River Mokau, the northern boundary of the province. From the Waitara northwards the soil is stiffer, and well adapted to grain crops; while between the Oneiro and Mimi Rivers, and especially in the neighbourhood of the Urenui, the soil consists to a great extent of a heavy clay suited for brick making. From the Mimi northward the soil is still a clayey loam, and at and near Mokau the finest brick clay is found in inexhaustible quantities. Before the war of 1860 several English brickmakers lived at Mokau and shipped large quantities of bricks, but on the outbreak of hostilities they were forced to leave, and from that time no English vessel of any description has entered the river. In the vicinity of the Urenui River the finest apples, peaches, and grapes are produced, all of them growing luxuriantly

even in a wild and uncultivated state. The banks of the river in many places are festooned with vines which in the season are laden with fruit. From the Kaipokonui River southward, the coast line, forming a slight inward curve, trends in a south-easterly direction for some thirty miles to the mouth of the river Patea, which is the southernmost boundary of the province on the coast line, though not bounding it at any other point except at its mouth, the river running its whole length through Taranaki. This part of the province, from the sea for several miles inland, is as a rule level and mostly clothed with grass or clover. The land adjacent to the coast is generally open and covered with fern, *phormium* grass, or clover for a distance varying from one to fifteen miles inland, while the interior is densely wooded. Between the Kaipokonui and the southern boundary of Taranaki the soil is generally a clayey loam and very productive. There is a general similarity in the ruling industries of the several districts. The settlers in all are engaged in agricultural and pastoral pursuits; in some the agricultural predominates and in others the pastoral, though in all they are more or less combined. The Petea district, extending from the Petea to the Waingongoro River, is mainly a pastoral district, being for the whole distance of some twenty-four miles perfectly level, except in the river courses, and covered with grass and clover. From the Waingongoro to the Stony River, about fifty-four miles, the land is still in native hands, with the exception of the small reserve for a town at Opunake, and some 800 acres in private hands at the same place. The country throughout the whole of this distance is interspersed with vast fields of *phormium tenax*. Extensive mills were established at Opunake about four years ago, and the work of manufacturing the fibre was continued until the autumn of 1873, when the continued fall in the market value of the article caused the stoppage of the mills. The natives throughout the district are willing to lease the right of cutting the leaf from off their lands, and it is only the instability of the market which caused the temporary collapse. From Stony River to the Tapuae River, a distance of ten miles, agriculture is the ruling industry, as it is also of that next in order, viz., from the Tapuae River to the Paritutu line, the northern boundary of the Egmont electoral district, a distance of about five miles, mostly occupied by Europeans. With the Omata block, about a mile and a-half beyond the Tapuae, commences the old settlement (as distinguished from the military settlements and the confiscated land,) viz., the provincial estate previous to 1863, which however also included the detached Tataraimaka block of 4000 acres. The Grey and Bell district, from the Paritutu line to the Mokau River, the northern boundary of the province, has a coast line of about forty-five miles. Of this at different intervals, and on an average for two-thirds of the distance, native lands abut on the coast. The

remainder of the coast line bounds land owned by the settlers. Agriculture is the principle industry of this portion of the settlement. The general features of the district have been already described. The flax industry has received a check in the remainder of the Egmont district and in the Grey and Bell, as well as at Opunake; and of nine factories for the manufacture of the fibre, which were at one time at work in the province, not one is at present in operation. In 1868 there was only one town in Taranaki, viz., New Plymouth—the spot on which the pilgrim fathers of the settlement landed in 1841, and which gave its name to the province; for, until 1858, it was known as the Province of New Plymouth, an Ordinance passed by the Legislative Council in 1858, altering the title to “Taranaki.” There were besides two villages, viz., the Hua and Omata. New Plymouth contains about 2800 inhabitants, and is the seat of the Provincial Government. The aspect of the town from the sea is charming, with the ground gradually sloping upwards from the beach, and a dark green belt of bush still rising in the middle distance, until the landscape culminates in the glorious background of the majestic snow-clad cone of Mount Egmont. The central point of the foreground is Marsland Hill, crowned with the immigration barracks. In front and to the right and left of this point, churches, chapels, and houses are to be seen peeping from amidst the trees, which have been plentifully planted by the settlers. During the war, for a while, the whole of the inhabitants of the Province, together with the Imperial troops stationed in Taranaki, were crowded into a portion of the town surrounded with trenches. New Plymouth then for the first time became unhealthy, consequent on some 5000 people being crowded into a space barely sufficient for a quarter of that number. It is however a very healthy place, and the dip of the land towards the sea supplies it with efficient natural drainage. Lying on the beach at New Plymouth and along the coast of the whole of the province, but in greater quantity in the vicinity of the town, is to be seen in great quantities—constituting in fact the principal part of its material—the famed Taranaki iron sand. Two valuable seams of clay have lately been discovered and are now being worked in the immediate vicinity of the town from which very good bricks are made. The town also contains an ironfoundry, a boat-building establishment, two breweries, and a soap and candle manufactory. Two towns have been established since the war, viz., Raleigh, more generally known as Waitara, at the mouth of the river of that name, and Carlyle on the Patea River; the former ten and the latter ninety-five miles from New Plymouth. The land is generally suitable for agricultural purposes, grasses well, and when grassed carries from six to eight sheep per acre. With the exception of a strip of open land, varying in breadth from one to seven miles, the whole face of the country is covered with heavy bush in

which there is much valuable timber. There is at present very little land in the hands of the provincial authorities and open for sale. Under the N.Z. Settlements Acts all the confiscated lands were vested in the General Government for purposes specified in those Acts, and all the sales lately made have been sales of confiscated land. Lands which have been acquired from the natives by purchase or over which the native title has become extinguished other than by confiscation, are known as waste lands of the Crown, and the gross revenue arising from the sale of such lands, after deducting the salary of the Receiver of Land Revenue, is handed over to the province and treated as provincial revenue. A large tract of land has been acquired by purchase from the natives on behalf of the Government in the Ngatimaru district, commencing some twenty miles from New Plymouth, and situate on the north bank of the River Waitara. A great part of this district is suitable for agricultural purposes; the remoter portion of it is, however, principally valuable at present for the totara growing on it. The soil of Taranaki is, as a rule, admirably adapted for root crops. Of the 90,000 acres held by residents, about 30,000 acres are fenced, and about 35,000 under cultivation, including land laid down in permanent grasses.

TASMAN, ABEL JANSZ, Dutch navigator and discoverer of T. and N.Z. In 1642 the Governor-General of the Netherlands India was Antony Van Diemen, and an expedition was fitted out by him for the purpose of exploring the coast of the Australian continent, which had been sighted by previous adventurers. It consisted of two ships, the *Zeehaan* and the *Heemskirk*. The command was given to Tasman. The only account of this memorable voyage—in the course of which T. and N.Z. were discovered—that the world possessed for more than a century after its termination was an abridgment published at Amsterdam in 1674, and a more extended abstract included in Valentyn's large work on the Dutch East Indian possessions. About 1771 however a manuscript journal of Tasman's, written by his own hand, was brought to England by an unknown hand and offered for sale to Sir Joseph Banks, who perceiving its value purchased it and deposited it amongst the treasures of his magnificent library. He also caused an English translation of it to be made by the Rev. Charles Godfrey Woide, chaplain to the Dutch Chapel at St. James's Palace. At Banks's death his library was bequeathed to the British Museum in London, where Tasman's journal is still deposited. The original document and translation were lent by Banks to Flinders, and also to Captain Burney, who was engaged in compiling his chronological history of the discoveries in the South Sea (5 vols. 4to, London 1803-7.) It contains the entire text of Tasman's manuscript, with the exception of some nautical details of no importance. The journal commences in the old

fashion of three centuries ago:—"Journal or description by me, Abel Jansz Tasman, of a voyage from Batavia, for making discoveries of the Unknown South Land, in the year 1642. May God Almighty be pleased to give His blessing to this voyage! Amen." The voyagers sailed from Batavia on 14th August 1642, and stood out south-eastward to sea. On the 27th October, after leaving Mauritius, a council was held, when it was resolved to keep a man constantly at the topmast-head to look out, and that whosoever first discovered land, sands, or banks under water, should receive a reward of three reals and a pot of arrack. On 24th November at 4 p.m. very high land was sighted, bearing E. by N., distant about ten miles; high mountains were also seen to the E.S.E., and to the N.E. two smaller mountains. Next morning the ships stood in for shore. "As this land," continues the journal, "has not before been known to any European we called it Anthony Van Diemen's Land, in honour of our high magistrate the Governor-General, who sent us out to make discoveries. The islands near us we named in honour of the Council of India, as you may see by the little map we made." The voyagers did not land, but continued cruising along the shore. On the 28th they came near three small islands, one of which (Mewstone) has the shape of a lion's head, and is about three miles from the mainland. Next day at 5 p.m. they came near a bay which seemed to be a good roadstead, and resolved to make for it; but a storm arose which obliged them to take in sail and stand out to sea again. To this bay Tasman gave the name of Storm Bay. The anchorage he aimed at is that where Captain Furneaux stopped at in 1773 and named Adventure Bay. On 3rd December the ceremony of planting a standard and taking possession of the new territory in the Prince's name was performed by the carpenter Francis Jacobsz, who swam through the surf to reach the shore. To this bay Tasman gave the name of Frederik Hendrik's Bay. He also marks the South Cape of Storm Bay with Tasman's Island lying just south of it; and the larger island near it he named Maria's Island "in honour of the excellent lady of the honourable the Governor-General." On the 5th the voyagers quitted Van Diemen's Land, the point last seen being the round mountain (St. Patrick's Head) "like a huge misshapen tower," then about six miles to the westward. Calculating his latitude and longitude by the new notation it would appear that the land first seen was Point Hibbs, and that had Tasman run up Storm Bay he would have reached the present site of Hobart Town. If instead of sailing eastward he had continued his course northerly about four degrees he would have struck the continent about three degrees east of the present site of Melbourne, midway between Wilson's Promontory and Cape Howe, while less than a degree north from his point of divergence would have brought him into what are now Bass

Straits. It is probable that his instructions were to sail for the south, where it was believed islands existed as rich in spices as those of the Japanese Archipelago. On 13th December he discovered a mountainous country, which he named Staaten Land, in honour of the States-General of Holland. He anchored in a "fine bay," which is really the strait between the Northern and Middle Islands of N.Z. While thus at anchor a disturbance took place with the natives, who, approaching in their canoes, surrounded the two vessels. Seven canoes full of Maoris in war costume lay off the *Zeehaan*, and five canoes, each containing seventeen men, put off for the *Heemskirk*. An affray took place in which the islanders upset the boat of the *Zeehaan*, killing three men and forcing others to swim for their lives. The weather being rough Tasman thought it prudent to depart without risking further combat; so naming the spot Murderer's Bay he sailed to the eastward. Here again the Dutch navigator was on the point of anticipating the discovery of Cook Straits. He sailed to the north to Three Kings Island, naming a cape to the eastward—on the north-west coast of the present Auckland—Cape Maria Van Diemen, in honour of the wife of the Governor-General. Being in want of provisions he sailed northwards for the islands of Cocos and Hoorn, discovered by Schouten in 1616, to lay in supplies. On 19th January 1643 he passed a high island, two or three miles in circumference, to which the name of Pylstaart or Tropic Bird Island was given from the number of those birds which frequented it. After meeting with many other adventures and making many discoveries, the expedition arrived at Batavia on the 16th June, after an absence of ten months and one day. In 1644 a second expedition was fitted out under the command of Tasman. The three vessels composing it were named the *Limmen*, the *Zeemeuw*, and the *Brak*. There can be no doubt that the navigator fulfilled his mission with honour and credit, and brought back numerous drawings and plans. These were carefully concealed, perhaps destroyed, by the company. The only fragment that looks like an authentic record is four paragraphs of a journal published in 1705 by Witsen, and purporting to have been written by Tasman. Better evidence of Tasman's fortune are the maps of 1648-60. In 1648 the map of Australia was inscribed on the floor of the Stadthouse in Amsterdam; and Turquet published at Paris a mappemonde, evidently based upon observations similar to those which Tasman was directed to make. So in the edition of Jansen's atlas in 1650, in the atlas of Klencke of Amsterdam, and in the sixteenth chart of Thevenot's *Relation De Divers Voyages Curieux* (1663,) distinct reference is made to discoveries which it is most reasonable to suppose were made by Tasman. In one of the early maps of Van Kuelen a portion of Tasman's track with soundings is given; and in the British Museum there is a chart which is regarded as an absolute copy of Tasman's own. If all this be so

it is clear that Tasman missed the discovery that New Guinea and New Holland are separated by sea, and that he sounded down the Gulf of Carpentaria, gave the names to Van Diemen's Gulf and Cape Van Diemen, and continued sounding all the way to De Witt's Land and then returned in a direct line north-west for Java. Nothing seems to be known with certainty of this great navigator's latter days. The obscurity that hangs around his name and the concealment of his journals and charts are a standing reproach to the Dutch nation.

TASMANIA, formerly Van Diemen's Land, the name given to it by Tasman, its discoverer, in honour of Anthony Van Diemen, Governor-General of Netherlands India. The name was changed to Tasmania, from Tasman's own name, by Royal Warrant, on the establishment of representative Government.

GEOGRAPHICAL FEATURES.—T. is an island nearly equal in size to Ireland, or Ceylon, or the Netherlands—*i.e.*, the kingdoms of Belgium and Holland together. Its length is 170 miles, its breadth 160 miles, and the area about 24,330 square miles, or 15,571,500 acres, exclusive of lakes and islands which belong to the colony, the aggregate of these being 1,206,500 acres, making a total of 16,778,000 acres, or 26,215 square miles. It is in the form of a triangle, or more nearly of a heart. T. is situated between the parallels of 40° 33' and 43° 39' S. latitude, and 144° 39' and 148° 23' meridians of longitude E., at the southern extremity of the Australian mainland, from which it is divided by Bass Straits, about 120 miles wide. It is conjectured that it was once part of the mainland, the islands in the straits being, it is supposed, part of a mountain range that connected the two lands. Indeed, it has been asserted that in remote ages Tasmania, Australia and New Zealand all formed part of one immense continent, that extended to Madagascar, Andaman and Ceylon. The botanical researches and comparisons of Drs. Hooker and Mueller go to confirm the supposition of the connection of the islands of T. and N.Z. with the mainland; the analogy of the flora of N.Z. and A., and of T. with both, being it is said almost complete. T. has been described as a "beautiful, well-watered island, rich in harbours and inlets, traversed by high mountain chains, full of crags, glens and ravines of commanding appearance, the basaltic cliffs of some being several hundred feet in perpendicular height. Everywhere there are good anchorages and many excellent harbours. Altogether the coast offers the most manifold changes and generally charming scenery, being for the most part of a bold and rocky character. The interior especially is delightful, and here are united, so to speak, the climate of Italy, the beauty of the Apennines and the fertility of England. Mountain and valley, hill and dale, crowned with high forests, and rich pasture grounds in the plains, afford the most pleasing variety."

ISLANDS.—The principal islands belonging to T. are fifty-five in number. The Furneaux group at the east end of Bass Straits, including Flinders Island, comprise an area of 513,000 acres; Cape Barren Island has 110,000 acres, and Clarke Island 20,000 acres; beside these are Chappell Island and Kent's Group. These islands are inhabited by persons who procure a living by seal-fishing and preserving mutton-birds. They number about 242 souls. Many of them are "half-castes," the offspring of marriages between the sealers and aboriginal women. At the west end of Bass Straits are:—King's Island, 272,000 acres (this island has acquired an evil reputation from the numerous fatal wrecks that have taken place on its shores;) Robbin's Island, 24,000 acres; and Hunter's Islands. Other islands of importance are, Waterhouse Island, Swan Island, Scouten Island, 7000 acres; Maria Island, 24,000 acres; Bruné Island (north and south,) 90,000 acres (South Bruné Island was the locality where the Aborigines collected by Robinson were placed;) Slopen, Franklin, and Huon Islands.

MOUNTAINS.—T. may be described as having two mountain chains, separated by the central district, through which is the communication between the north and south of the island. That to the east, or the dividing range, winding in its course in the form of a Z through the island has an average height of 3750 feet and an average distance of forty miles from the sea. It runs nearly north and south parallel with the E. coast, and among the peaks are Row Tor, 3895 feet; Mount Barrow, 4644 feet; Mount Victoria, 3964 feet; Ben Nevis, 3910 feet; Ben Lomond, 5010 feet; Mount Nicholas, 2812 feet; and Brown Mountain, 2598 feet. The western chain consists of an elevated table-land averaging 3000 feet in height in the centre of the island, which contains all the large lakes and from which diverge numerous ranges in all directions except to the eastward. From the table-land spring the following peaks:—Table Mountain, 3596 feet; Miller's Bluff, 3977 feet; Dry's Bluff, 4257 feet; Quamby Bluff, 4000 feet; Ironstone Mountain, 4736 feet; Cradle Mountain, 5069 feet (the highest in the colony;) the Du Cane Range; Mount Olympus; Mount Humboldt; Mount Hugel, 4700 feet; Mount William, 4360 feet; and Mount Hobhouse, 4031 feet. Among the other diverging ranges and peaks are, to the north, Mount Roland, 4047 feet; Black Bluff, 4381 feet; Valentine's Peak, 3637 feet; to the west, Mount Dundas, 3922 feet; Mount Murchison; the Elden Range, 4789 feet; the Frenchman's Cap, 4756 feet; to the south are Wyld's Crag, 4399 feet; Mount Field, 4721 feet; Mount Anne; the Arthur Range, 3668 feet; Mount Picton, 4340 feet; Mount Wellington, 4166 feet; Adamson's Peak, 4017 feet; and Mount La Perouse, 3800 feet. Wallace writes as to the mountain peculiarities of the island:—"T. may be called the Switzerland of the south, and is perhaps the most thoroughly mountainous island on the globe. It can hardly

be said to have any mountain ranges, but is one continuous series of mountains and valleys, peaks and glens. The highest mountains just exceed 5000 feet; but there are more than twenty which range between 4000 and 5000 feet, and these are pretty evenly distributed over the whole island, being found in the north-east, north-west, centre and south. The south-eastern portion only is somewhat lower, but is equally mountainous, the heights ranging from one to three thousand feet. We have here an admirable example of the effects of sub-aerial denudation, or the eating away of a country by atmospheric agencies—rain and running water, frost and ice, assisted perhaps by subterranean movements. The island was once a vast undulating tableland, the surface of which is generally indicated by the higher mountain tops now dotted over its whole surface. The valleys have been excavated in the softer or more decomposable rocks. There has probably been a subsidence towards the south-east, indicated by the lower elevation of the mountains, and by the islands, peninsulas, and generally broken character of the coast. In this direction is the great line of valleys, which affords the means of communication between the north and south of the island. In the north-east and west-central portions are extensive tracts of high table-land, from which rise the two highest of the mountain-peaks—Cradle Mountain in the west, 5069 feet, and Ben Lomond in the east, 5010 feet."

PENINSULAS.—On the east coast, Freycinet Peninsula, its western shore being washed by the waters of Oyster Bay; on the south-east, Forrester Peninsula, connected to the mainland by East Bay Neck. Tasman Peninsula is a continuation of Forrester, and is joined to it by Eagle Hawk Neck. Ralph Bay Peninsula is also on the south-eastern side of the Island jutting out into Storm Bay.

CAVES.—On the northern coast from west to east are:—Cape Grim, Circular Head, Rocky Head, Table Cape, Port Sorell Point, Flinders Point. Stony Head, Water-house Point, and Cape Portland; on the eastern coast are:—Cape Naturaliste, Eddystone Point, St. Helens Point, Long Point, Cape Tourville, and Cape Bougainville; on the southern coast are:—Cape Pillar, Cape Raoul, Tasman Head, Cape Bruné, South-East Cape, South Cape, and South-West Cape; on the western coast are:—Rocky Cape, Point Hibbs, Cape Sorrell, Sandy Cape, and West Point.

RIVERS.—The island is well watered and abounds in rivers, rivulets, and creeks, the average fall of which may be estimated at ninety-three feet per mile. The principal rivers are:—the Derwent, on the estuary of which is Hobart Town, which issues from Lake St. Clair, receiving in its course the Nive, Dee, Ouse, Clyde, and Jordan from the north, and the Florentine, Russell, Styx, and Plenty from the south; the Huon, navigable and running through a fertile country, which receives the Cracroft, Picton, and other streams, and falls

into D'Entrecasteaux Channel; the Coal River, rising in the eastern chain of mountains and running south into Pittwater. The mouths of these three rivers are to the south-east of T. To the south-west and west are—the Davy River, running into Port Davy; the Gordon, flowing from Lake Richmond and receiving in its course the Wedge, Denison, Serpentine and Franklin Rivers, falling into Macquarie Harbour; King River also falls into Macquarie Harbour; the Pieman River, consisting of the rivers Mackintosh, Murchison, Huskisson and Donaldson; the Arthur River, which receives the Hellyer—these two last falling into the Southern Ocean. On the north, flowing into Bass Straits, are—the Inglis, the Emu, the Leven, the Forth, the Mersey, the Tamar—a tidal river formed by the confluence of the North and South Esk at Launceston, a considerable stream, its sea mouth being practicable for vessels drawing fourteen feet. Coasters can also enter the Don, Forth, Leven, and some others on the northern coast. The North Esk receives the St. Patrick's River about fifteen miles up, and the South Esk receives as tributaries the Meander, Lake River, Macquarie River and St. Paul's River. Another large river falling into Bass Straits is the Ringarooma. On the east coast the only river of importance is George's River, running into George's Bay.

BAYS AND HARBOURS.—The west coast is bold, rocky, and inhospitable; but there are at least three accessible ports. The principal harbours are, on the west coast—Port Davy (much frequented by whaling vessels,) Pieman River and Macquarie Harbour. A steamer plies from Launceston to the north-west coast; a trade is safely carried on at all seasons, and there is abundance of good soil and fine timber yet awaiting the enterprise of man. On the north coast Stanley at Circular Head, Emu Bay, Port Frederick at the mouth of the Mersey, Port Dalrymple at the mouth of the Tamar, and Waterhouse Roads between Anderson and Ringarooma Bays. On the east coast George's Bay, Oyster Bay, Spring Bay and Fortescue Bay. The south and south-east of the island is studded with safe bays and harbours, the principal being Port Arthur, Storm Bay, Norfolk Bay, D'Entrecasteaux Channel, Port Espérance, Southport and Recherche Bay.

LAKES.—There are numerous and extensive lakes on the elevated table-lands, the largest being the Great Lake in the county of Westmoreland, covering an area of upwards of 28,000 acres; Lake Sorell, in the county of Somerset, 17,000 acres; Lake St. Clair, in the county of Lincoln, 10,000 acres; and Arthur Lake (county of Westmoreland) and Lake Echo (county of Cumberland) occupying 8000 to 12,000 acres. These lakes form the head waters of the principal streams flowing south, west, and north. There are a great many smaller lakes and mountain tarns. Most of these are very deep, situated in rock-basins, and owing their origin to the same causes which have produced

the beautiful lakes of the European Alps, of Scotland, Cumberland, Wales, and other mountainous countries in the temperate zone.

GENERAL ASPECTS.—The scenery of T. is picturesque and varied. Its higher mountains are snow-capped for a large part of the year, while their slopes and valleys are clothed with evergreen forests. Fine peaks, rocky precipices, rushing streams, and foaming cataracts, alternate with fertile plains and valleys or grassy uplands. The central valley and its branches furnish much fertile land, and it is here that the best cultivated tracts are seen. Here are well-fenced fields, highly-cultivated gardens, good roads, well-built homesteads, and all the characteristics of the best parts of England. William Howitt, writing in 1854, thus describes the portion of this valley between Campbell Town and Hobart Town:—"The country, the farther we advance towards Hobart Town, increased in beauty. The valley along which we drove became narrower, the hills more lofty, and much more varied in their outline than any Australian scenery which I had yet seen. The valleys were rich, and for the most part as well cultivated as in England. Owing to the difference of tenure here and in Victoria a very different state of things has been the result. Here the occupiers of the land are the owners, and not mere squatters who have no sure tenure of the land and therefore do nothing to it. Here then, instead of mere isolated wooden huts standing in the unappropriated forest, we have a constant succession of towns and villages bearing the singular medley of names which colonists delight in—Ross, Oatlands, Green Ponds, Brighton, Bagdad, Jericho, Jerusalem, and of course the river Jordan. All round these villages, which consist of substantial and even elegant houses, extend the richest fields enclosed with hedges generally of sweet-brier or furze or broom, but also a good many of honest English hawthorn. There you see cattle, sheep, pigs enormously fat, and abundance of poultry of all kinds feeding and flourishing in their respective resorts—the meadows, the woodland slopes or the farm-yards. It is England all over. Everywhere you descry lovely country houses, with all the earthly blessings of fine gardens well walled in, with their conservatories and forcing-houses, their extensive shrubberies, verdant parks and lawns, fields in pasture or under the plough, and woods sloping down solemnly from the hills, with a very tempting aspect. Many of these hills are remarkably steep, yet so rich and smooth are they, that the farmers have ploughed them to their very summits, and grow splendid crops of corn where you would hardly have supposed that a team could have maintained its footing."

CLIMATE.—The climate of T. has many advantages over that of any other part of A., and it is hence termed the sanatorium of the south. Owing to its small area and exceedingly uneven surface. a considerable elevation with a corresponding

change of temperature is everywhere within reach by a journey of a few hours. It possesses the full summer heat due to its latitude and even some excess, for it feels the hot northern winds from the Australian plains, but however hot the days may be the nights are always cool and refreshing, owing to the proximity of the lofty mountains and the cool Antarctic seas. The mean temperature of Hobart Town is $54\frac{1}{2}^{\circ}$ Fahr. The mean summer temperature is 62° with a maximum (rarely) of 100° , while the mean of winter is 47° with a minimum rarely falling below 29° , though on the uplands at an elevation of 2000 feet it often sinks to 18° below the freezing point, producing ice of a considerable thickness. Rain varies in quantity in different parts of the island, Hobart Town and the east coast having little more than 20 inches, Launceston about 30, while Macquarie Harbour has over 100 inches. But it also varies greatly at the same place, Hobart Town having a range of from 14 to 40 inches. The rainfall though small is well distributed over the year, the mean number of days on which rain falls at Hobart Town being 145, occurring more or less in every season. There is abundance of wind, often violent, but thunderstorms are rare. The atmosphere is rich in ozone, and epidemic diseases are almost unknown. The climate is highly favourable to infant life, nine out of every ten born surviving the first year; and it is especially restorative to enfeebled constitutions from warmer countries.

FLORA.—"Although the physical features and climate of T. are so marked, and the island is separated by so wide an area of the sea from the Australian continent, yet its flora is essentially Australian, and more especially allied to that of the mountainous parts of V. Out of 1063 species of flowering plants only 280 are not Australian, while only 22 genera and 267 species are peculiar to T. It is curious that, although apparently so isolated from all the world except A., this island possesses a considerably larger number of European genera and species of plants, as well as a larger proportion of plants characteristic of N.Z. and the Antarctic lands than are found in A. itself. The forests abound with valuable timbers, the blue-gum (*Eucalyptus globulus*) often reaching a height of more than 300 feet, while the celebrated Huon-pine (*Dacrydium Franklini*) is a most valuable timber for ship-building. Beautiful flowers abound; the Epacrises, Compositæ, Rutaceæ and Leguminosæ are rich in species, and there are nearly eighty distinct kinds of terrestrial orchidæ, many of them having the most curious and elegant flowers."—Wallace.

FAUNA.—"It is somewhat remarkable that the animal life of T. offers more striking peculiarities than do its vegetable forms. It possesses two remarkable mammals, each forming a distinct genus, and both quite unknown on the mainland. One is the "tiger wolf" of the colonists—the *Thylacinus cynocephalus* of naturalists—the largest

of the carnivorous marsupials. It is nearly as large as a wolf, and is handsomely striped across the back and hind quarters. It is exceedingly bloodthirsty and commits great havoc among the flocks of the settlers whose farms lie near the wooded mountains in which it dwells. The other animal is the *Sarcophilus ursinus* or "native devil," a thick-set creature resembling an ugly bear-like eat. It is black with white patches, and considering its smaller size is even more destructive than the *Thylacinus*, and is exceedingly savage and untamable. It was formerly very abundant and destroyed great quantities of poultry and sheep, but having been persistently hunted and trapped, is now getting scarce in most districts. Both these animals are nocturnal. It is a very singular fact that both these species have recently become extinct in A., their remains being found in the post-tertiary drifts and cave deposits. What causes can have exterminated such hardy and ferocious creatures in the one country and preserved them in the other it is not easy to conjecture. There are no other genera of mammals peculiar to T., but several of the species are distinct from those of the mainland, among them the *Echidna*, or porcupine ant-eater, and the wombat; but the latter, though offering some differences, is not generally admitted as a distinct species by naturalists. Birds are abundant, but they are generally the same as those of the adjacent parts of A., no genera and comparatively few species being peculiar. There are only three species of snakes, but all are venomous."—*Wallace*.

GEOLOGY—"The extremely mountainous character of the whole surface of T. leads us to anticipate the wide prevalence of the ancient Palæozoic and metamorphic rocks, and the abundance of granite. These formations constitute almost the whole of the table-lands and lofty peaks. Mesozoic rocks occur in the lower hills, and are more prevalent than in A. Sandstone, supposed to be of Triassic age occurs near Hobart Town, forming hills capped with basalt. Tertiary beds occupy much of the larger valleys and plains, some of the latter being basaltic; beds of fresh-water limestone occur in the south, and there are raised beaches on both sides the Derwent River. Igneous and volcanic rocks abound. Porphyries and greenstones occur on most of the plateaux, and form parts of many of the highest mountains. Dykes or beds of greenstone are the cause of most of the Tasmanian waterfalls. These are probably all Palæozoic, while basalts occur of every age down to the Pliocene Tertiary. There are no true volcanic cones or lava streams as in Southern and Eastern Australia. The islands in Bass Straits are granite, which corresponds with that of the north-eastern corner of T. and of Wilson's Promontory on the opposite coast of V. The secondary sandstones produce fine building material. Limestone occurs in a longitudinal band in the Derwent Valley and on the north coast, where are extensive caves. Coal

and lignite occur in many localities, and are believed to be both of Palæozoic and Mesozoic age. Some of the coal is of good quality, but the character of the country makes the mines difficult of access, and little of it is yet worked. Gold also occurs in quartz veins, as in A., but in no great quantity, and the mining operations are of but little importance. Rich iron ore occurs on the north coast, and in many other localities. Tin, lead, antimony, manganese and plumbago also occur, but only the tin has been worked to any extent. There are also some quarries of good roofing-slates. T. has been described as a network of ridges enclosing numerous small plains and valleys. Many of these ridges are of greenstone, with intervening valleys of Palæozoic rocks, while some of the higher peaks are capped with quartz or syenite. When the geological structure of the island is thoroughly worked out and the whole surface accurately surveyed and mapped, we shall have an admirable illustration of the effects of denudation, controlled and modified by variations in the texture and position of the rocky framework, in producing a highly complex mountain system with its intricate tracery of ravines and river-valleys."—*Wallace*.

ABORIGINES.—The aboriginal population which was never numerous has now become entirely extinct, the last of the race, an old woman, having died in 1876 at the age of seventy-three. At the time of the colonisation of the island it is estimated that they numbered six or seven thousand. These people were in many respects a peculiar race, quite distinct from the Australian natives, and more resembling the races of Melanesia. They were shorter and stouter than Australians, with flatter noses, but the great difference was in the hair, which instead of being fine and silky was rough and woolly like that of most of the African and Papuan tribes. Their distinctness from the Australians is further proved by their total ignorance of the two characteristic weapons of that country—the boomerang and the throwing-stick. They used no weapons but a spear thrown by the hand, and a club. They had no shields. Their huts were as rude as those of the Australians—mere open shelters from the rain and wind. They had no clothing, no pottery, and no agriculture. Although living on an island and everywhere near the sea or navigable rivers, they had no boats, and only a few tribes on the south and west coasts constructed rude rafts propelled with common sticks in place of paddles or oars. Their only other manufactures were baskets and string. They were long believed to be ignorant of the art of making fire, as they were so very careful never to let it become extinguished; but "fire-sticks" similar to those used by most savages have been found among them, and it is therefore more probable that the women were made to keep up a constant supply of fire, in order to save the men from the considerable labour and delay of procuring it by friction in a country where suitable, dry, and

easily ignited wood was not always to be found. They were not cannibals, and do not appear to have treated their women with the same reckless barbarity as the Australians. They burnt their dead, and are said to have had a distinct belief in a future state. Although so low in all the material indications of civilisation, there is reason to believe that they were far higher than the Australians both intellectually and morally. When the last remnant of them were living on the islands in Bass Straits, they showed not only an aptitude but a positive love of learning. They became cleanly in their habits and neat and orderly in their dwellings. The men became industrious; they made roads and worked in the fields, and they took great delight in games such as cricket, dancing, swings and marbles. The women learnt to sew, and made mat dresses for themselves and their families; and all this is said to have been done without compulsion or pressure, but of their own free will. Taking all these things into consideration, we cannot but believe that here was a race with capacities for advancement which never had an opportunity of development till too late. Their first introduction to civilisation was through rude sealers who visited the coasts and the vilest convicts who escaped into the interior. Their country being occupied by white invaders, they made war against them in vain. Even the mistaken kindness of the more humane settlers and of the Government became their ruin; for the gifts of clothing they received, in addition to that which they captured in their numerous successful raids on the houses of the early settlers, worn for a time and then lost, bartered or thrown aside, rendered them susceptible to cold, and thus brought on the lung diseases that, more than any others, proved fatal to them. Thus has passed away an interesting race, whose affinities are a puzzle to the anthropologist. Their origin will probably ever remain an unsolved enigma. The last man, William Hanne (King Billy,) died at Hobart Town on 3rd March 1869, aged thirty-four years. At the first settlement of the colony the Aborigines numbered some thousands, but from the time of the massacre at Risdon in 1803 till 1832 war was ruthlessly waged between them and the colonists. In 1830 an attempt on a gigantic scale called *The Line* was made to drive the Aborigines into a corner of the island. It signally failed, not one being captured, but the exhibition of numbers and power is thought to have had some influence on the blacks and to have led to some extent to the success of the efforts of Robinson. In the year 1830 he undertook the part of conciliator or pacificator, and after five years of untold dangers and hardships, with the assistance of some friendly blacks, was successful in gathering in the whole of the remains of the Tasmanian race, who were placed on South Bruné Island. From here they were transferred to Gun Carriage Island, and eventually the remnant, reduced to forty-four souls, was transported to

Oyster Cove, a few miles from Hobart Town. In 1854 they numbered but sixteen, and from that time they gradually died off. At their several settlements efforts were made to Christianise them and teach them the arts of civilisation, but the results were not very encouraging, and the change of mode of living and other causes had a detrimental effect and considerably hastened their end.

THE SOIL.—In a well-written account of the colony recently published it is stated that there is much variety in the nature of the soil of T., according to locality. In some places it is poor, with hardly alluvium enough for cultivation; in others it is remarkably rich, yielding luxuriant crops to a very indifferent style of farming. The central plateau affords a great extent of fine pasture, and the alluvial soil of the lower plains and valleys, derived chiefly from the disintegration of the trap rocks, is exceedingly fertile. As a rule most of the European grains, fruits and vegetables can be cultivated and brought to perfection, and some kinds of tropical plants also thrive in certain localities. Tasmanian wheat and barley have long held a high reputation, although, in common with other Australian Colonies, the farmers have of late years suffered severely from the ravages of "rust," and in one or two uneven seasons frost has very materially affected the crops. Of the soil generally it may be said the basaltic formation prevails in unbroken sections all over the island, and as a rule is good friable land, easy to work, dry lying, suitable for all kinds of crops grown, and also a good soil for artificial grasses and clover. Another and more lasting kind of soil for repeated croppings is the alluvial clayey nature overlying the numerous river flats, and in some localities prevailing on the hill sides and uplands of broken country in irregular patches. This class of land gives a splendid permanent pasture. A third variety is a sandy loam of a light nature, easy to work, and is the best wheat-growing soil, but does not hold grasses or clover for a series of years.

POPULATION.—The population of the colony by the census of 7th February 1870 was 99,328—52,853 males and 46,475 females, being more than four times the population of W.A. and almost the same as Q. in 1869. On 31st December 1878 it was calculated that the population was 109,947—males, 58,036; females, 51,911. During the year there were registered 3502 births, 1700 deaths, and 866 marriages. The professions, trades, or occupations of the people by the census of 1870 were as follows:—Army and navy, 169; artisans and mechanics, 4473; civil servants, 615; clergymen, 129; domestic servants, 4319; farmers, 4837; farm labourers, 10,310; hawkers, 151; lawyers (including barristers, solicitors, and attorneys), 71; licensed victuallers, 408; labourers, other than agricultural and mechanics, 3701; merchants and bankers, 102; miners and gold-diggers, 179; medical profession, 81; stockholders, 594; schoolmasters and schoolmistresses, 558; shopkeepers,

1001; sailors and others connected with the sea, 879. The remainder are too numerous to be classified, and comprise tradesmen of all kinds, manufacturers, clerks, compositors, and others. As regards birth and nationality, 59,119 were native born, 1793 were born in other colonies, 37,145 claimed the United Kingdom as their fatherland, 506 were Germans, 235 belonged to the various European countries excepting Germany, 143 were Americans, 128 were born in the East Indies, the remainder for the most part belonging to various British dependencies in both hemispheres. The total number of houses or dwellings was 20,364, of which 7844 were brick, 12,421 wood and iron, and 99 canvas, 18,048 being occupied, 2146 being empty, and 170 in course of erection.

EDUCATION.—The higher branches of education are under the management of a Council; the lower under that of a Board. There are seven public schools in Hobart Town, three in Launceston, and at least one in every country township, supported by the Government, and open to all, under a Board, under whose supervision is the distribution of all moneys voted by Parliament for the purpose of public education. In 1878, 164 schools in all were in operation, the average number of scholars on the roll being 8297, and the average daily attendance being 6032. There were on the rolls 12,458 scholars, taught by 112 male teachers, 146 female teachers, and forty pupil teachers and paid monitors; the average cost to Government of each scholar was £2 13s. 9½d., the average expenditure per child being £3 16s. 4d. The average cost to Government of each scholar (including cost of administration) was £2 17s. 6½d. From these schools exhibitions are attainable by examinations in each year to one of the superior schools, of which there are four—Horton College, High School, Hutchins' School, and the Church Grammar School. These exhibitions are thirty-two in number and vary from £16 13s. 4d. to £20 a year. During 1879 thirteen in all were awarded. The Council of Education annually confers two scholarships and the degree of Associate of Arts on such candidates as have attained the prescribed standard. In 1879 there was one successful for the scholarship; twenty-two passed for the degree of associate. To the successful candidates and to them alone are open the Tasmanian scholarships of which two of £200 per annum each, tenable for four years at a British university, are offered for competition every year. The attendance of children at school is compulsory under a fine of £2, unless it can be shown that the child is being privately educated, or is prevented by sickness or other valid cause from being present. There are four ragged schools, all in Hobart, with an average attendance of 391.

AGRICULTURE.—The leading crops are wheat, oats, barley, potatoes, peas and beans. Hops are also largely and profitably cultivated. Fruits of all kinds grow luxuriantly, including cherries,

plums, quinces, mulberries, peaches, apricots, walnuts, filberts, almonds, figs, gooseberries, strawberries, raspberries, currants and the grape. Fruit preserving forms an important branch of industry. The Tasmanian export of jams and preserved fruit in 1879 amounted to 3,915,881 lbs., valued at £100,000. 142,252 bushels of green fruit were exported, valued at £51,519. The statistics for the year 1879-80 show that the number of acres under cultivation was 366,911, of which 45,191 were in wheat; 6571 in barley; 37,259 in oats; 5958 in peas; 353 in beans; 186 in tares; 9762 in potatoes; 2048 in turnips; 124 in carrots; 1120 in mangold-wurzel; 78 in onions; 3553 in artificial grasses; 35,638 in hay; 578 in hops; 6559 in gardens and orchards; 1198 in green forage; 117,666 in permanent artificial grasses; 26,287 under bare fallow, 66,399, all other cultivated land. The yield of the principal crops is thus stated:—Wheat 1,042,999 bushels; barley 182,753 bushels; oats 1,065,847 bushels; potatoes 31,103 tons; hay 54,079 tons; hops 738,616 lbs. The average yield per acre was:—Wheat 23'08 bushels; barley 27'82 bushels; oats 28'60 bushels; potatoes 3'18 tons; hay 1'51 tons; hops 1280 lbs. The live stock was:—Horses 24,593; horned cattle 129,317; sheep 1,835,970; pigs 38,610; goats 2278; mules 4; asses 11. The yield of fruit during 1879 was:—140,277 bushels of apples, 19,340 bushels of pears. The agricultural machinery employed on farms and stations comprised 102 engines of 775 h.p., 94 clod-crushers, 150 cultivators, 11 hay elevators, 531 horse-hoes, grubbers and scarifiers, 90 mowing machines, 162 subsoil ploughs, 276 double-furrow ploughs, 133 reaping machines, 157 reaper and mower combined, 29 sowing machines, and 187 threshing machines. Of the total area of the colony 4,193,445 acres have been alienated, either by sale or grant. 2,023,013 acres are held on depasturing leases; annual rental being £8360.

MINERAL AND OTHER RESOURCES.—The colony is divided into two districts, called the "Western Mining District" and the "Eastern Mining District." The mineral resources of the colony, which had been neglected for many years, received a great impetus at the end of 1872 by the discovery of extensive deposits of tin ore at Mount Bischoff, in the north-west quarter of the island; and about the same time attention was directed to the extensive deposits of iron ore, especially on the banks of the River Tamar. Tin has since been found spread over a considerable extent of country in the opposite, or north-east corner of the island, and has now become one of the most important products of the colony. Though during 1879 the yield fell off, the yield of pure tin from the Mount Bischoff ore is said to have been from seventy to eighty per cent., the average being about seventy-four per cent. In 1876 the value of tin in ore and ingots exported was £100,000; in 1877 it was £296,941; in 1878 it was £316,311. Gold mining has become a recognised industry, and the returns

from some of the lately-opened fields have been very encouraging. The precious metal has been found widely scattered over the northern portion of the island, both in the alluvial and in quartz veins. The auriferous region has been described as embracing the following localities:—The Pieman River, the Hellyer diggings in the bed and on the banks of the river of that name, Anderson's Creek, and Brandy Creek, Nine Mile Springs, Den Diggings, Back Creek Diggings, Laura, Pipers River, Denison Diggings, Thisle, Waterhouse, and at Mangana and the Black Boy goldfields. The first discovery of gold it is said was on the Tullochgorum estate, near Fingal shortly after the Victoria diggings were opened. The gold mining statistics for 1878 were as follows:—Number of miners 1050, of whom 545 were engaged in alluvial and 505 in quartz. Value of plant £46,000, £2000 alluvial and £44,000 quartz. Yield of gold from the alluvial 11,462 ozs. of gold valued at £45,750, an average of £3 19s. 10d. per oz.; from quartz 13,787 ozs. from 15,085 tons of stone, valued at £54,250, an average of £3 18s. 8d. per oz., average yield being 17 dwts. 12 grs. crushed, at an average cost of about 9s. 6d. per ton. For the year 1879 the statistics are 2060 miners of whom 1535 were engaged in alluvial and 525 in quartz. Value of plant £60,200, £5200 alluvial and £55,000 quartz. Yield from the alluvial 37,750 ozs. of gold valued at £146,500, an average of £3 17s. 7d. per oz.; from quartz 22,405 ozs. from 15,334 tons of stone valued at £84,395, an average of £3 15s. 4d. per oz., average yield being 1 oz. 18 dwts. 7 grs. per ton. Up to 30th June 1879 the yield of gold from the year 1866 is approximately estimated at 48,753 ozs. 15 dwts. 2 grs. of the value of £191,181 14s. 5d. from the alluvial, and 72,181 ozs. 3 dwts. of the value of £285,816 14s. 5d. from the quartz. A lode of bismuth of great extent has been discovered at Mount Ramsay, and pronounced by Ulrich to be one of the richest if not the very richest in the world. Lodes of copper and lead have also been discovered. A lode of antimony two feet thick has been found at the 120-foot level in the Waratah Company's claim. It assayed 28·8 per cent. of antimony, 24 per cent. of lead, and silver in the proportion of 7 ozs. 9 dwt. 8 gr. to the ton of ore. Diamonds have been found at Flinders Island. Coal is abundant at Mount Nicholas and Douglas River, in the north-east of the colony; also at Hamilton in the centre, at the Mersey in the north-west, at Jerusalem and at Gardiner's Bay, a locality about fifty miles S. of Hobart, where a four-feet seam is now at work. It has analysed 61·4 per cent of pure carbon. In addition to these there are extensive coal mines at Port Seymour which are not now worked: this is a bituminous coal. A seam of bituminous coal has been found near the Sandfly Rivulet and is now being worked. There are also extensive deposits of anthracite coal at Port Arthur and New Town, with which the city of Hobart

Town is partially supplied. During 1878 there were raised in all 12,311 tons. Limestone is abundant and of excellent quality. Large quarries of stone admirably suited for building purposes are in work, and it is exported largely to Melbourne where many of the principal public buildings are constructed with it. It is a compact, fine-grained white or brown freestone. The Law Courts, Melbourne, are built with freestone from the Orford and Okehampton quarries. During 1876 the following mines or quarries were being worked:—1 bluestone, 4 coal, 2 flagstone, 8 freestone, 1 iron ore, 3 lime, 2 limestone, 1 slate, and 2 tin ore. The quantities raised in 1879 were—2500 tons of ironstone, 9514 tons of coal, 8500 cubic feet of flagstone, 123,221 cubic feet and 20 tons of freestone, 12,900 bushels of lime, 1824 tons of limestone, and 5791 tons of tin ore. There are 57 companies engaged in mining pursuits, of which 24 are for gold, 1 for iron, 32 for tin, 1 (the Emu Bay) is a prospecting company, and 1 is for tin smelting: the shares range from £1 to £50, and the capital from £600 to £250,000. Timber is plentiful, the wood of the Eucalyptus, or gum tree, being of great value for ship-building purposes, railway sleepers, and house work, and all purposes where strength and endurance are required. The pine and the wood of many other trees are well adapted for furniture, fittings, and in-door work generally. Wattle bark is largely exported for tanning purposes. At the Melbourne Intercolonial Exhibition in 1880 the exhibits from T., showing the value and extent of its resources, received marked attention. The Tasmanian iron has been found to possess some remarkable properties, one of which is that steel made from it is as malleable as soft Swedish iron. It appears to be extensively distributed, but has not been turned to practical account owing to the ore being impregnated with chromium, which has greatly depreciated its value for manufacturing purposes. The slate quarries are now turning out slates of excellent quality. Near Brown's River is a shot tower, the manufacture of which is fast superseding the imported article, and is in good demand in the neighbouring colonies.

ELECTRIC TELEGRAPHS.—A line of telegraph exists between Hobart Town and Launceston, between Launceston and Deloraine, and also extends to Bothwell, to New Norfolk, and other places. In April 1869 telegraphic communication was established by means of a submarine cable between T. and V.

RAILWAYS.—The lines of railway in working are the Launceston and Western Railway connecting Deloraine, Westbury, Longford, Perth, and Evandale with Launceston; and the main line of railway from Hobart Town to Launceston. The Launceston and Western Line was constructed by a company at a cost of £450,000 (or excluding interest £429,604, being £95·47 per mile,) of which £50,000 was raised by shares, the remaining £400,000 by Government debentures bearing 6 per

cent. interest, the interest partly re-guaranteed by the railway district. A further sum of £60,000 at 5 per cent. was subsequently raised to complete it. The line was formally opened by the Governor on 10th February 1871. On 3rd August 1872 the line was taken over by the Government of the Colony and is now under the control of the Minister of Lands and Works. The length of the railway is forty-five miles, the gauge being 4ft. 8in. The Main Line Railway extends from Hobart Town to Launceston 133 miles. The Mersey and Deloraine Railway, to connect the Mersey River with Deloraine, was partially opened on 1st January 1871; eighteen miles only were completed, leaving twelve miles to connect it with Deloraine. It was constructed by private individuals; but from insufficiency of capital and other causes the undertaking collapsed. The question of purchasing and completing the line was under the consideration of the Legislature in February 1880, but the Bill to authorise the purchase was thrown out.

REVENUE, EXPORTS AND IMPORTS.—The revenue for 1879 (not including loans) was £375,367. The Customs realised in 1879 £199,688. The exports for 1879 were £1,301,897. The exports of wool alone for 1879 amounted to 7,385,002 lbs., of the value of £407,227, and of tin £303,203. The imports for 1879 were £1,267,475. The other principal articles of export are bark, bran and pollard, butter and cheese, flour, fruits (preserved and green), gold, wheat, oats, barley, hides, skins and leather, hops, horses, sheep, sperm and black oil, fruits, vegetables, and colonial brewed ale. The export of hops amounted to £26,512, and of fruit and jams to £151,802. In 1879 the exports amounted to £11 14s. 10½d. per head of the population, and the imports to £11 7s. 11d. For the first six months of 1880 the imports amounted to £659,236, and the exports to £832,193. During the same time there were exported £115,606 value of gold, and tin to the value of £161,638. The debt of the colony at the end of 1879 was £1,786,800, which has been incurred for the following purposes:—Public works, including railway, £1,305,429; immigration, £194,000; to commute State aid to religion, £100,000; payment of an old debt to Imperial Government, £30,500; debentures for deficiency in revenue, £156,871. The principal part of these debentures is issued at 6 per cent. per annum, payable half yearly, and the remainder at 4 and 5 per cent. The amount of interest paid during the year was £91,838. The indebtedness per head of the population is calculated at £15 16s. 11½d. The expenditure (excluding services provided for by loans) in 1879 was £402,295. In his Financial Statement, made on 18th August 1880, the Treasurer stated that the present year (1880) began with a deficiency of £7712. The estimated revenue for the year was £430,770, and the expenditure £418,192, leaving a surplus of £12,578, and deducting the deficit at the beginning of the year it would leave £4866 of

surplus to begin the year 1881. The revenue for 1881 was estimated at £435,070, and the expenditure at £434,971, which would leave an estimated surplus of £10,099. The amount proposed for public works was £275,000, including £120,000 for the Mersey Railway. It was proposed to raise a 4 per cent. loan of £567,000 for works and the redemption of debentures.

MANUFACTORIES AND INDUSTRIES.—The climate is especially adapted to malting and brewing and also to the growth of hops. The Tasmanian brewed ale is that which is chiefly drunk in the colony, and an export trade is carried on with N.S.W. and V. There are eighteen breweries, twenty tanneries, four soap and five candle manufactories, eight jam-boiling establishments, fifty-two saw mills, thirty-five agricultural implement works, four brass foundries, fourteen coachbuilding factories, eighty-one fellmongeries, twenty-two steam flour mills, thirty-seven water mills, three potteries, two tin smelting works, and there is also now one manufactory of cloth, tweeds, blankets, &c., from Tasmanian wool, which has been stimulated by the payment of a bonus of £1000 by Parliament. The articles manufactured are of excellent quality.

GOVERNMENT.—The constitution was settled by the local Act of 18 Vic., No. 17. By this Act a Legislative Council and a House of Assembly are constituted, called the "Parliament of Van Diemen's Land." In 1871 an alteration was made by the addition of one member to the Council and two members to the Assembly (Act 34 Vic., No. 42.) The Legislative Council is composed of sixteen members, who must be natural born or naturalised subjects not holding offices of profit or emolument from the Crown (except responsible ministers,) and not less than thirty years of age, elected for six years by all natural-born or naturalised subjects of the Crown of full age, who possess either a £30 freehold, a leasehold of £200 yearly value, or are officers in the army or navy not on active service, or have a degree of some university, or are in holy orders, or are medical practitioners. The House of Assembly consists of thirty-two members for whom no special qualification is required save that of being of the age of twenty-one years and subjects of the Queen, and who are elected for five years by £7 householders or leaseholders, or freeholders of estate of the value of £50, or selectors who have paid up to the amount of £50, and all subjects holding a commission in the army or navy, or possessing a degree, or in holy orders, or receiving a salary of £80 a year. The elections are conducted on the ballot system. The legislative authority rests in both Houses united, while the executive power is vested in a Governor appointed by the Crown. The Governor is by virtue of his office Commander-in-Chief of the troops in the colony. He is aided in the exercise of the executive power by a Cabinet of responsible ministers, consisting of four official members—the Colonial Secretary, the Colonial Treasurer, the

Attorney-General, and the Minister of Lands and Works. A Minister without a portfolio has occasionally been included. The Members of the Cabinet must have a seat in either House of Parliament.

HISTORY.—I. *Early Navigators*.—Tasmania, as stated in the preceding article, was discovered by Tasman in 1642, and named after the Governor-General of the Dutch East India possessions. In 1772 its shores, left apparently untouched for so many years after the first discovery, were visited by Marion, the French navigator. He anchored, as Tasman had done, in Frederik Hendrik Bay, and landed with a party, but departed again hastily after an encounter with natives; and recorded his being unable to procure water, or to find a tree fit to make a mast of, thereby giving ample proof that his search was very superficial. In the same year Cook, in the *Resolution*, and Furneaux, in the *Adventure*, on their voyage of exploration towards the South Pole, became separated during a fog. Cook sailed to N.Z. Furneaux touched at V.D.L., discovered Adventure Bay, sailed along the East Coast, and then also made for N.Z. Cook, on his third and last voyage to the Pacific, visited the island himself, anchoring in Adventure Bay, where he left some pigs. The edition of his voyages published in London in the last century describes the delight of his officers with the spot, and mentions "stately groves, rivers, and lawns of vast extent," with "thickets full of birds of the most beautiful plumage, and various note." In 1789 John Henry Cox in the brig *Mercury* attempted to enter Adventure Bay, but being driven to the eastward, discovered Oyster Bay. Bligh touched at V.D.L. in 1788, and again in 1792, when he planted some fruit trees, fig, pomegranates and quinces. In 1792 Rear-Admiral Bruné D'Entrecasteaux, in the ship *Recherche*, accompanied by Captain Huon Kermadec in the *Esperance*, having been sent out by the French Government to ascertain the fate of La Perouse, discovered the channel which bears the Admiral's name, and found that it extended to the Storm Bay of Tasman. They entered and named the Huon and the "Rivière du Nord" (now the Derwent.) Their charts are said to be the finest specimens of marine surveying ever made in a new country. La Billardière, the renowned botanist, was naturalist to this expedition. Up to this period the island was believed to form part of the "Great South Land," but in 1798 Bass made in a six-oared whale-boat from Port Jackson, a voyage of exploration lasting eleven weeks, during which he satisfied himself of the existence of a dividing channel; and on his representations Governor Hunter authorised Flinders to accompany him in the *Norfolk*, a colonial sloop of twenty-five tons, for the purpose of confirming the supposition. They then discovered Port Dalrymple (named after Alexander Dalrymple, hydrographer to the Admiralty,) and passing along the coast to a peculiar headland "like a Christmas cake," which they called

Circular Head. The extreme N.W. point they named Cape Grim; and observing the mountains noticed by Tasman when he visited the coast, they gave to two of them the names of his vessels, *Heemskirk* and *Zeehaan*. Point Hibbs was named after the master of their little sloop, and on their return to Point Jackson, Governor Hunter, at the desire of Flinders, bestowed the name of Bass on the important strait which had become known through Bass's intrepidity and enterprise.

II. *First Settlers*.—In 1803 Lieut. Bowen was sent from Sydney in the *Lady Nelson* for the purpose of making an auxiliary settlement in V.D.L. connected with that of Port Jackson. He selected the spot previously pointed out by Flinders as especially suitable for such an undertaking, and landed with his small party at Risdon, on the Derwent. This little pioneer band was greatly augmented the following year by the arrival of the comparatively numerous body of civil and military officers, marines, and convicts who removed from Port Phillip, ostensibly on account of the unfitness of that country for occupation; but the fallacy of this assumption has been fully proved. This second detachment on arrival from Port Phillip landed at Sullivan's Cove, now the port of Hobart, under the command of Lieutenant-Governor Collins. The *Lady Nelson* was then dispatched to Port Dalrymple, and surveyed the entrance of the Tamar. In consequence of the favourable report made, a small party was sent thither from Port Jackson, under Colonel Paterson, to form a settlement, in October 1804. On the banks of a small stream called Humphrey's Rivulet, about four miles north of Hobart, it was that these first settlers planted their homesteads. Four persons fixed themselves there, each receiving from the Government 100 acres of land. The names of these founders of the colony, as they stand in the first page of the oldest land register of the Survey Office, are Edward Miller, Leonard Fosbrook, Mathew Bowden, and J. M. Johnson; some, if not all, of whom were persons holding important posts in the Government establishment of the day. From these small beginnings the colonisation of the island progressed steadily, though not rapidly. The new settlement on the west bank of the Derwent was named by Collins after his patron, Lord Hobart, but for many years was usually spoken of as the "Camp." Subsequently the county, at first including half the island, was called after the same nobleman. The northern settlement, formed by Colonel Paterson, was seated on the western shore of the Tamar, and called York Town. From this spot the greater part of the new establishment was removed in 1806 to the junction of the North and South Esk Rivers. The Tamar was traced, and named by Colonel Paterson after a Cornish river, and the valley of Launceston after the chief town of Cornwall, in honour of Governor King, whose father was a draper in the latter place. Both as a traveller and naturalist, but more particularly as a

botanist, Paterson is remembered by the scientific world. He directed the Government botanical establishment at Parramatta, and the repository of native shrubs intended for the gardens at Kew. He planted trees at York Town, some of which are said to have been growing there within the past few years. Port Dalrymple, as the northern settlement was called, was not under the government of Hobart until 1812. The first communication between Hobart and Launceston was opened by Lieutenant Laycock and his party; they were nine days on the route, and their arrival at Hobart excited great astonishment. The orders issued by the Home authorities in 1803 for the removal of the settlers from Norfolk Island (which had been colonised in 1788,) not having been complied with, were peremptorily repeated in 1808 by Mr. Windham, then Secretary of State, and Captain Bligh, directed Captain Piper to compel the colonists to evacuate the island, and even to shoot anyone who might retreat to the woods to avoid embarkation. They were conveyed to V.D.L. chiefly in the *Estramina*, *City of Edinburgh*, and *Sydney*; 254 arrived on 15th October 1808. On the determination of the Government being announced, the settlers manifested great repugnance. The elder people declared they would not quit the country; it was, however, the decree of an irresistible will. The inhabitants were offered a settlement in V.D.L. or N.S.W.; mostly they chose the former country. They received from the Government whatever would contribute towards reconciling them to the change. Vessels were provided for their removal, their possession in land was doubled, and it was freed from all conditions and reservations. They received cattle as loan, and they were rationed as new settlers from the public stores. That the change was beneficial to the rising generation can hardly be doubted; but the effect on the parents was generally painful. Time was required to equal the cultivation of the spot they had left, compared with which even V.D.L. seemed blank and barren. Years after, they spoke of the change with regret and sadness. On the arrival of the *Sydney*, Collins looked narrowly into the probable resources at his disposal, and sent Joseph Holt to examine the land on the Derwent, with a view to future location. He proceeded along its shores, until a ledge of rocks obstructed the passage of his boat; then ascending an eminence not less in apparent height than the Dromedary Mountain, "I sat down," he writes, "on its top, and saw the finest country eyes ever beheld." This was that extensive district which, from the previous residence of its occupiers, was named New Norfolk. The spot whence he surveyed the subjacent land he called Mount Casha. The settlement was early involved in great difficulties. The hoe, the usual implement of husbandry, effected but a slow and discouraging progress; supplies from Port Jackson were forwarded in small quantities, and were soon altogether interrupted. In 1806 a disaster occurred

which reduced the elder colony to severe privation. The tempting fertility of the land bordering on the Hawkesbury, the Nile of this hemisphere, induced the petty farmers, whose homesteads dotted its margin, to overlook its dangers. An inundation, remembered as "the great flood," exceeded all former devastations; vast torrents, of which the origin was unknown, descended from the mountains, and pouring down with prodigious violence, suddenly filled and overflowed the channels of the river; and rising to the height of sixty and eighty feet in a few hours, swept away the stacks of corn, the live stock, and even the dwellings. A vessel approaching the coast saw fragments of the floating ruins many miles distant from the shore. Thus, lately possessing a superabundant store, the poor suffered extreme destitution, and the price of maize and wheat rose to £5 and £6 per bushel. Unable to succour the colony, the Government left it to its own resources, and for several years the scarcity continued with various intensity. The kangaroo hunters were the chief purveyors of food. The officers who were allowed servants sent them to the woods and sold their spoil to the Government. Considerable profits were made by the more successful; the commissariat allowed one shilling and sixpence per pound; and the foundation of some fortunes were laid by persons whose servants were faithful and expert. A marine, assisted by two convicts, delivered to the king's stores 1000 lbs. of kangaroo per month, and continued in this occupation for several years. A few coarse biscuits were distributed while they lasted, but the substitute for bread was the dried and pounded flesh of kangaroo. The Government, unable to feed, could no longer task the prisoners; to lessen the pressure they were sometimes permitted to disperse in search of subsistence, and thus laid the foundation of those lawless habits which afterwards brought the colony to the verge of ruin. The *Sydney* had been chartered to India for wheat, but was lost, and the colony was disappointed of the expected relief. When the calamity became known a second effort was made. Colonel Paterson while Acting-Governor of N.S.W. contracted with Captain Bunker of the *Venus* to bring a cargo of wheat from Bengal. It was not until 1810 that she anchored in the Derwent; the dread of famine was removed, and wheat was now valued at twelve shillings a bushel. The change of seed enabled farmers to clear their ground of that mixed and inferior grain which had disappointed all attempts at agricultural independence. Whilst he was at Bengal, the captain of the *Venus* received from the Governor two prisoners, supposed to be castaways from a vessel seized at Port Jackson. Stewart, formerly a lieutenant in the navy, secretly contrived a plan to take the *Harrington*, a vessel richly laden, and provisioned for a long voyage. The wind blew fair as she lay in Sydney harbour, a tempting prize; embracing the favourable movement,

Stewart called together several companions whom he could trust, and submitted his project at the instant proper for its execution—the first successfully attempted by prisoners. Thus, before suspicion was awakened, he had seized a boat, hurried on board, mastered the crew, and was scudding before the breeze. But at sea his good fortune forsook him; the *Harrington* was recaptured by the *Greyhound*, and both ships were lost on the coast of Luconia. These pirates were permitted to land at the Derwent and were left behind by the *Venus*. They were found at the house of Garth, a settler, by soldiers sent to seize spirits secretly landed from the vessel. Mistaking the errand of the soldiers, one of these men called on his comrades to resist them; and being enraged by a refusal, he fired and inflicted a mortal wound. Such complicated crime was not extraordinary; but the kind of force necessary in the civil government, and the shelter afforded to outlaws, were symptoms of social disorder which soon after assumed an alarming character. During the administration of Collins the progress of the colony was barely perceptible. There were no roads in the interior; no public buildings; the house of the Governor was a mere cottage, too mean for the accommodation of a modern mechanic. When the transfer from Norfolk Island commenced at the close of 1805, stock belonging to the Governor-in-Chief was purchased by George Guest who sold the sheep at £5 per head, and was repaid in cattle. The first Tasmanian house stood on land adjoining the Macquarie Hotel; it was built by Lieutenant E. Lord, of wattle-and-dab; its windows were like the portholes of a vessel. That it was the first constituted its chief claim to distinction; it was considered as an achievement of civilisation—a trophy gained upon the wilderness. All were not so well lodged; yet such houses are soon reared. Posts, joined by wall-plates, fixed in the ground, woven with wattle rods, plastered with mingled clay, sand, and wiry short grass, and whitened, a grass-thatched roof, a chimney of turf piled on stone, a door and a window, and the cottage is finished. A few acres of land had been cultivated at New Town by prisoners in charge of Clarke, the superintendent; cattle had arrived from Bengal and sheep from Port Jackson; but the progress of the settlement had hitherto been slow. In N.S.W. gangs of men stripped to the waist laboured together, and were exposed to rigorous discipline common to slaves. These methods of tillage were introduced into V.D.L., where as yet there were no fields prepared for the plough, nor beast of draught to facilitate human toil. The chief overseers were not skilled in cultivation; one had been a shoemaker, the other a tailor; and while they were expecting large returns, they were ignorant that the full ears which promised an abundant yield were smut, not grain. This early failure was attended with disastrous results. In 1810 Collins attempted to establish a newspaper, *The Derwent*

Star and Van Diemen's Land Intelligencer. Though but a quarto leaf, with broad margin and all the contrivances which dilate the substance of a journal, it was much too large for the settlement, where often there was nothing to sell; where a birth or marriage was published sooner than a paragraph could be printed; where a taste for general literature had no existence, and politics were excluded. The second number contains a rather pompous account of Governor Macquarie's inauguration at Sydney. The next issue, besides a Government order or two, describes the feat of Barclay the pedestrian, a thousand miles in a thousand hours; the wonderful longevity of Joseph Ram, a black of Jamaica, who died in his 140th year; then the greatness of Daniel Lambert, whose body weighed 52lbs. fourteen times told, and who was sent by an inclined plane into his grave. Then follow a eulogy on the Governor's profession, one trial, one ship, two births and one marriage. It was the misfortune of Collins to be involved with the parties responsible in the deposition of Governor Bligh. This remarkable deviation from the ordinary conduct of British soldiers has been attributed partly to the composition of the military force raised for that colony, and partly to the temper of Bligh. The officers merged the military character in the mercantile spirit, and were accustomed to enjoy privileges in virtue of their commissions which they converted into a monopoly of trade. The distance of N.S.W. from the centre of commerce induced the Crown to provide for the settlers the miscellaneous articles which are usually kept only by the shopkeepers. At Port Jackson there were public magazines stored with every requisite for domestic use, such as potters' ware, utensils for the kitchen, and the implements of farming. These were issued at stated prices, rather less than such commodities cost in Europe; but to prevent them becoming the objects of speculation an official order for every issue, specifying the article was necessary. Such methods of distribution gave satisfaction, notwithstanding ample room for partiality and corruption. On the arrival of Bligh he found the improvident settlers discontented and poor, completely in the hands of the martial dealers. Perhaps from a love of justice he attempted to rescue them from the grasp of these intermediate agents, who bought their produce at a narrow price and gave them in exchange goods bearing an enormous percentage. Bligh permitted the farmers to draw from the public magazine whatever was necessary for private use, and took their engagement to deliver their grain to the stores at the close of the harvests. This interruption to the customary dealings of the officers naturally provoked them. Bligh reciprocated their aversion and resented their disrespect. When Bligh arrived at Hobart Town he was received by Collins with the respect due to his station. He was, however, soon followed by dispatches, which informed the Lieutenant-Governor of the movements at Sydney. Collins, as Bligh

stated, intended to arrest him; at all events he re-embarked, and the settlers were indicted from holding communication. A free man, Belbin, was flogged for the infraction of this order; but afterwards received a grant from the Crown for his loyalty. George Guest espoused the same side; the vessel was ill-provisioned, and he secretly drove down his cattle to the beach, where some were slaughtered for the use of the *Porpoise*. Bligh returned to Port Jackson, though the time for his honorary restitution was passed; he was received with respectful formality. A proclamation had already been issued, prohibiting suits of law for injuries suffered from the usurping Government, and giving indemnity and protection to all who had acted under its authority; but Bligh was empowered to carry home all who might be able to throw light on his deposition. This order must have terminated the government of Collins had he survived. This was the last important occurrence in the eventful life of Collins. He died on the 24th March 1810, in the fifty-sixth year of his age, having held the administration six years and thirty-six days. His death was sudden; except a slight cold there was little warning of its approach. He died whilst sitting in his chair and conversing with his attendant. His funeral was celebrated with all the pomp the colony could command, and 600 persons were present. The share he accepted in the responsibility of the deposition of Bligh disturbed his tranquillity, and it was thought hastened his end. Collins was buried in the church-yard of St. David's at Hobart Town. To provide a temporary place for public worship, a small wooden church was erected on the spot, and its altar was reared over his grave. This building was blown down in a tempest, and its materials being carried off left the resting-place of Collins long exposed to the careless tread of the stranger. Sir John Franklin, always generous to the memory of official worth, reared a monument bearing this inscription:—"Sacred to the memory of David Collins, Esq., Lieutenant-Governor of this colony, and Lieutenant-Colonel of the Royal Marine Forces. On the first establishment of the colony of New South Wales he was employed as Judge-Advocate. And in the year 1803 he was entrusted by His Majesty's Government with the command of an expedition destined to form a settlement at Port Phillip, on the south coast of New Holland, but which was subsequently removed to Van Diemen's Land. Under his direction as Lieutenant-Governor the site of this town was chosen, and the foundation of its first building laid in 1804. He died here on the 28th March 1810, aged fifty-six years. And this monument, long projected, was erected to his memory in 1838 by direction of His Excellency Sir John Franklin, K.C.H., K.R."

III. *Governor Macquarie*.—On the demise of Collins, the government devolved on Lieutenant Edward Lord, until the arrival of Captain Murray, of the seventy-third regiment. The Governor-in-Chief (Macquarie) visited V.D.L. during Murray's

administration. This auspicious event was the subject of great exultation. Macquarie was received with all possible formality and tokens of gladness; a salute from a battery of no great power; an illumination in the small windows of the scattered cottages; and addresses delivered by the delegates, not bound to declare the number of their constituents. Nothing remarkable is remembered of this visit, except that Macquarie traced the future city. He complained of the utter neglect of right lines in the erection of dwellings, which advanced or retreated according to the whim of the builder. The centre of the projected town he called St. George's Square; in this he intended to rear a church and town hall, and the quarters of the main guard; the open space he designed for a market. The streets which intersect each other he called by the names which still distinguish them: Liverpool-street, after the Prime Minister of that name; Macquarie-street, after himself; Elizabeth-street, in honour of his wife; Argyle-street, of their native country; and Murray-street, in compliment to the officer in command. The plan sketched by Macquarie has not been absolutely followed, nor has it been improved. He ordered the erection of a signal staff on Mount Nelson, named after the vessel which brought him to port and conveyed him safely to Port Jackson. The settlers on the Derwent expressed a fervid admiration of his devotedness in thus venturing to face the dangers of the visit; especially accompanied by his consort—so they distinguished Mrs. Macquarie. The Governor merited their gratitude, for his hand was liberal. In February 1812, Colonel Geils became acting Lieutenant-Governor, and remained until the arrival of Colonel Davey. Geils devoted great attention to agricultural pursuits, and first formed at Risdon a considerable farming establishment. Ordered to India with the troops under his command, he forwarded his youthful sons to the Cape of Good Hope, thence to be conveyed to England. The colonists heard soon after with deep commiseration, that the vessel in which they re-embarked was lost.

IV. *Governor Davey*.—Colonel Thomas Davey, the second Governor of V.D.L., arrived on 4th February 1813. His manner of entrance indicated somewhat of his peculiar character, for the weather being warm he carried his coat on his arm. His subsequent demeanour was characterised by great eccentricity; and on what principle he could have been selected as the presiding power over a reformatory settlement is one of those enigmas which only an intimate knowledge of red tape could solve. He took pleasure in practical jokes and rough humour; his countenance was strongly marked, and by a peculiar motion of the scalp he delighted to throw his forehead into comical contortions. He shared in common a taste for spirituous liquors, and was not unwilling to participate wherever he was welcome as a guest. As a marine he had been present in many important actions, among the rest at the battle of Trafalgar,

His intended departure from Europe he concealed from his family, by whom it was discovered accidentally: they reached the vessel by extraordinary exertions, and in neglect for all the usual preparations for the voyage. The ship which conveyed his luggage was taken by the Americans during the war—for him a fortunate loss; indemnified by the largest grant ever conferred in the island (3000 acres,) for it was not intended that the captors could have made an extensive prize. Mrs. Davey, a lady of a meek and uncomplaining spirit, is spoken of with respect, and the Governor himself with kindness; for under a rough exterior was concealed a generous disposition. During Davey's government 200 female prisoners were brought down from Sydney in the brig *Kangaroo*; proclamation was made, and the settlers were invited to receive them. There was little delicacy of choice; they landed and vanished; and some carried into the bush changed their destination before they reached their homes. Yet such is the power of the social affections, several of these unions yielded all the ordinary consolations of domestic life. The conveniences of civilisation were not wholly neglected. The ports were opened for general commerce in June 1813. Messrs. Kemp and Gatehouse, E. Lord and J. H. Reibey supplied the colony with English goods, which were disposed of at great profits by the retailers. These also sent carts through the country laden with such commodities as a cask of rum, basket of tobacco, chest of tea, bag of sugar, and bales of slop clothing. Sometimes the gain was enormous, as the goods were often exchanged for sheep and cattle, and the lucky hawker returned to camp with a flock worth five times the value of his merchandise. Men who have since counted their incomes by tens of thousands and feasted princes at their tables made their first money by shouldering a peddler's pack through the Tasmanian bush. Before this time the settlers were frequently without the means of obtaining other covering than what they made for themselves out of the skins of animals, and coats of kangaroo and opossum fur continued to be worn long after the absolute need of them had ceased. The resources of the colony began to be developed at this time. Birch, an enterprising merchant, fitted out a vessel to survey the western coast in 1816. The same year Captain Kelly, long known as pilot and harbour-master in Hobart, discovered Macquarie Harbour and Port Davey. Captain Florence found a new species of pine, very highly valued by artificers. Birch was rewarded with one year's monopoly of the trade he had opened. The whale fishery was considerably enlarged; the plough was introduced, and gradually superseded the hoe; corn was exported; and a mill was erected. In February 1817 the foundation of St. David's Church was laid. Passage boats connected the banks of the Derwent. A Civil Court for the recovery of debts not exceeding £50 was established. In the same year a third attempt at the establishment of a newspaper succeeded; a

second, made in 1814, having failed like its predecessor. The rigorous censorship exercised by Government rendered the publication but little, if at all, more generally interesting than the *Government Gazette* of the present time. Still the advent of the *Hobart Town Gazette and Southern Reporter* marked an era in colonial advancement, and Andrew Bent, the publisher, when his first number appeared on the 1st June 1816 must have felt himself almost famous. When the severe restrictions at first imposed were removed by Sir Thomas Brisbane in 1824, the stream of eloquence so long pent up broke forth tumultuously, as a few extracts from the first leading article of Bent's emancipated paper will show:—"We esteem ourselves a BEACON placed by Divine graciousness on the awfully perilous coast of human frailty." "We view ourselves a A SENTINEL, bound by allegiance to our country, our sovereign, and our God. We contemplate ourselves as the WINNERS for the public." "We desire to encourage the cloudless flames of rectified communion, rejecting each effusion, however splendid, of degenerated curiosity and perverted genius, of misanthropical acerbity and calumnious retrospection." One feels almost overcome as one reads such bitter words, until the modesty of the closing paragraph restores self-possession. "The duties of our typographical province are performed by the proprietor and one assistant." The welfare of V.D.L. was about this time greatly retarded by the number, daring, and prolonged depredations of the bushrangers. In some districts the inhabitants offered a sanctuary to the criminals, and, as their scouts, gave notice of the approach of danger; while in others the settlers were driven before them. To check their ravages, Davey declared the whole colony under martial law; he punished with floggings persons, whether free or bond, who quitted their houses by night. Several offenders were captured, and suffered death. The inhabitants to the number of 600 expressed their approval of this stretch of power, but it was promptly disallowed by the Governor-in-Chief. On many previous occasions the same course had been pursued. To constitutional law the Lieutenant-Governor was both indifferent and a stranger. Davey, when he relinquished his office, remained for some time as a settler; he was not however successful. He returned to England, where he died on 2nd May 1823. His contemporaries speak of his character in terms of eulogy. The modern colonist will remember that the tastes of society have since that period been modified, even in Great Britain; and that character can never be fairly judged when separated from the circumstances in which it is developed. Then the town was a mere camp; the etiquette of office necessary when a community is advanced would be folly in its infancy.

V. *The Bushrangers*.—Bushranging commenced in 1813, but was suppressed pretty vigorously. By 1824 this practice had again attained a fearful

height. The insecurity of life and property, the murders, burnings of houses, stacks and crops, the robbery and destruction of live stock, must have seriously impeded the advance of the colony. The military officers and men took an active part in hunting down the most desperate ringleaders, and some of them became famous as gallant and successful thief-takers. Martial law made short work with those who were captured. Michael Howe, a merchant seaman, afterwards a man-of-war's-man, a deserter and highwayman in England, had escaped the gallows only by a legal flaw, and was transported to V.D.L. Being assigned as servant to a settler, he soon "took to the bush," joining an armed gang of twenty-eight runaway convicts, of whom he became second in command under one Whitehead, a desperado of the first water. This band became the terror of the country. They had good intelligence of any armed force in pursuit of them or of any property open to pillage; for the low settlers and convict stockmen, either from fear or inclination, connived at and assisted these outlaws. Whitehead being shot in an attack on a house where a party of the 45th Regiment were lying in ambush, Howe became the leader, and he maintained his authority by his superiority in mental and bodily vigour, and by cutting off those of his followers who stood in his way. By stealing horses, and performing flying night marches, they pounced upon unprepared victims, sometimes a hundred miles from the spot where they had been heard of a day or two before. Proclamations, offers of pardon and passages to England, rewards of money, strenuous exertions by the troops, the police, and the loyal inhabitants, treachery among themselves, the bullet and the gibbet, gradually thinned the ranks of Howe's villainous retainers. One day, hotly pursued by a party of the 46th, and accompanied only by a faithful black girl who had been the partner of his perils for some years, Howe—finding that she retarded his flight—fired at and wounded the poor creature, who in falling was captured by the soldiers, the ruffian escaping only by throwing away his arms and his knapsack. Putting aside the brutality of this act, its impolicy was very soon apparent, for she, who had hitherto followed his steps with the fidelity of a spaniel, now tracked them with the fierce sagacity of the bloodhound; and, acting as a scout to the military, so harassed the flying and solitary bandit, that he resolved to surrender, on terms, to the authorities. His terms were accepted, and giving himself up to an officer of the 46th, he was imprisoned at Hobart Town. This was his second surrender to Government. On the first occasion he quickly broke his arrest, and was off to the woods again. Meanwhile the gang had been reinforced to about twenty men, and several sharp encounters took place between them and the soldiers, in one of which an officer was badly wounded. Howe gave but little of the useful information that he had promised to Government, and yearning for a life of crime and excitement, he

once more escaped to the bush; and once more highway and house robberies, cattle lifting, extortion of money and arms by threatening notices, burnings, violence and murder were rife in the land. At this time Howe, in his correspondence with the authorities and others, styled His Majesty's representative the Governor of the Town—himself the Governor of the Rangers. A hundred guineas reward was offered for his capture and that of a brother bandit named Watts, and eighty and fifty guineas were offered for the live or dead bodies of seven or eight rogues of inferior degree. In course of time all were killed or taken, excepting the two first. Watts then resolved to sacrifice his comrade, and with a shepherd named Drewe, who had been on friendly terms with Howe, laid a plan for his capture. Accordingly, at daylight one morning these men, well armed, approached the spot where Howe harboured. Drewe concealed his musket in a thicket. Watts "cooey'd" and Howe came up—but the villains so distrusted each other as to stipulate that the prining of their guns should be knocked out simultaneously. While employed in making a fire to cook some food the two traitors flung themselves upon Howe, threw him down, tied his hands, and disarmed him of his gun and two knives. They then marched their prisoner—worth £50 a-piece to them—towards Hobart Town—Watts in front, Drewe behind him, with loaded arms. He was snug enough one would have thought; but suddenly Howe, who possessed immense muscular strength, snapped his bonds like tinder, and with a concealed dirk stabbed Watts in the back. He fell, and Howe seizing his firelock, shot Drewe through the head. The wounded accomplice contrived to escape and hide himself in the bush before the arch-ranger of His Majesty's colonial woods and forests could reload, for the purpose as he afterwards said—"of finishing him." But his own race was well-nigh run. An additional hundred guineas were offered for the death or capture of the robber and murderer. His existence was now like that of a wild beast. Solitary and savage, clothed in kangaroo skins, and overgrown with hair like another Orson, he obtained food and ammunition, his only requirements, by robbing distant shepherds' huts. In spite of the high rewards few relished the idea of risking an encounter, either single or double-handed, with such an antagonist. At length a kangaroo hunter, named Warburton, and one Worrall, a transport mutineer of the *Nore*, concocted and carried into effect a plot for taking him. A private soldier, named Pugh, a determined fellow was selected to assist them. Warburton was to induce Howe, by a promise of a supply of ammunition, to come to his hut, where the two others lay concealed. Driven by want, but under strong suspicions of foul play, he entered the door with musket cocked, observing which Pugh instantly fired. "Is that your game?" said Howe coolly, and returning the soldier's shot he ran for his life. Neither shot had taken effect, nor was

one fired by the mutineer at the flying outlaw better aimed. Howe was trying to load his piece as he ran, when his two foes overtook him, and brought him to bay. A furious though unequal combat with clubbed muskets then took place, and resulted in the death of this famous brigand, who, having his skull beaten in by the blows of his two powerful assailants, dropped and expired without a word or a groan. Thus fell Michael Howe, the bushranger, and with him the practice of bush-ranging itself, in V.D.L. Lest natural admiration of brute courage should incite a feeling of pity for his fate this notice may be closed with one sentence of his history :—"During his long career of guilt, Michael Howe was never known to perform one humane act." On one occasion fourteen of these men escaped from Macquarie Harbour in a boat, and landed on the coast about twelve miles from Hobart Town, where they formed a secret retreat, from whence they could issue and pounce on the settlers, whom they robbed, and in many instances murdered. Two of the most daring were selected as leaders, from whom they were known as Brady and McCabe's gang of bush-rangers. Their first depredations were for the purpose of obtaining arms and ammunition, which they succeeded in doing, and soon became the terror of the island. In their sanguinary career they were most cruel towards those masters who were severe upon their assigned servants and had them flogged for misconduct; consequently the prisoner population sympathised with them, and aided them with provisions and timely information. There was a dash of romance about many of their acts that showed an inclination to imitate the exploits of famous highwaymen in England. On another occasion a party of eight soldiers of the 40th regiment of infantry, quartered at Hobart Town, were dispatched under the command of Lieutenant Gunn, of the Madras infantry, to go in quest of Brady and his gang. This appears to have been known to that redoubtable bushranger, for he had the effrontery to intimate that he would be at Sorell Town on a certain day and a certain hour. Lieutenant Gunn—who was a very tall man, standing, it is said, six feet seven inches—paid little heed to this piece of bravado, and on that day scoured the neighbouring country with his men but could not get a glimpse of his enemy. The soldiers returned wet and weary to their temporary quarters in the gaol, and Gunn went to a friend's house. In less than an hour a man came to the door and requested to see him concerning the bushrangers. Suspicious of foul play, he approached the man with a loaded musket in his hand, when the villain discharged the contents of a rifle at him, shattering his arm from the wrist to the shoulder, and he fell apparently lifeless. The man, supposed to be Brady himself, thereupon proceeded with his gang to a house where a party of ten gentlemen were dining. They marched in and captured them, ordering them, upon pain of death to walk before them to the

gaol, where the soldiers were, calculating that they would not fire upon their hostages. When they reached the gaol the soldiers were taken by surprise, their hands and legs tied, and the whole party kept in durance for two hours, under an armed sentinel at the gate, who was told to shoot them if they moved, while others of the gang robbed the stores. This they effected, and decamped with several pack-horses laden with supplies. One gentleman at last ventured to the door, but on looking round observed the armed bushranger. An hour afterwards one of the townspeople, ignorant of the affair, was passing, and walked up to the sentry asking him what was the matter, but received no answer after repeating the question. On closer examination of this formidable-looking personage, he discovered he had been addressing a post dressed up as a dummy, standing "at ease," with musket and fixed bayonet. The captives then ventured out, laughing heartily at the bushrangers' exploit in so successfully deceiving them. The foregoing account of an exploit by these lawless men illustrates the better side of the picture; but it is only fair to state that many of the men became outlaws in consequence of retaliation for cruelties they had suffered at the hands of severe masters. In those days the lash was the instrument of punishment resorted to, often on the slightest occasion, for chastising offenders, especially by the retired military and naval officers, who were so accustomed to its use, in keeping up discipline in the services to which they belonged, that they did not spare it on the prisoner population under their irresponsible control. The slightest provocation or saucy answer from an assigned servant, was the signal for his conveyance handcuffed to the adjoining magistrate, who almost invariably sentenced the wretched prisoner to twenty-five or fifty lashes there and then, with a lash of heavy-knotted whiplcord, that drew blood from his bare shoulders at every wale, until the victim presented a sickening sight. As there was seldom any discrimination in awarding this punishment, frequently on the bare assertion of the master, without enquiry into the cause of offence, the educated and more intelligent class of prisoners suffered equally with the boorish and ignorant. It was men of the former stamp that chiefly formed the gangs of bushrangers, and hence they were a match for the cleverest of the police and military, whose efforts to capture them they eluded not only for months but for years. The circumstance which chiefly favoured them was the mountainous nature of the country, covered with almost impenetrable forests, affording secure and secret fastnesses for their abode, while the fears in some cases and sympathies in others of the prisoners, servants on the farms and stations, secured them from their pursuers and furnished them with food. Besides a feeling of revenge against the free community generally, and a desire to retaliate on certain task-masters, the motive which first led many to become bushrangers was that of trying to escape from the island altogether.

Very few, however, perhaps not one in fifty, succeeded in doing this, and many were given up by the masters of the vessels on board of which they managed to secrete themselves. The difficulty of escaping, and the stringent laws of Arthur, which empowered any settler to shoot down a prisoner in arms, rendered these desperadoes utterly reckless; so that for many years no one travelled without being armed, and every farm throughout the country was barricaded at night in case of attack. Thus while on the one hand the free colonists benefited from prison labour, on the other the moral and personal evils counterbalanced the material good. At the same time it is only justice to state, that where the convict servant of ordinary character was assigned as shepherd, ploughman, or mechanic, to a discriminating master of kindly disposition, no employer could be better served; and in case of danger he or his family were protected by his people from the depredations of the bushrangers. Many cases have been recorded by such colonists of devotion and disinterestedness, by both male and female prisoners, to them in times of emergency, when life and property were imperilled, not only at the hands of bushrangers but hostile aborigines.

VI. *Governor Sorell*.—William Sorell, third Lieutenant-Governor, landed on 8th April 1817. To restore safety to the colony was the first duty of the Governor; on his assumption of office he called the inhabitants together and, enabled by their subscriptions, he offered large rewards, and thus inspired both the soldiers and the constables. In less than three months the greater portion of the bushrangers were destroyed or captured. During Sorell's administration, the colony suffered no serious disturbance from outlaws. This display of rigour was followed by judicious precautions; he ascertained more frequently the distribution and employment of the prisoners of the Crown, and removed many temptations to disorder and crime. It was the practice, established first a few months after his arrival, to muster the whole population annually. Notice was sent through the districts requiring the attendance of the several classes, who accounted for their families and their stock; the name, the residence, and civil condition of every inhabitant became known. Sorell thus ascertained the increase of cultivation and cattle, and whatever indicated progress. The landing of settlers direct from Great Britain was an important event: their efforts were experiments, and their achievements were prophetic. The political philosopher may trace in their errors, trials, and successes, the lessons afforded by experience for the instruction of nations. The rapid advance of modern colonisation tends to underrate the first efforts of our predecessors. The first colonial boat-builder founded a great commercial navy; the first shepherd held in his slender flock a treasure of unimaginable worth. The arrival of many emigrants led to the exploration of the country. The hunters were usually the

pioneers, but beyond the general features of the scenery, they afforded little information; wild cattle were the better guides. To provide a settlement for strangers, Sorell explored the region lying between the Shannon and the Clyde to its Junction with the Derwent; free from timber, and within twenty miles of navigable waters. At this district were located several distinguished settlers, including many retired naval and military officers. Here the same land regulations were in force that prevailed in N.S.W. According to the means of the person taking up land he was entitled to any quantity not less than 320 acres, or half a square mile. The ratio of capital to land was in the proportion of one square mile, or 640 acres, for every £500 sterling. But an important clause in the act was the definition of what was capital, namely: stock of every description, implements of husbandry and other articles which may be applicable to agricultural purposes; likewise any half-pay or pension which the applicant received from the Government. On these liberal terms many retired officers in the army and navy availed themselves of the regulations, and became the leading settlers in the work of colonisation. Indeed, long after their pioneer labours were over, this element in the body-politic preponderated above any other in the colony, and distinguished its social condition from that of N.S.W. From this circumstance also the tone of the upper class of society was rigidly maintained, especially where there was no medium class to blend them with the prisoner community, as in Australia. Between the ex-military or ex-naval officer and the labourer there was a wide gap. Hence the discipline of the one was intolerable to the other, which led ultimately to a state of outlawry and brigandage among escaped felons unexampled in the history of Australian colonisation. The manner in which these officers turned their "swords into ploughshares" was very simple, and will be best described by one of themselves, Lieutenant Jeffreys, R.N., in his account of the country:—"The author, having fixed upon a spot, was supplied by the Governor with three or four convicts (labourers,) to whom were added a ploughman and overseer, both free men. The site of his intended farm was previously well-known to his overseer. These men were provided with three weeks provisions, and such tools and implements as were necessary to their labour. Having a cart to carry their tools, &c., they arrived at the spot about four o'clock in the afternoon. It was out of the author's power to accompany them, but as they themselves related the story, the ploughman was appointed cook, and whilst he was making the necessary arrangements for refreshment, the rest with their axes cut down such timber as was requisite to erect a temporary hut. This they completed and rendered perfectly water-tight before sunset, when they all sat down to such a repast as the cook had provided for them. Their meal consisted of the hind-quarters of a kangaroo cut into mince-meat stewed in its own gravy, with a few

rashers of salt pork—this dish is called a ‘steamer.’ They added to that a sufficient quantity of potatoes and a large cake (damper) baked in the wood-ashes of the fire. These people have often declared that they never in their lives ate a meal with greater relish and appetite than they did this supper. Afterwards the grog went merrily round, and the plains and valleys rang with three times three, in ‘Success to the Captain’s farm!’ A small fire having been made at the foot of the hut they retired to rest, and after a refreshing sleep rose at daylight to renew their labours. In a few days the plan and foundation of a garden were laid out, after which they all set to work to build a more commodious house for themselves and their master. This house consisted of two rooms, occupied by the overseer when his master was not there, and a large kitchen and sleeping place for themselves. In a very short time the author had the satisfaction to see twenty acres of land broken up, and about two hundred acres fit for the plough. In doing this it was not necessary to cut down more than 500 trees. In this manner it is possible for hundreds of settlers, at a very moderate expense, to establish themselves in this delightful part of the globe, the abode of peace, plenty, and rural happiness.” Since this incident occurred on the banks of Pittwater, although the condition of the colony has gone through many phases, social, political and material, the farms have continued their progress without alteration as the abodes of peace and plenty, with a hospitable welcome to the traveller. While the retired naval officers verified the proverbial saying that “sailors being accustomed to plough the deep invariably take to ploughing the land,” so the military officers seemed to prefer sheep and cattle grazing. For these purposes they had to import stock, at first from N.S.W., and afterwards from Europe. The average temperature of V.D.L. being colder than any part of A. (except on the Maneroo Plains, near the Australian Alps,) this consideration affected the quality of wool and the breed of sheep. Consequently English bred ewes—chiefly Teeswater—were crossed with Spanish rams, producing a moderately fine wool, with a larger fleece, which made up in quantity for deterioration in quality. Although the climate affected the wool in this manner, the increase was not diminished; if anything the sheep were more prolific than on the mainland, as they regularly dropped their lambs within the seven months, seldom having less than two, frequently three at a birth, but they were not allowed to rear more than two. This rapidity of increase soon spread the settlers’ flocks over the limited pasture lands of T., and notwithstanding the fact that the grass was richer and denser than on the pastures of the older colony they had to sow English grasses in moist places to feed their stock. However well adapted the Australian grasses are to the climate, they afford but small nourishment in proportion to the area as compared with those of Europe.

Where the latter may feed three sheep to an acre the former often requires three acres to a sheep. The result was that sheep fell in value and pasture lands rose, until at last not an available spot was to be found for increase on the island. Hence the settlers were forced to cross Bass Straits for new pastures in A. As these pioneers of Tasmanian colonisation penetrated into the interior they were the discoverers of new streams, hills, valleys and plains; and like their more renowned predecessors in exploration, they, each in his way, gave these geographical features a “local habitation and a name.” There is much room for criticising the incongruity of local names in these countries, where there is no affinity with the places they are named after. Native names are preferable, which in A. are both euphonious and characteristic of the indigenous people. In T. it would appear that the early settlers were sadly at a loss to find names for new places. It is related in the country that within a certain district they had recourse to the only two books the community could boast. One of these was the Bible, and from it they named the Plains of Jericho, the River Jordan, and Jerusalem Plains. The other book was the “Arabian Nights’ Entertainments,” from which the valley of Bagdad was named. So that the traveller in T. may traverse the delightful Plains of Jericho until he comes to the River Jordan, and passes through the Valley of Bagdad on his way to Jerusalem. Besides the “gentlemen farmers,” as they were called, many non-commissioned officers, free emigrant farmers of small means, and emancipated prisoners settled on small grants of land, and succeeded as well as their wealthier neighbours. Those who had a previous knowledge of agriculture or grazing not only outstripped the amateur farmers, but many laid the foundations of large fortunes by their practical knowledge. As an instance:—For many years the value of the wool was so depreciated, from its bad condition and want of attention to the sheep, that few thought it worth while to clip the fleeces, often throwing skin and fleece away, or using them as litter for pigs. At last one practical sheep-farmer collected these skins, took off the wool and washed it; he was thus enabled to give four-pence per pound for greasy wool. When it was cleaned and properly packed in bales, it fetched from a shilling to one shilling and six-pence per lb. in the English market. This enterprising settler amassed a large fortune, and by his example encouraged others to wash the fleece on the sheep’s back, after using medicine to cure the cutaneous disease. This largely increased the profit from stock, which previously had no value save for the carcass. Even that value was only comparative, as actual money in the shape of gold or silver coin was rarely seen; for a system of barter prevailed in the early days of the colony. So many sheep, bullocks or pigs, were bartered for a horse, or served to liquidate a merchant’s bills. Six sheep at one time were equal to a gallon of rum,

and a horse was worth two or three hundred acres of land, valued at half-a-crown an acre. During this rude system of commerce, where the metallic currency was scarce, a paper currency was in circulation, of promissory notes from sixpence to twenty shillings, issued by any person who thought his credit good enough to warrant his attempt at banking. This kind of money was called "currency," to distinguish it from His Majesty King George III.'s coin, and was of a depreciated standard, however good the issuer's credit. From lack of specie during the time of war with France, when gold was at a high premium in England, Spanish dollars became a standard currency both in notes and metal, and at one time the latter became so scarce that a piece was struck out of the middle, about the size of a shilling, for which sum it passed, and was called a "dump," while the mutilated coin was called a "ring-dollar," as legal tender for four shillings, both stamped with the king's head. This bastard money was not plentiful, as the only source from whence it could be obtained was at the commissariat, where the supplies to that department were monopolised by four or five contractors. This was the largest and most lucrative business in the colony, and it increased in proportion as the prison population was augmented from the mother country. It was through the fostering means sent for the maintenance of her delinquent children that the mercantile community of Hobart Town became at one time the wealthiest in Australia. As already pointed out, that locality had very limited sources of wealth within itself; it was the government expenditure, derived from the British treasury, that enriched the free settlers, while the labour of the prison population made the streets and roads of the capital of T. While the material prosperity of the colony was thus advancing with rapid strides, the moral and social condition of the community was retrograding; not only among the felon portion, assigned or emancipated, but amongst the free settlers, not excluding those who had held the king's commission. Profligacy was tolerated within the walls of the Government House; and as few of these retired officers were married men, they selected mistresses from among the female prisoners. No doubt the absence of virtuous women, in their own station of life, led to this state of demoralisation, for it is recorded that Mrs. Fry, that good and benevolent woman, hearing of the disparity of the sexes among the free population, sent out twelve respectable, though poor ladies, who were married immediately on landing, and became the most exemplary wives and mothers in the colony. This lax state of society existed during the Governorship of Sorell. His successor, Arthur, cleared out the Augean Stables left by his predecessor, and restored the character of the colony to a more respectable status. In performing this task he encountered much opposition from those who preferred a loose state of society. Of these were many influential individuals, who carried their opposition into

politics, and banded together to thwart Arthur in carrying out his stringent measures for the better government of the colony. About three years previous to Arthur's accession to office, coal was discovered on Tasman Peninsula, and it was determined to form a penal settlement at the spot, for the purpose of working the coal, and at the same time establish a place of secondary punishment for crimes committed by transported offenders in the colony. Another settlement of the same character was formed at Macquarie Harbour on the west coast, where these pioneers were employed cutting timber for building purposes. From these settlements it was that the prisoners contrived to escape, and betook themselves to the mountains as bushrangers. The narrow grants and wretched homesteads of the emancipist cotters, the sole farmers at that time of this immigration presented but little to please. The settler, whose imagination pictured the rustic beauties and quiet order of an English farm, saw unfenced fields of grain, deformed with blackened stumps; a low cottage of the meanest structure, surrounded by heaps of wool, bones and sheepskins; harrows and water-carts amidst firewood; mutton and kangaroo strung on the branches of trees; idle and uncleanly men of different civil condition but of one class; tribes of dogs and natives. No green hedges, or flowery meadows, or notes of the thrush or nightingale; but yet there were the park-like lands, the brilliant skies, the pure river; and above all, the untainted breath of the atmosphere. In 1820 there were only two estates, those of E. Lord and Colonel Davey, on which fences were erected; and the destructive incursions of cattle were subjects of many complaints; yet in that year £20,000 had been obtained for wheat exported to Sydney. The first crops were prolific; the early settlers chose the more fertile and open plains; and many selected sites for their dwellings on natural lawns of surpassing beauty. The dispatch of vessels direct from England rapidly increased the population; in one year (1822) 600 settlers entered the port, and by the capital which they invested, and the habits of decency and enterprise they exhibited, gave a new tone to the colony. A succession of publications drew attention at home to the capabilities of V.D.L. It was described in the *Quarterly Review* for May 1820 by a friendly pen, which stated that during three years a detachment of 100 men had not lost three, and that Hobart Town had been sixteen months without a funeral. For several successive years new books were published describing the fertility of the soil and the beauty of the climate. These generally contained a theory of pastoral increase—a geometrical progression towards wealth. The increase was, indeed, rapid beyond oriental precedent. Between 1810 and 1820 it was estimated at fifty-fold. The adaptation of these colonies for the growth of wool first drew the attention of several gentlemen of Hamburgh, whose importation afterwards promoted the improvement of our flocks. The position

of V.D.L. favoured its settlement. Vessels bound to Port Jackson often touched at the Derwent to discharge portions of their cargo; and weary with the length of their voyage, emigrants listened to the persuasions of the colonists, and the hints of the Lieutenant-Governor himself. The advantages offered to settlers, so late as 1818, included not only grants of lands but loans of stock and seed; and a price for wheat, long standing at ten shillings per bushel, and for meat sixpence per pound. The settlers were entitled to rations for themselves and their convict servants for six months. It was stipulated that the stock should be replaced by the increase, and the wheat repaid at the harvest. Such engagements were, however, rarely fulfilled. No suits could be prosecuted by the Crown in the local court, and vague threats of disfavour were the only means of recovery; these were understood as formalities. The Crown, by the prohibition of distillation, prevented a consumption of grain, and until a fixed price was given corn had been sometimes of no value whatever. A partial market was assured, to prevent the total neglect of agriculture. The patronage, of course, led to official corruption; many officers received wheat from their servants in commutation of labour, and some of more than usual inferiority was thus admitted by a Launceston commandant, a refugee Frenchman, who threatened to transport the storekeeper for calling in question its quality. The commissioner Bigge recommended the bounty should be entirely abolished, distillation permitted, and supplies purchased by tender. A deficiency could be no longer apprehended. There were 7400 inhabitants at the close of 1821, who possessed 15,000 cultivated acres, 35,000 horned cattle, 170,000 sheep, 550 horses and 5000 swine. With such resources the danger of famine finally disappeared. The herds were composed chiefly of Bengal cattle, imported an early period; but the emigrants introduced the most valued of the English breeds, which have entirely supplanted the early stock. The herbage and the climate are equally favourable to the increase of cattle. The interior of the country being quiet, tickets of occupation were granted to settlers, who were enabled to establish large herds and flocks on the lands of the Crown. The scarcity of provision in N.S.W. soon created a considerable demand for the produce of this country, and in 1820, meat to the value of £10,000 was purchased by the Crown for exportation. Macquarie, when his administration was drawing to a close, came on a tour of inspection to V.D.L. He arrived in the *Midas*. The squally weather, which prevented his immediate landing, gave time to prepare for his reception. He disembarked on 24th April 1821, saluted from the battery, and by the military, who lined the road to the Government House. At his former visit in 1810 the population did not exceed 1500. A few scattered and miserable huts separated by thoroughfares but half recovered from the forests, then constituted the capital, which had now acquired something of

an English aspect. There were 426 houses and 2700 souls. Few scenes are more pleasing than those which, assisted by memory, display the growth and triumph of industry. The gratification of all parties was visible; and a general illumination closed the day. It was a day of pardons and bounty; when the prisoner received his liberty and the settler his heritage; every inhabitant who had no plaint to prefer, had yet thanks to pay. The bachelors of Hobart Town gave a public ball to the Governor. One hundred and fifty sat down to supper, and the gentlemen danced together till the morning. On 29th June Macquarie sailed in the *Caroline*. He was accompanied to the water's edge by a large concourse of people, and carried with him applause which his amiable vanity prized, and which his beneficence desired. Macquarie inserted in the *Sydney Gazette* the details of his progress and observations. Whatever he described, he lauded; the architectural taste of the private buildings, the handsome church, the commodious military barracks, the strong gaol, the well-constructed hospital, the enterprise and industry of the people, their spacious harbour, their battery, signal post and pier are all distinguished with the minuteness of an auctioneer's catalogue, and nearly in its phrases. During his progress he gave names, among which many remain memorials of his love of country: Staffa, Ulva, and Olmaig, Perth, Campbell Town, Oatlands, Strathallen Creek, Roseneath. The townships of Sorrell, Brighton, and Elizabeth were designated by him; the last in honour of his wife. His own name is found everywhere. The wool of V.D.L. was not an export until 1819. The original stock of sheep were introduced by Colonel Peterson—a mixture of Teeswater, Leicester, and Bengal breeds. Sorrell imported some Merino lambs from Macarthur's flock in N.S.W. These were distributed amongst the settlers, and from that date the wool of the island became known to commerce. In 1819 a small quantity of wool sent home did not pay its freight. Henry Hopkins saw it lying in the London Docks in the worst possible condition. But the success of Macarthur's enterprise in sheep-breeding cheered him on. In 1821 he sent home twelve bales, the whole export of that year, bought at 4d. per lb. and sold in London at 7d. per lb. The venture in 1821 only fetched £88. In 1823 wool was exported to the declared value of £4399. In the third year of Sorrell's administration £20,000 was obtained for wheat exported to Sydney, and £1000 for salt meat. At the end of 1821 there were 170,000 sheep in the colony, 550 horses, 35,000 head of cattle and 5000 swine. The *Britannia*, a vessel the property of Messrs. Enderby and Sons first discovered the whale fishery. On doubling the south-west cape of V.D.L. the crew saw sperm whales; in their progress to Port Jackson they fell in with prodigious shoals as far as could be seen from the mast-head. On arriving at Port Jackson the captain secretly

informed the Governor, who facilitated his preparation for a cruise. The sailors however did not conceal their observations, and two other vessels, the *Mary Ann* and *Matilda*, sailed one day before the *Britannia* and the *Salamander*, on 1st November 1791. On their departure they encountered bad weather, but saw whales in great plenty. The attempt was for the moment unsuccessful. Great expectations were formed by the colonists, who anticipated that the port of Hobart Town would become a rendezvous of fishermen. This fishery pursued subsequently with so much vigour, was of little immediate value to V.D.L. The duties payable on exports from the colonies were both excessive and unequal; especially in oil the difference amounting to almost absolute prohibition; being twenty times greater than by London ships. The settlers could only procure for their own consumption or the Indian market. The whalers often carried on their operations in sight of the towns, and heaps of whalebone at that period lay on the eastern shore. Of the first whale taken in the Derwent, Jorgen Jorgenson declared himself the captor. The trading pursuits of the inhabitants were fettered by the privilege of the East India Company. The act of Parliament authorising its charter prohibited the employment of vessels less than 350 tons between England and N.S.W.; the small coasting trade, was, therefore, solely eligible to the people of these colonies except in vessels unsuitable to the extent of their commerce. Thus, even the Mauritius was closed against the corn and the meat of the country. This law was repealed in 1819, and thus vessels of any tonnage could be employed in the colonial trade. In the islands of Bass Straits sealing was pursued with such vigour, that it was comparatively exhausted at an early date: small vessels were employed in the dangerous navigation and were not unfrequently lost. Few instances of nautical disaster and personal misfortune have surpassed the case of Captain Howard in 1819. He was robbed of an iron chest containing money and jewels to a large amount. Next, the *Lachlan*, his property, was stolen by convicts. He freighted the *Daphne* for India, and sailed with two women and a boy besides the crew. They anchored at Kent's group, and Howard landed. The brig, some hours after, was observed to drift; the wind blowing hard on to the shore, her destruction was inevitable. The long boat was laden, and leaving behind the passengers and some seamen, Howard after great efforts, reached the Derwent. Under his direction, the *Governor Sorell* was dispatched to receive the people left on the island. Meanwhile the *John Palmer* entered the group, took off the women and the boy and a bag of 400 dollars left in their charge, and was lost with the whole of her cargo. Nor was the *Governor Sorell* more fortunate. The seamen of the *Daphne*, who left the island in a boat, saw on the N.E. coast of Cape Barren the binnacle and other fragments of that vessel, in

which Howard perished. The same fate seemed to attend his property after his death. He had freighted the *Frederick* and the *Wellington* with sheep and cattle for the Isle of France, a market which then offered large gains. After some delay they reached the Northumberland Islands, off which the stock all died from want of room and the influence of the climate. Unwilling to proceed without cargo, the captain detained the vessels for spars. Here the *Frederick* was wrecked and twenty-two of the crew were drowned; but the chief officer, one woman and a boy reached the *Wellington*. They then proceeded to Timor, constrained on the passage to subsist on the preserved hides of the cattle. From Timor they proceeded to Batavia; the captain died, the crew dispersed, and the vessel was taken under charge by the Orphan Chamber, her register being lost and her owners unknown! A calamity still more singular is also worth recording. The *Surrey*, Captain Raine, left the Derwent in 1820. Having heard that men were detained at Ducie's Island, he went there in search of them. The men came to the beach, but they could scarcely articulate from exhaustion. They had belonged to the *Essex*, a whaler. One day a whale of the largest class struck the vessel, and broke off part of her false keel; she then went ahead of them a quarter of a mile; and turning back met the vessel with such a tremendous velocity that she was driven back at the rate of several knots; the sea rushed in at the cabin doors; every man on deck was knocked down, and the bows were completely stove in. The sailors were obliged to abandon the vessel, and after visiting several islands were found by the *Surrey* as described. The strong inclination to trade common to emigrants, was in these colonies a passion while the settlers were of the lower class. The want of coin induced the Government to pay the debts it incurred in rum, which, commonly valued at £1 per bottle, passed from hand to hand. The commissariat receipts were however the chief medium of exchange; they were acknowledgments of the delivery of goods for the use of the Crown. They were paid by the settlers to the merchants, who on the appointed days presented them for consolidation, and received in return bills on the Lords of the Treasury. Every trader issued his own notes. In Hobart Town these were issued in great profusion. Often of the lowest value, both in amount and in credit, they kept afloat by the risk which their refusal involved. When presented in small quantities they were usually paid. A trader rejecting his neighbour's bills would be harassed by his revenge. This was however done in some instances. A large issuer of notes in Launceston was staggered by a sudden demand for payment. To maintain his credit he borrowed dollars, and gave additional notes as security. A few days after they were returned, and the same dollars were again borrowed by the unfortunate financier. The run was devised by

his clerk, who managed by such manœuvres to obtain a large bonus for negotiating a loan of coin. The credit of these notes depended greatly on the Naval Officer, a sort of collector; if admitted in payment of duties they were current everywhere. The criminal courts continually exhibited frauds consequent on these small issues. The issuers however had many chances in their favour. The issuers did not always know their own notes, but great numbers were destroyed by persons intoxicated or were lost or worn out. The meaning of payment in currency they interpreted as giving one note for another, or four shillings for five shillings! The colonial dollars were mutilated to prevent their exportation. In 1810 dollars were imported from Bengal. To make a smaller coin the centre was struck out, and these were valued at 1s. 3d.; the ring retaining its full current value. The Crown paid the dollar as five shillings and received it as four shillings, thus gaining twenty per cent. in exchange for bills and in the settlement of accounts. An injustice so shameful became the subject of parliamentary reprobation, and was ultimately suppressed. In 1824 the *Samarang* imported £100,000 of British silver, and the Lords of the Treasury directed that British coin should be paid to the troops, and taken in exchange for Treasury bills. The establishment of the V.D.L. Bank (1823) was the most effectual remedy for many financial difficulties. The traders obtained a charter from Sir Thomas Brisbane; the capital was divided into shares of 200 dollars each, and its direction was committed to a local board. The issues of individuals were finally suppressed by Act of Council. The detection of many frauds enabled the dishonest, with a show of right, to dispute payment. They were sometimes recovered in the Court of Request. Justice was once secured by Mr. Howe in the following manner:—The defendant was requested to select the notes he admitted to be genuine, and then to hand both parcels to the bench; these being marked were dropped purposely, and the defendant unsuccessfully attempting the same division once more, showed that his repudiation was fraudulent, and he lost the cause accordingly. The manners of a people are seen in the law courts. A series of trials arising from the same transaction included a considerable portion of the settlers, and illustrated the trading habits which prevailed. Mr. Gunning being indebted to Mr. Loane, a merchant, agreed to pay him in cattle; this agreement was superseded. Fearing, notwithstanding, that his claim would be damaged by a general insolvency, Loane took with him seven men and swept from Gunning's premises a herd of various ownership. For this he was called in question by the police as a felon; in retaliation he instituted actions for malicious prosecution. Crossley, an emancipist lawyer, issued summonses and instructed the officer to arrest contrary to standing orders; but Timms the Provost-Marshal, to exhibit a spectacle, captured the Police Magistrate proceeding

to Government House. The whole settlement was involved in actions arising out of the debt, rescue and criminal charge, either as parties or witnesses. The Provost-Marshal was dismissed for "drunken arrogance." These trials occurred in 1821 during the circuit of Judge Barron Field, who was induced by the representations of Commissioner Bigge to hold a session in the settlement. The first minister of religion resident in the colony was Knopwood, who came out as chaplain to Collins' expedition. In the absence of clergymen it was customary for the magistrates to conduct public worship, or where that was not possible, to assemble the prisoners and accompany the inspection with a few words of advice. About 1820 the attention of the London Committee of the Wesleyan Mission was aroused by their agent stationed at Port Jackson to the spiritually destitute condition of "a settlement called the Derwent, two weeks sail distant." In May of that year the Rev. B. Carvosso on his voyage to N.S.W. touched at Hobart Town, and was cordially received by Knopwood, who introduced him to the Governor. He preached from the steps of a dwelling-house, his congregation being partly within and partly without, and his wife leading the psalmody. His text was the words: "Awake, thou that sleepest!" West adds that the colony required such addresses. Carvosso's description of the inhabitants is that they were kindly but dissolute. "At New Norfolk," writes West, "and at Pittwater, with a population of several hundreds, no religious services had been performed. A seriously-minded soldier, by diligent inquiry, found out a settler said to be religious. To converse with this person he took a journey of fifteen miles, and found him swearing!" Some Methodist soldiers of the 58th Regiment obtained a room for worship in Collins-street, Hobart Town, where eight persons met on 29th October 1820. Mr. Noakes and Sergeant Waddy were the leaders of this little band of Christians. A mob without assailed the house with fury, drowning their prayers and hymns with shouts and hootings. But the Governor interfered and intimidated the disturbers. In a little time the congregation numbered 300 persons, and fourteen persons enrolled themselves as members. The first Sunday-school was opened on 13th May 1821. Sergeant Waddy was sent to India, where he died. A prisoner named Donne—but whose real name was Cranmer, and a lineal descendant of the great archbishop of Henry the Eighth's time—much helped the rising Christian community. He is mentioned with respect in the early records. In September 1821 the Rev. Mr. Horton arrived. He found the settlement in a miserably low moral condition. He writes: "The wretchedness of Launceston is past description. Of the deaths at New Norfolk all except two are attributed to drunkenness." David Lord gave Horton a plot of ground to build a chapel. Subscriptions to the amount of £400 were obtained. But the money was all expended on the walls, and for a long time the building

remained uncompleted. Two years afterwards the Rev. Ralph Mansfield with some assistance from the Government and the Wesleyan society in England, finished the structure. Mansfield remained in the colony until 1825. A considerable immigration of religiously-disposed persons took place in 1822, drawn to the island by the accounts sent home by Carvosso. Knopwood was superseded as principal chaplain by the Rev. William Bedford, a zealous minister. The Presbyterian Church was founded in 1822 by the Rev. Archibald Macarthur. About this time a branch of the Bible society was founded. The Rev. John Youl, formerly missionary at Tahiti, was appointed chaplain at Port Dalrymple in 1819. Previous to his arrival no minister of religion had ever visited the district. Launceston had no resident minister of religion till 1824. The first place of worship in the town was used alternately as a court-house, a sleeping place for prisoners and a stable. "The disposition of Youl," writes West, "was amiable, and his professional reputation unblemished. Placed in a station of little promise, he cultivated the minds and affections of the young, and discountenanced vices he could not extirpate." The first Roman Catholic priest established at Hobart Town was the Rev. Philip Connolly. In spite of the low state of religion and morals a hospitable reception was generally accorded to ministers of religion by the residents in the country districts. At the time of the *Emerald's* arrival the landing-place at Hobart Town was Hunter's Island (named after Governor Hunter of N.S.W.), now the "Old Wharf," and at high tide people used to pull off their shoes and stockings, tuck up their trousers, and walk from the island, where ship's boats landed them into "Camp." As an instance of the small value attached to the possession of land in these old days, we may cite the cases of Mr. Meredith and Mr. Gregson, who having town allotments of ten acres each, situated in Davey-street, given to them by Government, declined to take up the grants, because, if they did so, they must comply with the conditions, and erect paling fences round the ground. At that time a town allotment could often be bought for a keg of rum, and the value of the property did not appear to warrant the outlay. So limited at that time were the supplies of the commoner articles, that eleven poor wretches, condemned to death, remained unhung for want of rope when the *Emerald* arrived, from whose stores the necessary quantity was obtained, and the awful sentence carried into execution. From this period the history of T. becomes more prosaic and business-like; the romance of discovery and early colonisation is merged in the matters of fact which are found in Blue Books and Parliamentary Records.

VII. *The Separation Movement.*—In July 1823 the Imperial Parliament enacted a "Law for the better Administration of Justice in New South Wales and Van Diemen's Land, and for the better Government thereof." This Act was to expire at

the close of the Parliamentary session of 1827. By it the old courts, with their military functions were superseded, and a Supreme Court was erected, whose jurisdiction extended to causes criminal, civil and ecclesiastical. It was also provided that the King might erect V.D.L. into a separate colony. The Act gave rise to a debate in the Imperial Parliament, in which Wilberforce, Mackintosh and Canning took part. The settlers generally were desirous that the separation from N.S.W. should take place. Governor Sorell however was opposed to the proposal. He deemed the measure premature, as tending to augment the expenses of government, and to deprive the people of the advantages of an appeal to the older colony, and of participation in that more liberal system of government a larger community could demand. A public meeting to petition for separation was held at Hobart Town, at which the resolutions were carried by acclamation, and the only dissentient (R. L. Murray) was rather roughly handled. The petition was forwarded to the King through Edward Barnard, the Colonial Agent in London. The petition failed of its object, doubtless because of the Governor's opposition. Towards the close of Sorell's administration the commerce of the settlement was greatly aided by the establishment of a company at Leith in Scotland, with a capital of £100,000, for the purpose of exchanging British commodities for colonial produce. The first vessel despatched was the *Greenock*; it was followed by others, including the *Triton*, Captain Crear. By these ships a large number of highly respectable immigrants arrived, "whose moral worth and successful enterprise," writes West, "have established their families amongst the chief of the land." But the shipments provoked the anger and broke up the monopoly of the local merchants. Sorell's administration ended in May 1824. It was in colonial estimation very successful. The Governor was popular by reason of his familiar manners and his easiness of access. His fine countenance attracted the confidence of the stranger. The settlers, to testify their regard for him, petitioned against his recall, and presented him with a testimonial of the value of £750. On his return to England he received a pension charged on the colonial revenue of £500 a year, which he enjoyed from 1825 till his death in 1848 at the age of seventy-four. The aspect of the island at this time was not inviting to strangers; but the current of colonisation was set in, and the ultimate superiority of the colony compared with all others became an article of Tasmanian faith. On this subject the agricultural societies maintained a war of papers. Barron Field, chief justice of N.S.W., was the champion of that colony, and dwelt on its vast forests, its wool, its boundless pastures and rivers. The president of the Tasmanian agriculturists urged all which became his position in defence of V.D.L. At that time protective laws had furnished them with more formidable weapons.

VIII. *Governor Arthur*.—Colonel George Arthur, fourth Governor, succeeded Sorell in May 1824. He had been formerly Superintendent at Honduras in the West Indies, and had acquired the reputation of an officer of inflexible and energetic disposition. He was a trusted associate of Wilberforce and Stephen, and the other leaders in the great anti-slavery movement. His arrival in V.D.L. did not excite any enthusiasm. He replied coldly to the customary address of welcome. He took occasion to express his conviction that the moral example of the free population was essential to the improvement of a class less favoured, and that while employing his authority for the general welfare he was resolved to maintain the rights of the Crown. These sentiments were not very acceptable to the free colonists. The Governor resolved on discountenancing all domestic immorality, and this fact gave rise to much opposition to him. He dismissed from the public service persons living openly immoral lives, and placed all of that class under a social ban. "However lasting the utility of this rigour," West adds, "its immediate consequences were irritation, resistance and contempt." This reserve of manners and austerity of rule contrasted unfavourably with the easy and unaffected manners of Sorell. In truth, Arthur seems to have regarded his position as simply that of superintendent of a penal settlement, and the mouthpiece of the Secretary of State. The state of the prison population, though considerably ameliorated by Sorell, was far from satisfactory. Left much at their own disposal from the hours of labour till their return, they were masters of that portion of the time most suitable for dissipation and crime. The extent of their depredations and the deliberation with which they were performed indicated an extensive confederacy. The subordinate police, prone to contrive with offenders, was ill regulated and insufficient. Goods were carried off in masses, bags of sugar and chests of tea were abstracted from the stores, cart-loads of property were swept off at once. The habits of the populace were daring, profane and intemperate, and to coerce such materials into order required the utmost vigour and discretion. The Chief Justice, John Lewis Pedder, brought from Great Britain the charter of the Supreme Court, which was proclaimed in the market-place on the 7th May 1824. On the 24th the court opened for business, and Joseph Tice Gellibrand presented his commission as Attorney-General. In his opening speech he declared his resolution to adopt the maxims of the illustrious Hale. He eulogised the jurisprudence of his country and especially trial by jury, but the military uniform which appeared in court, if it did not lessen its utility, deprived the institution of its grace. The first person tried was named Tibbs, for killing a negro, who whilst watching for thieves was himself taken for a robber. The first prosecution for libel was at the instance of R. L. Murray, formerly a captain in the army. The establishment of a

Supreme Court seemed to be the signal for an outbreak of disorder and violence. Many prisoners escaped from confinement, and for a long period a succession of depredators alarmed and pillaged the colony. The settlers promptly tendered their assistance to the Government to garrison the town or scour the bush. An account of the chief bush-rangers and their deeds has been already given. The unsparing sacrifice of the robbers captured gradually terminated the practice of bushranging, and the colony enjoyed a long period of comparative repose. The duties levied by order of the Government were collected by the Naval Officer, who received a commission of five per cent. on the amount. Dr. Bromley, surgeon to the First Fleet, subsequently made seven voyages to the colonies, when he obtained the appointment. The infrequent examination of the accounts led to undetected pilfering, and in 1824 a defalcation of £8269 was reported by a jury of merchants appointed to make an audit. Dr. Bromley's integrity was not impeached; his servants had been guilty of almost daily peculation. The percentage system was abolished, and the offices of collector and treasurer were separated; Jocelyn Thomas was nominated to the former and Mr. Hamilton to the latter. Smuggling was still carried on to a large extent despite increased activity on the part of the customs officers. The merchants of Hobart Town were deeply offended at the imposition of a duty on their imports higher than that fixed by Governor Brisbane at Port Jackson, and petitioned Arthur to equalise the charges. The reply of the Governor was a contemptuous refusal. A dispute between Arthur and Gellibrand, the Attorney-General, led to the dismissal of the latter by the Governor on the alleged ground of unprofessional conduct. The dispute excited much interest in legal circles, both in the colony and in the old country. The appeal of Gellibrand to the profession completely vindicated his conduct, but he was not reinstated in his office. His successor was Joseph Hone, brother of the celebrated William Hone, author of the *Everyday Book*, *Table Book* and *Year Book*. Hone's gentleness of disposition won him universal respect. In December 1825 Governor Darling visited the island and proclaimed the independence of the colony. The announcement was followed by a time of much festivity. While he was present Darling was entitled to govern, but when he set sail Arthur, who had been previously addressed as "Your Honour," assumed the authority of Governor-in-Chief and, responsible only to the Home Office, became "Your Excellency." The Legislative and Executive Committees were appointed. In 1827 the island was divided into police districts, so that the prisoner population might be brought more directly under the control of the Government. This was a great improvement in the internal discipline of the colony. Prior to that time instances of harsh and unjust treatment of prisoners by their employers were very frequent, and the lash was in incessant

occupation. A proposal made by Commissioner Bigge to change the site of Hobart Town to Brighton was favoured by Arthur, but the protests of the merchants, who had a large amount of property invested there, prevented the removal. Up till 1824 Georgetown had been the capital of the northern side of the island; but Bigge determined that Launceston should thenceforward be the site, and the penal establishment was accordingly removed thither. A grant of 250,000 acres of land was made by the Home Government to the Van Diemen's Land Company in 1825; and in 1826 their first settlement was formed under Edward Curr at Circular Head. One of the persons in the service of this company was a convict named Jorgen Jorgenson, whose life of adventure was very remarkable. He had been a seaman with Grant and Flinders. Sir William J. Hooker, the celebrated botanist who, when a young naturalist, met with Jorgenson in Iceland, said that his talents were of the highest order, but his moral and religious character was of the lowest. "He was seaman, explorer, traveller, adventurer, gambler, spy, man of letters, man of fortune, political prisoner, dispensing chemist, and King of Iceland—and was transported for illegally pawning the property of his lodging-house keeper." The adjustment of titles to land granted by the various Governors was a vexed question during the whole of Arthur's administration. Many of the limits of the grants had been defined by an expedient said to have been practised in Ireland. A string was tied to a dog's tail, and when the dog stopped running that was taken to be a mile! Thousands of acres had been thus measured off and endless confusion resulted, until finally, in 1831, the Caveat Board rectified the claims made. In 1825 G. T. Howe established the *Tasmanian* newspaper in Launceston, and in the same year, in connection with Dr. Ross, started the *Government Gazette* in Hobart Town as the official rival to Bent's paper, the *Hobart Town Gazette*. The strife between Bent and Arthur was long and fierce. The Governor resolved to extinguish the liberty of the Press, and in 1827 he got an Act passed by the Legislative Council giving him unlimited power of suppression. Bent was refused a license to publish his paper, the title of which was the *Colonial Times*. Bent next tried the publication of a monthly magazine at the price of five shillings a number; but this did not succeed. The Governor's despotic conduct roused the colonists to remonstrate, and the Secretary of State (Lord Goderich) disallowed the Act for suppressing the liberty of the Press. Bent however was indicted for a libel on the Governor and fined £500. In 1829 two journals were started in Launceston—the *Advertiser*, by John Fawkner, and the *Cornwall Press*, by S. Dowsett. The quarrels of Arthur with the Press was continued till the end of his administration. He was charged with employing spies, and some facts that transpired in the courts favoured the charge.

IX. *The Black War*.—The incidents of the Black War have been already narrated under that head and that of "Robinson;" but as forming a chapter in V.D.L. history may be here briefly recapitulated. When Arthur assumed the Government in 1823 it was expected that among the stringent measures he initiated something would be done to suppress the war of races going on between the settlers, convicts, and natives. But these expectations were disappointed, and for seven years the colony continued to be in a state of anarchy. At last it became necessary for the Government to take some decisive measure for the suppression of this native warfare and the restoration of peace to the island. After consulting with his advisers, Arthur projected a scheme of a Quixotic character, to try and drive the whole surviving native race from the interior of the country to Tasman Peninsula as if he were driving a battue of deer. For this purpose he called on all the colonists capable of bearing arms to join the available military and police force, and form an army stretching across the country inhabited by the natives and drive them before it. By this means a force of about 4850 men was mustered, armed with guns and ammunition from the public stores, while the expenses of the expedition were to be disbursed out of the commissariat treasury. This was in 1830, when the commercial affairs of the colony were very dull. All the colonists readily engaged in the affair, as it would circulate a good deal of money amongst them. On 1st October the force was marched into the interior of the island, sufficiently far from Hobart Town to be north of the districts occupied by the hostile natives. Here they were formed into a line, stretching east and west, over hill and dale, mountain and valley, forest and plain, until they formed a complete *cordon* of military posts moving towards a common centre. As they advanced, this line extended sometimes to sixty miles, where the country was sufficiently open to admit of their spreading. At others it became narrowed to half that width, when they had to pass through dense forests and thickets. It was estimated that there were at least 1800 natives in the island, and that this mixed army had surrounded nearly the whole of them. On they marched towards their goal almost sure that the enemy would be captured on the peninsula. Scattered over such an extent of country it was no easy matter to provision this motley army, while the rough country they had to traverse wofully damaged their boots and clothing. Excepting a few faint-hearted volunteers, the colonists stuck to the main body; and after six weeks toil and privation by flood and fell, this *cordon* narrowed to the rallying point at East Bay neck, where the peninsula is only half-a-mile wide. Here the regulars were sent on to secure their game after such a formidable battue, which cost about £30,000, never doubting but that they would find the frightened aborigines crowded towards the extreme point of land. They returned with *one*

old woman and a sick man. Of course the natives slipped through their lines while they advanced, and returned to their camping grounds after the grand army had passed on. Great ridicule was bestowed on the result of this expedition, which realised the old adage of the mountain labouring and bringing forth a mouse. The ragged appearance of the army, with toes and elbows peeping out in their nakedness, caused much amusement. But all agreed that it was a capital campaign, as so much money had been spent, and the fortunes of many previously needy colonists were laid. The failure of this expedition rendered the aborigines bolder than before, and they committed depredations on the settlers in the rear of the army sent out to capture them. In this emergency Robinson came forward and proposed a scheme of winning over the natives by gentle means, promising them food and clothing if they would come into Hobart Town where they might be safely guarded or sent to some place of security. The success of Robinson's scheme, and the ultimate extinction of the native race, have been already narrated.

X. Close of Arthur's Administration.—When the Constitutional Act approached its term the colonists determined to seek not only for trial by jury, but for a voice in the Legislature. A petition adopted by a meeting held in 1827 was confided to a deputation, who were instructed to forward it through Arthur, and to entreat his concurrence with its prayer. A time was fixed to receive them; but when at Government House they were met by a blundering message postponing the interview for one hour. Deeming themselves and their constituents slighted, they declined a second attendance. Arthur published a vindication of himself. He stated that business of great importance with Mr. Curr had prevented his examination of the documents; he had requested the delay only to prepare himself for the audience, and regretted that the colony were deprived of his friendly offices by an unreasonable caprice. This paper fell into the hands of the deputation a few hours after the vessel had sailed with despatches for the Secretary of State. They considered this a manœuvre contrived to stifle their defence, and instantly dispatched a fast sailing boat to pursue the ship with an exculpatory letter. The hostility of Arthur to the petition was well understood, and there were many others who did not sympathise with its object. Sir John Owen presented it to the House of Commons without a word. The Ministers expressed their desire to grant free institutions so soon as the colony was ripe to enjoy them, when Mr. A. Baring (Lord Ashburton) remarked that colonies are never ripe for free institutions until they get them. Mr. Marshall, the shipping agent, attempted to form an association in London in 1828 for the protection of these colonies. All persons commercially or otherwise interested were eligible for membership. A correspondence was projected with the leading colonists,

and it was assumed the British Government would readily attend to representations emanating from such a course. The scheme did not obtain the support it merited, and the scattered colonial interests could never be combined for a joint action. The partisans of Arthur ridiculed the plan, and it came to nothing. The Constitution Act, which became law on 25th July 1828, differed in many of its provisions from the last. Under the former Act the Attorney-General could refuse to file a bill, and exercised this discretion in a case of libel. The new law authorised the court to permit an information to be exhibited by any person, and the Attorney-General was bound to indict except in felony or capital prosecutions. Jennings, a solicitor, claimed the interference of the court against the Attorney-General, Montagu. One Savery, who had been transported for forgery, was sued for a debt; but Montagu, who had been a passenger with the debtor's wife and felt interested in his welfare, stayed proceedings by verbal guarantee. When Jennings attempted to enforce the agreement Montagu replied that he was more to be affected by the sun than the wind, and added, "I know how to defend myself against a person ten times more able or wicked than yourself." The Judge decided that the Attorney-General was not bound to sign a bill of indictment against or to prosecute himself. The indemnity due on a returned bill of exchange was decided by the court (1826,) on a friendly suit, "*Cartwright v. Mulgrave*," at the expense of the merchants. It was deemed proper to give a high compensation, both as solace for disappointment and to discourage a careless issue of bills. The plaintiff paid £112 currency for £100 sterling, calculating that £120 currency would be required in London for the £100 sterling. The assessors fixed 25 per cent. to cover all losses, and the sum has been allowed by the Supreme Court on all similar cases to this day. In 1827 Captain Dillon of the *Research*, an East India Company's ship, the discoverer of the relics of La Perouse, visited Hobart Town. He was prosecuted for assault and false imprisonment by Dr. Tytler, a gentleman commissioned by the Asiatic Society to conduct the scientific enquiries the voyage might favour. He was seized, confined to his cabin, threatened with the lash, and guarded by New Zealand savages, among whom were two called by Dillon "Prince Brian Boru," and "His Excellency Morgan McMurrah," who espoused the quarrel of the captain, and offered to grill and eat the unfortunate physician. The jealousy and violence of Dillon strongly indicated insanity, and Dr. Tytler represented his fears to the second in command. This opinion became known to the captain, and led to the assault and imprisonment, from which the doctor was released by a writ of *habeas corpus*. The Chief Justice, in pronouncing judgment, explained the absolute power and stringent responsibility of a captain in the

management of his ship's company, and sentenced Dillon to fine and imprisonment; but the latter was remitted in consideration of his enterprise. In 1827 the public treasury was robbed of £1400. The thieves entered at night, while the sentinel was on guard, and the rifled chest was found hidden under a tomb in the adjacent burial ground. Three persons and the sentinel were tried for the offence; but on the second day the Crown Prosecutor was not in his place. The truant lawyer was enjoying a breakfast, while the court and prisoners were watching the door of entrance. The patience of the Judge gave way, and he directed a verdict of "not guilty" to be entered. The Crown relieved the Treasurer from his responsibility for the loss. On the trial of Salmon and Brown for murder at Macquarie Harbour in 1829, a military jury exhibited that institution in no pleasing form. They disagreed on their verdict; Lieutenant Matheson, conceiving that the facts did not sustain the indictment, declined to convict. His co-jurors were unanimous; and after three days and nights he submitted. On the Saturday evening the men were sentenced, and executed on the Monday following. Their confession left no doubt of their guilt; they had committed murder that they might escape from misery; but they asserted that the principal was Browne, and the accessory Salmon—the reverse of the indictment. During their long consultation the jurors were allowed refreshment; but on Friday evening several resolved to elope. At a late hour they broke past the astonished constables and returned to their homes. They were however recalled by the Sheriff and kept under stricter watch until the trial ended. Amusements of the turf, officially patronised in other countries, were discouraged in this. From an early date occasional matches were made for large stakes; but in 1827 races were regularly established at Ross. The course was lined off, a stand erected, in which about fifty well dressed people were spectators. The riders were equipped in different coloured clothing, and as they darted along, obscured at intervals by foliage, the scene was picturesque and animated. A race was contested by Messrs. Gregson and Hardwicke, which the latter lost. Arthur probably had no great taste for such pleasures; but he ascribed his unwillingness to support them to their tendency to excite the prison population, and seduce them into disobedience and crime. No regulations or punishments could hinder their haunting the tents, or deter from intemperance and consequent miseries. Happily, dissension disappeared in the presence of distress. Arthur's name is on the list of subscriptions for the family of Captain Laughton who, having lost his property by shipwreck and fraud, was drowned on the coast. Arthur gave twenty guineas, and thus fixed the high scale of colonial benevolence, which no vicissitude of public affairs has abated. The largest private subscriber was Captain Carne of the *Cumberland*, not less unfortunate than

Laughton. When no tidings were heard of the vessel, it was supposed she had foundered; but in 1828, Captain Duthie, of the *Bengal Merchant*, threw light on her fate. He had found the *Clarinda*, Captain Crew, at Rio, who had been boarded in lat. 8° S. The pirates chained him to the deck while they robbed the vessel; he saw a bucket on which he could trace the word *Cumberland*. Some of the pirates proposed that Crew should walk the plank, but were resisted by the captain. A little black boy shipped by the *Clarinda* at the Cape De Verde Islands remembered the pirate vessel as often seen in that port. In what form the *Cumberland* perished is not certainly known. Pirates executed in England for other crimes were supposed to be guilty of this; more than a hundred and fifty perished by their violence. Some they cut down, and others they cast overboard. They were driven to the port of Cadiz by a storm, and attempting to negotiate a bill they were detected. A ship of war conveyed them to Gibraltar, where several suffered; others were forwarded to England and condemned there. The story of the capture was long a standing topic in the unarmed merchantmen that passed her track. As the emigrant afterwards approached the supposed latitude he heard with bated breath the fate of the *Cumberland* whenever a strange sail darkens the horizon. In 1828 the Government determined to establish a school at New Norfolk, called the "King's Grammar School." The members of the Government were the board of guardians; the master was in holy orders. This effort was also frustrated. Such attempts were not however lost; they were in reality not only the pledges, but the causes of final success. But the establishment of the King's Orphan School in 1828 was successful. It was chiefly designed for the numerous children whose parents were unable to support them, who had deserted, or who were dead. It was placed under the guidance of a committee, and afforded protection to many children who must have sunk under the influence of a vicious example. In the absence of natural ties the settlers have often displayed a parental tenderness in educating the children of the outcast and the stranger. The public institutions which multiplied at this period tended to mitigate the spirit of party. In 1826 several tradesmen met to project a Mechanics Institute. In 1827 they called a meeting of the inhabitants, who having chosen Gellibrand their chairman, organised the institution; the Governor was invited to be patron; the Chief Justice was chosen president, and James Wood appointed secretary. Dr. James Ross, called the "Birkbeck of Tasmania," delivered the first lecture on 17th July on the "Science of Mechanics." The second was on "Astronomy," by Gellibrand senior; Hackett gave one on "Steam Engines;" Giblin, senior, one on "Astronomy," and Dr. Turnbull on "Chemistry" completed the course. James Thomson gave lessons in geometry to a youthful class. These

efforts languished during the absence of the secretary in Great Britain; but in September 1829 the former lecturers reappeared; contributions increased, and a library and apparatus were obtained from England. In 1830 two hundred members were enrolled, and the institution was promoted by all classes of society. Among its supporters Dr. Ross occupied the first place. He was a man whose name will be ever mentioned with respect. His political career does not receive unqualified praise; as a partizan of Arthur he sometimes sanctioned by his pen what it is difficult to vindicate; but he contributed to the intellectual advancement and external reputation of the colony beyond any person of his day. Dr. Ross was the son of a Scotch advocate; educated at Aberdeen University, he was some time employed as a planter in Grenada, where he became an advocate of negro freedom. He afterwards established a school at Sevenoaks in Kent; but his family kept pace with his fortunes. He determined to emigrate and arrived in V.D.L. in 1822. Some error in the shipment of his goods, upon the schedule of which he claimed 2560 acres, deprived him of one-half. He chose his location on the Shannon, and called his cottage the "Hermitage." Here he was vexed with the incursions of cattle, the perfidy of his servants, the dread of bushrangers, and the visits of the blacks; and he willingly accepted the office of Government printer, which Bent had lost. The *Courier*, his newspaper patronised by the Governor, obtained a large circulation, and in 1830 published 750 copies. He wrote with great facility and copiousness. In a letter to a friend, he said: "I write my articles, engrave my vignettes, set the types, adjust the press. Sometimes I set up a few lines myself, and dictate at the same time to one or two of my compositors. Sometimes I write three lines of a sentence for one, three lines of a sentence for another. I teach my own children, nine in all, at the same time that I write paragraphs." A genial spirit, except when troubled by political anger, usually sparkles in the writings of Dr. Ross, and in such they are rather unfair than bitter. Wherever Arthur disliked, Ross opposed. He denounced the emigration of the poor, and Archbishop Whately charged him with baseness in supporting the penal system of transportation; but no colonist would question his sincerity. Dr. Ross retired from his literary labours in 1837, and not long after closed his earthly toils. In his last address to the public he said, "independence of spirit has been my motto; freedom my watchword; the happiness of my fellow-men my object; and the truth of our religion my buckler and consolation." Such was the account of himself; and may be left as his merited eulogium for posterity. An association with objects more extensive and more ambitious in organisation was projected by John Henderson, a surgeon from Calcutta, in 1829. It was denominated the "Van Diemen's Land Society." The members proposed to collect and diffuse

information respecting the natural history, produce, mineral wealth, statistics, condition and capabilities of V.D.L. The Governor accepted the office of patron of the society, and its establishment was celebrated by a public banquet. In his account of the institution, the founder and president relates that, although it enrolled the heads of departments and the most respectable settlers, he found himself surrounded by spectators rather than coadjutors, who, in the absence of "selfish interests" and personal advantage could not be stimulated to toil. Dr. Henderson, whatever his science, was disqualified by his censorious dogmatism to rule. His work was an outline of projects which entered into every imaginable department of political economy, and contemplated a social revolution. The charter of the V.D.L. Bank having expired, it became a joint stock company and enlarged its capital to £50,000, ten per cent. being charged upon discounts. The Tasmanian Bank was a private one, of which the Gellibrands were the proprietors. The limited business carried large profits, and the purchase of bills not passed in the regular course of discount yielded large returns. The Derwent Bank, established chiefly by persons connected with the Government, was opened for business on 1st January 1828 with a capital of £20,000. At the same time the Cornwall Bank, with £10,000, was established by the merchants of Launceston, and the facility of monetary transactions increased on every side. The arrival of considerable investments from India brought rupees into extensive circulation, and they formed a great proportion of the current coin. The large imports of English goods, and the increase of promissory notes, alarmed several persons connected with trade. An advertisement signed by John Dunn offered a quantity of shares in the Derwent Bank on liberal terms. At a meeting of shareholders, Dunn maintained that the liabilities of the community were dangerous, and twenty times greater than the circulating medium. It was replied that bills were chiefly multiplied by re-sales, and that the cash of the consumer would be transmitted through the whole mercantile chain. The V.D.L. Bank discovered a singular fraud by the cashier in 1828. Amongst the large accounts which were unlikely to be drawn he debited the cash which he employed as a private discounter of bills. The sudden presentation of an unexpected draft led to an examination, and £2000 were found deficient. The money was refunded, except a trifling amount, and prosecution waived. The interest of the officers of the Government in the Derwent Bank occasioned complaint. The risk, liabilities, and antipathies of trade were deemed unsuited to their duties. At the Governor's request the relation was disguised, but it was not dissolved. The state of trade at this time wore a deceptive aspect. Dr. Henderson reckoned the actual profit of the colony at one and a-half per cent., while Prinsep, a barrister of Calcutta, described every branch of

business as a path to opulence. In 1829 a merchant sold £1500 worth of goods at an advance of fifty per cent. and a credit over three years bearing fifteen per cent., amounting to £2250 in all. A glut sometimes reduced the value of merchandise below London price. The increase of capital and the opening of cash credits facilitated the operations of the settlers, but tempted many to ruin. The Government rewarded the rapid improvement of estates, the erection of substantial dwellings, farm buildings and fences, by grants of land in extension. To secure the proffered boon the settlers accepted the assistance of money-lenders, whose claims at length absorbed the proceeds of their toil. During a progress through the colony the Governor visited many establishments, and distinguished the enterprising agriculturist with special favour. On his return to head-quarters he expressed the pleasure his inspection had afforded; and noticed in a public order Gatenby, of the Isis, as a "good old English yeoman," and an example of enterprise and skill. Well assured that His Majesty was desirous that the character of a plain, upright farmer should meet with encouragement and reward, he added to the settler's grant 1000 acres. The "Gatenby farmers" were henceforth noted as a favoured class, and many anxious for the same recompense borrowed, enclosed and improved, until they had not a rood of land to call their own. The most distinguished money-lender was Sheriff Ferreday, whose ordinary charge was thirty-five per cent., or less with ample security. After a few years he returned to Europe, having realised £20,000 by usury. At his death he devised a portion of his wealth to Oxford University to found a scholarship. He suffered much vituperation, probably with little comparative justice. "His Bible," said Gellibrand, "is his bill-book and his gold his god," a quotation from Burke highly relished at the time. The Treasury was again robbed in 1832. It was observed that the office papers were deranged; constables were stationed to watch, and a sentinel was placed at the door. The sudden examination of the chest by the Governor discovered a more serious transaction. It appeared that capital had been borrowed from the chest without authority to the amount of some thousands; the money was however restored. No public care could reclaim these funds from their tendency to escape, and they were not deemed sure until out of the custody of the Government. The Secretary of State directed the public cash to be deposited with the banks. The Treasurer was not authorised to retain more than £10,000 of paper, and the V.D.L. and Derwent Banks each received charge of £10,000 in cash. During six years the revenue had risen from £30,000 to £60,000. Notwithstanding a very liberal official expenditure, the surplus funds in 1831 amounted to nearly £10,000. The interior communication was facilitated both by the business of the police and the cheap labour in the hands of the Crown. The post of

Sorell's time was a private speculation, conveyed on foot, afterwards on horseback. On 19th June 1832 a "cheap and expeditious conveyance to and from Launceston" was announced. The owner, J. E. Cox, drove tandem, at the rate of forty miles a-day; only one passenger was accommodated, at a fare of £5. The practicability of the journey was then the subject of considerable betting. In 1827 and the two following seasons N.S.W. suffered serious droughts, which increased in severity. Rivers were exhausted, and their beds left dry. Not only the want of rain was felt, but a withering blight, travelling in a defined current over the cultivated districts, cut off their harvests. In two years the cultivation of wheat in V.D.L. increased from 20,000 to 30,000 acres, and the average price of wheat at Hobart Town was eight shillings per bushel. This stimulated further production, and tended to avert from V.D.L. the distress which over-speculation and scarcity produced in N.S.W. This dearth was followed by two plentiful harvests and a depression of prices. The farmers of N.S.W. entreated Governor Darling to establish a corn law, to check importation. In declining the project he attributed the successful competition of this country to the superiority of its wheat and facility of transit; and hinted that the elder colony was indebted to foreign supplies for its subsistence. The penal character of the colony at this period was constantly indicated in the entire spirit of legislation. Thus a house could be broken into at night, when a person suspected as an absconder was expected to be found there; whoever engaged a convict, though in ignorance of his civil condition, incurred the penalties of "harbouring." Publicans were liable to fines for supplying such persons even with common refreshment. Any man might arrest another whom he chose to fancy a prisoner at large. These deviations from the practices of society in its regular state were occasionally vexatious, but not commonly. The settlers being acquainted with each other, and the servants usually known to the constables, prevented those practical evils, otherwise inevitable. At the accession of Arthur the country about the Clyde and Shannon was stocked with numerous herds, and from their bulk the lands on which they fed were then called the Plains of Bashan. The herdsmen acquired great skill in tracking and driving the cattle. Their stations were in advance of the located districts, and opened many fine patches of country. Their horsemanship was celebrated; they galloped amidst the trees, now stopping, now leaning to the right or to the left; avoiding obstruction and escaping collision with wonderful agility. They lived a half-savage life; were the reckless oppressors of the natives; often the accomplices of the bush-rangers, and accused of many crimes. To brand the cattle, they were driven within an enclosure seven feet high, and when exhausted by hunger, one man armed with a pole threw a

loop round the horns, another entangled the legs, and the beast was branded with a heated iron; then turned into the woods, or driven to market. Little caution respecting the rights of ownership was observed; several were capitally convicted, when probably they were careless rather than deliberately criminal. The larger herds belonged chiefly to gentlemen of different families but of the name of Lord. In describing their depredations, it was said that a party of the E. L's, D. L's or the R. L's had made an excursion. The complaining farmer was told that he might impound, but not maim them; but a troop of horsemen were required for this purpose. "The glorious 23rd of May." Such was the day and month of 1831, separated by those who witnessed its achievements to everlasting renown. The excitement of the campaign against the blacks had absorbed political animosities, and brought all parties together; but by this time the popularity of the Governor was spent. The struggle for parliamentary reform agitated Great Britain, and the colonists determined to attempt the recovery of their rights as Englishmen. So lively was the interest in the affairs of Europe, that the tricolour was mounted by more ardent politicians. The last wave of revolution, which had scattered thrones, rippled on these shores. A meeting was called by the Sheriff, and the principal speakers were the Gellibrands, Crombie, Cartwright, Dunn, Abbott, F. Smith, Meredith, Lascelles, Gregson, Jennings, Kemp, Hewitt, and Lowes; of these none were so conspicuous as Mr. Thos. Horne (a relative of the Great Horne Tookey) afterwards puisne judge and who was described as the "honest barrister" by the admiring press. "If crushing," said the learned civilian, "is to be brought into operation no doubt I shall be crushed. Let them crush me and they will associate my name with the record of this meeting, which history will preserve to the latest period of time." The object of the movement was to bring under the royal notice the government of the colony and to demand trial by jury and a Legislative Assembly. The petition to the King was entrusted to the custody of Mr. Sams, who was proceeding to Great Britain. Whether it ever reached the throne was a matter of dispute; some said it had been committed to the deep, with much solemnity; others that it had passed from the messenger to the hands of a merchant, who disregarded its fate. It obtained no reply. The colony had just reason to complain at the time. The Supreme Court had been closed for many months; the business of the Legislative Council detained the Judge and Attorney-General from their proper functions, and for nearly two years no gaol delivery had occurred at Launceston. Two persons, father and son, charged with cattle stealing, had been two years awaiting trial, when they were both acquitted. The evidence against them was of the slightest description, yet during their detention domestic calamities had overtaken them. The delay was still further extended by the issue

of a new charter, and with the usual incaution of the Secretary of State. This charter arrived 1831; it nominated Mr. Pedder chief justice and Alexander Macduff Baxter puisne judge. It made no provision for continuing process begun in the late court, and required colonial legislation to cure the defects of its details. Baxter, the puisne judge elect, had been Attorney-General of N.S.W. His relations with Darling had not been cordial, and he was disgraced in the eyes of the public by domestic differences; his wife was insane and he himself was intemperate. Just before he left Sydney for V.D.L. he was bound over to keep the peace and was declared insolvent. On his arrival the royal warrant for his induction had not reached the colony, and after some delay he returned to N.S.W., and thence to Great Britain, where he died. Baxter ascribed his ruin to his grant from the Crown; he employed persons to look after his estate, and they conducted him to beggary. The Lieutenant-Governor resolved, if possible, to exclude Baxter from an office which he could only dishonour, and passed an act pronounced by the lawyers a piece of "doubtful and dangerous legislation," by which the clause of the charter requiring two judges was expunged, thus constituting the court of one. The Act of Parliament, however, authorised the measure; the Council had power to repel or annul a patent until the pleasure of the Crown was known. The Act was approved, and remains among the laws. Occasions might occur when the course of justice would be arrested in a small community by requiring many officers to constitute a court. The reformers were not disheartened by their failure; they assembled again the following year at the request of the Hornes, Gellibrands and the Gregsons. The effort was unavailing. In 1834 it was renewed with still more earnestness; the former parties re-enforced by many important accessions maintained the popular cause. Repeated disappointments excited some bitterness, which was expressed in strong terms. Mr. Thomas Horne reminded the Home Government that they would make "a dissatisfied and turbulent people, ready to use their power and assert their rights if necessary by force of arms." He advised the oblivion of minute grievances, and said "were the angel Gabriel to propose one measure and Satan another, if he considered Satan's the most politic he should have the honour of adopting it." But neither importunity nor threatenings prevailed. These efforts were renewed in the following year; but in 1835 some of the chief advocates of a Legislative Assembly deprecated the penal institutions of the colony, and proposed that all convicts, on their arrival, should be set free; of this plan Mr. R. L. Murray was a distinguished advocate. A case occurred in which a young man, Robert Bryan, was tried on two separate indictments, and such was the evidence, that many unprejudiced persons concurred in the verdict; yet the witnesses against him were open to suspicion. It was commonly asserted that he was sacrificed, if not by the

contrivance with the concurrence of the Government. The trial was reported by the *Colonial Times*. The editor, Henry Melville, pointed out in strong language the suspicion of unfairness; the dependence of the jury; the presence of the Governor at Launceston during the trial; the infamous character of certain of the witnesses; and the overruling a challenge of a juror by the prisoner. The remarks of Melville were carried beyond the tolerated bounds of public criticism; the Attorney-General, Stephen, induced the court to issue an attachment. The defendant was required to admit the authorship; this being done, the judge whose conduct he had censured pronounced the sentence. To judge, condemn, and imprison, at once and by the party offended, included all that tyranny could ask. Any reference to the proceedings of a court which the judge might choose to pronounce a libel might consign to perpetual imprisonment. A similar case at Newfoundland was discussed in the House of Commons, and the ministers joined the opposition in severely reprehending the practice. The papers published the debate, and Arthur slowly obeyed the signal and gave Melville his liberty. Motions for attachment have not often disgraced the administration of justice; they are relics of barbarous times. This process was issued against Fawcner, the editor of the *Launceston Advertiser*, who escaped by an apology; and it was moved for by the Attorney-General (Stephen) against Murray and Melville for calling an affidavit of the Solicitor-General to the effect that a fair trial could not be obtained in Bryant's case with a colonial jury—"an extraordinary document!" The judges dismissed the application, when Stephen remarked that he "thanked God he despised the observations as well as scoundrel-like motives which influenced them." A public meeting demanding trial by jury was held in 1834; an address was presented to Arthur by deputation. In urging the amendments of the law they referred to the extraordinary powers possessed by the Government. Arthur, in reply, professed a liberal desire to gratify their wishes; but denied that he possessed extraordinary powers or that "they required to be watched with more than usual jealousy." He had however deferred the establishment of British laws to the last possible moment, and certainly possessed great powers; on the whole, more capable of perversion than any ever known in a British colony. The Attorney-General, Stephen, was desirous of substituting for the assessors a jury of seven instead of twelve. His project was opposed by Mr. Kemp, and indeed very generally disapproved. It was argued that the chances of influence multiply as the number of jurors are decreased, and that the national practice was the only safe guide. The amount of discussion that attended the dispute was prodigious: pamphlets and letters without end. The prejudice of the people was however on the right side; although there is nothing sacred in an

even number, the retrenchment must have increased the facility of corruption. The law as it ultimately passed removed the danger by giving either party a right to demand a jury; and to the party against whom the application was made a choice between a petty and special jury; but three-fourths were taken as the whole after six hours' deliberation. This act was framed in virtue of an order of council by the King in 1830. It provided that in criminal prosecutions where the Governor, or any inferior officer, civil or military, could be interested in the result of a trial, a jury taken from the special jury list should try the issue. Towards the close of Arthur's administration many not prone to party strife were anxious for its termination. The meetings to petition were more frequent and assumed a more genial character. As the causes of dissension became better understood the patronage of the Governor ceased to be considerable, and no colonist was a lover of unprofitable despotism. These sentiments prevailed in both penal colonies. A "political association" was formed in V.D.L. A standing Council was organised under the auspices of certain leading politicians, who discussed the measures deemed necessary to amend their social and political condition. Thomas Horne, the secretary of this body, opened a correspondence with the Governor, and endeavoured to direct his attention to its complaints. Arthur declined recognising his credentials without an express sanction from the Crown. The association however carried on its debates. The Council deliberated in public; the members were assembled in the body of the hall and spectators were admitted to the gallery. Their proceedings were reported in the newspapers, but with party colouring. By Dr. Ross they were turned into bitter ridicule; his remarks were retorted with cruelty and insult. A storm collected around him he could not disperse, and he laid down his pen soon after with expressions of ill-concealed anguish. The recall of Arthur, long anticipated by his enemies, at length arrived. Some months before he had been informed by the Secretary of State that "having continued him in his Government for the unusual period of twelve years, the Crown intended to name his successor." On the recommendation of Mr. Huskisson the duration of an ordinary Government was limited to six years. Special reasons withdrew V.D.L. from the operation of this rule. The Ministerial changes at the seat of empire left Arthur's influence unimpaired. The variations of national policy rarely reached his sphere. Unwelcome orders he managed to modify or evade. The difficult nature of his duties, the distance of his Government from supervision, and the weakness of the free population enabled him to assume and maintain for many years a discretion all but unlimited. He repressed the outrages of the lawless and restored comparative tranquillity. Under his auspices the chief town, which he found consisting of a few frail dwellings, assumed the aspect of a commercial city. Many he received in chains were established in social happiness; many

immigrants who arrived with slender resources had risen to opulence. In 1836 the revenue had increased from £16,000 to £106,639; the imports from £62,000 to £583,646; the exports from £14,500 to 320,679; mills, from 5 to 47; colonial vessels, from 1 to 71; churches, from 4 to 18; the population had risen from 12,000 to 40,000; and every branch of public and private enterprise exhibited the same general aspect. It would be absurd to ascribe to Arthur even the main credit of these results; they were the effect of that spirit of industry which ever characterises the native of Great Britain and which nothing can wholly extinguish. Nor was this prosperity without alloy. The unproductive improvement encouraged was sometimes unhealthy. The settlers were deeply involved: the valuation of property was raised beyond reasonable calculation. The pleasing delusion was cherished by the members of the Government whose official and private interests concurred to dupe them. Happy were they who sold. Arthur left many who, acquiring his favour by the extent of their outlay and the vigour of their enterprise, were laden with debts from which they never recovered, and a prey to perpetual solicitude. West thus sums up his estimate of Arthur's administration:—"A just estimate of Arthur's administration must include all the peculiarities of his position and the complicated interests he held in trust, whether they relate to the Imperial Government, the free, or the bond. The measures best for the colony were not always compatible with the design of its establishment. Nor must we forget that, in surveying the past we have lights which rarely attend the present; that much which experience may amend it is not possible for wisdom to foresee. The primary object of the Crown in colonising this island was accepted by this Governor as the chief aim of his policy. The settlement of free men he considered but subsidiary to the control and reform of the transported offender; their claims, their duties, and their political rights were, in his view, determined by their peculiar position. They were auxiliaries hired by royal bounties, to co-operate with the great machinery of punishment and reformation. As the representative of the Crown, he stood off from the colonies in their sympathies and ultimate views. Employed not to build up a free community of Englishmen, but to hold in check the criminality of an empire, with him the settlement was an institution requisite to the effective execution of penal laws. Such he found it; such he desired to mould its growth, and to prolong its destination. Thus, except in the capacity of employers, he regretted the arrival of free men, and warned the ministers of the Crown that by their encouragement of emigration they were destroying the value of bond labour, the dependence of the settlers, and the adaptation of the island for the purposes of a prison." In the course of his administration Arthur had most places at his temporary disposal; he

filled them wherever possible with his friends, and he left his nephews in the highest appointments within their professional capacity. Arthur drew out a minute detail of official subordination. The duties prescribed for his officers were defined with laboured exactness, and the reins of control met in his hands. Everything was referred to himself, and his instructions were definite and generally irrevocable. Many persons appointed by the Crown were dismissed or thrown off by his contrivance. Accident placed many officers in his provisional gift. Baxter, a judge elect; Gellibrand, an attorney-general; Ferreday, a sheriff; Thomas, a treasurer; Burnett, a colonial secretary; O'Ferrall, a collector of customs; and many in lower station, relinquished or lost their appointments by the determination of his inflexible and unflinching will. The forfeiture was sometimes obviously just; but it was a maxim of his Government to fill the departments with persons who knew no patronage except his own. Among them were candidates for the same gifts who looked for fortunes beyond the limits of their duties; they cultivated farms, became competitors for prison labour, and speculators in commerce. The Supreme Court and the newspapers were often occupied by their recriminations; sometimes they exchanged challenges and sometimes writs. The colonists in opposition saw, not without some gratification, dissensions which seemed to weaken the common enemy, and the press was often enriched by the malice of official pens. Many were, however, too wise to quarrel; their quiet industry enabled them to combine the public and private employments without scandal and with success. They were indeed accused of peculation; but specific charges were generally rebutted, and can now only be noticed as a rumour, and dismissed as detraction. The industry of Arthur was constant; his attention to the details of his Government, and his perseverance as a despatch-writer were universally admitted; a large proportion of his time he spent in his office, and toiled with an assiduity which would have been fatal to ordinary men. It was commonly stated that he was not very accessible; but he willingly heard those whose education and habits qualified them to suggest. Persons of every rank were admitted to an audience on a slight pretence. He was quick in estimating the characters and capacities of all who approached him. The great works of Arthur were attributed by his opponents to sinister motives; those most frequently mentioned were the new wharf at Hobart Town, the road to Richmond, and the Bridgewater causeway. Arthur benefited by his fore-knowledge. The imputations of personal injustice or corruption were not unfounded; what he gained, others did not lose, except by the common risks of a sale. Thus the property of the Rev. Robert Knopwood whom he was said to defraud, was several times in the market; it was offered by advertisement many years before; its future

appropriation to commerce was predicted, and was described to enhance its price. It was offered by Knopwood to Mrs. Hodgson for £800; it was purchased by H. Jennings, a nephew of Gellibrand, a senior, without reference to Arthur; and was finally sold to his agent at a small advance. The new wharf rendered the purchase highly advantageous; but there was neither deceit nor oppression. But although many of his works will perpetuate his memory while the country lasts, they could only be justified by their connection with penal arrangements. The discipline prescribed did not admit of rapid movement or wide distribution. Huts were necessary for the convicts, houses for their offices and various stores; and it was only on extensive exactions that labour could be inspected with success. The waste of expenditure was rather apparent than real. The objects contemplated were not colonial, and thus if the local obligation is lessened the ground of complaint is diminished. During his Government Arthur became wealthy; his estates were numerous and their sale realised a large amount. That he acquired them improperly is not even capable of suspicion, that he applied clandestinely the means afforded by his office to improve them is equally destitute of evidence. Arthur held his last levée on the afternoon of his departure. Several hundreds were present, collected from all parts of his Government. He proceeded with the chief officers, civil and military, to the beach, where the 21st Fusiliers awaited him. Multitudes attended his progress; the wharf was crowded with spectators; a hundred boats surrounded the Government barge and followed him to the ship. The vessels in the harbour were decorated, and his numerous friends gave the usual demonstrations of favour. In these feelings many did not participate. Some followed him with hisses and groans, others illuminated their houses in token of joy. Some fell into the hands of the police, overpowered by their excessive gladness. Having gone through the ceremony of embarkation, he returned to his office, and spent the night in completing his last labours. Adverse winds detained the vessel, and he passed the Sabbath in sight of that country where his name can never be forgotten, and where monuments more durable than brass, formed by his care, will remain to the end of time."

X. *Governor Franklin*.—Before the departure of Arthur the brigade-major of the military district, Lieutenant-Colonel Kenneth Snodgrass, C.B., arrived at Hobart Town from Sydney. He was sworn in as Acting-Lieutenant-Governor on 31st October 1836. He had attained a military reputation in the Burmese war, of which he published a narrative. He was cordially received and his temporary relations were too brief to leave any impression on colonial affairs. The appointment of Sir John Franklin, Captain in the Royal Navy, and Knight of the Guelphic Order of Hanover, was announced by Sir George Grey in the House of Commons on the 13th April 1836. He was

accompanied by Captain Maconochie, late Secretary of the Geographical Society, and one of the Professors of the London University; and by the Rev. William Hutchins, in whose favour V.D.L. was erected into an archdeaconry. Franklin assumed the government on 6th January 1837. The nomination of Franklin was acceptable to the colony. His profession, his career and character, were considered auspicious. He had accompanied the illustrious Flinders on his voyage of discovery, and was at Sydney when the first party left that colony to colonise the island. During thirty-four years he had himself obtained great nautical renown; his intrepidity, his sufferings, his humanity and piety, had been often the theme of popular admiration, and were not unknown in Tasmania. The colonists were resolved to give him an appropriate welcome. He saw with astonishment the signs of wealth and activity in a country which he only remembered as a wilderness. Crowds followed him with acclamations; addresses couched in language of eulogy and hope poured in from every district. The progress of the Governor through the colony was attended with feasting, balls, and public festivities. On his entrance into Launceston he was escorted by three hundred horsemen and seventy carriages; the streets were thronged; the windows were crowded by fair spectators who shared the general enthusiasm. The private settlers received him with unsparing hospitality; he was both oppressed and delighted with the signs of popular joy. The hearty frankness of his replies was contrasted with the official coldness ascribed to his predecessor. He repeatedly reminded the colonists that although ambitious of their favour the duties of his station would probably oblige him to disappoint their desires. He assured them that he came among them without prejudice, and determined to "see with his own eyes, hear with his own ears and judge with his own judgment." On his return to the seat of Government Franklin addressed a despatch to Lord Glenelg, containing an exulting description of his tour. He had seen the colony in its holiday dress, and all parties had mingled their acclamations. He depicted with expressions of astonishment the easy circumstances and general intelligence of the settlers, and especially noticed their exertions to acquire religious and educational advantages. His Lordship replied that this report confirmed his estimate of Franklin's predecessor. In his first minute to the Legislative Council Franklin pronounced an eulogium on Arthur's services, and laid on the table a despatch of the Secretary of State of similar import. The feelings of personal respect with which the people regarded Franklin were greatly increased by the amiable and high-spirited character of his wife. Lady Franklin possessed in her own right a large private fortune, which she employed in the most generous and kindly manner; her counsel and her wealth were ever ready to promote prosperity and alleviate sufferings. And yet in spite

of all this personal esteem the experience of the new Governor among the colonists was far from being agreeable. Before the arrival of Franklin two nephews of Governor Arthur had been raised to very high positions. One of them, Montagu, was Chief Secretary; and during his uncle's government he had contrived to appropriate to himself so great a share of power that Franklin, on assuming office, was forced to occupy quite a secondary position. By some of the colonists the Governor was blamed for permitting the arbitrary acts of the Chief Secretary; while on the other hand he was bitterly denounced as an intermeddler by the numerous friends of the ambitious Montagu, who himself lost no opportunity of bringing the Governor's authority into contempt; and at length went so far as to write him a letter containing—amid biting sarcasm and mock courtesy—a statement equivalent to a charge of falsehood. In consequence of this he was dismissed; but Franklin, who considered Montagu to be a man of ability, magnanimously gave him a letter to Lord Stanley, recommending him for employment in some other important position. This letter, being conveyed to Stanley, was adduced by Montagu as a confession from the Governor of the superior ability and special fitness of the Chief Secretary for his post. Lord Stanley ordered his salary to be paid from the date of his dismissal; and Franklin had to submit to this insult to his authority. After the cessation of transportation to N.S.W. in 1840 hopes were entertained that T. would likewise cease to be a penal settlement; and, under this impression, great numbers of emigrants arrived in the colony. But, ere long, it became known that T. was not only to continue as before a receptacle for British felons; but was, in fact, to be made the *only* convict settlement, and was destined to receive the full stream of criminals that had formerly been distributed over several colonies. The result was immediately disastrous to the free settlers, for convict labour could be obtained at very little cost, and wages therefore fell to a rate so miserable that free labourers, not being able to earn enough for the support of their families, were forced to leave the island. Thus in 1844 whilst the arrival of energetic and hard-working emigrants was adding greatly to the prosperity of the other colonies, T. was losing its free population, and was sinking more and more into the degraded position of a convict station. Lord Stanley, Secretary of State in 1842, proposed a new plan for the treatment of convicts, according to which they were to pass through various stages, from a condition of absolute confinement to one of comparative freedom; and again, instead of being all collected into one town, it was arranged that they should be scattered throughout the colony in small gangs. By this system, it was intended that the prisoners should pass through several periods of probation before they were set at liberty; and it was therefore called the Probation Scheme. The great objection to it was that the

men could scarcely be superintended with due precaution when they were scattered in so many separate groups, and many of them escaped, either to the bush or to the adjacent colonies. At the time of Franklin's first visit to the northern part of the island the comparative resources of the two districts were as follows:—Launceston, 11,734 acres under cultivation, and 95,852 sheep; Hobart Town, 2769 acres, and 3107 sheep. The total live stock in the colony numbered 745,556 sheep, 82,249 cattle, and 6459 horses; with 69,662 acres in crop. Immediately the resources of Launceston were known, its trade increased so rapidly that it exceeded that of Hobart Town, notwithstanding its being the seat of Government. In 1838 the shipping numbered 188 vessels of 22,135 tons, carrying imports valued at £230,399, and exports, £262,183. At this time the population of Launceston was upwards of 8000; the town contained two English churches, one Scotch church, one Wesleyan chapel, one Independent chapel, and one Roman Catholic chapel, besides two schools for boys, two for girls, and one infant school. The total population of T. in the same year was:—Free, 23,040; convicts, 16,000. The former were classed religiously as:—Church of England, 16,000; Church of Scotland, 2500; Church of Rome, 2250; Wesleyans, 1280; Independents, 630; Baptists, 170; Quakers, 80, and Jews 130. Franklin had brought out with him as private secretary Captain Maconochie, who had a benevolent theory of his own, founded on the "mark" system, and set himself to collect facts. In his estimate of prisoners Maconochie, it is said, was equally deceived by a generous confidence and by his pity for human suffering. He embodied the results in a report and sent it home to the Colonial Office without having fully explained the contents of the despatch to Franklin. On its publication he was dismissed by the Governor, and stormy discussions followed the charges made against the settlers. Sir William Molesworth's select committee of the House of Commons had recommended that transportation to N.S.W. and T. should cease. It was determined to adopt a middle course, and Norfolk Island was selected for the new experiment. Maconochie was appointed by Governor Gipps Commandant of the Island, "to test the ideas he had propounded and to seek the success he had foretold." At once he removed all outward signs of the severest discipline. The gaol doors were thrown open, the gaoler loitered before the deserted prison, and the prisoners "yielded to the spell of a transient enchantment." The "mark" or reward system by which they could obtain freedom by good behaviour was explained to them, and they were exhorted and entreated in tones humane even to tenderness. In May 1840, 1800 prisoners on Norfolk Island were set for one day (the Queen's Birthday) absolutely free to join in a general festivity, at which sports and a theatrical performance took place. Glees and songs were sung, tobacco and rum were served out and three cheers

for Her Majesty and three for the Commandant rent the air. No accident occurred—the gaol was entirely unoccupied—no theft or disorder had disgraced the day. “Its novelty gave to Maconochie’s system the air of delirium; the disciplinarians of the ancient *regime* raised their hands with astonishment.” But Franklin’s expectations of a peaceable and prosperous rule were doomed to disappointment—the system of Machiavelian complication and intrigue which at that time pervaded the conduct of the Government hampered and baffled the simple-hearted honest sailor, and left him the victim of designing officials until the closing years of his sojourn in T., when he finally saw and broke through the entanglements drawn round him by covetous and evil counsellors. “His administration was eminently disinterested. He had no private speculations or secret agents, and his measures were free from both the taint and the reproach of corruption.” A contemporary writer remarks:—“The constant efforts of Sir John and Lady Franklin to arouse and foster a taste for science, literature, or art were more often productive of annoyance to themselves than of benefit to the unambitious multitude. The coarse and unmanly attacks made in some of the public papers on Lady Franklin, whose kindness and ability, even if not appreciated at their full value, ought at least to have met with gratitude and respect, were most disgraceful. Lady Franklin’s attempts to introduce evening parties in the *conversazione* style were highly unpopular with the pretty Tasmanians, who asked, ‘Why could not Lady Franklin have the military band in and the carpets out, and give dances, instead of such stupid preaching about philosophy and science and a parcel of stuff that nobody could understand?’” Many efforts had been made to obtain admission for the public during the sittings of the Legislature. The members had been long released from the oath of secrecy, and their votes, and even the substance of their speeches, were occasionally known. Franklin determined to throw open the doors of the Council Chamber in 1837, and expressed a conviction that the freedom of public discussion, founded on accurate knowledge, would confirm the measures or correct the wanderings of the Legislature. As the first sittings of the Council, the novelty of the privilege secured an attendance at the debates; but the desultory and heavy discussions soon tired the patience, and members pointed with exultation or regret to those deserted benches, where patriots had vowed to watch the course of legislation. A bill was introduced by Franklin, and passed into law in November 1837, which authorised the Governor to grant £300 to any congregation to provide a parsonage, and £700 for the erection of a church, or a sum not greater than the amount subscribed by the people. It directed the issue of a salary of £200 to any minister of the three churches whose congregation should be equal to eighty adults, or in towns to two hundred. The discussion

of this bill created considerable controversy; the ministers of the Church of England were especially opposed to its latitudinarian aspect, and Archdeacon Hutchins represented that the principle was wholly untenable on Christian grounds. Archdeacon Hutchins died suddenly in June 1841. His estimable private character and clerical zeal endeared his memory to many. The Hutchins Grammar School was erected as an appropriate memorial of his worth. The vacancy occasioned by his demise suggested the establishment of the diocese of T. This was founded by letters patent on 27th August 1842, when Dr. Francis Russell Nixon was constituted first Bishop. In 1840 the Legislative Council sanctioned the establishment of a college and the erection of buildings. The cost was variously estimated from £12,000. The Queen’s School, intended to be afterwards a preparatory institution, was first formed. The denominational leaning of the college awakened considerable opposition. G. P. Gell, of Cambridge University, was nominated principal of the college. The Government, by the advice of Gell and the Archdeacon, selected New Norfolk as the college site. On 6th November 1840 the foundation-stone was laid by Franklin, assisted by the Members of Council and heads of departments and Captains Ross and Crozier of the Antarctic Expedition. The year 1840 was the most prosperous year in the history of V.D.L. The revenue rose to £183,000. The imports were £988,000, and the exports £867,000. The chief difficulties in Franklin’s official career were in ameliorating the condition of the prisoners and dealing with the vast numbers of those who were poured into the colony. In the five years subsequent to 1840 nearly 20,000 persons were transported to the colony. The smiling aspect of the settlement underwent an entire change, and “the old free settlers,” says Sir Charles Dilke in his *Greater Britain*, “will tell you that the deadly shade of slave labour has not blighted Jamaica more thoroughly than that of convict labour has Van Diemen’s Land.” During the first year of Franklin’s administration nearly 14,000 snakes were killed in the island, and Lady Franklin paid nearly £700 for their destruction. The extensive land sales, combined with the demand for labour, induced Franklin to promote immigration. A vessel was dispatched to Adelaide, where many were suffering severe distress. The N.Z. emigrants were also dissatisfied, and many found their way to colonies where wages were high. This course was inconvenient, and excited great indignation among employers in S.A., who prevailed on the Government to pass a law intended to check emigration to V.D.L. Franklin disapproved of these methods of supplying the labour market, and proposed to devote £60,000 for the introduction of suitable working families from Great Britain. By many this movement was hailed with strong expressions of approbation as a pledge of social elevation of the working classes. The greater part of the settlers appointed Henry Dowling their agent; and

shiploads of emigrants were sent out in rapid succession. On their arrival a financial crisis reduced their wages. The Home Government changed its views, and resolved to continue transportation; the land fund, which had reached £50,000 in 1841, rapidly declined; and in 1843 Lord Stanley was informed that for years to come little revenue could be expected from the sale of land. The local officers, unable to pay the charge, were induced to dispute it, and they attempted to east on the agents of immigration the failure of plans disallowed by the Commissioners. They evaded the payment for one year. The claims of the shippers were instantly allowed by the Secretary of State with the usual interest, and Dowling, who had been aspersed by the Local Government, was amply vindicated by the Commissioners. The Colonial Secretary charged him with collusive sale of his agency to London shippers, and a fraud on the Colonial Treasury. Dowling protected his character by an appeal to the Supreme Court, when Horne the attorney-general admitted that the imputation was unfounded, but succeeded in convincing the jury that no malice is to be inferred from the tenor of a libel when the writer cannot be supposed to be influenced by mere personal animosity. Dowling lost by his agency more than a thousand pounds. An exceedingly useful class of emigrants arrived under the Commissioners, who readily sanctioned the applications, regard being had to the equality of the sexes. The Commissioners defended their opposition to the plans of the local Government. They asserted that private agents could never select labourers sufficient to freight a ship; and they inferred that transferable orders for the payment of bounty on the arrival of emigrants would be either matters of traffic, or that private persons, discouraged by the difficulties of their task, would abandon it in despair. For two or three years the emigrants were satisfied and moderately prosperous. The subdivision of town property was rapid. On every side small brick tenements multiplied. Every mechanic aspired to possess a dwelling of his own. But Lord Stanley's system of probation rapidly told on the condition of the workman. He stood aghast; he persevered for a time; he appealed to the Government for protection against convict competition. For one-fourth its actual cost his property passed into the hands of others; in Launceston especially many suburban neighbourhoods were deserted. The emigrants brought out at so much public and private cost were expelled to the adjacent settlements, to begin the world anew. One of those seasons of general distress to which small communities are especially liable pervaded the entire colonies (1841-4.) A variety of causes contributed to augment its pressure, and to involve the whole in commercial embarrassment. The imports of N.S.W. and V.D.L. exceeding £20 per head; the high price of grain, reaching 28s. per bushel; the enormous rate of interest, and the boundless

extravagance of credit and expense, produced a convulsion all but universal. The measures of the Government increased the pressure of these difficulties. The land sales by auction at Port Phillip were succeeded by the system of selling on special surveys at £1 per acre, and he who one year before had competed for his purchase found the next section in the hands of his neighbour at half the price he had given. The settlers in the elder colonies had speculated deeply. Stock and implements were transferred to the new country under cover of credit. Competition raised the value of bullocks to £30 per pair, of horses to £60, of sheep to £2, the wages of servants to £50 per annum. The Government had raised the minimum price of land, and thus those who were entitled to take up their surveys under a lower denomination hastened their purchases with borrowed money. The London merchants consigned immense quantities of goods on speculation, which were poured into the market; the promissory notes of irresponsible persons were taken by their agents; the fraudulent laid up for the crisis; insolvent estates were crowded into auctions; goods sunk below the expenses of the factor; dividends of a few shillings in the pound represented the assets of persons indebted from £50,000 to £100,000; and had not the chief losses finally rested with the London merchants and the English banks the disasters of the times must have long retarded colonial prosperity. The effects of this revulsion were soon felt in V.D.L., where peddling traders had thriven in momentary credit by the union of worthless names on their bills. As an instance — one hundred bushels of wheat, sold ultimately for £40, were transferred to a succession of speculating purchasers, who raised among them £1000 on credit of the exchange from one to another. The Governments of the colonies had exhibited remarkable miscalculation. In all, the Treasury failed to meet the expenses. The deposits formerly realised by land sales were withdrawn from the banks. Debentures were issued; new taxes were imposed. The commercial panic was in full career when the Crown renewed transportation to V.D.L.; and thousands and tens of thousands of British offenders were gathered on the island. The expenditure of the Government, though large, was chiefly confined to the Capital or fell into the hands of the merchants; but it is worthy of remark that, except one house all who could pretend to that rank maintained their position. The settlers were, however, deeply involved. They were mostly induced to purchase at the land sales by borrowed capital. They complained bitterly of the usury, to which their produce bore no comparison, and incessantly invoked the Legislature to limit the exactions of money-lenders. To aggravate these evils American flour poured into the colonial markets, drawing their cash and rendering agriculture profitless. The declarations of insolvency were daily. Whole streets of mechanics and traders followed each

other. A common liability to the same ordeal introduced a system of dangerous license; and men walked away with their creditors' property without molestation and almost without reproach. The statistics of these times afford a memorable warning to all: to the Government, that by enticing people to purchase the land the general revenue will suffer by their imprudence; to the banks, that by reckless advances capital will be sacrificed for nominal assets; and to British merchants, that by glutting every store with speculative consignments they render their exports of no value—that they ruin the shopkeeper, whose capital they destroy by the competition and sacrifice of their own. But the great resources of the colonies soon manifested themselves. A settler at Port Phillip discovered or applied the art of boiling down the surplus stock, so as to produce the tallow of commerce; and sheep worth 2s. 6d. rose to 8s. The discovery of the Burra Mines raised Adelaide from deep prostration. The opening of new tracts of country offered a vast field for successful enterprise; wool once more rose in price; the banks lowered their discounts to a reasonable level; the goods saved from the general wreck appeared in the shops of those who took the tide at its flow; and every colony exhibited the sign of returning vigour—all but V.D.L. The last three years of Franklin's administration were chiefly employed in arranging the details of the system of convict discipline, afterwards expanded by Lord Stanley to gigantic proportions, and described sufficiently already in this history. Accompanied by Lady Franklin, the Governor penetrated the western district of V.D.L. to Macquarie Harbour, formerly a penal station, to ascertain its fitness for a similar purpose, and some of the perils of his early life were renewed. His absence for several weeks awakened great anxiety, and his return was greeted with a general welcome (1842.) The appointment of Franklin to this Government was made at the instance of William IV., by whom he was greatly esteemed. It was the expectation of Franklin to find an easy retreat, like some of the military governments, where veterans enjoy the dignity of office without its toils. But he found himself doomed to encounter all the responsibilities of ordinary legislation and government, with difficulties peculiar to a penal colony. For this his former pursuits had not prepared him. His manner was often embarrassed and hesitating, and presented a contrast to the quiet vigour of his more able but not more amiable predecessor. The colony had attained that development when the public institutions require construction, and the popular will must in some measure regulate their form and spirit. The administration of the Governor was eminently disinterested. He had no private speculations or secret agents, and his measures were free from both the taint and the reproach of corruption. Such faults were sometimes imputed, but they were the staple slanders of writers without credit or name. His expenditure greatly exceeded his

official income; and while the plainness of his establishment and entertainments was the topic of thoughtless censure, the charities of his family were scattered with a liberal hand. The piety of Franklin was ardent, and his conscience scrupulous. His remarks in council on the sports of some idle boys in the government domain on the Lord's-day exposed him to the satire of scorners. An anecdote, on the authority of Captain Back, shows his harmless character in a striking light. The writer observes—"As an illustration of the excellent individual to whom it refers, I may be pardoned for introducing it here. It was the custom of Franklin never to kill a fly, and though teased with them beyond expression, especially when taking observations, he would gently desist from his work, and patiently blowed the half-gorged intruder from his hands, saying, 'the world is wide enough for both.' Manfully (an Indian chief) could not refrain from expressing his surprise that I should be so unlike the 'old chief' who would not destroy a single mosquito." The name of Franklin is indissolubly connected with the great problem of modern geography—the connection of the Polar Seas with the North Pacific Ocean. In 1818 he was first employed in this service, but returned without success. In 1820 he conducted an overland expedition to the Coppermine River. This party suffered every kind of hardship, from the loss of boats and the mutiny of their attendants: several perished, having eaten their old shoes and scraps of leather: yet Franklin recorded in his journal the following grateful expressions:—"We looked to the great Author and Giver of all good for the continuance of the support hitherto supplied in our greatest need." They completed a journey of 5550 miles. The narrative of this expedition excited at the time much admiration, as a rare example of intrepidity, perseverance, and elevated piety. In 1824 Franklin was entrusted with the charge of another expedition. They were attacked by the Indians, and the party was saved from destruction by the coolness and judgment of the leaders: they encountered storms, fogs, and cold, which prevented their reaching their destination. The efforts considerably enlarged the scientific knowledge of the icy region. On his return to England in 1843, it was to confide to Franklin a new effort to discover the north-west passage. Accompanied by Captain Crozier, he sailed in May 1845. The vessels—the *Erebus* and *Terror*—were furnished with provisions and artificial fuel for four years. They were last seen by whalers in Lancaster's Sound. In 1847 the long absence of Franklin and the 136 persons under his command awakened considerable alarm. English expeditions, both by land and water, a reward of £20,000 offered by Parliament, and the earnest co-operation of foreign Powers, did all that money, or daring, or affection could accomplish to solve the mystery of their fate. Though these efforts were not relinquished for years, the issue ceased to be regarded with hope; except by Lady Franklin,

whose exertions to rouse and prolong the search excited the sympathy and admiration of nations.

XI. Governor Wilmot.—Sir John Eardley Eardley-Wilmot, Bart., succeeded Sir John Franklin on 21st August 1843. His short and troubled administration, although crowded with incident, presents few events of permanent interest. Charged with the development of a gigantic scheme of penal discipline, founded on erroneous data, and imperfectly sustained by material resources, he was involved in the discredit of its failure; whilst some persons whose vanity he had not cared to conciliate, and others whose hypocrisy his ready wit had unveiled, conspired for his undoing, and by covert innuendo and malicious fabrications which obtained credulous attention instead of indignant rebuke from Mr. Gladstone, then Secretary for the Colonies, the cruel scheme succeeded, and destroyed its victim ere the truth could be declared. Wilmot received his appointment from Lord Stanley, whose political leadership he followed in his secession from the whigs, occasioned by the reduction of the Irish church. During successive Parliaments he represented Warwickshire, and for twenty years was the Chairman of the Quarter Sessions of that county—in England a post of some consequence. He inclined rather to the Liberal than the Tory section of the House, and supported most measures favourable to civil and religious freedom. On the question of negro slavery he was a coadjutor of the decided abolitionists, and on his motion apprenticeship, a milder form of slavery, was finally terminated. He contributed papers on prison discipline, and initiated a bill for the summary trial of juvenile offenders. Thus he appeared not unqualified to preside in a colony where penal institutions constituted the main business of government, and where many religious opinions divide the population. Wilmot landed at a distance from Hobart Town, and delayed his entrance on office to afford time for removal of Franklin's household. When he was sworn in, the town illuminated, and the usual excitement of novelty, were the appearance of public welcome. The open and affable address of the Governor attracted the people. He rapidly traversed the island. The agricultural knowledge he possessed, his promptitude in forming and expressing opinions, contrasted with the habits and manners of his predecessor. Those who were experienced in official life foresaw the dangers of a temper so free and of movements so informal. The opponents of the late Governor recommended the neglect of all the distinctions which had limited intercourse, and some persons never before seen at Government House were admitted to the closet, and boasted of their intimacy and influence. Scarcely had Wilmot entered office when an exercise of mercy brought him into collision with one of the judges. Kavanagh, a notorious bushranger, was condemned to death; he had fired on a settler, whose house he attempted to pillage. In giving sentence the judge remarked that he had seldom

tried a culprit stained with so great an aggregate of crime. Ten minutes before the time appointed for his execution the Governor granted a reprieve. Judge Montagu was indignant, and those who had suffered by the depredations of the robber shared in his feeling. The press, in commenting on the commutation, predicted that the culprit would not long escape the scaffold. He was implicated in the murders of Norfolk Island, and suffered death in 1846. Judge Montagu shortly after the reprieve tried four men for a similar crime, and instead of pronouncing sentence directed death to be recorded. He stated that the sparing of Kavanagh could only be justified by the almost total abolition of capital punishment. At a meeting of the Midland Agricultural Association Wilmot noticed these reflections, and declared that he would never inflict death in consideration of offences not on the records of the court, and that in this case robbery only had been proved. He thus early complained of anonymous attacks, and admitted that in offering these explanations he was outstepping the line of his situation. Topics of a far more agreeable nature were suggested by the special business of the day. He dwelt with great fluency on the advantages of agriculture, and dilated on the importance of independent tenants and an industrious peasantry. "You," he observed, "are to consider yourselves as the column of a lofty pillar; but, depend upon it, a tenantry form the pedestal—a virtuous, moral, and industrious peasantry the foundation on which that pillar rests. I see around me some of your largest proprietors, who this day are lords of wastes and princes of deserts, but who, if the system of tenantry be carried out as fully as it deserves, will become patriarchs; and the future Russells, Cavendishes, and Percys of the colony may be proud to date their ancestry from any one of you." This strain of compliment was returned by Mr. Kemp, the oldest of the settlers—so many years before distinguished in the deposition of Governor Bligh. He congratulated the meeting on the appointment of His Excellency, whose presence he compared to "the vivifying rays of the sun after a long cheerless winter, encouraging the ploughman to resume his labours with fresh spirit." The prevalence of bushranging, though far less than at an earlier period, induced the midlanders to project a yeomanry corps. They were to provide weapons, meet for exercise, and always stand prepared to answer a summons. They proceeded to the choice of a treasurer and secretary—Messrs. Keach and Leake, junior. They were however informed that the levying of armed men is the prerogative of the Queen. On reference to the Governor he declined to sanction their incorporation, while he praised their martial spirit. Bushrangers rarely move in numbers, and a military is not the kind of power best adapted to suppress them. On meeting his council on 21st October 1843, Wilmot expressed his admiration of the colony, its soil, its climate, and immense resources. He promised to consider the pecuniary difficulties

of the settlers, with a view to their alleviation. Referring to the appointment of a Comptroller-General, the chief officer of the convict department, he declared his cordial concurrence with the new discipline as a reformatory system; and, noticing the recent arrival of a bishop, he avowed his preference for the Episcopal Church, and in still stronger terms his attachment to religious liberty and equality. The salary of the Governor was augmented to £4000 per annum; the former uncertain but expensive allowances were withdrawn. Franklin had enjoyed £2000 per annum as salary, and the Government houses of Hobart Town, New Norfolk, and Launceston, a farm at New Town, and a large garden in the domain. The salary of the new Governor was given in full discharge of all demands. The beautiful gardens he determined to throw open to the public. Having accepted the office of President, Wilmot convened the Tasmanian Society, formed by Franklin, and presented a series of alterations in its organisation. He proposed that it should consist of a president, four vice-presidents, and a council of twelve, to be nominated by the Governor; and that at first it should be limited to fifty fellows. The project was distasteful to the original members of the Tasmanian Society, who objected to the summary increase of their body. Wilmot proceeded to incorporate those who concurred with his views as "The Horticultural and Botanical Society of Van Diemen's Land." They were then entrusted with the Government garden, and the appropriation of a grant of £400 per annum required for its cultivation. Wilmot received the Government in a condition most unfavourable to his tranquillity. The arrival of many thousands of prisoners had for a time quickened trade, and some months elapsed before they became competitors for the bread of the free mechanics. The universally low price of labour, the demand for dwellings, and the closing of a local branch, which liberated small capitals, occasioned a competition for town allotments, and set all classes to building. But this stimulus was soon exhausted, and workmen of every grade began to suffer distress. They found hundreds of passholders working at a price to them indeed ample, but on which a family would starve. The regulations introduced by Lord John Russell discouraged employments of prisoners in the towns, where they could easily indulge every evil inclination, and where they abated the value and respectability of labour; but such was the pressure of numbers on the colonial Government that its officers were glad to abandon all reformatory theories to get rid of the crowds which idled their time and burdened the British treasury. The free operative class appealed to the Government for redress. Wilmot replied by appeals to their humanity; he said that many prisoners of the Crown, influenced by bad example, ignorance, and want, had lost their liberty; that it would be unkind and unjust to obstruct their progress to competence and reformation. These excuses for a

policy which tended to depress honest workmen only convinced them that it was time to retire from the country. A more powerful class might have shown that the proper office of mercy is to shorten the duration of a sentence, and not to inflict punishment on unoffending families of freemen. A party of colonists chose Gilbert Robertson as their secretary, and formed an association to promote the amelioration of financial embarrassment. They nominated a "central committee," to prepare information for the guidance of the Government, and to watch over legislation. The difficulties of the agriculturists from the low price of grain induced them to look for artificial relief. With too much facility Wilmot gave hopes which he could not realise. The imposition of a heavy duty on N.S.W. tobacco, amounting to prohibition, and that just as it was reaching considerable perfection, led to the imposition of a duty on grain. It was the wish of the Tasmanian settlers to restore free-trade between the colonies, and to impose discriminating duties on the produce of foreign countries; but the harsh and ridiculous system of colonial Government, which discriminated between Australian and Canadian grain, compelled one British colony to treat another, its next neighbour, as an alien, and that while England demanded free admittance for English manufactures. The peremptory instructions of Lord Stanley were conveyed to the local governors in terms of intimidation. They were forbidden to allow any kindred colony the least advantage over foreigners, or to pass any Bill for that purpose, and were told that any evasion of this restriction would occasion the high displeasure of the Crown. The reason alleged for this interference was that colonies could not be expected to understand the treaties and trading systems of the parent state; as if any treaty should have hindered a commerce actually not more distant than the trade between London and Liverpool. Wilmot warmly espoused the claim of the Australian Colonies to share in the privilege of Canada, in favour of which the duties had been relaxed on colonial grain. Mr. Hutt brought their petitions before the attention of the Imperial Parliament; but he could not plead a political necessity, and the ministers were able to resist without the risk of a rebellion. They asserted that the distance made the concession of no practical value, while it would tend to augment the alarm of the English farmers. Thus, while they humoured the empty fears of their own constituents, they afforded another example of the futility of colonial petitions which however just it is convenient to disregard. To benefit the rural interest the Governor proposed a grand scheme of irrigation. An eminent engineer, Major Cotton, was employed to report on the subject, and suggested the detention of the waters of the vast lakes which overflow from the heights of the western mountains. A rate to be imposed on the various estates was to discharge the cost. Thus in those seasons of drought which

sometimes occur the low lands would be most increasingly fertile. The immediate object—the employment of probation labour at the colonial cost—detracted something from the charms of the project. Nor did it seem just that the settlers should risk the ultimate cost of an undertaking they could not limit. Wilmot earnestly recommended the scheme to the Home Government, but Lord Stanley hesitated until the evils of the probation system enforced a change, and lessened the labour at the disposal of the Crown. Had the men been employed on a work so popular they would have been withdrawn from the colonial eye, and the interest of their new labours might have extinguished the prevailing discontent. But while the Governor waited for instructions the men were idle, or employed in useless attempts at cultivation on barren land, of which the produce rarely defrayed the cost of the implements destroyed. In 1836 Mr. Spring Rice (afterwards Lord Monteagle) took advantage of a considerable local land fund to throw on the Council the police establishment of the colony occasioned by transportation. The sum then required (£14,000) was comparatively unimportant, and it was urged that the labour of convicts employed on public works at the cost of Great Britain, except £4000 for superintendence, was a sufficient compensation. But the charge for constabulary and prisons gradually increased to £36,000. The land fund, after deducting £97,000 expended for emigration, for the support of the aborigines, and the working of the land office, yielded in ten years a surplus of £207,000 carried to the general revenue; but during this time the charge for police and gaols exceeded £311,000. The increase of judicial expenses, and especially of witnesses, was proportionately great; and this last item in one year (1846) although most lighter crimes were disposed of in a summary way, rose to £6000. The execution of public works by the Crown had been the sole vindication of these charges. From this arrangement Lord Stanley departed, and in peremptory terms prohibited a spade to be moved but on payment from the colonial treasury. Thus at a season of commercial stagnation the benefit of convict labour was withdrawn, while the charges for police and gaols rose to one-third of the entire revenue of the colony, and in two years and a-half a debt accumulated to £100,000. Notwithstanding the obvious injustice of this burden, the treatment of the N.S.W. legislature gave slight hope of redress. Lord Stanley directed Sir George Gipps to obviate the threatened resistance of that council by hastening pardons to the prisoners, by withdrawing them from the service of the settlers, and by sending those not otherwise disposable to V.D.L. He was forbidden to relieve extreme financial difficulties by drafts on England, or draw from the military chest, although at the period an immense body of convicts remained long after transportation had ceased. The disregard of a more powerful colony led the people

of V.D.L. to infer that from a minister so unscrupulous no justice could be expected while evasion was possible. Wilmot was deeply embarrassed, but he determined to adhere to the instructions of the Secretary for State, whose distance prevented his perceiving the hopelessness of his project until that discovery was unavailing. The positive nature of these injunctions left no room for discretion. The Governor was commanded not to adopt any detailed regulations at variance with the scheme prescribed by the Crown, or to depart from its provisions without express authority. Wilmot resolved that the utmost extent of taxation should be tried rather than infringe the orders of Lord Stanley. A bill to raise the duties on sugar, teas, and foreign goods from £5 to £15 per cent. encountered an earnest but unavailing opposition. The bill was still more obnoxious from a clause, afterwards abandoned to levy the duty on the current value of goods at the market of consumption, instead of export, a mode which taxed all the expenses of shipment. Mr. Gregson proposed the rejection of an impost required only by the extraordinary pressure of convictism. Several of the non-official members voted with the Governor for the last time. A committee of the Council had been appointed to ascertain how the expenditure could be reduced and the revenue augmented. They enumerated various forms in which further taxation might be practicable. These were proposed by the Governor. Auctioneers, pawnbrokers, publicans, butchers, eating-house keepers, stage-coach and steam-boat proprietors, cabmen, and watermen, were to be subject to new or increased license fees. This project aroused the people to an unusual degree. On the day of public meeting a procession of cabs and waggons, decorated with flags bearing the inscription, "No taxation without representation," presented a novelty in colonial agitation. Mr. Kemp the veteran politician presided. The opposition prevailed, and the Governor resolved to withdraw the obnoxious measure. It would be difficult to discern a line beyond which taxation might not pass, if every trade and profession can be subject to arbitrary imposts levied by a legislature at the mere dictation of the Crown. So late as August 1844 the Secretary for State refused to entertain the claim for relief. He stated that the colony would be obliged to expend a sum nearly equal although all the convicts were withdrawn; for their sakes, he said, the island was colonised; they constituted the working population; and, he added, that in the military and naval protection, the support of the unemployed convict, and the capital and cheap labour poured into the colony, a fair proportion of expenditure was borne by the Crown. Pressed by extraordinary difficulties Wilmot again urged the injustice of these conclusions. He complained that not only India, China, and the Cape of Good Hope, but N.S.W. were pouring in felons of the worst description, who as pass-holders occasioned a vast

outlay for the suppression of crime. He told his lordship that for several years the land fund had totally failed, while the expenses of police and gaols, of judges and witnesses, had risen to £50,000. At this time the number of arrivals was 5000 annually, sent from every colony and dependency of the empire, as well as from the United Kingdom. There were between 3000 and 4000 pass-holders unemployed, 7000 in private service, 6000 about to emerge from the gangs, 8000 with tickets-of-leave or conditional pardons, and in all more than 30,000 unqualified to quit the island without the consent of the Crown. It had been publicly rumoured that rather than allow the Appropriation Act to pass, several members had resolved to resign. Captain Swanston, less prominent in opposition, waited on the Governor and earnestly advised him to forward another set of estimates prepared by Captain Swanston for the approval of the Secretary of State. He warned him that should he persevere a rupture would inevitably follow. In this interview the Governor expressed his determination to proceed. He forgot, it would seem, some of those forms of civility which no man can safely neglect, and Captain Swanston left him with a sense of personal affront—an immedicable wound. In this temper the Council met on 3rd October. Gregson called the attention of the members to a question submitted to Mr. Francis Smith, a barrister: Whether as chairman of a committee, the Governor had a deliberative and casting vote, and whether the quorum required by law at a meeting of the Council was requisite in committee; and thus whether the estimates were legally passed through the committee, the numbers present being less than one-third, and the Governor giving his double vote. Smith gave his opinion that the estimates were in law rejected instead of carried; but the Chief Justice considered the sitting of committee merely a convenient method to sift beforehand items afterwards to receive a legal sanction in the Council. The Attorney-General without notice was unprepared to give an opinion, and a motion of Gregson for delay was lost. The Colonial Secretary then moved the third reading of the obnoxious bill, when Dry rose to read a minute, signed by the members in opposition, objecting to the proceedings. This being rejected as irregular, Gregson proposed that the third reading should be delayed, that the members dissenting might bring forward other estimates. In urging this motion he rebutted the "disloyal" imputation, and referred the Governor to the unity existing in the country party in proof that inevitable necessity alone had prompted the co-operation of persons otherwise adverse. This motion being lost before the Appropriation Act could be carried, the Opposition quitted the Council. Those remaining did not constitute a quorum, and the legislative session was abruptly terminated. The *Gazette* of the 4th November announced that Charles Swanston, Michael Fenton, John Kerr, William Kermode, Thomas G. Gregson, and Richard Dry had resigned

their seats. The cause of the "patriotic six," as they were called, was eagerly espoused by the colony. To supply the vacancies which were occasioned by their retirement was the labour of weeks. The Governor defended himself from the charge of despotism, and declared that he would never interrupt the freedom of debate or attempt to force the compliance of the Council. The opposition press held up to scorn those disposed to accept a nomination, and gentlemen who did so were assailed with scandalous abuse—so easily is the noblest cause degraded by its friends. A more suitable expression of popular feeling was given on the return of Dry to his native town. He was escorted by a large concourse of people, and with all the usual tokens of public esteem. The father of Dry was exiled during the political troubles of Ireland in the last century, and after a respectable career attained considerable wealth. The son, the first legislator chosen from the country born, the colonists saw with pleasure consecrate himself to the cause of his native land. Gregson, the leader of the Opposition, was honoured in a more substantial form. A body of his admirers by contributions of large amounts raised a testimonial in the shape of 2000 guineas and plate with a suitable inscription. On no previous occasion had public sympathy so attended political controversy; and never was the legislative freedom of the country more earnestly desired. A bill for electing commissioners of paving and lighting for the city of Hobart passed the Council in August 1846, and although disliked as an indirect scheme of taxation, was not unpopular. The first election under it occasioned a keen competition and considerable excitement. It was the first instance of representation, but the bill made no provision for a scrutiny, and a returning officer declared the poll against the protests of the defeated candidates. In closing the session (September 1845) Wilmot announced his recall. Although not usual then to address the Council, he stated that he could not permit the members to disperse without acknowledging their assistance. A delusion for a time might expose a public man to popular injustice; but however misjudged, either during his lifetime, or after death, his character would require no other vindication than the truth would afford. He informed them that his recall was not occasioned by his differences with the late members, but was ascribed to an imputed neglect of the moral and religious welfare of the prisoners; and he added that the memory of their kindness would remain with him during the short remainder of his life. In his last address to the Council Wilmot alluded to the benign influence of time on a slandered reputation. This was soon after explained. Secretary Gladstone had accompanied the recall with a private letter which stated that rumours reflecting on the Governor's moral character had reached the Colonial Office of a nature to hinder his future employment. Nothing specific was stated, and no clue to enquiry given. Rumours

had long been current, and they were spread with activity. The *Atlas*, a Sydney journal, compared the Governor to the Tyrant of Capreae, and referred to his private habits with expressions of disgust. Remarks of a similar tendency appeared in a London periodical. It stated that the conduct of Wilmot excluded the respectable inhabitants of Hobart from his society, and made it impossible for ladies to enter his house. This was instantly rebutted by Sir John Pedder and other official persons, who declared their entire disbelief in these charges. Wilmot conjured Gladstone to state the time, place, and circumstances, and the names of his accusers, and the exact nature of their imputations. In reply, he observed that the persons who mentioned these rumours did not profess to support their credit by any statement of particulars, but to found them on general notoriety. He added, that it "was not in his power to convey what he had not received." No Governor was more unfortunate in his political position. He could only tax and restrain. There was nothing in his gift. To the substantial difficulties of the people around him he was unable to offer more than those general assurances which often exasperate rather than console. The state of religious parties increased his disquiet. He had to adjust the claims of churches to spiritual authority. In declining to erect ecclesiastical courts, Wilmot not only gratified many, but he followed the direction of his legal advisers. Wilmot, like most governors, considered himself the servant of the Crown, restrained in his discretion by absolute and specific instructions. Had Lord Stanley acted with prudence he would have left much to Wilmot's judgment; but just before he had dilated with vast perspicacity on the tendency of governors to act in behalf of the colonists, to forget Imperial interests, to misapply the funds and pervert the labour belonging to the Crown. The precision of his injunctions left no alternative but to obey. Had Wilmot at once declared the impracticability of Lord Stanley's schemes he might have been re-called, but the responsibility of an utter failure would have rested with his chief. The interested reports of his subordinate officers unfortunately enabled him to hold out hopes of success, which were never realised, and to furnish an excuse for his condemnation. The Governor was impatient of contradiction. He had been accustomed to debate; but the sarcasm which falls harmless on the floor of St. Stephen's Chapel in a colony cut to the bone. He forgot that the head of a government can hardly say too little of men or measures. In a conflict of words, to an executive chief victory and defeat are alike pernicious. The usual order had been given that the Governor, during his residence in the colony, should enjoy the complimentary distinctions of office. It was commonly understood that his stay would be prolonged; but he died soon after his retirement, on 3rd February 1847, in the sixty-fourth year of his age. The treatment

he had received from the Colonial Office, and his death far from the honoured sepulchre of his fathers and the scenes of his early political fame produced a general sentiment of regret. All the houses of business showed marks of mourning. A public funeral attended by the administrator and the newly-arrived Governor was thronged by the citizens. An ornamented Gothic tomb was erected in St. David's Burial Ground to the memory of Wilmot by subscription. It stands near the highway. His remains were interred close to the tomb of Collins. Charles Joseph La Trobe, Esq., Superintendent of the Port Phillip district, and subsequently first Governor of Victoria, superseded Wilmot (13th October 1846.) During his short stay as "administrator" he was employed in a careful scrutiny of the probation department. In performing this difficult duty he displayed exemplary activity and decision. He resolved to remove every officer chargeable with incapacity or neglect, and thus many were dismissed. This promptitude exposed him to imputations of harshness; but although it is probable he did not wholly escape errors of judgment the chief acts of his administration were amply vindicated by the facts he saw. The opinions he expressed sustained the colonial impressions respecting the convict system. While he suggested many improvements in its details he concurred with the general wish for its extinction. Latrobe never met the Legislative Council; and his Government being limited to the established routine left nothing to record.

XI. *Governor Denison*.—Sir William Denison, captain in the corps of Royal Engineers, succeeded Wilmot on 26th January 1847. He brought with him a high reputation for professional ability and administrative capacity. His arrival was welcomed by the better class of colonists as the inauguration of a new state of society. From his profession as an engineer acquainted with the construction of public works, he directed his attention chiefly to the improvement of Hobart Town and of the penal establishments throughout the island so as to employ the prisoner's labour, which was being rejected by the free colonists for that of the immigrants who were arriving in great numbers. In his effort he was most successful in utilising that labour for the benefit of the colony and for the convicts themselves. For example:—In Hobart Town he planned some docks, to be cut out of the government reserved lands and regulated the labour of the prisoners so that the active and well disposed men could lessen their term of punishment by industry. For this purpose he estimated what was a fair amount of work to be done in a day under the old system and all above that went to the credit of the labourer in reducing his time of imprisonment or labour on government works. Moreover he gave those men a certificate of good character, if they were entitled to a ticket of leave, so that they might the sooner obtain remunerative employment. The effect of this system was to get

on with such works as the docks quicker than it could have been executed by free paid labour. The material result was beneficial to the colony at large and the government in particular, who thereby sooner got rid of the men who were consuming the public stores. Soon after Denison's arrival an order came out from the Home Government for the re-instatement of the "Patriotic Six." The colonists encouraged by this concession vigorously set to work to obtain their two great desires—namely, government by elective parliaments and the abolition of transportation. It was found that between the years 1846 and 1850 more than 25,000 convicts had been brought into the colony; free immigration had ceased and the number of convicts in the colony was nearly double the number of free men. In all parts of the world, if it became known that a man had come from V.D.L., he was looked on with the utmost distrust and suspicion, and he was shunned as contaminated. On behalf of the colonists, a gentleman named McLachlan went to London for the purpose of laying before Gladstone the grievances under which they suffered; at the same time, within the colony, Pitcairn strenuously exerted himself to prepare petitions against transportation, and to forward them to the Imperial authorities. These representations were favourably received, and in a short time Denison received orders to inquire whether it was the unanimous desire of the people of T. that transportation should cease entirely. The question was put to all the magistrates of the colony, who submitted it to the people in public meetings. The discussion was warm, and party feeling ran high. There were some who had been benefited by the trade and the English subsidies which convicts brought to the colony, and there were others who desired, at all hazards, to retain the cheap labour of the liberated convicts. These exerted themselves to maintain the system of transportation; but the great body of the people were determined on its abolition, and the answer returned by every meeting expressed the same unhesitating sentiment—transportation ought to be abolished entirely. Accordingly, it was not long before the colonists were informed by the Governor that transportation should in a short time be discontinued. But Earl Grey was now preparing another scheme for the treatment of convicts; he wished to scatter them in small bands over all the British colonies, instead of concentrating them into one small island. In this way T. would receive a much smaller number; whilst he expected that the colonies would gladly avail themselves of the proffered convict labour. But the promise which he had now given to the Tasmanians was made before he had considered whether it was possible to keep it. Ships filled with convicts were sent out to the various colonies, but the prisoners were not allowed to land. In 1849 the *Randolph* appeared at Port Phillip Heads; but the people of Melbourne forbade the captain to enter. He paid no attention to the order, and

sailed up the Bay to Williamstown. But when he was preparing to land the convicts he perceived among the colonists signs of resistance so stern and resolute that he was glad to take the advice of Governor Latrobe and sail for Sydney. But in Sydney also the arrival of the convicts was viewed with the most intense disgust. The inhabitants held a meeting on the Circular Quay, in which they protested very vigorously against the renewal of transportation to N.S.W. W.A. alone accepted its share of the convicts; and we have seen how the reputation of that colony suffered in consequence. The vigorous protest of the other colonies had procured their immunity from this evil in its direct form; but many of the "ticket-of-leave men" found their way to V. and N.S.W., which were therefore all the more inclined to assist the Tasmanians in likewise throwing off the burden. A grand Anti-Transportation League was formed in 1851; and the inhabitants of all the colonies banded themselves together to force the Home Government to emancipate V.D.L. Immediately after this, the discovery of gold greatly assisted the efforts of the League, because the British Government perceived that prisoners could never be confined in the colony, when by escaping from it and mixing with the crowds on the gold-fields they might in a few days make their fortunes; and there was now reason to suppose that banishment to Australia would be rather sought than shunned. The gold discoveries in N.S.W. and V. attracted both free and bond from the colony, which subtracted further elements of capital and labour from its resources. Many of the most wealthy and enterprising merchants left Hobart Town and Launceston for Melbourne, where they ultimately became leading men in commercial circles. The proximity of Launceston to Port Phillip rendered the communication quicker and easier than with the neighbouring chief ports on the mainland. Moreover as it was the port of the grain districts of T., and the demand increased in Melbourne beyond all local supplies, the farmers in the surrounding country obtained high prices for their produce, and the traffic across Bass Straits was daily increased, both by sailing vessels and steamers. Besides agricultural produce, there was a large traffic in timber for building purposes and the construction of wharves, railways, and other works going on in V., so that an unusual amount of shipping was employed by the Tasmanian traders. In these vessels there was likewise a large passenger traffic, and that almost exclusively in one direction, towards the region of gold. From 1851 an exodus of the population took place which continues up to the present day. At first in the confusion produced by that event, there was not much discrimination in the class of people who migrated and many prisoners escaped in vessels from want of proper supervision. The respectable class who remained behind did not object to their departure or show any desire to direct the attention of the authorities to the fact. Indeed there is reason to

conclude that many ruffians were assisted in crossing the straits by a liberal allowance of cheap or free passages. Be that as it may, there are proofs that tickets-of-leave were seldom refused to any applicants who could show that they were eligible for its extension to Port Phillip, a privilege that was seldom granted in former times. Thus while T. was lessening her population and her resources, society was being purged of the convict leaven that previously had poisoned it. But the Victorians rebelled against the influx of these depraved people, who carried rapine and bloodshed through the province, and augmented the state of anarchy which the gold discoveries had produced on her quiet pastoral home. So frightful was the increase of crime from this cause that the Victorian colonists in defiance of the Imperial laws of the mother country, refused to allow these Tasmanian felons to land on their shores. Notwithstanding their efforts in that direction, an immense number of the most incorrigible prisoners left T. never to return. The effects of this voluntary deportation upon the social condition of that regenerated colony has been of the most beneficial description. A more peaceful and better behaved community does not exist in the Australian Colonies. The huge gaols and penitentiaries in Hobart and Launceston are either empty or turned into warehouses, while the interior of the country is entirely free from bushrangers. This continued withdrawal of capital and labour in a few years so impoverished the colony by reducing the value of landed property and raising the rate of wages that a revulsion ensued in the state of public feeling, and the loss of material prosperity counteracted the moral advantages obtained. Those who contended formerly for the continuance of transportation as the chief source of their wealth now pointed to the ruinous condition of their once flourishing towns. Hobart Town especially illustrated the altered state of affairs. Whole streets of houses became untenanted and deserted, and the splendid harbour with its docks and jetties no longer presented the bustle of commerce consequent on the arrival of transport ships and vessels with supplies for the government establishments. Launceston fared better as it shipped its produce to the gold colonies and kept up a profitable traffic with Melbourne. In the interior "the thirst of gold" withdrew many of the enterprising settlers from their farms to try their fortunes in the neighbouring colony. A stagnation prevailed in town and country which affected the pecuniary interests of every one who remained in the island; so that those who had rejoiced most at the circumstances which had combined to purge the community of its moral evils looked back with regret to the "old times" when the cause of these evils had enriched them, and as they had calculated, made them independent for life. Now however house property was a drug, and the small rents with difficulty obtained could no longer meet their

expenditure. Many landlords not only had to reduce their establishments but again to put their shoulders to the wheel and work for a living. In these days of humility many who had condemned Denison for fostering the convict system now withdrew their censures, and looked to him for government assistance to restore prosperity to the country. But his powers were no longer of that irresponsible and unlimited character they had been; the advent of the gold discovery and the cessation of transportation came at the time when a new constitution had been granted to the Australian Colonies conferring self-government upon them. Consequently the real power of the Governor was placed in the hands of his responsible advisers and the two houses of legislature elected by popular suffrage and vote by ballot, in whose power the control of the public purse and framing of local laws was centred. This local Parliament seeing the exodus of the colonists to the Australian goldfields endeavoured to arrest it by offering rewards for the discovery of the coveted metal in Tasmania. They argued generally that as the formation of the country approximated to that of V. it was logical to suppose that some portion of the island would prove to be auriferous. In order to ascertain the exact geological character of the districts which seemed to promise the existence of gold-bearing rocks, an invitation was sent to the Rev. Mr. Clarke of Sydney, a skilful geologist, who had written a pamphlet to prove that he was aware of the gold deposits in the Bathurst country long before Hargreaves' discovery, who evidently had profited by what Clarke had written about it in his printed statements. After diligent survey many places were pointed out as auriferous, and small specks of gold were washed out of auriferous soil, but no sufficient quantity was found to encourage people to venture working long at the diggings. For upwards of ten years "prospecting" was carried on by parties fitted out at the cost of the colony and their exertions met with variable success. The most promising district was found at Fingal, some distance from Launceston, where a good many ounces of gold have been washed out of the soil and gold-bearing quartz found to yield a fair percentage on being crushed. But even these indications failed to rouse the settlers from their apathy. At last Hargreaves was invited over from N.S.W. to explore these regions and he arrived in November 1864. On examining the districts already "prospected," he reported favourably concerning the quartz-mining resources and by experiment showed that with proper machinery it might yield a good profit. This buoyed up the hopes of the Tasmanians that their island had its payable gold mines and they looked forward to renewed prosperity from that source. It was in 1850 that T., like the other colonies, received its Legislative Council; and when the people proceeded to elect *their* share of the members, no candidate had the slightest hope of success who

was not an adherent of the Anti-Transportation League. After this new and unmistakable expression of opinion, the English authorities no longer hesitated and the new Secretary of State, the Duke of Newcastle, directed that from the year 1853 transportation should cease. Up to this time the island had been called Van Diemen's Land. But the name was now so intimately associated with ideas of crime, that it was gladly abandoned by the colonists, who adopted from the name of its discoverer, the present title of the colony, Tasmania. West sums up his estimate of Denison's Administration in the following terms:—"The opposition of Denison to the colonial will on transportation, his injustice to the Judges, and his sarcastic delineations of colonial character, narrowed the circle of his friends. In future times an opinion more favourable to his reputation may be expected to prevail. It will then be remembered that he promoted the advancement of science, fostered liberal education, increased the facilities of commerce, abated the practical evils of the convict department, advocated the principles of legislative freedom, and by a respectable private character sustained the moral dignity of Government. But even then it will not be forgotten that in perpetuating the convict curse he adopted any argument, however false, and tolerated any ally, however abject." In 1846-7 important additions were made to the educational means of the colony. An episcopal institution, called Christ's College, was formed at Bishopbourne. Scholarships were founded by the medical, military and clerical professions, and divinity scholarships endowed. Lord Stanley recommended the establishment of a proprietary high school, open on equal terms to all denominations, and promised the patronage of the Crown. The site reserved for this purpose at Hobart Town was granted by Denison to the Episcopalians for the Hutchin's School. This alienation was deemed unjust. Instead however of wasting time in unavailing complaints, the friends of education were convened by Henry Hopkins, an opulent merchant, when a prospectus was submitted by the Rev. Dr. Lillie and J. West. A thousand pounds were subscribed in the room, and in five weeks £5000. The first conspicuous object seen by the stranger on entering the river is the High School of Hobart Town, an edifice erected amidst enchanting scenery, on a site granted by the Crown, and possessing architectural attractions which have yet to be equalled in this hemisphere. The institution is managed by a council of nine, chosen by the shareholders. The rector, nominated by the London University, was the Rev. J. A. Froude, author of the *Nemesis of Faith*—a publication which led to his instant resignation. James Eccleston, appointed in his stead, survived the opening of the school one month. A thousand pounds were subscribed for his widow.

XIII. *Responsible Government*.—Governor Denison held office till January 1855, when his successor,

Sir Henry Young, arrived with the full powers of Governor-in-Chief, and the new Constitution in his possession. Denison was transferred to N.S.W. On taking his departure he was presented with an address by a section of the colonists, and a testimonial of the value of 2000 guineas. From this period to the present time the history of the colony is one of purely domestic politics. When the Legislative Council undertook the task of drawing up the new Constitution, it was arranged that the nominee element, which had now become extremely distasteful, should be entirely abolished, and that both of the legislative bodies should be elected by the people. Sir Henry Young filled the office from January 1855 to December 1861. During his time the electric telegraph was introduced, the division of the colony into municipalities took place, and the metropolis was lit with gas, and railway communication was initiated. Colonel Gore Browne was the next vice-regal representative, and remained in office till December 1868. In that month H.R.H. the Duke of Edinburgh visited the colony. In January 1869 Sir Charles Ducane, K.C.M.G., arrived in the colony. He mixed freely in the amusements and movements generally of the colonists, and his speeches on public occasions were always of the practical character that might be expected from his former position as a statesman and a country gentleman of England. During his governorship the opening of the Launceston and Western Railway took place. In July 1874 Mr. Weld, Governor of W.A., was gazetted to the Governorship of the colony, being sworn in on 13th January of the following year. He completed his term of office in the early part of 1880, and was succeeded by Major C. G. Strahan, C.M.G., late Governor of the Barbadoes and Windward Islands. Pending his arrival the government was administered by Sir Francis Smith, the Chief Justice, who was afterwards relieved by General Sir H. J. Lefroy. The later Governors were all men of ability, and very popular among the Tasmanians. After the initiation of responsible government in 1856 various reforms were introduced. By the very liberal Land Act of 1863 inducements were offered to those who wished to become farmers in the colony. For the purpose of opening up the country by means of railways, great facilities were given to companies who undertook to construct lines through the country districts; and active search was made for gold and other metals. But in spite of these reforms the population was steadily decreasing, owing to the attractions of the gold-producing colonies. No great amount of land was occupied for farming purposes, and even the squatters on the island were contented with smaller runs than those in the other colonies. They reared stock on the English system, and their domains were rather sheep farms than stations. Indeed the whole of T. wore rather the quiet aspect of rural England than the bustling appearance of an Australian

colony. But the efforts to throw off the taint of convictism were crowned with marked success; and from being a gaol for the worst of criminals, T. has become one of the most moral and respectable countries. In later years the population has begun to show a small increase, and now that the fortunes of all the colonies depend more on their general sources and less on the yield of gold, T. with its wonderfully varied facilities for production, has been able to lay the foundations of solid prosperity.

TASMAN'S HEAD is the southernmost point of Bruné Island in T.

TASMAN'S ISLAND, an island of T., situated off Cape Pillar in Tasman's Peninsula.

TASMAN'S PENINSULA, in T., is bounded on the N. by Norfolk Bay; on the W. by Storm Bay; and E. and S. by the ocean. Its principal capes are Cape Pillar and Cape Raoul. It has several fine bays. There is a smaller peninsula named Forrester's between it and the mainland. Deposits of coal have been found here.

TAYAN MOUNTAIN, a remarkable mountain of N.S.W., at the head of the Colo river; it is a well-known point in Mitchell's trigonometrical survey, being visible from the Wollombi hills and also from Honeysuckle hill on the Bathurst road.

TAYLOR'S ISLAND, in S.A., is the largest island in the N. part of Thorny Passage, and lies two and a-half miles N.W. half N. from Grindal Island. It is one and a-half miles long and has a small islet off its N. and another off its S. end. This island was so called after Taylor, a midshipman of Flinders ship, the *Investigator*, that gentleman having been one of the boat's crew who were lost near Thistle Island in February 1802.

TEBBUTT, JOHN (1834—) astronomer, is a native of N.S.W. An aptitude for mathematical studies turned his attention in early life to the study of astronomy, and he became a self-taught adept in that science. He constructed a small observatory, took observations, and contributed papers on astronomical subjects to the journals. In 1862 he was elected member of the Philosophical Society of N.S.W., and contributed to it several papers on astronomical and meteorological subjects. These are to be found in the published "Transactions" of the Society. The last of these papers contains a discussion of the longitude of the Sydney Observatory, based on lunar occultations observed at Windsor, and points to the conclusion that a considerable positive correction is required to the previous determination of longitude from moon culminations. On the resignation of the Rev. W. Scott in 1862, the appointment of Government Astronomer was offered to Tebbutt, but declined by him. In 1867 he received the Silver Medal of the Paris Exhibition Commissioners for his paper on the Progress and Present State of Astronomy in N.S.W. In 1869 the astronomical work at Windsor was deemed of sufficient importance to admit of Windsor being

adopted in the British Nautical Almanac as an astronomical station. It was also placed in the list of the "Astronomische Jahrbuch." Although not connected with the Royal Astronomical Society, that body continued to publish Tebbutt's contributions; and in 1873 conferred on him the fellowship of the Society. He contributed his share to the data furnished by the Australian Colonies in 1874, for the solution of the problem of the sun's mean distance from the earth. In addition to his numerous contributions on astronomical subjects, he is the author of *Sixteen Years Meteorological Observations*, the greater portion of which has been published and distributed by him.

TERMINATION ISLAND, an island lying to the S. of W.A., discovered and named by Vancouver in 1791.

THAKOMBAU (CAKOBABU,) the War King of Mban in Fiji, has during his eventful career shown himself a man of great resolution. In 1832 his father, Tanoa, was driven from his throne, and most of his family were murdered. He plotted in secret until his plans were ripe, when he defeated his enemies and revenged himself in the barbarous manner of his country. He was up to this time known as Thikinoru or the Centipede, but the title was then changed to Thakombau (Evil to Mban,) Tui Vita and Vanni Valu. He then took the management of affairs, but had many difficulties to contend with. At one time he was saved by the assistance of the King of the Friendly Islands; at another the American Government demanded a fine for losses incurred by Americans, and he only obtained the money from the Polynesian Company by selling 200,000 acres of land. After becoming a Christian he always protected the converts. He ceded the whole of the Fiji group to Great Britain for a pension in October 1874, when the Islands were formally taken possession of in the name of the Queen by Sir Hercules Robinson, who went over from Sydney for that purpose, in company with the Attorney-General Innes. In November 1874 he visited Sydney in company with his two sons, Timotee and Joseph Celnua, the latter of whom had been educated at Newington College, near Sydney. They were the guests of Sir Hercules Robinson, at Government House, and their presence in Sydney created considerable excitement.

THERRY, SIR ROGER (1800-1874) jurist, was a native of Ireland and was called to the Irish Bar in 1824. He was acquainted with George Canning, and edited the volumes of his parliamentary speeches published after that statesman's death. In 1832 he was appointed Commissioner of the Court of Bequests in N.S.W. He was a strong advocate of the claims of the Roman Catholics to equal privileges with the other denominations, being himself a member of that communion. In 1835 the office of Chairman of Quarter Sessions had become vacant by the

resignation of Foster, its former occupant, and the election of a new Chairman devolved on the magistrates of the colony. The only candidate was Therry. He was the favourite with the Governor's immediate supporters, but besides this circumstance, the Opposition party owed him a grudge on his own account. In 1833 an act of insubordination on the part of some assigned servants took place on the station of Major Mudie, at Hunter's River. A number of these men, deeming themselves grievously ill-used by the overseer and other persons in authority on the station, revolted during the sheep-washing season, went to the dwelling-place and seized the fire-arms there, rushed to the place where their companions were employed and discharged several shots towards the overseer, who saved himself only by rushing into the water and placing himself in the midst of the assigned servants, who were there at work. The refractory men made little effort to escape and were soon apprehended. They were tried at Sydney, and having been found guilty, and their crime being capital, six of them suffered death. The men did not attempt to deny their offence; but during their trial persisted in the statement that they had been goaded on to their crime by the tyranny and ill-treatment to which they had been subject at Castle Forbes, the name of the station. Therry defended the men on their trial, and exerted all his forensic ability in supporting the defence which the accused had unanimously put forward. The men were executed, but while the law exacted and received its due public sympathy was in favour of the victims, and a desire was generally manifested in the columns of the press and elsewhere, that if not in consideration of the memory of the six unhappy men who had yielded their lives, at least in mercy to the living and in justice to the character of the colony, an investigation should take place with the view to testing the truth of the allegations relative to the system of discipline which obtained at Mudie's establishment. The Governor yielded to this desire, and a commission of enquiry was appointed. The result of their investigation was a condemnation of the mode in which assigned servants were dealt with at Castle Forbes, and the Governor struck Mudie out of the commission of the peace. Then followed the usual amount of journalistic comment. The wordy warfare however was not confined to the newspapers. A pamphlet appeared bearing the signature of "Humanitas," which gave a detailed account of the inquiry, and commented in no mild terms on the owner of the Castle Forbes property and on the minions whom he employed in carrying out his system of discipline. This pamphlet was circulated in England as well as in the colony, and in both places excited considerable interest and discussion. In England the papers stated that if no other good resulted from the inquiry, and the subsequent publication of the pamphlet, they had the effect of disabusing the public mind of an idea generally entertained

at home that transportation to N.S.W. was no longer a punishment. Therry was looked on as being the author, or at least one of the concocters of this pamphlet, whether or not on sufficient grounds it is unnecessary to say. The Governor had instituted the inquiry and for his reason, besides this uniform protection of the poorer population, he had aroused the antagonism of the magisterial class. Therry was patronised by the Governor, and on this ground alone he was somewhat obnoxious to the magistrates; he was, moreover, generally supposed to be the author of a publication which had exposed, not merely an individual, but the large employers of convict labour generally, including the greater portion of the magistrates, to a certain degree of obloquy, both in the colony and in England. Hence on two grounds he had earned the enmity of the class whose principal members had now an opportunity of deciding for or against him. They set up in opposition to him C. D. Riddell, Colonial Treasurer, who was elected by a bare majority of votes. Riddell's election was duly gazetted, but the Governor resented the departure from official propriety which the treasurer had displayed, in allowing himself to be made the instrument of a hostile faction, by removing him from the seat in the Executive Council, which he held by virtue of his official position. In May 1842 Therry assumed, temporarily, the office of Attorney-general, on the occasion of Plunket paying a visit to the mother country. A service of plate, valued at £500, was presented to Therry by the public, in acknowledgment of the justice and efficiency with which he had administered the office of Commissioner of the Court of Requests. In 1845 he was appointed Resident Judge at Port Phillip, and held the office for some time. In 1846 he was appointed Judge of the Supreme Court, and Primary Judge in Equity in N.S.W. He retired from the bench in 1859, and returned to Europe. He published in England a book detailing his recollections of N.S.W., containing many anecdotes of families and private individuals. This work caused much excitement in some quarters, and the first edition of it was called in. A second edition with the objectionable portions omitted was then issued.

THIERRY, BARON DE. Early in November 1837 a strange character arrived in N.Z. in the *Nimrod*. This was the Baron de Thierry, an Englishman with a French title. He was by birth and education a gentleman, but a visionary. He proclaimed himself as the "sovereign chief of N.Z." He had met with Hongi at Cambridge in 1820, and Mr. Kendall received from him thirty-six axes wherewith to buy land for him, on his return to N.Z. In virtue of those axes, the Baron claimed an estate of forty thousand acres. He brought with him ninety-three persons, including his secretary, master of stores and other officers. The Rev. James Buller writes:—"I was present at a conference he had with the native chiefs at

Otararau. They smiled at his demands. It ended in the cession of about three hundred acres of good forest land to him, on the part of Tomati Waka and Taonui. They said they were sorry they had not a good house to offer for the accommodation of himself, the Baroness and their retinue. He built some fragile houses and began the making of a road, which was, he said, to be extended to the Bay of Islands. But ere long the poor Baron was deserted by all his followers. He afterwards took up his abode at Auckland, where he obtained a scanty living as a teacher of music, and died in great poverty in 1864, at the age of seventy-one. Airy as his scheme was, his claims were recognised by the French Government. Their ships of war that touched at Auckland had orders to pay him great respect."

THIRSTY SOUND lies on the N.E. coast of the Continent. In this inlet Cook lay and called it Thirsty Sound because it afforded him no fresh water. Here he landed for the third time on the coast of N.S.W.

THISTLE ISLAND, in S.A., is a large island lying from four to six miles E. of Cape Catastrophe, and forming the E. side of Thorny Passage. It is twelve miles in length, and from half-a-mile to two miles wide. Off this point lies a small islet surrounded by breakers. Near the middle of the island the land rises to such a height as to be visible at a distance of ten or twelve leagues from a ship's deck. At the N.W. extremity are some white cliffs, with a shoal bight between them and a sandy beach at the bottom of it. This island was discovered by Flinders on 17th February 1802, in his exploration voyage along the S. coast. He at first mistook it for the E. coast of the inlet (Spencer's Gulf) into which he was sailing, but on landing the following morning he discovered his error. Its name was given from a melancholy circumstance which occurred at the time. A number of small islands having been seen to the N., a boat's crew in charge of Thistle was sent to search for an anchorage, but were lost by the upsetting of the boat, caused by the strong ripple. Flinders therefore called the island after his unfortunate officer.

THOMAS, MESAC, D.D. (1816—) Bishop of Goulburn, is a native of England, and was educated at Trinity College, Cambridge, where he took the degree of B.A. in 1840, and M.A. in 1843. Some years afterwards he received the degree of D.D. He commenced his career as a clergyman at Birmingham, where he held a curacy; was shortly afterwards appointed Vicar of Tuddenham in Suffolk, where he remained from 1843 to 1845; became incumbent of Attleborough in Warwickshire, labouring there from 1845 to 1851. He displayed a combination of zeal, perseverance and ability which marked him out as fitted for more extensive undertakings. In 1851 he became secretary to the Colonial and Continental Church Society, and held this office until he was appointed first Bishop of the diocese of Goulburn in 1863.

During the years of his sojourn in London as secretary of this Society, Dr. Thomas organised missions for the spiritual benefit of cabmen and other classes. The diocese in N.S.W. committed to the episcopal charge of Dr. Thomas extends from the 34th parallel of S. longitude to the border of V., and comprehends a widely-scattered population, with some important centres of enterprise. By the exercise of sagacious and considerate activity and generous kindness which marked his previous career, he has won for himself great influence in the community. As a member of the House of Bishops, in the Provincial Synod in the General Conference, and in the General Synod, Dr. Thomas has taken a conservative stand. Anything that bears, to his mind, the semblance of a departure from the principles of the Church of England meets with his determined opposition. He paid two visits to England, and on each occasion obtained substantial assistance for the Australian Church. He spends the greater part of his time travelling from parish to parish through his extensive diocese.

THOMAS, WILLIAM KYFFIN (1821—1878.) journalist, was a native of London and was educated at the Grammar School in Rickmansworth. He came with his father to S.A. at an early age. Except for a short period in 1842 when he was engaged in agriculture, and in 1852 when he was for some months at the Victorian diggings, he was always identified with the *S.A. Gazette and Colonial Register*, established by his father, to the sole proprietorship of which journal he succeeded shortly before his death. He joined the volunteer force in 1860, and was a supporter of the Mission to the Aborigines, the Bushman's Club, and other similar societies.

THOMSON, SIR EDWARD DEAS (1800—) a native of England, was educated at Harrow, and completed his studies at Caen in Normandy. On his return to England he was for some time engaged in acquiring a knowledge of mercantile business, and assisted his father (who was Accountant-General of the Navy) in introducing the system of double entry into the accounts. In 1826 he went to the United States of America for the settlement of some business connected with the property of his deceased mother, and returned to England in 1827. His observations coming before Mr. Huskisson attracted so much attention that he was appointed Registrar of the Orphan Chambers at Demarara; but the situation of Clerk of the Council in N.S.W. having become vacant he applied for and obtained an exchange, and arrived in Sydney in December 1828. In 1833 he married a daughter of General Sir Richard Bourke, Governor of the colony. In 1837 he was appointed Colonial Secretary and Registrar of Records and a Member of the Executive and Legislative Councils. From 1843 he represented the Government in the Legislative Council until 1854, when he was compelled to obtain leave of absence for two years on account of ill health. In May 1853 a select

Committee of the Legislative Council was appointed to prepare a Constitution Bill; and this having been passed shortly before his departure for England, he was appointed conjointly with Wentworth to watch its progress through the British Parliament. He was also appointed one of the Commissioners for the colony at the Paris Exhibition of 1855. Thomson, on the occasion of his departure, was presented with a testimonial by his personal friends, and the admirers of his political conduct as Colonial Secretary during a period of seventeen years. For this purpose a sum of £2250 had been collected. Of this sum £1000 was appropriated to the purchase of a service of plate, the remainder was devoted to founding the "Thomson Scholarship" in the Sydney University, and to procuring a portrait of the recipient. The testimonial was presented in the theatre in the presence of a large concourse of the citizens. In 1856 he retired from the public service on the full pension acquired by twenty-eight years service. At the election of 1856 he was asked to allow himself to be nominated for Sydney, but the state of his health compelled him to decline. He represented the Government in the Upper House as President of the Council. In 1851 he was appointed a Fellow of the Senate; in 1862 he was Vice-Chancellor of the University, and in 1865 Chancellor, which position his increasing age induced him to resign in 1878. He was made a K.C.M.G. in the same year.

THOMPSON, JAMES MALBON (1830—) is a native of N.S.W., and was educated at Cape's Grammar School. He was admitted an attorney and solicitor of the Supreme Court at Sydney in 1855; commenced practice in Ipswich in 1857; entered Parliament as member for Ipswich in 1868; and has ever since sat for the same constituency almost without interruption. He has filled various offices in Parliament; was Chairman of Committees for two years; accepted a portfolio as Minister for Lands in the Palmer Ministry of 1870, and in July 1873 was transferred to the political control of the Public Works Department till the resignation of the Ministry in 1874. In January 1879 he again accepted office in the McIlwraith Palmer Ministry as Minister of Justice, which position he still holds.

THOMSON RIVER, in Gippsland, V., is a fine stream rising in the N. of the Albert range, in the Australian Alps, near the Jordan gold-fields, and flowing S.E., about eighty miles into the Latrobe river, which it joins two miles below the township of Sale. The Thomson has its source by several heads from springs, and is liable to floods from the melting of snow at intervals the whole year round, particularly in the spring of the year. Its upper portion is through a rugged and precipitous country, and its lower part through grassy forest and fine rich open park-like plains, this portion of the country being essentially the garden of A. The town of Sale is situated on the river, which is navigable for a few miles above the latter place,

having an average depth of about eighteen feet and a width of about fifty yards. The Thomson is fed by the Jordan, Aberfeldy, and Macalister rivers, and a number of small creeks. Many of these creeks, particularly those near its source, are auriferous, and in the lower part of the river fish is plentiful; the water is sweet and good. At a distance of about fifty miles from Sale, and S.E. of Mount Baw-Baw, near the bank of the river, has been discovered a vein of copper ore, twelve feet in thickness. A lode of copper has also been found near the same place, in a dyke of decomposed greenstone, which has intruded into the schistose rocks, about 100 feet wide. Grey copper ore, blue and red carbonates, and ore thickly studded with copper pyrites and red ore, are reported to have been found in different places in the neighbourhood.

THORN, GEORGE (1838—) is the son of George Thorn, the oldest inhabitant and founder of the town of Ipswich in Q., and was educated at King's School, Parramatta, N.S.W., and Sydney University, where in 1858 he obtained his degree of B.A. Thorn followed pastoral pursuits for the following nine years. His first appearance in public life was at the general election in Q. in 1867, when he was returned one of the Members for West Moreton. He continued to represent that constituency in the next two Parliaments. At the general election of 1873 when the whole colony was split into single Electorates he stood for Fassifern, which included part of the old Electorate of West Moreton, and was returned by a majority of nearly five to one over his opponent. A new Ministry having been formed by Macalister shortly after the meeting of Parliament, Thorn accepted the portfolio of Postmaster-General and a seat in the Legislative Council as Representative of the Government in that Chamber. He entered on his duties in January 1874. From his first accession to office Thorn did good service in the work of postal and telegraphic communication, pushing on and establishing lines and stations in Q. Thorn has shown great zeal on all occasions to further the progress of that colony; and has not failed to give publicity to its greatness in every mode that lay in his power. In October 1874 he visited Sydney and attended a conference for the laying of cables to connect N.Z. with N.S.W., and extending the communication to Singapore and Europe *via* Normanton. In 1876 he became Premier and Minister for Works, but resigned in 1877 and visited Europe in 1878. The following year he returned, and was elected Member of the Legislative Assembly for Dalby in April.

THORNTON, SAMUEL (1835—) Bishop of Ballarat, is son of the late Thomas Thornton, F.R.A.S., who was for many years connected with the London *Times*. Educated at Merchant Tailors School, Thornton obtained at sixteen an open exhibition at Queen's College, Oxford, and graduated there at twenty, having gained a first class in

moderations and a double second in classics and natural science. Proceeding to a fellowship, he was ordained by Bishop Wilberforce in 1858, and commenced duty in East London, where he was appointed Diocesan Clerical Missionary by Bishop Tait. In this office he preached in the open air and amongst the masses of the people, and was twice arrested by the police on the unfounded charge of obstructing thoroughfares. In 1859 he was appointed incumbent of St. Jude's, White-chapel, in succession to the well-known Hugh Allen. His evangelistic labours amongst the criminal and poverty-stricken classes recommended Thornton to the notice of the trustees of St. George's, Birmingham, a leading parish, with a population of 16,000 souls. He accepted the rectory in 1864 and laboured in this sphere until 1875, when he was selected for the new bishopric of Ballarat by the Bishop of Melbourne and the Chief Justice of V., then in England, in consultation with the two archbishops. He was consecrated by royal mandate at Westminster Abbey on 1st May 1875; the new diocese of Ballarat thereby coming into existence. It includes the western half of V. and contains some 150,000 souls and forty-five parishes, with three archdeacons and forty-two other clergy, besides eleven probationary clergy at work. The bishop belongs to no religious party, possessing broad sympathies. He has from time to time been a contributor to periodical literature, and is an eloquent preacher, a man of great energy of character, and exceedingly zealous in his vocation.

THURSDAY ISLAND, in Q., is an island in Torres Strait, off the extreme northern coast of the colony, centrally situated between Prince of Wales, Horn, Hamond, Friday, Wednesday, and Goode islands, between one and two miles from each. It is the new Government settlement, superseding Somerset, and has been selected on account of its advantageous position, being in the track of all vessels sailing through the Inner Channel, a harbour of refuge, and much used for the pearl-fishing fleet. It is also within easy distance of New Guinea. The Government buildings comprise a court-house and offices, a coxswain's cottage, a lock-up, two houses, and barracks for water police, and the magistrate's house, built on an eminence, all these buildings being at the eastern end of the island. There are numerous pearl-fishing stations within from three to fifty miles of Thursday Island. The climate is said to be salubrious, a cool S.E. wind blowing the greater part of the year; the temperature rarely exceeds 90°.

TODD, CHARLES (1826—) electrician, is a native of London, where he was educated. On leaving school he was engaged as assistant and calculator at Greenwich Observatory, at the same time continuing his studies under some of the Professors of Cambridge University. In 1848 he was appointed Assistant Astronomer at Cambridge Observatory, which position he held until 1854,

when he took charge of the Galvanic department of the Royal Observatory, Greenwich, and was also appointed by the Lords of the Admiralty one of the Astronomers. In 1855 Lord John Russell, Secretary of State for the Colonies, appointed Todd to the position he now holds of Astronomer and Superintendent of Telegraphs for S.A. In 1870 the Governor of the colony amalgamated the Telegraph and Postal departments, and Todd was appointed Postmaster-General. As far back as 1859 Todd pointed out the importance to England of having an independent telegraph system, and when the proposal was made to construct a line of telegraph wire from Adelaide to Port Darwin, to be there connected with a submarine cable between Java and Singapore, he entered heartily into the work, a large portion of which was done under his personal superintendence. The line which connected the Australian Colonies with the rest of the world was completed on 22nd August 1872, amidst great rejoicings. Todd connected the wires in the centre of the continent, at Mount Stuart, and received a great number of congratulatory messages. For this important national work he received from Her Majesty the honour of the Companionship of the Order of Saint Michael and Saint George. Henry Ayers, who was at the head of the South Australian Government at the time the line was completed, also received the honour of Knighthood, as well as that of C.M.G. Todd has since planned the overland line to Eucla, 1000 miles in length, connecting S. and W.A., which was carried out under circumstances of peculiar difficulty, owing to the desert nature of a large portion of the country. The Port Darwin line is nearly 1900 miles in length, and the benefits which have resulted from it to all the Australian Colonies are immense. It has led to the pastoral settlement of hundreds of thousands of square miles of country which will eventually be of very great value, and will probably be ultimately occupied by a large population. The constant communication with Europe has greatly benefited the colonies in a commercial point of view, and the heavy cost of the line has in this way indirectly been more than repaid. Todd has contributed to the scientific world the results of some valuable astronomical observations, amongst which may be mentioned those on the Transit of Venus in 1874, the cloudy haze over Jupiter first noticed in 1876, and others during the two following years, and the Parallax of Mars in 1878. He is a member of several learned and scientific societies, including the Royal Astronomical Society and the British Meteorological Society. His services to the S.A. Government in connection with the settlement of the Northern Territory are above all commendation. A statement of them will be found under that heading.

TOOWOOMBA, is the principal town of the rich pastoral district called the Darling Downs, in Q. It is situated on the summit of the main

range, about 1950 feet above the sea level. It lies 102 miles W. of Brisbane, and about seventy-eight miles (by rail) from Ipswich. It was erected into a municipality on 24th November 1860. The surrounding district is agricultural and pastoral.

TORRENS, SIR ROBT. RICHARD (1814—) son of Colonel R. Torrens whose services in the Walcheren Expedition are matter of history, was educated at Trinity College, where he took the degree of M.A. In 1841 he was made Collector of Customs in S.A., with a seat in the Legislative Council, and some time afterwards Treasurer and Registrar-General. At the first election under Responsible Government he became member for Adelaide, and devoted himself to instituting a new system for the transfer of lands, thenceforth popularly known as "The Torrens Act." In 1863 he returned to England, and was a few years afterward elected a member of Parliament for the Borough of Cambridge.

TORRENS REAL PROPERTY ACT, the great measure of legal reform devised by Sir R. R. Torrens. He felt, as many more have done, the scandalous delay and expense of transferring real property under the old law of England. This system of transferring real estate by deed was brought from England to Australia, where it was soon found to be productive of the evils which attended it in the old country. In every fresh transaction in real property a new deed was necessary, which recapitulated all the deeds that had gone before; this was both cumbrous and costly. It was thought that it might be possible to invent a simpler, cheaper, and safer system; and the method of thinking out and formulating this system belongs to Torrens. He had been Collector of Customs at Port Adelaide, and his official employment made him familiar with the laws relating to shipping, having "just such an acquaintance with the English Constitution and laws as ordinarily entered into the education of an English gentleman." His starting point was to apply to the transfer of land the principles which regulate the transfer of shipping property by means of registration. The idea was a correct one, but between its conception and its formulation into a code of law there was a long and painful interval. He consulted the then Chief Justice, Sir Charles Cooper, and other legal gentlemen, and they gave him but little encouragement. He was not a lawyer. Many technical difficulties would arise which would need a lawyer's trained skill to surmount, and they warned him that he might expect no help or support from the profession. Torrens however was one of the few men who are not to be discouraged by want of sympathy, or beaten by opposition. The subject was near his heart, and he pondered over it night and day, until it assumed shape and form in his mind. He drafted a Bill, submitted it to some of his friends, listened to their suggestions, adopting them where he thought it wise to do so, and then brought it before Parliament. The Bill was laughed to scorn by the profession, but it was

eagerly and enthusiastically welcomed by the public. Most of the lawyers stood aloof. For a layman to attempt to alter the whole system of transferring real estate by deed which had the prestige of immemorial usage in its favour, and to deal with real estate as if it were a mere chattel, was as absurd as if a tailor were to invent a new method of cutting for fistula, or an illiterate ploughman a new method of calculating an eclipse. Torrens however made light of both opposition and ridicule. There was a crying evil to be remedied; he had undertaken to remedy the evil and in spite of all opposition he would do it. Torrens was returned to Parliament as one of the members for the city of Adelaide for the express purpose of carrying the Bill through the Assembly. The legal members opposed him "tooth and nail," but he had a large majority of willing supporters at his back, and the Bill was literally forced through the House by "the brute force of a tyrannical majority." There was greater opposition in the Legislative Council, which has always been found more conservative of old institutions. But public opinion and the sense of the community were too strong to be resisted, and the Bill passed the Council, was assented to by the Governor on 27th January 1858, and became law. At the request of his friends Torrens resigned his seat in Parliament and became the official head of the department. He suggested or superintended all the machinery required for practically working the new system. He laboured at it unceasingly, and when the Act came into operation, on 2nd July 1858, all the office machinery was ready to work it. The first great principle of this Act is the transferring of real property by registration of title instead of by deeds; the second is absolute indefeasibility of title. The system is very simple and very inexpensive. The certificate of title is registered in the official registry at the Lands Titles Office, the owner obtaining a duplicate certificate. All transactions under the land appear on the face of the certificate so that at a glance it may be seen whether the property is encumbered or any charges are made upon it. If an owner wishes to mortgage his land he takes his certificate to the office and has the transaction marked upon it. If he wants to sell he passes over the certificate to the purchaser and the transaction is registered. Any man of ordinary intelligence can do all that is necessary for himself when once his property is brought under the Act. The only difficulty is in getting the title registered at first. After that it is all plain sailing. When a man holding property under deed wishes to have it placed under the Act he takes his deeds, which are his title to the property, to the office. The deeds are carefully examined by the solicitors to the Lands Titles Commissioners; and if there is no difficulty, and after all due publicity is given and precautions taken to prevent fraud or mistake a certificate is issued and the old deeds are cancelled. From the moment the land is brought under

the Act and a certificate is granted, the title of the person holding the certificate becomes indefeasible, unless it has been fraudulently obtained; and he can hold the property against the world. Provision is made for errors that may possibly occur, by which persons may be damaged or deprived of their property. Even though a wrong may have been done, yet an innocent holder of a certificate cannot be dispossessed of his property. But to compensate persons who may through error or fraud have been deprived of their property, an assurance fund has been created by a percentage of one half-penny in the pound being levied on all property brought under the Act. This fund now amounts to between £30,000 and £40,000, and all the claims that have been made upon it during the twenty-two years the Act has been in operation amount to only a few hundred pounds; a sufficient proof of the carefulness exercised in the examination of old titles before the certificate is issued in the first instance. Since this Act came into operation all land grants issued from the Crown have been registered under it, and a large amount of property formerly held under deed is now registered. Confidence in the Act has gradually grown up. The lawyers very soon withdrew active opposition, and the simplicity of the scheme commended it even to the legal mind. Up to the close of 1874 the value of the property brought under the operation of the Act, including land grants, was £9,260,186. The benefit to the community of having a cheap, simple, and expeditious method of dealing with land is incalculable. Dudley Field, the well-known American jurist, recently on a visit to S.A., expressed his great admiration at the simplicity of the Real Property Act, which was much in advance of any system of dealing with real estate with which he was acquainted. The Act has been amended more than once, to render it more workable, but its essential principles have been jealously guarded. Soon after it was set in operation, Torrens obtained leave from the Government to visit the neighbouring colonies at their request, to explain and help to initiate this Act, and now all the colonies have adopted the Torrens Act of registration of title. The principle of the Act has also been accepted by the first jurists at home, where several attempts have been made to get it into operation. Lord Westbury's Act was a step towards it, but it had some serious defects which have prevented it being a success. There is no doubt that it is much easier to introduce the system into new colonies where titles are easily traced, than into old countries where, during the lapse of generations, they have become complicated.

TORRENS LAKE is a vast inland salt lake in S.A. discovered by Eyre, and is about ninety miles N. of Spencer's Gulf. It was at first supposed that this lake extended in a horseshoe form all round the N. side of the E. part of the colony, but more recent discoveries have dispelled this

illusion, and it is now found that good pastoral country lies to the N. of the lake, and between it and another similar sheet of water, known as Lake Eyre.

TORRENS RIVER, in S.A., is the river on which Adelaide is situated. It was named after one of the first founders of the colony.

TORRES, LUIS VAEZ DE, a Spanish navigator, was second in command in the expedition of De Quiros in 1606. When Quiros was leaving the Bay of Saints Phillip and James in his Australian land, the ship commanded by Torres by some unexplained mischance parted company with its consort. Torres remained at anchor in the bay for a fortnight afterwards. He then set sail and steered along the west side of the territory, which he found to be well watered and possessed of many ports. He found it to be an island, not a continent. It is now generally believed to have been one of the islands belonging to the archipelago of the New Hebrides, and geographers give the name Espiritu Santo to the largest island in that group. For two months Torres threaded his course through the intricate navigation of the region lying to the N.E. of the true Australian continent. While sailing westwards, and in $11\frac{1}{2}^{\circ}$ S. latitude, he descried land which he rightly believed to be the eastern extremity of New Guinea. Still continuing his course, he at length sighted land to the S. The daring navigator, without knowing it, had in reality sailed through the famous strait which now bears his name. He had therefore perceived the north-eastern corner of the continent now called Cape York. Pursuing his devious course, Torres arrived at Manilla in the Philippines, in May 1607. The record of Torres' voyages was drawn up by his own hand, under the title of "Relation of Luis Vaez de Torres concerning the discoveries of Quiros as his admiral. Dated Manilla, 12th of July 1607." This precious document was allowed to lie unnoted amongst the archives at Manilla until the capture of that city by the English in 1762. The papers then fell into the hands of a Scotchman named Dalrymple, who kept possession of them, translated them, and gave them to the world in an historical work he subsequently published. Dalrymple, zealous for the fame of the great Spanish navigator, gave the name of Torres to the straits which he was the first European to penetrate.

TORRES STRAITS. The straits which divide A. from New Guinea; its distance across, from Cape York, the northernmost point of A., to New Guinea being about eighty miles. It took its name from the Spanish navigator Torres, who sailed in 1605 from Peru, with the object of discovering the Tierra Austral. He passed through the strait in 1606, but the great discovery of the strait was kept unknown till 1762, through the jealousy of the Spanish monarchy, which kept the reports of its navigators a secret from the world. It was not until 1770 that the world received full confirmation

of it—Cook passing through and settling the question. It is a mass of islands, shoals and reefs, of which the navigation is at all times difficult, and with a contrary wind impracticable. The water is nowhere deep. Towards the narrowest part of the strait it is seldom more than twelve or fourteen fathoms, and often not above half as much. The bottom is everywhere seen, and in clear weather, and with a vertical sun, the traversing of those channels is a novel scene, even to those who are familiar with the sea. This strait is advantageous only as a passage from A. to China and India. April, May and June, appear to be the most agreeable months for passing through the straits; the east monsoon is then in its vigour; the nights are calm and serene; the land wind comes from the southward at day-break and freshens for a part of the morning, but dies away at noon, and is then succeeded by the sea wind, which begins at the E. but shifts to the northward and E. and dies away at night; at this time the E. wind is regular and steady at a distance from the land.

TOWER HILL. A remarkable volcanic mountain in V. with a perfect extinct crater, standing in the Tower Lake nine miles N.N.E. of Belfast, and entirely surrounded by water. It has an exceedingly picturesque appearance and is much visited by sightseers. The surrounding country is very fertile, and potatoes of excellent quality are grown over a large area.

TOWNS, ROBERT (1794-1873) was a native of Northumberland in England. Having at an early age a great desire to become a sailor he was placed on board a collier running between Shields and London. Whilst on board he diligently applied himself to the work of getting a practical knowledge of his profession, and when the vessel was in port used to attend a night-school kept by an old mariner, from whom he learnt some of the elements of navigation. At the age of sixteen Towns was made mate, and the following year took command of the vessel. A few years afterwards he was entrusted with the command of a brig trading in the Mediterranean. Towns made sufficient capital whilst in this trade to enable him to build a vessel for himself which he called *The Brothers*. In 1842 he retired from a seafaring life and settled in Sydney, where he established the well-known mercantile house which bears his name. Towns employed many vessels in the "Island Trade," collecting sandal wood, cocoa-nut oil, &c. When his business had largely increased he took into partnership Alexander Stuart. In 1851 Towns took an active part in re-organising the Bank of N.S.W., increasing its capital and otherwise making it suitable to the growing demands of the colony; he was from that time till his death connected with the directory of the bank. Towns entered largely into pastoral pursuits, and held a number of stations in North Australia. Townsville, an important township and electorate was named in his honour. He was the first to introduce the

cotton cultivation on an extensive scale, for which he, at an expense of £20,000, formed a plantation of 2000 acres, and employed about 260 South Sea Islanders. He was appointed to the Legislative Council in 1856, and continued to take an active part in mercantile marine and all matters affecting the shipping interests to the end of his career. In private life he was remarkable for generosity and kindness; during the Crimean War he contributed largely to the "Patriotic Fund," and gave £500 for the relief of the sufferers by the Lancashire cotton famine. Towns was at one time connected with John Robertson and Charles Cowper in taking up the country known as the "Plains of Promise," on the Albert and Norman rivers, Gulf of Carpentaria.

TOWNSVILLE, a town in Q., situated on the shores of Cleveland Bay, about 870 miles N.W. of Brisbane. It was found by John Medwin Black in 1864, and named after his partner Captain Towns. It is picturesquely built on the north bank of the Ross creek, and partly on the slope of a mountain, which rises to an altitude of 1000 feet. There is a large shipping trade, Townsville being the port for an immense territory to the W. and N.W., including several gold-fields and much pastoral country, even to the Diamantina, which however is hampered by the openness of the anchorage—large vessels, and even the inter-colonial steamers, having to lie nearly three miles off the shore. A magnificent stone breakwater is in course of construction which will remedy this.

TRENCH, ROBERT LE POER, jurist, is a native of Dublin, and was articled to the celebrated pleader and conveyancer Coventry, and was called to the English Bar (Inner Temple) in June 1842. After having spent several years travelling in various parts of the world, he came to V., and was appointed Clerk of Petty Sessions in Kilmore, and shortly afterwards was promoted to the office of Clerk of Petty Sessions in Ballarat. In 1855 he was admitted to the Victorian Bar, in the same year with Sir George Stephen, Judge Bindon, and Robert Walsh. He soon became a leading member of his profession, and has long been looked upon as a high authority on mining law. In the famous case of *Learmonth v. Bailey* and others—perhaps the most important case that was ever tried in Australia—he was retained for the defence, and had the satisfaction of gaining a verdict for his clients. On the formation of Berry's first Government in August 1875, Trench was appointed Attorney-General; and when Berry again became Chief Secretary, in May 1877, Trench resumed his position in the Crown Law Offices, and was subsequently appointed one of the Land Tax Commissioners.

TUFNELL, EDWARD WYNDHAM (1814—) is a native of England, and was educated at Eton and Wadham College, Oxford. In 1846 he was Rector of Beechingstoke; in 1850 he was made Prebendary of Salisbury; in 1858 Rector of SS. Peter and

Paul, Marlborough; and was consecrated first Bishop of Brisbane in 1859. He resigned the see in 1875.

TURNER'S CREEK is a fine stream of water in Q., flowing into the Gulf of Carpentaria; it was discovered by Leichhardt during his journey overland to Port Essington. It lies to the westward of the river Marlow, and is named in acknowledgment of the support that Leichhardt's expedition received from George Cooper Turner of Sydney.

TWOFOLD BAY, in N.S.W., lies 240 miles to the S.W. of Sydney and thirty miles from Cape Howe. It was discovered and named in January 1798 by Bass, who obtained permission from Governor Hunter to explore with Flinders, in an open whale-boat, the coast to the S. of Botany Bay. It is a good harbour, possessing good anchorage, protected from all winds, excepting those from the eastward. Snug Cove was so named by Flinders; it is a very small cove, and only large enough to afford mooring room for about half-a-dozen vessels. A cove situated on the south where stands the town of Boyd, affords perfect shelter to vessels from every wind. "From its proximity to the Menaroo country" wrote Wells in 1848, "it is likely to become a very thriving place. As a port it stands well to compete with Port Jackson, and will very soon be a place of considerable trade. The land in the immediate vicinity of the town of Boyd is good, and a vast extent of land of the first quality stretches far and wide to the westward and southward, inviting the agriculturist and grazier, and holds out the fairest promise to persevering industry. It is admirably situated for a commercial town, being a sort of half-way house between Sydney; Hobart Town in T.; Launceston in T.; and Sydney and Melbourne. It is the general place-of-call for the steamboats regularly plying along the coast between the metropolis and all the settlements to the southward, both in A. and T.; and it is anticipated that every acre of available land within a moderate distance of Boyd Town will bear a high price in the land market. A remarkable high peaked hill named Mount Imlay, after the discoverer of the Menaroo country, lies behind the head of the bay." It is needless to add that these sanguine anticipations were never realised. Twofold Bay is now a solitude.

TYRRELL, DR. WILLIAM (1807—1879) first bishop of Newcastle, N.S.W., was son of a former Remembrancer of the city of London; his mother was a daughter of the celebrated optician Dollond. He was educated at the Charterhouse, in London, and afterwards went to St. John's College, Cambridge, where he gained a scholarship and graduated as fourth senior optime. In 1847, when it was resolved to divide the bishopric of Australia, he left his English parish to undertake the duties of Bishop of Newcastle. He was indefatigable in visiting even the most remote parts of this vast diocese, and must have travelled many thousands

of miles in this way; he was a good horseman and performed by far the greater part of his episcopal visitations on horseback. Knowing that the gradual withdrawal of State aid on the death of the present incumbents would soon leave the Church entirely dependent on the voluntary contributions of its members, his main anxiety for many years past had been to inaugurate a scheme for the permanent endowment of the diocese. His scheme provided endowments for a bishop, an archdeacon, three canons, and a number of licensed clergymen; also £10,000 to provide incomes for superannuated clergy; £5000 (towards which the bishop's sister promised £2000) for the help of sick clergymen taking rest and air; £25,000 for the training of future clergy; and £44,000 for the religious education of the young. The entire scheme involved the investment of a quarter of a million sterling for the benefit of the Church in the Newcastle diocese. Of this amount a portion, comparatively a very small portion, was raised in his lifetime. The bulk of it was to be provided, under the bishop's will, by the appropriation of the annual profits of his valuable station property. His name will be held in lasting remembrance in the diocese. The particular distribution of the half million of money he bequeathed is given above. One of the Bishop's greatest trials of late years (added to his paralysis) was the long disastrous drought which existed in that part of Australia and prevented his carrying into effect his munificent scheme, his property having been seriously injured by it. He lived just long enough to see the long-wished-for rain set in, and this much lightened his anxiety. He died at last on 24th March from hernia, brought on by his long and rapid journeys on horseback. At his funeral there was an immense gathering of clergy and laity.

U.

ULLATHORNE, WILLIAM BERNARD (1806—) was a native of Yorkshire, and educated at St. Gregory's College, Downside, England. After being admitted to the priesthood he became a missionary to Australia in 1832, and was appointed Vicar-General, being well known for his zealous labours amongst the prison population. Ullathorne was the first Catholic priest who visited Norfolk Island, and he succeeded in obtaining the appointment of a Catholic bishop for the colony. Through giving evidence before a Parliamentary Committee in 1838, he exercised great influence in putting a stop to transportation to the penal settlements. Having returned to England, he was stationed at Coventry. He was appointed Vicar-Apostolic of the Western district, and consecrated Bishop of Hetalona, *in partibus*, in June 1846; was transferred to the Central District in July 1848: and translated to the See of Birmingham in September 1850, on the restoration by the Roman Catholic

authorities of their hierarchy, in obtaining which he bore a prominent part. Amongst his published works are : *A Reply to Judge Burton* (1836) ; *Horrors of Transportation* ; and *The Australian Mission* (1838.)

V.

VANCOUVER, GEORGE, British navigator, sailed with Cook in his third voyage. Whilst on an expedition to South America, in September 1791, he touched the S. coast of the Australian continent at Cape Chatham, to which he gave the name. Sailing eastward he came to a sound in which he cast anchor on 28th, and named it King George III.'s Sound. The first land he saw was a high mountain, which he named Mount Gardiner, and some islands off the mainland were called Eclipse Isles. Tracing the shores of the sound inland, he reached a high rocky point, which he named Point Possession. He quitted the sound on 11th October and proceeded eastward in the examination of the coast ; but, baffled by unfavourable winds, he abandoned his design. He then sailed away on his main expedition to the N.W. coast of America. The last land seen by him was named Termination Island. In sailing out of King George's Sound, his vessel had struck on a bank covered with oysters, to which the name Oyster Harbour was given. This completed the navigator's discoveries in Southern Australia.

VAN DIEMEN'S LAND, the early name of Tasmania. A full account of the Island is given under that heading.

VAN EDEL, JOHN, Dutch Navigator, discovered and named Van Edel's Land, in 1619.

VAN NUYTS, PETER, Dutch Navigator, discovered and named Van Nuyts' Land in 1627.

VANSITTART HILLS are situated in the district of Liverpool Plains, N.S.W., near the Yorke River. They were named by Oxley after the Chancellor of the Exchequer, Sir Nicholas Vansittart.

VAUGHAN, ROGER WILLIAM BEDE (1834—) Roman Catholic Archbishop of Sydney, is the son of Colonel Vaughan, of Courtfield, Herefordshire. The family is one of the oldest of the county families of England, having been founded by Herbert, Count of Vermandois, who came from Normandy with the Conqueror, and was Chamberlain to William Rufus. The great-uncle of the Archbishop was the celebrated Cardinal Weld. His eldest brother is Roman Catholic Bishop of Salford. His uncle is Bishop of Plymouth, and his cousin the Rev. Dr. Clifford is Bishop of Clifton. He was educated by private tutors until 1851, when he was sent to St. Gregory's College, Downside, near Bath, an institution conducted by Fathers of the English Benedictine Congregation. In 1853 he entered on his novitiate,

was professed in the following year, and in 1856 went to Rome to complete his study of divinity. In 1859 he was ordained priest by Cardinal Patrici, in the Church of St. John Lateran. He returned to Downside in the latter end of the same year, and was made missionary priest of a large district. His labours for two years were great and most successful. In 1861 he was made Professor of Philosophy in the Benedictine Institution at St. Michael's, near Hereford ; and in 1862 was elected, in spite of his youth, to the Cathedral Priorship. This office he retained until his consecration as Archbishop of Sydney in 1879.

VERDON, SIR GEORGE FREDERIC (1834—) is a native of England, and came to V. in 1851. He established himself at Williamstown, and in 1859 was elected to represent that constituency in the Legislative Assembly. In 1860 he was chosen Treasurer in the Heales Ministry, and occupied that position until the close of the following year, when the third O'Shanassy administration was formed. He was called to the bar in 1861. When the O'Shanassy Government resigned in 1863, Verdon became Treasurer in the McCulloch administration, and held that office until 1868. In 1866 he was sent as commissioner from the Government to England for the purpose of bringing the subject of the defences of the colony under the consideration of the Imperial Government, and succeeded in obtaining a contribution of £100,000 towards the construction of the ironclad *Cerberus*, as also the gift of the *Nelson*. He also negotiated a loan for public works, and was instrumental in establishing the Melbourne Mint. On his return to V. he was elected member for Emerald Hill, but soon resigned his seat on accepting the appointment of Agent-General for the colony. This position he filled with great ability until 1872. He was knighted by Her Majesty for his public services, with the order of G.C.M.G. When he resigned the Agent-Generalship, he accepted the office of Colonial Inspector and General Manager of the English, Scottish and Australian Chartered Bank, a position which he now holds. Verdon is a Fellow of the Royal Society, of the Royal Geographical Society, and of other scientific societies.

VERVAIN PLAINS, are situated in Q. They were discovered by Leichhardt, and named from their being entirely grown over with Vervain.

VICTORIA, the smallest and most southerly of all the continental colonies, was originally named Port Phillip, and bore that name as a district of N.S.W. until its separation from the parent colony in 1851. On its erection into an independent colony, it was named after Her Majesty Queen Victoria. Mitchell, on his first exploring journey southward from the Murray, proposed to call the new province Australia Felix, from the mildness of its climate, the fertility of its soil, and the beauty of its scenery, but this name was never adopted.

I. GEOGRAPHICAL POSITION, AREA, AND BOUNDARIES.—V. is situated at the south-east of, and is the southernmost colony on, the Australian continent. It lies between the 34th and 39th parallels of S. latitude, and the 141st and 150th meridians of E. longitude. Its extreme length from E. to W. is about 420, its greatest breadth about 250, and its extent of coast-line nearly 600 geographical miles. According to the latest computation, the area of V. is 88,198 square miles, or 56,446,720 acres. The whole continent of A. is estimated to contain 2,983,264 square miles, and therefore V. occupies about a thirty-fourth part of its surface. Great Britain, exclusive of the islands in the British seas, contains 89,644 square miles, and is therefore slightly larger. V. is bounded on the N. by the River Murray, and by a direct line running in a south-easterly direction from a place near the head waters of that stream, called the Springs, on Forest Hill, to Cape Howe. The positions of the extremities of this line are as follow:—

	Latitude S.			Longitude E.		
	°	'	"	°	'	"
The Springs ...	36	47	56.90	...	148	11 57.75
Cape Howe ...	37	30	23.09	...	149	58 35.50

The western boundary which divides it from S.A. is a line about 242 geographical miles in length, approximating to the position of the 141st meridian of E. longitude, and extending from the Murray to the sea. This line was, in 1847-9, marked upon the ground as the 141st meridian, and was accepted and proclaimed as such in the *Government Gazettes* of the period in the two colonies; but its true position is now found to be $140^{\circ} 58' 7.26''$, and it therefore follows that V. exercises jurisdiction over about 360 square miles of South Australian territory. The error was discovered in the course of the Geodetic Survey of V., which was commenced in 1857, when according to the first observations made by the surveying staff, the marked line appeared to be two and a-half miles to the eastward of its proper position, and it was consequently supposed that S.A. had encroached upon V. to that extent all along the frontier. It was afterwards discovered that, owing to errors in the *Nautical Almanac*, the Victorian geodetic lines had been placed four miles too far to the westward, the necessary result being that, instead of S.A. having possession of any portion of the territory of V., the latter was in occupation of a strip of South Australian territory one and a-half miles broad and 242 miles long. This fact the S.A. Government have submitted should be held to be sufficient reason for the reconsideration and re-marking of the boundary line; but to this the V. Government object, more especially as they made no demand for its alteration when the error was supposed to be two and a-half miles the other way, and also because in the present state of science, it is admitted to be impossible in these latitudes to lay down meridians at very great distances from the primary within a nearer approximation to their true position than a quarter of a mile, so that, if the boundary were

readjusted now, improved methods in a few years might indicate that the line was still wrong. It may be observed that what is known of the position of the marked boundary line is entirely due to Victorian observers, and S.A. has never, so far as is known, taken any steps towards testing the accuracy of their observations. The southern boundary of V. is the Southern Ocean, Bass Straits, and the Pacific Ocean. The Southern Ocean is reckoned to extend as far east as a line drawn from the north part of King's Island to Cape Otway; Bass Straits from that line to one drawn from the north part of Flinders Island to Wilson's Promontory; and the Pacific Ocean from the last-mentioned line eastward. The southernmost point in V., and consequently in the whole of A., is Wilson's Promontory, which lies in lat. $39^{\circ} 8' S.$, long. $146^{\circ} 26' E.$; the northernmost point is the place where the western boundary of the colony meets the Murray, lat. $34^{\circ} 2' S.$, long. $140^{\circ} 58' E.$; the point furthest east is Cape Howe, situated in lat. $37^{\circ} 31' S.$, long. $149^{\circ} 59' E.$; the most westerly point is in the line of the whole western frontier, which, according to the latest correction, lies upon the meridian $140^{\circ} 58' E.$, and extends from lat. $34^{\circ} 2' S.$ to lat. $38^{\circ} 4' S.$, or 242 geographical miles. The Melbourne Observatory is a building specially erected for observatory purposes on the Government reserve on the south side of the River Yarra. According to the latest computation, its lat. is $37^{\circ} 49' 53'' S.$, and its long. $144^{\circ} 58' 42'' E.$

II. PHYSICAL FEATURES.—The surface of V. is even more diversified, and less easy to describe, than that of N.S.W. A broad and irregular range of mountains runs through the colony from E. to W., dividing it into two unequal parts, all the truly Victorian rivers having their sources on the southern side of the watershed and flowing to the sea, while those rising on the northern slopes all empty themselves into the Murray. The eastern and loftiest portion of the mountain range is known as the Australian Alps, while its extension westwards is termed the Dividing Range. Farther west it is called the Pyrenees, some of whose peaks are incongruously named Ben Nevis and Mount Ararat. Beyond these the range turns northward and forms the Grampians, whose principal peak, Mount William, is 5600 feet high. The highest part of the Australian Alps in V. is Mount Bogong (6508 feet,) forming part of a northerly spur between the Mitta-mitta and Ovens Rivers and about fifty miles west of the N.S.W. boundary. Further west a few peaks rise above 6000 feet. All along the main chain are many northern and southern spurs and short ranges, as well as a number of outlying peaks and mountains often extending to a width of fifty or a hundred miles. In the central part of the Dividing Range the hills vary from 2000 to 3500 feet, while both here, and more especially in the country west of Melbourne, are hundreds of volcanic mountains, some with very perfect cones and craters. There

is no connected system of coast-ranges. To the east are the Wanderer Hills entering the colony from N.S.W. The Strzelecki Range crosses the southern promontory, while another crosses the south-western promontory and terminates at Moonlight Headland a little north-west of Cape Otway. The larger portion of V. is mountainous or hilly, and it is only in the north-western portion that we meet with plains at all equal in extent to those of N.S.W. This is the Wimmera district, extending from the Pyrenees and Grampians to the Murray, and covering an area of more than 20,000 miles. Here are vast sandy and sparsely grassed plains intersected with belts of "myall scrub" and forests of Casuarina, Banksia, and Eucalyptus. Occasionally patches of land occur suitable for agriculture, but by far the larger portion is only suited for pasture. In some parts there are extensive swamps, and the whole district is liable to severe droughts, so that water has to be obtained by means of wells from 80 to 140 feet deep. With the exception of the Murray, V. has few navigable rivers. In winter these rivers become angry torrents, carrying devastation over much fertile country. During the summer heats many of them dwindle down to small streams or to detached pools of water, while some entirely dry up in exceptionally dry seasons, bringing terrible loss to the stock-owners, whose cattle die by thousands from want of water. The principal rivers in the order of their length are—the Murray, the chief sources of which are in the colony and whose main stream bounds it for a distance of nearly 600 miles, its total length measured along its course being 1400 miles; the Goulburn, 230 miles long, a tributary of the Murray, having its source in the great Dividing Range to the N.E. of Melbourne; the Glenelg, 205 miles long, rising in the Grampians and flowing in a westerly and southerly direction to the sea at the S.W. corner of the colony; the Loddon, 150 miles long, has its sources in the Dividing Range N.W. of Melbourne and flows nearly due north to the Murray; the Wimmera has its sources in the Pyrenees and Grampians, and flowing northward loses itself in salt lakes and arid plains before reaching the Murray; the Avoca, 130 miles long, rises on the eastern slopes of the Pyrenees and also terminates in swamps and lakes; the Hopkins, 110 miles long, rises in the Pyrenees and flows southward to the ocean; the Ovens, 100 miles long, rises in the Australian Alps, near Mounts Smyth and Selwyn, and flows in a N.W. direction to the Murray; and the Yarra Yarra, 90 miles long, which rises among the southern spurs of the Dividing Range, and flowing west, enters the bay of Port Phillip at Melbourne. There are numerous lakes in V., but many are saline, and some are depressions near the shore, only separated from the ocean by sandbanks. A few are formed in ancient craters. The lakes of the Wimmera district are mostly salt—as Lake Hindmarsh which covers more than 25,000 acres.

Lake Burrumbeet, near Ballarat, and some others among the mountains, may be true alpine lakes, but these interesting geographical features have not been sufficiently examined. The scenery of V. is diversified and pleasing. The hills and mountains are mostly clothed with dense forests; and the ranges of the Australian Alps offer much grand mountain scenery. Again in the west the Pyrenees and Grampians are very picturesque, and some of the rivers are broken by waterfalls of great beauty. The whole country from Melbourne westward is exceedingly rich in soil and varied and beautiful in scenery. Here there is an additional charm in the numerous extinct volcanoes which occur in extraordinary numbers. In many instances the craters are perfectly defined, leaving not the slightest doubt as to their former character. In general they appear as isolated cones such as Mounts Elephant, Eles, Napier and others, standing out conspicuously from the surrounding level; in others, as the Warion Hills, between the lakes Colac and Corangamite they assume the form of a small chain comprising about a dozen volcanic hills. Within and around the craters are strewn rocks of pumice and lava; and the lower part is often occupied by a small lake, sometimes of fresh water, at others of salt, or nauseous to the taste and smell, as from the presence of sulphuretted hydrogen. This fine country is also variegated with salt lakes and lagoons, some of which, by their circular form, their peculiar mineral water, and a sort of escarpment around them, have the appearance of craters, although not in the customary form of cones. Luxuriance of vegetation everywhere accompanies the volcanic deposits, to such an extent as sometimes to be injurious to the animals that feed on it. Westgarth remarks:—"The picture of the past, called up by geological science, contrasts strikingly with the present scenery. The most violent commotions of nature have been succeeded by the opposite extreme of tranquillity. Sheep fat for the shambles the whole year round, horses in the highest spirit and condition, oxen half a ton in weight, sport over the verdant grass supported by the deep soil now covering the once livid rocks that were vomited over the country." Howitt also, in his *Two Years in Victoria*, speaks of the "rich black volcanic earth and the greenness of the luxuriant vegetation in the country between Ballarat and Geelong, and westward to the Glenelg River. He describes the upper valley of the Moorabool as being exceedingly picturesque, the river running through deep glens enclosed by lofty precipices and hung with fine forests. For miles the banks of the river display extreme beauty, winding about amid noble promontories scattered with giant trees, and high hollow combs as impressive in their seclusion as they were rich in soil. Here and there mounds rise out of the bottom of the valley so rounded and beautiful that one wonders not to see them seized upon and crowned with picturesque mansions,

Others run in low lines across the valley, looking as if designed by some skilful landscape-gardener to give effect to princely grounds, yet so draped in delicate verdure as only nature could drape them."

III. CLIMATE.—Although V. is not so hot as N.S.W. or Q., there is not much difference in the maximum summer temperature, which often rises to 100° or even to 108° Fahr. in the shade. There is however a considerable amount of fine clear weather not oppressively warm, and except when the hot northerly winds blow, the climate is exceedingly agreeable. In the lowlands frost is almost unknown, but in the mountainous districts it often freezes at night, although the days may be of a summer temperature. The mean temperature of Melbourne is 58°. The rainfall is very variable in different years. The mean at Melbourne is 25 inches, but it has been so low as 14 inches and as high as 48 inches. In the mountains, especially towards the east, the rainfall is greater, while the Wimmera district in the north-western interior is very dry, having rarely above 14 inches, while the soil is mostly sandy and the evaporation enormous. On the whole V. has probably the most agreeable climate of any part of the continent of Australia.

IV. NATURAL HISTORY.—Being (comparatively) so small, and divided by no great natural barriers from N.S.W. or S.A., it is not to be expected that V. should present many peculiar forms of animals or plants. Its varied surface and rich soil are however highly favourable to vegetable and animal life, and the special Australian flora and fauna are here developed with great luxuriance. Many English quadrupeds and birds have now been introduced and become naturalised; such as hares, rabbits, deer, goats, pheasants, partridges, quails, white swans, foreign ducks, thrushes, larks, and other song-birds; and many of these are becoming more or less plentiful. Rabbits have increased in some of the scrubs to such an extent as to be a nuisance. Deer may be found in some of the mountain ranges; and the Axis deer of India, of which thirty-five were turned out in the Wimmera district a few years since, now number herds of some hundreds in the ranges of the Western Grampians and in many of the surrounding mountains. Angora goats have also been turned out, and many of the birds have increased wonderfully, so that the sweetest songsters of England may be often heard in the woods of this remote colony. The southern slopes and valleys of the Dividing Range to the N.E. of Melbourne are clothed with magnificent forests, and it is here that trees have been found surpassing in height the famed giant trees of California. Among the various tributaries of the Watts River (a northern branch of the Yarra Yarra) several species of Eucalyptus attain gigantic dimensions never met with in any other forests. There are large tracts near the sources of the Watts where the trees average from 250 to 300 feet high, mostly straight as an arrow and with very few branches. Many fallen trees measure

350 feet in length, and one huge specimen, which lay prostrate across a stream, was found by actual measurement with a tape to be 435 feet from its roots to where its trunk had been broken off by the fall. This broken end was three feet in diameter, so that at the lowest estimate the entire tree must have been over 500 feet high—by far the loftiest tree as yet ascertained to exist on the globe. At five feet from the ground it measures eighteen feet in diameter. The tree had been much burnt, and the broken top entirely destroyed. This tree was a eucalyptus, probably of the species named *E. obliqua* or *E. amygdalina*. The tallest of the Wellingtonias of California do not exceed 325 feet, but they are usually thicker at the base. This huge fallen tree was however eighteen feet in diameter at five feet from the ground, and some are said to exceed twenty feet in diameter, but these are rarely more than 300 feet high. It is therefore probable that not only in height but also in the quantity of timber in a single tree, these Victorian eucalypti far surpass all other trees in the world.

V. GEOLOGY.—The geological formation of V. is very varied, and this helps to give the country much of its beautiful and romantic scenery. It possesses far less of the barren tertiary sandstone than the other colonies, and a larger proportion of palæozoic and volcanic rocks, to which it owes its extreme fertility. The Dividing Range running through the centre of the country from east to west consists of granitic and Silurian rocks, which extend also to the Grampians on the west and the Australian Alps on the east. South of the mountains to the sea was once an enormous deposit of upper palæozoic or secondary rocks, which have since been denuded. These rocks had a strike at right angles to the mountain range, and the beds of quartz and other hard rocks now stand up in ridges running north and south across the country so regularly that they are used as sure guides by the wandering bushman. These more recent deposits seldom produce much gold, and it is owing to their extensive denudation that V. owes much of its auriferous treasures. The mode in which the gold occurs has already been described in our chapter on the Geology of Australia, and need not be repeated here. Devonian sandstones, slates and limestones, occur in Gipps Land. Secondary rocks, though scanty, occur in the Cape Otway country, and in the region east of Western Port, as well as in the Wannon district east of the Glenelg River. These regions are poor, and are either uninhabited or pastoral. Coal is found at Cape Otway and Western Port, but it is not of great value, being of Mesozoic age. Tertiary deposits cover one-third of the surface of the colony. The calcareous or desert sandstone of Pliocene age, which is so largely developed in W. and S.A., enters V. in the west and north-west, and forms much of the poor arid pastures of the Wimmera country. To the south of the mountains small patches of it only are found at Port

Phillip Heads and Western Port. The quartz, gravel, clay, sandstone, and conglomerate, in which alluvial gold is found, is Older Pliocene, while the fresh-water sandstones of Geelong and of the Loddon valley are Newer Pliocene. The coloured clays of Warrnambool on the south-western coast are Post-pliocene. Miocene beds occur in the Moorabool valley west of Geelong and in the Cape Otway region; while the sandstone of Portland in the west and the rough limestone of the Gippsland lakes are of the same age. The extinct volcanoes of V. are very remarkable, and apparently very recent, so that the traditions of eruptions existing among the natives may be founded on fact. Many of the plains, as those north and west of Melbourne, are formed by outflows of basalt, as are some very extensive plains in the western part of the colony. The successive flows of basalt, beneath which the "deep leads" of the gold-miners are found, have already been described. The volcanic cones and craters which are so abundant in the south-west of V. and in the Dividing Range have discharged basalt, lava, scoriæ, cinders, mud, and ashes. In many places, as about Ballarat, these extinct volcanoes may be counted by the score. Some are filled up at the summit, others are surrounded by a rim miles in extent, while others again have their craters filled with water. Several of the western lakes appear to have been craters. Many of these volcanoes were in eruption during the Miocene period, others in Pliocene and Post-pliocene, or even in recent times. To the south-west, near Lake Colac, are singular ridges of lava and basalt forming a labyrinthine network of rock, among which caverns of considerable extent have been found.

VI. MOUNTAINS.—A range of mountains traverses the entire length of the colony, dividing it into two unequal parts. This range runs in an eastern and western direction, generally at a distance of sixty or seventy miles from the sea-coast. It is part of the Australian Cordillera and is called the Dividing Range; all the Victorian rivers have their sources in this range or in its spurs, those to the north running towards the Murray and those to the south flowing into the sea. Its eastern part, which divides the Gipps Land district from the Murray, is known as the Australian Alps. It varies in height from 1000 to 7000 feet, the principal peaks being Mount Smyth, Mount Selwin, The Twins, Forest Hill and the Cobboras. The range dividing the Wimmera district from the county of Ripon is termed the Pyrenees; the principal peaks are the Coorong-Ageering, the Jambour and Ben Nevis. The Grampians form the west termination of the Great Dividing Range; the principal peak is Mount William, 5600 feet high. Other mountains are—the Benambras, the Gibbo, Bogong, Buffalo and Futter ranges; the Delatite, Mount Wellington, Bawbaw, Hoddle, Strzelecki, Dandenong, Victoria and Sierra ranges. The ranges running at right angles to the main dividing range are not very lofty, and consist

mostly of heavily-timbered hills, although in the Geelong and Ballarat districts are numerous bald hills the slopes of some of which are in a high state of cultivation as vineyards and otherwise. The highest peaks of the mountain system of Victoria are the following:—Bogong 6508 feet, Feathertop 6303 feet, Hotham 6100 feet, Cobboras 6025 feet, Cope 6015 feet, Buller 5911 feet, Gibbo 5764 feet, Wills 5758 feet, Howitt 5715 feet, Buffalo 5645 feet, Twins 5575 feet, Wellington 5363 feet, Tamboritha 5381 feet, Cobbler 5342 feet, Kent 5129 feet, Forest Hill 5000 feet, Benambra 4940 feet, Castle Hill 4860 feet, Ellery 4255 feet. As far as is known at present there are at least fifteen peaks over 5000 feet high, and fifteen between 4000 and 5000 feet; there are also many peaks above 4000 feet whose actual height have not yet been determined.

VII. CAPES.—The principal headlands are—Cape Bridgewater, Cape Nelson, and Cape Otway (the last-named is at the south-western extremity of the colony, and usually the first land sighted by the emigrant,) Cape Volney, Point Flinders, Port Phillip Heads, and Point Lonsdale on the south, to the west of Port Phillip Bay; and Point Nepean, Cape Schank, Cape Paterson, Cape Liptrap, and Wilson's Promontory, also on the south, to the east of Port Phillip Bay.

VIII. RIVERS.—The absence of rivers of any size is one of the greatest obstacles to the opening up of the country; with the exception of the Murray, the Yarra-Yarra, and the Gippsland streams, none are navigable in the English acceptance of the term. The names of the principal rivers, in the order of their length, are as follow:—The Murray 2400 miles, 670 miles of which flows along the Victorian border, Goulburn 230 miles, Glenelg 205 miles, Loddon 150 miles, Wimmera 135 miles, Avoca 130 miles, Hopkins 110 miles, Wannon 105 miles, Ovens 100 miles, Yarra-Yarra 90 miles, Latrobe 90 miles, Mitta-Mitta 90 miles. In winter time the rivers of A. are frequently swollen by the heavy rains into angry torrents, which carry all before them in their resistless course, and, overflowing their banks, devastate the country. Many of the smaller streams, colonially called "creeks," and, indeed, some of the larger rivers in the west, dwindle down into mere threads of water, and occasional pools, or water-holes, during the summer heats, and sometimes dry up altogether; a circumstance which, when it occurs, is productive of terrible loss to stockowners, cattle dying in thousands from drought.

IX. LAKES.—There are numerous salt and fresh water lakes, many of these being dry during the summer months, and all of them more or less shallow; the largest of these is Lake Corangamite, covering 48,640 acres. This lake, with a number of small ones in its neighbourhood, has no outlet, and is extremely saline, from the accumulation of salt in solution passed into it by drainage from the basalt rock, the water being kept down by

vaporisation, while the quantity of salt continually increases. In the summer the lake falls, by evaporation, considerably below its winter level, leaving on the banks large quantities of native salt in crystals, the gathering of which forms a remunerative occupation to those residing in the district. A few miles distant from this is Lake Colac (fresh water,) 6400 acres in extent. Lake Burrumbeet, in the county of Ripon (fresh water,) embraces an area of 5440 acres. Lake Albacutya, in the Wimmera district, covers 13,440 acres; Bolac, in the same division, 8960 acres; Lake Connearre is 7680 acres in extent; Lake Hindmarsh, 25,840 acres. The Gipps Land lakes, Victoria, King, Reeve, and Wellington, are approachable from the sea at certain times, a belt of sand only separating them therefrom. This belt or bar is periodically opened at a stated point by the neighbouring settlers, thus setting free the accumulated waters, and opening a channel for the vessels which ply to and from the lakes. Works have been commenced with a view to make the entrance permanent. The largest of them is Lake Victoria, covering an area of 58,240 acres; Lake Wellington occupies 46,080 acres.

X. HARBOURS.—The principal harbours are Port Phillip Bay, 40 miles long and about the same width at the widest part, area about 700 square miles, the head waters of which are called Hobson's Bay and form the port of Melbourne; the south-western waters of Port Phillip Bay form Corio Bay, on the shores of which Geelong is located; others being Portland Bay, Port Fairy, Lady Bay, Western Port, and Port Albert.

XI. DIVISIONS.—V. is divided into four districts—Gipps Land, the Murray, Wimmera and Loddon. (1.) *Gipps Land*, so named after one of the early Governors of N.S.W., includes Gipps Land north and Gipps Land south. This district occupies the south-eastern portion of the colony and comprises about one-fifth of the whole territory of V.; much of it, to the north and east particularly, is unavailable for agricultural or pastoral purposes from its rugged and mountainous character, but there are in other parts large tracts of grazing and tillable country, rich deposits of alluvial soil predominating in some parts, rendering large returns for the labour of cultivation. Owing however to the heavy timber, gum, and ironbark that grow on it in many places, its clearing is attended with considerable toil and expense. In the south and west portion a large quantity of land is occupied for farming and cattle-grazing, for which its rich and fertile soil peculiarly fits it. A large proportion of the fat cattle supplied to the Melbourne market during the winter months is received from here. Its mineral resources are immense, comprising gold, silver, copper, iron, tin, lead, coal, marble and limestone. In the north-west portion of the district quartz reefs are very numerous, and these are now being systematically worked, and in many cases with remunerative results. The climate and soil are well fitted for the

growth of oranges, limes, hops, tobacco and opium, and its rivers abound in fish. The population by the last census was 20,000, and the railway which now connects Melbourne with its chief town Sale, will be likely to considerably increase that number. The lakes are admittedly the finest in V., and are a great source of attraction to tourists and sportsmen; the fishing and shooting are unsurpassed. The principal rivers are—the Avon, Thompson, Tambo, Snowy, and Latrobe, all rising in the dividing range or its spurs. The mountain ranges are numerous, and most of them are covered with snow for a considerable portion of the year. The chief towns are—Sale, Stratford, Bruthen, Alberton, Rosedale, Tarraville, Palmerston, Bairnsdale, and Jericho. Gipps Land is a country of colossal mountains, of magnificent streams, and of fertile plains. The geological formation is chiefly volcanic, with large outcropping beds of granite and trap rock to the north-east. In the south it is carbonaceous, and contains lepidodendron, and other fossil plants characteristic of the English coal strata, and nearly all over the district auriferous indications have been found. (2.) *The Murray District* is a vast tract of country lying in the north-east, and comprising the Omeo, Ovens, and Goulburn districts. It is well watered by several streams, which flow through it north and south, the principal of these being the Mitta-Mitta, Kiewa, Ovens, Broken, and numerous tributary creeks. It is generally a mountainous country, the ranges being lofty, rugged, and thickly covered with fine trees. The principal of these are—the Bogongs, Benambras, Buffalo, Stathbogie, and Delatite. The Ovens to the north, and the Omeo to the south-east, the Buckland about the centre, and the Woods Point diggings to the south-west, are noted for their auriferous wealth; and mining, both alluvial and quartz, is extensively carried on. In the north-east are vast plains of fine grass-land, principally devoted to pastoral pursuits, most of the land being held on lease from the Government by squatters and sheep-farmers, some of whose runs are as large as an English county. There is also some good agricultural land in the district, which is principally used for the culture of the vine and tobacco, and the growth of wheat. The North-Eastern line of railway cuts through a considerable portion of this district, and the facilities afforded to farmers and others for quickly and cheaply transporting their stock and produce to a market is doing much to develop the fine capabilities of the country. The most important towns are—Avenel, Euroa, Benalla, Wangaratta, Beechworth, Chiltern, Belvoir, Yackandandah, Tarraville, Rutherglen, Wahgunyah, Buckland, Bright, Mansfield, Jamieson, and Woods Point. The geological formation is varied, consisting of lower silurian with recent surface drift, principally of shale and slate, and occasional basaltic plains with vast outcropping beds of granite. (3.) *The Wimmera District* is a large extent of country, occupying the whole of the north-west portion of V., and

covering an area of 25,000 miles. It is almost exclusively pastoral, and consists for the most part of vast sandy and sparsely-grassed plains, intersected with belts of myall scrub and forests of she-oak, box, honeysuckle, and stringy bark. Occasional patches of land suitable for agricultural purposes have however been found and taken up by settlers. In the north-west are extensive swamps, caused by the overflow of the Murray River. There are some ranges of mountains in the south, but generally the country is flat. The principal rivers are—the Wimmera, Yarriambiack Creek, and the Avon and Richardson; they are all however liable to dry up, and in the dry season become mere chains of water-holes. The country is badly watered, and in hot seasons suffers greatly from drought. Water is obtained by the squatters by digging wells, which at a depth of 80 to 140 feet almost invariably give fine fresh water. The geological formation is pliocene tertiary, with granite and porphyry dykes. Gypsum has been found in a few places. (4.) *The Loddon District*, occupying the north central part of the colony, is also principally pastoral, but containing some auriferous land towards the south. The Loddon, whence the district takes its name, flows from south to north directly through it. The leading towns are—Sandhurst, formerly known as Bendigo, Ravenswood, Dunolly, Inglewood, and Wedderburn. The geological formation is generally lower silurian, with recent surface drift.

XII. POPULATION.—On 15th August 1835 the white population of Port Phillip was 14; in 1836 it was 234. By the census of 1871 the total corrected returns were 731,528, of whom 401,050 were males and 330,478 females. The number of inhabited dwellings in the colony was 158,481; uninhabited, 6997; places building, 866; in all, 158,481. Among the population were 17,857 Chinese, only 31 of whom were females. The aboriginal population of V. when the colony was first settled numbered 5000. In 1851 their numbers were reduced to 2693; in 1863 they had dwindled down to about 1908. At the date of the census in 1871 they numbered 1330, viz., 784 males and 546 females; on 15th March 1877 their numbers were reduced to 1067 (in this were included half-castes)—633 males, 434 females; children, 297, those entirely black numbered 774, and those of mixed blood 293. On 1st January 1880 the Registrar-General estimated the population on that date as 899,333, of whom 489,559 were males and 409,774 were females. The mining population was 37,553. The increase during the year being 11,243 males and 8648 females. The births in 1879 numbered 26,839—11,327 males and 13,112 females; the deaths numbered 12,120—7033 males and 5087 females. The marriages, 4986. In proportion to every thousand of the population the births were 3021; marriages, 561; deaths, 1364. Of the deaths 4640 were of children under five years of age. On 30th June 1880 the population was estimated at

908,852—494,763 males 414,089 females. Total 908, 852. The census taken in 1881 gave the population at 860,000 in round numbers.

XIII. SOIL AND PRODUCTS.—The land available for pastoral and agricultural purposes has been approximately classified thus:—of rich light loam, generally distributed near the coast, there are 36,000 square miles, generally to be met with on terraced flats along the river valleys and running in narrow belts along the sea-coast; it is also found in extensive level plains with stunted timber and thickly-grassed undulating forest country; the geological features of these stretches are clay, sand, lime, gravel, tertiary, and superficial deposits, including alluvial of cold sandy clays and loams, occupying the central, north, north-east, and south-east portions of the country, there are 28,000 square miles in hilly and undulating country abounding in iron-bark and stringy-bark trees growing on clay, slate, schist, and sandstone: of rich black and chocolate soils, eminently adapted for purposes of tillage, distributed in the south-western and central districts, there are about 12,000 square miles of volcanic origin: of light and sandy soil of granitic formation, in patches throughout the country, there are about 8000 square miles: of rich sandy loams near Geelong, and in the counties of Normanby and Dundas, South Grenville and Polwarth, there are about 3000 square miles showing shales and soft sandstone. Nearly everything grown in England flourishes in V., and very many things that the cold uncertain climate of England will not allow to attain to maturity thrive in the colony. Wheat, barley, and oats—the latter cultivated more as hay than for grain—are the farmers' leading articles. Next come potatoes, rye, peas, beans, maize, sorghum, mangold-wurtzels and beet, clover, and various fodder grasses, which are largely grown. Of tobacco too a large breadth has been devoted to its cultivation. Among other things which have been successfully tried are hemp, flax, hops, chicory, sugar, beet, canary grass; and in fruit, all kinds flourish, as do also olives, oranges, guavas, black mulberries, and other fruits. The cereals do remarkably well. The greatest weight recorded of a bushel of wheat is 69 lbs. 4 oz., the average for the last five years has been 61 lbs.; the average weight of oats is 40 lbs., of barley 51 lbs., and of maize 55 lbs. As many as 50 and 60 bushels of wheat, 60 bushels of oats, and 42 bushels of barley per acre have been obtained; but these returns are unusual. From the nature of the soils and the favourable character of the climate, wine and oil of good quality can be produced with ease in V. Already the wines made in the colony have taken a high place in the estimation of European connoisseurs, and the cultivation of the grape will form a source of great wealth. Large vineyards have been planted, and while the quality of the wines is such as to command a ready sale at a high price, the yield is large, the average being about 250 gallons per acre. The culture of the vine has received a serious check through the ravages of

the *Phylloxera vastatrix*; but it is believed that the ravages of the disease have been magnified. The apple, pear, peach, and nectarine, apricot, almond, gooseberry, currant, and fig, and the cabbage, cauliflower, turnip, carrot, parsnip, asparagus, pea, bean, water-melon, rock-melon, and tomato, may be seen all growing together luxuriantly in the same plot of ground, while the borders blossom with the fuchsia, geranium, violet, daisy, and other common flowers of the English garden.

XIV. AGRICULTURE.—According to the statistics for the year ending 31st March 1880 the following figures show the state of land returned as in occupation 16,615,000 acres. Number of holdings exceeding one acre, 49,025. Extent of land in occupation (purchased land)—Freehold, 8,991,033 acres; rented, 1,627,611 acres; total, 10,546,634 acres. Selected land (purchase not completed,) 6,068,283 acres. Total area in occupation, 16,614,917 acres. Extent of land under tillage, 1,687,400 acres. The area of land under wheat was 707,738 acres; average yield, 13·3 bushels; total yield, 9,407,503 bushels; Maize, 2451 acres, produced 61,922 bushels. Oats, 167,721 acres; average yield, 24·0 bushels; total yield, 4,024,962 bushels. Barley, 43,208 acres; total yield, 1,065,759 bushels. Hay, 201,169 acres; average yield, 1·5 tons; total yield, 291,781 tons. Potatoes, 41,600 acres; average yield, 4·0 tons; total yield, 167,986 tons. Rye, 1243 acres; produce, 18,479 bushels. Peas and beans, 21,454 acres; produce, 574,815 bushels. Turnips, 193 acres; produce, 2070 tons. Mangold-wurtzel, 1056 acres; produce, 14,894 tons. Onions, 1040 acres; produce, 7347 tons. Tobacco, 531 acres; produce, 1297. It may be mentioned that the tobacco crop of 1879-80 has failed in most of the districts. Vines, 4285 acres; produce, 106,185 cwt. Gardens, 12,841 acres. Orchards, 7464 acres. Beet, carrots, &c., 375 acres. Chicory, 392 acres. Hops, 260 acres. The land under grain crops was 933,805 acres; root crops, 44,234 acres; green forage, 508,644 acres; other crops, 8157 acres; land in fallow, 162,245 acres. The breadth of land sown in wheat was 16,116 acres in excess of that in the previous year. The grain crops, as compared with 1877-78, show the following increases:—Wheat, 3,346,766 bushels; oats, 1,658,936 bushels; barley, 648,602 bushels; maize, 21,168 bushels; peas, 326,379. Rye shows a decrease of 2337 bushels. In root crops there are these increases:—Potatoes, 69,028 bushels; turnips, 724 bushels; mangold-wurtzel, 6619 tons; beet and parsnips, 1238 bushels; onions, 3747 bushels. In chicory there is an increase of 1201 bushels, in hops of 1360 cwt., in tobacco there is a decrease of 14,365 cwt., in grapes of 33,502 cwt., in the wine, made 163,810 gallons. For the year ending 31st March 1879 the value of the agricultural implements and machinery on farms and stations was estimated at £2,025,916, the improvements at £16,845,527, a total of £18,871,443; 103,520 hands were employed on farms and stations. The principal agricultural machinery &c. on farms was comprised in 385 steam engines

of 2994 h.p. The other machinery in 1878 was 39,878 carts, 11,737 chaff-cutters, 14 cultivators, 564 earth scoops, 3 grubbers, 28,227 harrows, 293 hay elevators, 1418 horse hayrakes, 1093 mowing machines, 34,808 ploughs, 8213 reaping machines, 9155 rollers, 3790 scarifiers, 830 thrashing machines, 8333 waggons, 123 windmills, 1922 winnowing machines, and 608 wool presses. On stations the returns were 24 steam engines of 193 h.p., 1059 carts, 337 chaff-cutters, 93 earth scoops, 250 harrows, 102 horse works, 55 mowers, 8 patent pumps, 740 ploughs, 62 reapers, 184 rollers, 84 scarifiers, 8 stump extractors, 31 thrashing machines, 285 waggons, 46 winnowers, and 376 wool presses. The number of live stock on land unconnected with stations on 31st March 1878 was—horses, 185,671; cattle, milch cows, 256,780; exclusive of milch cows, 741,489; sheep, 5,611,964; pigs, 179,209. On stations to same date—horses, 17,479; cattle, milch cows, 11,330; exclusive of milch cows, 164,577; sheep, 4,502,303; pigs, 4182. On farms and stations to same date—horses, 203,150; cattle, milch cows, 268,110; exclusive of milch cows, 906,066; sheep, 10,114,267; pigs, 183,391. The returns of stock to 31st March 1879 were—horses, 210,015; milch cows, 290,407; other horned cattle, 894,436; sheep, 9,379,276; pigs, 177,373. The value of agricultural produce and live stock imported into and exported during 1878 was as follows:—Imported in 1878, £1,293,421; and in 1879, £1,586,721. Exported in 1878 (Victorian,) £1,091,834; other, £73,691; total exports for 1878, £1,165,526. Exports from V., 1879, £810,715; other than Victorian, £85,245; total exports, £895,960 for 1879.

XV. LANDS.—The estimated area of the colony is 56,446,720 acres, of which 23,000,000 acres are unavailable for selection, being mallee scrub, mountains, &c., leaving the accessible area at 33,446,720 acres. Of this superficies there had been alienated or reserved up to 31st December 1878, 24,073,835 acres, leaving yet unalienated 9,372,885, which would be further increased by 2,050,000 acres of lands which had reverted to the Crown, and making the approximate area available for selection on 1st January 1879, 11,422,885 acres. The Land Acts expire this year (1880,) but owing to the perturbed state of politics it is not likely that any radical change will take place at present. The stations or runs number 701, embracing 17,183,843 acres, the yearly rent being £104,843 8s. To 469 of the runs there are attached 1,690,317 acres of purchased land. The average size of each run is about 24,513 acres, the rental being about 1½d. per acre.

XVI. RELIGION.—There are 2815 churches, chapels and other buildings used for public worship. The denominations are now entirely self-supported—the annual grant of £50,000 having terminated on 31st December 1875.

XVII. EDUCATION.—The system of public primary education in V. is free, secular, and compulsory, the Act establishing it having come into force on

the 1st January 1873. The department is under a Minister of Education, who is alone responsible to Parliament and the country, in whom (or his successors) all school properties are vested, and virtually at whose disposal are the appointment and dismissal of officers. Attendance at the schools is compulsory between the ages of six and fourteen years; the attendance to amount to sixty days in each half-year, any of the following reasons only being a valid excuse for non-attendance:—Efficient education elsewhere; sickness, fear of infection, or any unavoidable cause; if there be no State-school within two miles; if a child be educated up to the standard. This provision of the Act is enforced by "truant officers," whose special business is to hunt up defaulting parents and compel them to have their children educated. The instruction imparted is severed from all connection or special arrangement with the religious denominations, is secular in the sense of not being distinctively religious, and is free in certain prescribed subjects, other subjects being allowed to be taught on the payment of small fees, fixed by regulations. On 1st January 1879, in the 310 schools districts of the colony, there were in operation 1456 State day schools, 208 State night schools, a total of 1664. The number of children enrolled during the year was 231,169—121,471 boys, 109,698 girls. The average attendance was 61,279 boys, 55,329 girls, a total of 116,608, a decrease on the previous year of 3350 on the rolls, nearly half of which it is stated by the Education Department is chargeable to the night schools. The number of new school-houses opened during the year was 154, affording accommodation for 15,193 children, and in addition 13 school-houses were enlarged to the extent of accommodation for 1668 children. The cost of the instruction of each child in average attendance in 1878 was £3 15s. 11d. in day schools, £1 12s. 2½d. in night schools, and £3 13s. 11d. for the two combined; these figures are somewhat higher than those of the previous year. The teaching power was comprised in a total of 3906 persons as follows:—Head teachers, 1278 males, 182 females; assistants, 231 males, and 603 females; workmistresses, 543; pupil teachers, 315 males, 754 females. The number of school buildings belonging to the department on 31st July 1878 was 1241, with accommodation for 130,429 scholars, and 792 teachers' residences. Between 1st July 1877 and 30th June 1878, prosecutions were instituted in 2172 cases by truant officers against parents for neglecting to send their children to school, resulting in 1547 convictions and 625 dismissals. Penalties were inflicted varying in amount from 1s. to £1, accompanied in some instances with costs to the extent of 5s., amounting in all to £521 18s. 6d. The returns for 1879 have not yet been published by the Government. On 1st January 1879, the private schools of all kinds throughout the colony numbered 596, with 37,582 scholars, taught by 1700 teachers. This number includes the college and grammar schools,

which number 6, with 57 masters and 1099 students, and are as follows:—The Church of England Grammar School, Melbourne, having 10 masters or professors, and 226 pupils; the Geelong Grammar School, also connected with the Church of England, having 9 masters, and 147 pupils; the Scotch College, Melbourne, in connection with the Presbyterian Church, having 12 masters and 342 pupils; the Wesley College, Melbourne, connected with the Wesleyan body, with 11 masters and 216 pupils; St. Patrick's College, Melbourne, belonging to the Roman Catholic Church, having 7 masters and 147 pupils; and St. Francis Xavier's College, Kew, also connected with the Roman Catholic Church, having 8 masters and 93 pupils. In connection with the Melbourne Grammar School there are three exhibitions of £21, tenable for three years, awarded annually to boys under fourteen for education in the School; also two of equal value given annually for two years to students going to attend the University. In connection with the Scotch College there is an exhibition of £21, tenable for two years, annually open to competition for boys under fourteen years of age; the successful candidate is required to attend the classes of the College. In connection with the Wesley College there is a scholarship called the "Draper," established in memory of the Rev. D. J. Draper, who was lost in the steamship *London*. It is of the value of £25, and is tenable for one year. Two other scholarships have also been founded by Mrs. Powell called the "Walter Powell Scholarships." They are of the value of £40 each. In addition to the foregoing there are a Presbyterian College at Geelong, a High School at Sandhurst, a college at Ballarat, a college at Hamilton, and two ladies' colleges, the Presbyterian College at Melbourne, and the Alexandra College at Hamilton. The Melbourne University was incorporated by Act of Victorian Parliament (16 Vic., No. 34) in 1853, was begun in July 1854, and opened 3rd October 1855, and takes a high rank among kindred institutions. Its degrees and diplomas (by virtue of Royal Letters Patent issued in 1859) entitle the holder to the same rank, precedence, and consideration as those of any University in the United Kingdom. The subjects taught comprise Natural Science, Mathematics, Law, Anatomy, Classics, History and Political Economy, Logic and Natural Philosophy, Chemistry, Engineering, Medicine, Branches of Law and Mining, each department being under professors or competent masters. It is under the government and control of a Chancellor and Vice-Chancellor selected out of and assisted by a Council of twenty members, of whom sixteen at least must be laymen, and of a Senate presided over by a Warden. It is endowed to the extent of £9000 annually out of the general revenue. During the year 1878 it was attended by 258 students, of whom 252 were matriculated, and 6 were non-matriculated. 114 matriculated during the year, making a total of 1213 who passed this examination since the

establishment of the University. The graduates were 30, of whom 10 took the degree of B.A., 6 of M.A., 4 of M.B., 6 of LL.B., and 2 of LL.D. The expenditure of the year amounted to £15,293; the income to £18,136; of this £11,250 was the Government grant, £6694 was derived from College fees, and £192 from other sources. The Church of England has an affiliated college within its boundaries; the Presbyterian Church a similar college, called the "Ormond," after the principal contributor of the funds; and kindred institutes will be erected by other denominations. The memorial stone of a new building called the "Wilson" Hall was laid on 2nd October 1879. It will cost in its erection upwards of £40,000, nearly the whole of which has been given by Sir Samuel Wilson, M.L.C. These are the latest educational Statistics to be had at time of compiling. The object of these institutions is to afford residence, domestic superintendence and tutorial aid to students attending the University, and also to serve for theological seminaries for students who have matriculated at the University.

XVIII. CHARITABLE INSTITUTIONS.—There are in all seventy-three institutions for the relief of the sick, indigent, needy, orphans, refugees and unfortunates. These institutions have 1376 dormitories, wards, or rooms, and 9402 beds. They were maintained during 1879 by £298,322 from the State Funds, from private contributions and from other sources, £219,506. The expenditure was £296 068.

XIX. INDUSTRIAL AND REFORMATORY SCHOOLS.—There are in various parts of the colony eleven Industrial and Reformatory Schools, having forty-six wards and 1018 beds. During the year 1879 1605 persons passed through these institutions, the number of inmates on 1st January 1880, being 781—397 boys and 384 girls. The year's expenditure amounted to £22,997.

XX. MINING.—The colony is justly celebrated for the wealth, extent, and variety of its mineral resources. Copper ore is found at St. Arnaud, Specimen Gully, and on the River Thompson; in Gipps Land, where native copper is found associated with other ores of copper in the form of carbonates and pyrites; it also occurs in small quantities at Steiglitz, Castlemaine, the Blue Mountains, Bendigo, &c. During 1879, 3862 tons of copper ore were raised, and 4228 tons were smelted, from which 388 tons 15 cwt. of regulus were obtained, and there were exported 135 tons 19 cwt. of copper, and 225 tons 15 cwt. of regulus. At St. Arnaud and Bethanga are silver mines. During 1879 no ore was raised, but there were smelted at the Mint and elsewhere, from gold, 22,680 ozs. 15 dwts. Tin occurs in numerous places in the district of Beechworth, in the beds of tributaries of the Yarra, Thompson, and Latrobe; also at Taradale, Franklin (Gipps Land,) and Strathbogie. During 1879, 4 tons 11 cwt. were raised. The smallness of the quantity raised as compared with previous years is accounted for by

the closing of several of the principal mines, especially the El Dorado. Antimony, in the form of sulphuret and oxide, is found at Heathcote, Whroo, Anderson's Creek, Rutherglen, Maryborough, Costerfield, Ringwood, Merton near Mansfield, and Nunawadding near Melbourne. During 1879, 495 tons 15 cwt. of antimony ore were raised, and there were exported 153 tons of ore and 245 tons 17 cwt. of regulus. Zinc has been found in Daylesford, also in Gipps Land; lead at Talbot, Avoca; and in Gipps Land, none was raised during 1879; cobalt at Yea; bismuth at Omeo and Tarrengower; manganese at Pleasant Creek, Daylesford, and Gipps Land; coal at Cape Paterson, Western Port, Gipps Land, and Coleraine. No coal was raised during 1879. 1353 tons 12 cwt. of lignite were raised from the Victorian Brown Coal Company's mine at Lal Lal. Kaolin has been discovered at Bulla-Bulla, near Melbourne, and at Beechworth; bitumen near Portland; iron is found at Lal Lal; during 1879, 120 tons were raised, which yielded 52 tons of metal; gypsum has been found at Kerang and Bridgewater; during 1879 six tons were raised. Limestone is now being worked at Waratah Bay, and several shipments have already been sent to the Melbourne market. Molybdenite (sulphite of molybdenum) has been obtained at Bulgoback (Gipps Land.) There were engaged during 1879, 190 miners in mining for metals and minerals other than gold. Diamonds and sapphires have been found in the north-eastern parts of the colony, or what is known as the Ovens district, at or near El Dorado, the Woolshed and Pilot Creek near Beechworth. During 1879 10 mineral leases for mining for other purposes than gold were issued, the extent of ground taken up being 1899a. 1. 1p. There were also issued 13 licenses to search for metals or minerals other than gold, the extent of ground held being 8320 acres. The leases were for silver, antimony, coal, and copper; the licenses were for coal and shale. The number of leases in force at the end of the year was 56, the total extent of ground held being 7785a. 26p. There are 9 smelting works, employing 121 men, with 45 furnaces and 5 steam engines of 113 horse-power. Up to 31st December 1879 the quantities and values of the principal metals and minerals raised since the discovery of the goldfields were—gold, 48,719,930 ozs. 11 dwts., value £194,879,722; silver ore, 20,060 tons, producing 151,267 ozs. 10 dwts. 14 grs., valued at £37,819; tin ore, raised, smelted, and exported, in all, £345,541; copper ore, copper and regulus exported, £72,764; antimony ore raised and exported, value £156,390; lead, 600 tons of ore raised, producing metal of the value of £4892; iron, 840 tons, value £3666; coal, 8971 tons, valued at £13,505; lignite, 5846 tons, of the value of £2705; kaolin, 1832 tons, valued at £7444; slates, £940; flagging, 80,160 square yards and 18,439 tons, valued at £48,921; magnesite, 6½ tons, about £12; gypsum, 28 tons, valued at about £12; ores, mineral earths, &c., £4802; diamonds and sapphires, about

£108. The total amount being £195,580,066. But V. is chiefly remarkable for its gold, to which it owes its extraordinary rapid progression; it has been stated that one-third of the total area of the colony may safely be considered as occupied by gold-bearing rocks. The gold occurs in quartz and alluvium; the latter was of course the first worked, surface mining being comparatively easy; this was however quickly exhausted, and some of the sinkings are now carried on at considerable depths. In addition to the quartz veins and the alluvial deposits derived from these and the surrounding rocks, gold is also found in the clay stone itself; and contrary to expectation flat bands of auriferous quartz have been discovered in dykes of diorite, which intersect the upper Silurian or lower Devonian rocks. Quartz of quite extraordinary richness has been obtained from these bands. Numerous quartz veins are also found in all those parts of the colony where the schist rocks appear at the surface; and they are met with too cutting the older sedimentary rocks under the tertiaries. The strata in which they occur present generally a low degree of metamorphism, and in many places are unaltered. The veins vary in thickness from an eighth of an inch to 100 feet; and some, almost as thin as paper, intersect rocks containing palæozoic fossils, and in such a manner as almost to cut the fossils; but the delicate structure of the caste is not altered, nor are any of the interspaces filled with quartz. The older auriferous deposits are reached by the sinking of deep shafts. In consequence of the course of the *lead* not being apparent on the surface, it frequently happens that the shaft penetrates the bed rock at a considerable distance from the *gutter*. In such a case the shaft is sunk through the schist to a sufficient depth, and exploring drifts are carried as far as 1200 or 1500 feet before the auriferous gravel is touched. The quantity of auriferous drift overlying the palæozoic rocks at Ballarat is very considerable. It is found not only in the main leads, but also in the numerous tributaries of these, and in isolated patches. The washdirt varies in thickness from one to twelve feet, and the average yield of gold has been from 10 dwts. to 2½ ozs. per cubic yard. Quartz reefing is extensively followed, employing much machinery and a large amount of capital; and, owing to the improvements in obtaining gold from the quartz, a yield of a few dwts. to the ton is found remunerative. The average yield per ton of the quartz crushed in each of the seven mining districts into which the colony is divided was as follows during the year ending 31st December 1879:—Ballarat, 6 dwts. 18'44 grs.; Beechworth, 10 dwts. 11'04 grs.; Sandhurst, 9 dwts. 8'09 grs.; Maryborough, 11 dwts. 22'67 grs.; Castlemaine, 5 dwts. 18'45 grs.; Ararat, 11 dwts. 17'73 grs.; and Gipps Land, 1 oz. 2 dwts. 18'66 grs. In all the districts, with the exception of Gipps Land, there is a falling off in the average yield per ton. The average of all the districts was 8 dwts. 18'77 grs. The average yield to 31st December 1879, of all

the crushings since records have been published have been 11 dwts. 1'08 grs. per ton. Some of the quartz mines are now worked to a depth exceeding 2000 feet, and, so far as can be observed, there is no diminution in the yield of gold in the higher levels. From the deeper levels (850 to 1200 feet) in the Stawell mines, 1 oz. 2 dwts. 12 grs. to 6 oz. 17 dwts. 10 grs. of gold have been yielded to the ton of quartz; and at Sandhurst they show returns varying from 11 dwts. to 1 oz. 16 dwts. 1 gr. per ton; at the Ballarat mines, from 200 to 1105 feet, the yield has been from 7 dwts. to 1 oz. 2 grs. of gold. From September to 20th December 1851 it was estimated that the total yield of the gold-fields then known was 243,414 oz.; in the following year 2,218,782 ozs., valued at £8,875,128, were raised; in 1856 the yield was 2,985,991 ozs., of the value of £11,943,964; in 1872 the yield was 1,331,337 ozs., in 1873, 1,170,397½ ozs., in 1874, 1,097,643 ozs., in 1875, 1,095,787 ozs., in 1876, 963,760 ozs., in 1877, 809,653 ozs.; in 1878, 758,040 ozs., 15 dwts. 19 grs., in 1879, 772,302 ozs. 15 dwts. 20 grs. The diminished yield of gold is mainly due to the gradual exhaustion of the alluvial deposits in the drifts of the first-discovered gold-fields. The alluvial gold obtained in 1879 was nearly less than one-fourth the quantity obtained in 1868. In the official report it is stated that "for the first time for many years the estimated yield of gold for the year (1879) from the Victorian mines bears a favourable comparison with, and is slightly in excess of, the yield for the preceding year. The gradual development of the newly-discovered auriferous lodes at Ballarat, and the improved yields from lode-mines at Maldon and other places, together with the assistance rendered to prospecting by the Government diamond drills, will it is hoped have a beneficial effect upon mining enterprise and lead to a further increase in the returns of gold for the current year." Gold mining is of two kinds—quartz mining and alluvial digging. The latter has already been alluded to. In working a quartz vein a shaft is sunk, either on the crown of the hill where the vein is found, or the reef is penetrated by an adit or tunnel. The quartz brought to the surface is broken into pieces, and passed through inclined spouts to the stampers, which resemble the ordinary stamps used in other countries for dressing ores. They weigh from two to nine hundredweight each, and one stamp strikes from fifty to eighty blows per minute, the fall of the stamp head being six to fifteen inches. A ten-horse power engine will give motion to eight stamps. The crushed quartz is carried by water over copper ripples, where the gold is brought in contact with mercury. Once a-week, or oftener, the ripples are cleaned out, and the amalgam retorted. The average yield of the crushed quartz has already been given. From the wash-dirt, which generally consists of quartz, gravel, sand, and clay, the gold is separated by puddling and washing, and from these, for the year ending 31st December 1879 the average was 1 dwt. 16'84 grs.

The yield from quartz-tailings and mullock was 1 dwt. 14·96 grs.; from pyrites and blanketings 2 ozs. 9 dwts. 1·75 grs.; and from cement 3 dwts. 14·09 grs. Nuggets of gold of great size and value have been found at various times in the colony. During 1853 several large masses of gold varying from 11 lbs. 11 ozs. 15 dwts. to 134 lbs. 11 ozs. were brought to light at or in the neighbourhood of Canadian Gully. The "Lady Hotham," found in 1854 weighed 98 ozs. 1 dwt. 17 grs. In 1855 two large nuggets, weighing respectively 40 lbs. and 47 lbs., were found at Bakery Hill; and in 1858 the "Welcome" nugget, weighing 184 lbs. 9 ozs. 16 dwts., was unearthed at the same place. On 5th February 1869, a nugget named the "Welcome Stranger," weighing 2280 ozs., was found at Moliagul, about an inch from the surface. In March of the same year a nugget was found at Berlin weighing 893 ozs.; and in the months of May and October following, two others were found in the same locality, quite near the surface. They were named the "Viscount Canterbury" and the "Viscountess Canterbury," and weighed respectively 1105 ozs. and 884 ozs. During the year 1870 several large nuggets were found, the principal of which were—one on 31st May at Berlin weighing 1121 ozs., another at the same place on 3rd October, weighing 896 ozs., and a third on 11th November, at Macintyre's diggings, and only a few inches from the surface, weighing 452 ozs. During the year 1871 also, large nuggets were found at Berlin. Amongst the largest were the "Precious," found on 5th January, weight 1621 ozs.; the "Kum Tow," 17th April, 718 ozs.; and the "Needful," 10th May, 247 ozs. These three nuggets were discovered at a depth of about twelve feet from the surface. A large number of nuggets have been found on other gold-fields, varying in weight from 20 ozs. to 200 ozs. In the year 1872 the undermentioned large nuggets were discovered:—On 2nd April, the "Crescent" was found at Berlin, at a depth of two feet; it weighed 14 lbs. 11 ozs. On 8th May a nugget weighing 477 ozs. was got in the same locality, at a depth of nine feet. At Dunolly the "Schlenrm" nugget was found, weighing 478 ozs., at a depth of three feet from the surface. The "Spondulix" nugget was found in a quartz reef at the same place, at a depth of eight feet from the surface; it weighed 130 ozs. Numerous other nuggets have been found, varying in weight from 20 ozs. upwards, but none of them call for special notice. The mining returns for the year ending 31st December 1879 are as follows:—22,769 alluvial miners, 14,784 quartz miners, a total of 37,553, of whom 9110 were Chinese. The average yield of gold per man was £76 1s. 2·32d.; these figures show an increase in the number of miners of 917, and a decrease of £6 11s. 9d. per man of gold raised. There were 1234 square miles of auriferous, alluvial, and quartz ground worked upon; the number of distinct reefs proved to be auriferous being 3592. The mining plant used on the various fields of the

colony was valued at £1,899,788. The machinery used in alluvial mining comprised 228 steam engines of 6134 horse-power, used in winding and pumping, 174 steam puddling machines, 2 buddles, 784 horse puddling machines, 178 whims, 219 whips or pulleys, 18,162 sluices, toms, and sluice-boxes, 32 hydraulic hoses, 494 pumps, 220 water-wheels, 158 quicksilver and compound cradles, 413 stamp heads (crushing cement,) and 11 boring machines. The quartz mining machinery was returned at 796 steam engines of 16,375 horse-power, 67 crushing machines operated by other than steam power, 6333 head of stamps, 52 buddles, 8 water-power winding and pumping machines, 517 whims, 427 whips or pulleys, and 12 boring machines. Comparing the totals of machinery employed on the goldfields in 1879 with the totals for 1878, the machinery used in alluvial mining shows a decrease of 12 steam engines, 257 horse-power, 47 horse puddling machines, 9 whims, 7 quicksilver and compound cradles, 25 stamp heads, and 3 boring machines, an increase of 3 steam puddling machines, 10 whips or pulleys, 3556 sluices, &c., 9 hydraulic hoses, 43 pumps, and 16 water-wheels. In quartz mining there is a decrease of 15 horse-power, 10 whims, 4 crushing machines, 5 buddles, and 37 whips or pulleys. There is an increase of 91 stamp heads crushing quartz, and 4 boring machines. There is a decrease in the total value of all mining plant on the gold-fields of £3706. Of 849,324 tons 16 cwt. of quartz crushed, the total produce was 374,926 ozs. 22 grs., the average yield per ton being 8 dwts. 12·17 grs. The richest quartz was from the Gippsland district, crushing 1 oz. 2 dwts. 18·66 grs. to the ton; the poorest was from the Castlemaine district, the yield being only 5 dwts. 18·45 grs. to the ton. The estimated yield of gold from the alluvial mines was 293,310 ozs., from the quartz, 465,637 ozs., a total of 758,947 ozs., an increase on the previous year of 907 ozs. The value of gold per ounce varied from £2 10s. in the Beechworth district to £4 3s. in the Ballarat district. The prices charged per ton for crushing quartz and cement ranged from 2s. 6d., the lowest, in the Castlemaine district, to £1 in the Beechworth district. During the year 1879, 314 gold mining leases were issued for an area of 5826 acres 2r. 8p. of land, the number in force at the end of the year being 1226, and extent of ground leased 18,315 acres 3r. 2½p. Since the commencement of gold mining, there have been issued in all leases 10,962, for an area of 199,528 acres 2r. 23 17-20p. The total area of land held as claims under the District Bye-Laws is 36,493 acres 2r. 20p. The estimated value of claims and leased lands was returned at £468,928. The length of water-races was 1936 miles 13 chains, the approximate cost being £242,196. There were registered during the year 167 companies, having 2,277,276 shares, and nominal capital of £1,286,674. The total amount of gold raised from the first discovery to 31st December 1879, was 48,719,930 ozs. 11 dwts., valued at £194,870,722. The total quantity of quartz

crushed to 31st December 1879 is stated at 16,092,530 tons 19 cwt., yielding 8,791,155 ozs. 5 dwts. 4 grains of gold, being an average of 10 dwts. 22·21 grs. per ton. There were nineteen shafts in the colony at the end of the year sunk to a depth of over 1000 feet, and one down 2032 feet. These shafts were:—At Stawell, 3 shafts respectively, Magdala, 2273 ft.; Newington, 1940 ft.; Prince Patrick, 1544 ft.; South Scotchman's, 1262 ft.; Crown Cross United, 1222 ft.; Pleasant Creek Cross, 1220 ft.; Oriental, 1200 ft.; Prince Alfred, 1280 ft.; Extended Cross Reef, 1117 ft. At Clunes.—New North Clunes, 1114 ft.; Port Philip, 1100 ft. At Sandhurst.—Victoria Reef, 1315 ft.; Great Extended Hustler's Tribute, 1350 ft.; Great Extended Hustler's, 1226 ft.; Lansell's No. 108, 1476 ft.; Hercules and Energetic, 1218 ft.; North Old Chum, 1190 ft.; Carlisle, 1191 ft. The estimated yield of gold for the quarter ending 31st March 1880 was 179,949 ozs. 12 dwts., from the alluvial, 66,174 ozs. 1 dwt. from the quartz, a total of 113,755 ozs. 11 dwts., an increase of 9399 ozs. on the returns of the corresponding quarter of 1879. The average yield of gold per ton of quartz was 9 dwts. 10·017 grs. For the following quarter ending 30th June, 1880, the yield of gold was, alluvial 74,959 ozs. 9 dwts., quartz 123,572 ozs. 18 dwts., a total of 198,528 ozs. 7 dwts. The average yield of gold to the ton of quartz was 9 dwts. 0·35 grs.

XXI. POSTAL.—In 1879 there were 1069 post-offices, employing 1210 officers of all grades. There were received and despatched:—23,215,648 letters, an increase on the previous year's returns of 890,717; 3,091,364 book-packets, a decrease of 118,932; 10,075,407 newspapers, a decrease of 621,924. There were 273 money-order offices. During the year 1879 there were issued 138,517 money-orders, of the value of £398,018 13s. 4d., and there were paid 150,525, of the value of £451,723 1s. 10d., the total transactions being 289,042 orders of the value of £851,741 15s. 2d. issued and paid; commission £5718 5s. 2d. The income of the Postal Department, including money-orders commission, for 1879 was £197,675; with telegraph collections, £56,704; the total was £254,379. The expenditure was £351,844. Altogether the deficit amounted to £97,474 6s. 2d., being £4754 15s. 3d. more than the previous year. During the year 1879, 65 additional post-offices and 25 additional telegraph offices (including those on the railway circuit) were opened, and 229 miles of new telegraph lines were erected; 20 new money-order offices and 13 new savings banks were opened. A resolution was adopted by the Legislative Assembly to reduce inland letter postage to one penny from 1st January 1880, but owing to the serious falling off this would cause in the returns, it was expected the resolution would not be acted upon. In connection with the Postal Department, it is proposed to establish a system of Government Life Insurance and Annuities, similar to that in vogue in the United Kingdom.

XXII. RAILWAYS.—All the railways in V. belong to the State. On 30th June 1878 the Government completed the purchase of the Hobson's Bay Railway. The purchase-money was £1,320,820, being at the rate of £80 for each paid-up share of £50. This line is now connected with the Gipps Land Railway by a branch from South Yarra. The railways—comprised under the name of the Northern, the North-Eastern, the Eastern and the Western Systems are as follows:—(1.) A line from Melbourne to Echuca (a double line as far as Sandhurst,) a distance of 156 miles. (2.) A line from Melbourne to Geelong 45 miles, and thence to Ballarat 55 miles, making 100 miles in all. (3.) A line from Geelong to Colac 50 miles. (4.) A line from Ballarat to Stawell 75 miles. This line is extended to Horsham. (5.) A line from Ararat to Portland 119 miles. (6.) A line from Ballarat to Maryborough 42 miles. (7.) A line from Wangaratta to Beechworth 26 miles. (8.) The North-eastern line from Melbourne to Wodonga 187 miles. This line connects with the N.S.W. line and thus places Sydney and Melbourne in railway communication. (9.) A line from Melbourne to Sale 125 miles; there are besides minor branches from these lines and the suburban lines around Melbourne. On 31st December 1879 there were 1108 miles of line open and 74 miles in progress, making in all 1182 miles. To the end of 1879 the railways had cost in construction and maintenance a total of £17,739,016.

XXIII. SHIPPING.—At the end of 1879 there were entered inwards 2084 vessels of 951,750 tons. The outward clearance were 2083 ships of 977,135 tons.

XXIV. IMPORTS AND EXPORTS.—The Imports for the year 1878 were £16,161,880, a decrease on the previous year of £200,424; the Exports amounted to £14,925,707, a decrease of £231,980. The Imports for 1879 £15,035,538; the Exports were £12,454,170; the excess of Imports over Exports was £2,581,368; and the total value of external trade was £27,489,708. The value of Imports in 1879 was less than in 1878 by £1,126,342. The value of Exports in 1879 was less than the value in 1878 by £2,471,537. The leading Imports and their value were cotton, woollen, silk and linen piece goods £1,525,297, manufactures of the same £163,663; boots and shoes £179,830; metals including wire £110,712; manufactures of metals including machinery £211,136; glassware, earthenware and porcelain £200,118; paper, books, stationery and printing materials £414,256; building materials £246,833; wool £2,494,573; gold and silver coin and bullion £1,300,986; spirits, wine and beer £671,388; tobacco, cigars and snuff £177,682; sugar £1,076,495; tea £513,271; oilmen's stores £15,649; breadstuffs £20,773; grain and pulse £563,517; live stock £891,249; bags, sacks and cordage £188,702; sewing machines £67,962; acids, chemicals, drugs £186,889; paints, glass and paper-hangings £179,014; fancy goods £33,609;

jewellery, clocks and watches, plate, &c., £58,748 ; tallow £19,072. The leading Exports were gold coin and bullion £2,628,062 ; leather £243,766 ; preserved meat £85,371 ; tallow £150,867 ; wool, 95,628,281 lbs., valued at £5,269,634 ; Victorian lithofractor £4,808 ; dynamite £10,208 ; fuse £1669 ; powder £3826 ; bark £15,000 ; Victorian cheese £33,297 ; Victorian cordage £15,711 ; copper £29,158 ; Victorian-made wines £7837 ; Victorian-made biscuits £26,779 ; agricultural implements £13,126 ; boots and shoes £128,217 ; butter £26,417 ; confectionery £14,549 ; flour £107,947 ; agricultural machinery £9838 ; machinery undescribed £55,828. The bulk of the foregoing articles were either made or produced in the colony. The total value of the products of the colony, comprising gold, wool, tallow, hides, breadstuffs, minerals, bark and timber, manufactures, &c., exported in 1879 was £8,069,857.

XXV. REVENUE.—The revenue for year ending 30th June 1880, was £4,621,519 14s. 3d. ; including sums recouped, amounting to £69,206 19s. 11d., and the balance forward from the previous year of £77,000. This sum was insufficient to meet the deficiency on the year's transactions, viz., £212,000 and became necessary to carry forward to the ensuing year a debit balance of £134,907 4s. 8d. ; the grand total was £4,767,720 14s. 2d. The expenditure was £4,833,378 13s. 3d., leaving a deficit balance.

XXVI. PUBLIC DEBT.—On 30th June 1879, the public debt of the colony was £20,048,222, contracted as follows :—Water supply to Melbourne and suburbs, £554,571 ; Railways, £16,008,708 ; Provincial Water Supply, Graving Dock, and other public works, £2,664,943 ; School Buildings, £720,000 ; Defences, £100,000. The yearly interest on the debt is £1,104,314 5s. 6d., at four, five, and nearly two-thirds of it at six per cent. The payment of both principal and interest of this debt are made primary charges on the revenue of the colony. The debt has since been further increased by the Railway Loan of £5,000,000, £3,000,000 of which was subscribed at £98 18s. 6d. in 1879, and the remainder eighteen months later, towards the close of last year, at an average of £104 13s. 8½d.

XXVII. PUBLIC WORKS.—On Public Works (exclusive of Railways and Water Supply) there have been expended up to 1879, £8,521,484, and on Roads and Bridges £6,906,039.

XXVIII. PUBLIC LIBRARIES.—The Public Library in Melbourne is the finest institution of this kind in Australia. It possessed at the close of 1879, 86,995 printed books, 21,213 pamphlets or parts, making a total of 108,208. It was visited during the year 1879 by 266,839 readers ; and in 1878 by 256,400. The total cost of the building and annexes to the end of 1879 was £185,789 16s. 9d., and up to the present time £281,606 17s. 10d. have been expended upon it. The National Gallery under the same roof was patronised during the year 1879 by 45,000 visitors, contains 89 oil

paintings, cost £17,000 ; 26 works in marble, cost £5600 ; 166 statues and works of art, cost £2000, making a total of £24,600, and 5943 drawings, photographs and prints. The Supreme Court Library, free to members of the legal profession, contains 13,725 volumes, and the expenditure from commencement has amounted to £15,427. All the leading towns have either a public library or a mechanics' institute. On 1st January 1879, these numbered 181. The total number of volumes in the various libraries, exclusive of those in the Public Library in Melbourne, was 245,068 ; to several of these local libraries books are periodically lent from the Public Library. The number during 1878 was 6974 volumes.

XXIX. SCHOOLS OF ART AND DESIGN.—In 1877 there were 22 Schools of Design, taught by 45 teachers, the total number of attendants being 1547. In the majority of these the instruction is given at night. The subjects comprise practical geometry, mechanical and architectural drawing, isometrical, perspective and free-hand drawing, both from models and from nature. Each school receives 2s. 6d. from the State for every pupil who attends eight times in one quarter. Fees varying from 2s. to 10s. per quarter are paid by the pupils ; the number of pupils on the roll 31st December 1879 was 1801 ; an exhibition of the work of pupils is held yearly in Melbourne, and local exhibitions are held in the other towns. There are also schools of mines at Ballarat and Sandhurst, where among other things the students are inducted into the mysteries of mining and the treatment of ores.

XXX. MANUFACTURES.—Very many things are now manufactured in the colony that were formerly exclusively imported, and these industries have been materially aided by the heavy protective tariff now in force. Among the articles and preparations may be instanced account books, diaries, and other manufactured stationery, dyes, glass, cloth, paper, cigars, starch, pianos, oilmen's stores, safes, brnshware, soap, agricultural implements, &c. ; in all the number of manufactories, large and small, according to the returns made up to 31st March 1880, exclusive of flour-mills, breweries, woollen mills, brickyards, potteries, tanneries, fellmongeries, and wool-washing establishments, is 1709, employing in the aggregate 29,194 hands and 709 engines, principally steam, of 8778 h.p. ; the machinery and plant being of the value of £2,156,759, the land £1,068,634, and the buildings £1,945,472—a total of £5,170,865. Among the industries may be enumerated the following manufactories, foundries, &c. :—7 account books, 56 printing establishments, 1 organ building, 6 pianoforte, 47 agricultural implement, 6 cutlery, 56 engine machine, 127 coach and waggon, 48 saddle and harness, 11 ship and boat, 4 graving and floating docks, 21 cooperage, 10 basket, 9 blind, 11 maltheuses, 1 sugar refinery, 2 whip, 1 patent slip, 16 bedding, 35 cabinet making, 17 chemical, dye, and essential oil works, 3 powder

dynamite, 1 fuse, 9 ink and blacking, 168 clothing and boot and shoe, 11 distilleries, 1 jute, 14 rope and twine, 13 meat curing, 16 biscuit, 8 confectionery, 24 cheese, 6 jam, 4 maziene, starch, &c., 100 aerated waters, 10 coffee and spice, 5 sauce and pickle, 15 tobacco and snuff, 9 brush, 1 curled hair, 3 flock, 7 glue, 7 fancy leather, 34 soap, candle, and tallow, 5 tar distilling, asphalte, 2 fancy box, 129 moulding, framing, and saw, 2 paper, 6 paper bag, 19 gas, 11 glass, 5 stone sawing and polishing, 2 ice, 1 antimony smelting, 1 bell, 10 electro-plate, 70 iron, brass, and copper, 81 iron and tin works and 11 wire working. Above returns only refer to manufactories of an extensive character, similar manufactories limited in operation not included. There are 122 tanneries, 39 engines steam of 467 h.p., number of hands employed 1777; total value of machinery, land and building £245,631. There are 2828 pits having tanned during the year ending 31st March 1880 1,875,610 hides and skins, the leather produced being valued at £737,354; wool washed 15,373,178 lbs. Flour-mills 139 with 134 engines 2571 h.p., number of hands employed 770; total value of machinery lands and buildings £439,596. Breweries 89, number of hands employed 885; 66 engines steam 459 h. p., brewing 13,769,990 gallons; value of machinery lands and buildings £464,375. Woollen mills ten, with ten engines steam, 596 h. p., number of hands employed 714, value of machinery, lands, and buildings £218,322. The cloth, tweed and flannel produced during the year ending 31st March, 1880, was 1,105,116 yards and 1838 blankets and sixty-two shawls, from 1,944,406 lbs of wool; total value of which is £173,239. Brickyards and petheries 170, with fourteen steam engines, 265 h. p., number of hands employed 807; total value of machinery, lands, and buildings £172,929. Meat preserving will shortly be conducted on an extensive scale, as companies for carrying out the frozen meat process have recently been formed, and this industry is expected to be of great importance to the colony. During the year 1879, 158 patents were applied for, and 158 articles, of which seventy-three are described under the head of "Literary, Dramatic, and Musical productions," were copyrighted. Since December 1869 a Copyright Act for the protection of inventors' interests has been in force. It applies to literary productions and works of art as well. Up to 31st December, 1879, there had been registered 2507 copyrights, of which 235 were for designs and manufactures in metal and other materials, 857 were for books and other literary compositions, including music, and 1415 were for photographs, paintings, drawings, and engravings. By the returns for the year ending 31st March, 1880, the mills for grinding and dressing grain number 139, of which 134 are driven by steam and 5 by water; estimated value of machinery and plant and land, £439,596. Three manufactories for the utilising and making of the skins of the various indigenous birds and

animals of the colony have for three years been established, and their operations have been attended with considerable success; also a silk company, which has for its object the cultivation of silk and grain.

XXXI. MINT.—A branch of the Royal Mint was opened in 1872; it is provided with the best machinery, combining all the latest improvements, and its operations are extending, now that a more reasonable charge is made for coining. Up to 30th June 1880, 3,768,147.70 ozs. of gold, valued at £15,039,076 12s. 3d., had been received and minted and issued as coin to the value of £1,496,300, and bullion £90,901 5s. 9d. During the year 1879 there were minted 656,555.84 ozs., and 1,740,276 ozs. bullion issued value £6829 12s. 11d. in coin, £2,740,000; total value of £2,746,829 12s. 11d. The average annual expenditure for the last five years, 1875-9, has been £13,332 16s. 2d., and the average annual receipts from the Mint during the same period have been £8445 2s. 10d.

XXXII. BANKING.—On 30th June 1880, there were 11 principal banks of issue in Victoria, having about 282 branches or agencies. Their total assets on that date were 24,854,318 14s. 3d., the liabilities being £17,750,896. The notes in circulation amount to 1,127,393, the paid-up capital was £9,122,250. The average rate of dividend was about $10\frac{1}{2}$ per cent., the highest being the N.S.W Bank, $17\frac{1}{2}$ per cent.; the lowest the Oriental, 4 per cent. The aggregate amount of dividends last declared was £482,800, the amount of reserved profits at the time of declaring such dividend being £2,686,909.

XXXIII. SAVINGS BANKS.—There are 12 ordinary Savings Banks, having on 1st July 1880, 38,281 depositors with £905,362 2s. 2d. to credit. The invested funds amount to £922,700. In 1879 there were 185 Post-office Savings Banks open. The deposits received were £452,984 1s. 4d., and the interest credited to depositors was £22,858 0s. 8d. The balance on the 1st January 1880, was £650,100 11s. 7d. The average balance to each of the depositors, who numbered in all 49,233, was £13 4s. 1d. Interest at the rate of 4 per cent. is allowed on deposit. Penny Savings Banks in connection with the State-schools of the colony have been introduced.

XXXIV. LIGHTHOUSES.—The principal lights on the Victorian coast are:—At Portland on Battery Hill, a fixed red and white dioptric; at Port Fairy a fixed and flashing dioptric light of the fourth order, coloured red and flashing every three minutes; at Warrnambool a fixed white light and a fixed red light; at King's Island, on Cape Wickham, a fixed white light; at King's Island, Currie Harbour, a light revolving every twelve seconds, viz., five flashes and ellipses alternately in a minute; at Cape Otway a revolving white light flashing every minute; at Port Phillip Heads a fixed red and green light on Point Lonsdale; at Queenscliff a fixed white light on the High lighthouse, and a fixed red and white

light on the Lower lighthouse, and on the Queens-cliff jetty a fixed green light; and on Swan Spit a fixed red and white light; also several leading lights for navigating Port Phillip Bay; at Cape Schank a fixed and flashing white light showing a bright flash every two minutes; at Wilson's Promontory a fixed white catoptric light; at Port Albert on Latrobe island a revolving dioptric light, altered in May 1880 from white to red; on Gabo Island a fixed white light.

XXXV. FRIENDLY SOCIETIES.—On 1st January 1879 there were 34 societies, having in various parts of the colony 756 branches, with an average of 45,661 members; the total income, including contributions and entrance fees, for the year 1878 was £161,880; the disbursements to members, with the cost of management and other expenses, brought up the total expenditure to £140,050. The aggregate amount to the credit of these societies at the end of 1878 was £372,384; the amount invested was £348,429. There were 62 building societies in the colony on the permanent, terminating and Star-Bowkett principles, having 21,404 members, with an income of £1,097,475; their assets were £2,970,101; their liabilities £2,594,786; and the moneys on deposit were £703,463. The average rate of interest allowed to depositors varied from 5½ per cent. to 8 per cent.; the total amount of advances to members during the previous year was £703,932.

XXXVI. CONSTITUTION.—Victoria is under the control of a Governor appointed by the British Government, whose term of office is seven years, and of an Executive Council, and two Houses of Legislature. The Executive consists of the Governor of the colony, and the Ministry for the time being. The Legislative Council at present consists of forty-two members, representing the fourteen provinces into which the colony is divided, which contain 110,000 electors. The qualification for a vote is a leasehold of £10 and £25 a year, or freehold property of equivalent value. The candidate's qualification is freehold, or property of the annual value of £100; the tenure of office is six years, one of the Members of Council from each province retiring in rotation at the expiration of every two years. The Legislative Assembly consists of eighty-six members, representing fifty-five electoral districts, containing according to the latest return 176,022 electors, and it is triennial in its duration. A member's qualifications are:—He must be of full age, have lived in the colony two years, and be either a British subject or a naturalised one. By an Act passed in December 1870, which was to remain in force for three years only, Members of Parliament are paid £300 per annum for "reimbursing their expenses." This arrangement is still in force, a continuing Act having been passed during the Session of 1880 (on 8th June.) The qualifications of a voter are so small that the system may be considered one of universal suffrage. The would-be voter must be a male person of twenty-one

years of age (not subject to any legal incapacity,) a naturalised or denizen subject of the Queen, and have resided in Victoria twelve months previous to the first day of January or July in any year, or have been naturalised at least three years. All voting is done by ballot.

XXXVII.—HISTORY:—As the history of V. includes also the history of the Port Phillip Province of N.S.W., which has already been narrated under the proper heading, all that will be given here relating to that earlier period, for the sake of preserving continuity and completeness, will be a reprint slightly condensed of Gurner's excellent and accurate "Chronicle of Port Phillip."

1770.

In this year the first discovery of Port Phillip was made by Cook in the *Endeavour*, 370 tons. On 19th April he came upon the eastern coast at a point afterwards within Port Phillip south of Cape Howe, which he named Point Hicks in honour of one of his lieutenants of that name who first saw the land. This name is seldom to be found on any modern chart.

1798.

4th June.—Bass when on an exploring expedition in a whaleboat, along the coast to the south of Sydney, entered Western Port, which he named. Governor Hunter named Wilson's Promontory.

October.—Bass in company with Flinders in the *Norfolk* discovered the straits between New Holland and V.D.L., which Governor Hunter named Bass Straits.

1800.

December.—Grant in the *Lady Nelson* passed through Bass Straits on a voyage from England to Sydney, when he named Mount Gambier, Cape Banks, Cape Northumberland, Cape Bridgewater, Cape Nelson, The Lawrence Islands, Portland Bay, Lady Julia Percy's Island, Cape Otway, Cape Patton, Governor King's Bay (the curve in the land at the entrance of Port Phillip;) Cape Liptrap, The Rodondo Rock, The Glennie Islands, The Hole in the Wall, Sir Roger Curtis Island, Moncur Island, and the Devil's Tower.

1801.

21st March.—Grant returned to Bass Straits and made a survey of the coast from Wilson's Promontory to and including Western Port; and returned to Sydney having named Cape Paterson and Cape Schank.

1802.

18th February.—Murray was sent by Governor King in the *Lady Nelson* to examine the bay now called Port Phillip Bay. He entered and named it Port King, in honour of Governor King, at whose request it was afterwards changed to Port Phillip, in honour of Governor Phillip. Lieutenant Murray also named Arthur's Seat and Point Nepean.

27th April.—Flinders in H.M.S. *Investigator* on a voyage from England to Sydney entered Port Phillip Bay. He named Indented Head; landed and ascended Station Peak and named it.

1803.

Early in this year Grimes, Surveyor-General of N.S.W., was sent by Governor King, in company with Lieutenant Robbins, R.N., and James Meehan, surveyor, to walk round and survey Port Phillip Bay. They reported having seen several streams falling into the Bay, the finest of which was a river at the northern end of the bay. Flinders states that it was from Grimes' plan that he completed his chart of Port Phillip.

9th October.—H.M.S. *Calcutta*, fifty guns, Captain Woodruff, and The *Ocean*, transport, 500 tons, Captain Matthews, arrived in Port Phillip Bay. The *Calcutta* had on board Lieutenant-Governor Collins, and the vessels contained free settlers and convicts, for the purpose of forming a settlement. John Pascoe Fawkner, then a boy, was with his parents on board one of these vessels. The party landed on the shore between Arthur's Seat and Point Nepean. The exact locality is a spot between the two points named the Sisters near Sorrento. Tuckey, first lieutenant of the *Calcutta*, published an account of this attempt to form a settlement, in which he says:—"Though the vicinity of the harbour's mouth afforded no situation calculated for the establishment of the colony, it was naturally expected from the extent of the port that convenient spots might be found; and the first lieutenant of the *Calcutta*, with two boats, was directed to ascertain this material point by as careful a survey of the port as time would permit." From the reports of this survey Lieutenant Tuckey in his book gives the following:—"On the eastern side of the port, twenty-eight miles from the entrance, a stream of fresh water empties itself into the port. The stream runs through an extensive swamp, and appears to be a branch from a large river at the northern extremity of the port, which the shortness of time and badness of the weather prevented our examining."

16th November.—The *Ocean*, transport, left Port Phillip Bay for Port Jackson.

27th November.—A marriage was solemnised at Sullivan's Bay Camp, Port Phillip, by the Rev. Robert Knopwood, between Richard Garrett and Hannah Harvey.

12th December.—The *Ocean*, transport, returned to Port Phillip Bay from Port Jackson.

14th December.—The *Francis*, schooner, arrived from Port Jackson. She was sent by Governor King to assist at the removal of Lieutenant-Governor Collins' party to V.D.L.

18th December.—H.M.S. *Calcutta* sailed for Sydney.

27th December.—Four of the convicts (William Buckley, David Marmon, — Pye, and David Gibson) escaped from the settlement. One of them (David Gibson) returned to the camp on the 24th January in a very exhausted state, and reported having seen the river now called the Yarra Yarra.

1804.

12th January.—The schooner *Edwin* arrived

from Port Jackson in Port Phillip Bay. She sailed for King's Island on the 17th inst.

20th January.—The *Ann* arrived from Port Jackson in Port Phillip Bay. She brought despatches from Governor King to Lieutenant-Governor Collins.

22nd January.—The *Lady Nelson*, from Port Jackson, and *Edwin*, from King's Island, arrived in Port Phillip Bay.

24th January.—In consequence of the reports of Tuckey's exploration being unfavourable, the settlement was abandoned. Collins, with all the settlers and convicts, sailed for V.D.L., to a spot on the left bank of the Derwent, called Restdown, or Risdon Cove, where in July 1803 a small party consisting of Lieutenant Bowen, a surgeon, three soldiers and sixteen prisoners, had been sent from Sydney to form a settlement.

1824.

October.—Hume and Hovell succeeded in travelling overland from Sydney to the shores of Port Phillip Bay; they crossed and named the Hume River (now the Murray) at Albury; saw and named Mount Disappointment; crossed and named the Ovens and the Hovell (now the Goulburn;) and reached Port Phillip Bay at a spot ten or twelve miles to the eastward of Geelong, called the Bird Rock Point. They saw and named Mount Wentworth (now Mount Macedon.) When they reached Port Phillip Bay, Hovell insisted that it was Western Port, Hume maintained it was Port Phillip, from the fact that there were no islands in it, a circumstance of which he had been informed by James Meehan, the surveyor who accompanied Charles Grimes in 1803, when he made the survey of the bay.

1826.

In this year, in consequence of reports that the French had resolved to found settlements on some parts of the Australian coast, and that King George's Sound and Western Port, or some other harbour in Bass Straits, were the places fixed upon by them for that purpose, instructions were sent from England to Governor Darling to lose no time in taking possession of those places. An expedition was accordingly sent from Sydney with that object, consisting of H.M.S. *Fly*, Captain Wetherall, and the brigs *Dragon* and *Amity*, with detachments from the 3rd Regiment (Buffs) and the 39th Regiment under Colonel Stewart. Captain S. Wright and Lieutent Burchell were to remain at Western Port, the former as commandant of the settlement. Hovell accompanied this expedition, for the purpose of carrying out further explorations. He made an extensive examination of the country in the immediate vicinity, and passed between Bass and Wright's Rivers, where he found excellent land, and then tried to cross the immense swamp at the north of the Port, but found it quite impassable; he however kept on his journey until he arrived at that part of Port Phillip which he, in company with Hume, had previously explored, when he was obliged to turn

back. The authorities at Sydney seem to have been inclined to endorse Hovell's opinion, that the place he and Hume had visited two years before, was Western Port. When Hovell got to Western Port he was convinced of the mistake he had made. This expedition reached Western Port, and the officers and soldiers intended for that place disembarked on its eastern side, and erected a small fortification at the eastern end of Phillip Island, which lies across the entrance. They found a French expedition had been there before them but that no steps had been taken to form a settlement. Some short time afterwards, the alarm about French occupation having subsided, and it having been found that the shores of the harbour were scrubby and far inferior to the land seen by Hume and Hovell some twelve months previously, the settlement was abandoned.

1827.

11th January.—Joseph Tice Gellibrand and John Batman, understanding as they stated, "that it was the intention of Sir Richard Bourke, Governor of New South Wales, to establish a permanent settlement at Western Port," made application by letter to that officer "soliciting a grant of land at that place proportionable to the property which they intended to embark," and stating that "they proposed to ship from Launceston 1500 to 2000 sheep and 30 head of superior cows, horses, oxen, &c."

17th March.—Sir Richard Bourke replied to Messrs. Gellibrand and Batman's letter, informing them "that no determination had been come to with respect to the settlement of Western Port, and that it was not in his power to comply with their request."

In this year the cutter *Fairy*, Wishart master, on a sealing voyage from Sydney to Lady Julia Percy Island, having been caught in a south-westerly gale, put into a bay which was named after this cutter Port Fairy.

1828.

In November or December of this year, Captain Griffiths visited Port Fairy in the schooner *Henry*.

December.—William Dutton visited Portland Bay in the schooner *Madeira Packet* on a sealing voyage. He was one of a boat's crew that landed at Blacknose Point and remained in the neighbourhood until the middle of January 1829.

1829.

July.—Dutton again visited Portland Bay in the schooner *Henry*, Captain McLean, on a sealing voyage. He was captain of a boat's crew which landed at Whaler's Point, or Single Corner (the present site of Portland,) where he remained sealing, and built a house and lived in it.

1830.

January.—Dutton again embarked in the schooner *Henry* on a sealing voyage. Sturt, accompanied by George McLean, having led a party down the Murrumbidgee river, reached a river which Hume and Hovell had crossed in 1824 on their journey to Port Phillip, and called the Hume. Sturt gave

it the name of the Murray, by which it has been since known, and followed it down to Lake Alexandrina (which he also named,) and thence to its entrance into the sea.

1831.

March.—Dutton again visited Portland Bay in the schooner *Henry*, then commanded by Captain Griffiths. The vessel anchored off Blacknose Point. Dutton landed and occupied for some months the house he built in 1829. He then left in the schooner *Elizabeth*.

1832.

November.—Dutton again visited Portland Bay and resided there until March 1833. He subsequently returned to Portland Bay in command of the schooner *Henry* and established a whaling station. He erected buildings and grew vegetables for his own use.

1833.

July.—Whilst there at this time, Edward Henty, on his way from Swan River to Launceston in the schooner *Thistle*, Captain Liddle, entered the bay.

1834.

19th November. — Edward Henty landed at Portland Bay with stock, and also boats, &c., to form a whaling establishment. This was the first permanent settlement in Port Phillip.

1835.

In this year an association was formed in V.D.L. consisting of John Batman, Joseph Tice Gellibrand, James and William Robertson, Henry Arthur, John Sinclair, Charles Swanston, James Simpson, John Thomas Collicott, Anthony Cottrill, William George Sams, Michael Connolly, Thos. Bannister, and John Helder Wedge, to colonise Port Phillip. It was determined by the association that Batman should at once cross over to Port Phillip, with a view, as Batman states in his journal, "Of secretly ascertaining the general character and capabilities of Port Phillip as a grazing and agricultural district." Concerning this visit, there are two sources of information, viz., Batman's journal, and his letter of the 25th June 1835 to Governor Arthur and the chart and copies of deeds accompanying it. Between these two accounts many grave discrepancies exist, concerning the details of the undertaking.

10th May.—From the journal it appears that on this day Batman embarked and left Launceston in the *Rebecca*, a craft of thirty tons, on board of which were, Harwood master, Robert Robson mate, four seamen, three white men, James Gumm, William Dodd, and Alexander Thomson, and seven aboriginal natives of Sydney.

11th May.—The vessel reached George Town and awaited a favourable wind.

18th May.—She put to sea, but in consequence of contrary winds did not get clear of the coast until the 27th, when a favourable wind springing up, she proceeded on her voyage, reaching Port Phillip Heads on the 29th, which she entered, sailed some twelve miles inside, and anchored in a small bay near indented Head. Batman, Captain

Harwood, and some of the natives landed at a spot where a native dog was seen on the shore: they made a tour in the interior, and came upon the fresh tracks of some natives, leading to a village of gunyahs, which apparently had not been abandoned for more than a day or two. Batman returned to the vessel at night, highly pleased with the country he had seen, after a ramble in which the party had walked about twenty miles. His natives preferred sleeping on shore.

30th May.—The wind during the night having increased considerably, and the vessel's boat being unable in consequence to bring off the natives, they were hailed and directed to go round to a point of land some fifteen miles distant, and meet the vessel at that spot, the present site of Geelong. Batman again landed, and made another inspection of the country, and was highly pleased with the prospect.

1835.

31st May.—Batman states that "the vessel was last night anchored in a fine little bay to which he gave the name of Gellibrand's Harbour," that he again went on shore, and set out to open communication with the Blacks, which after a march of some twelve miles he succeeded in doing by about one o'clock. The party he then met consisted of twenty-four women and twenty-three children. Whether from a similarity of language, or freemasonry, Batman could not discover, but his Sydney natives and these aborigines seemed to understand each other. A corroboree, with song, was got up in quick time, in which all joined. They informed Batman that the men of their tribe had gone up the river. After the dance the women and children accompanied Batman to the coast where he presented them with blankets, glass beads, &c., after which he arranged to meet them again the next day, when they took their departure. In the course of this day's journey he travelled, going and returning, thirty miles, having ascended a sugar-loaf hill, which he named Mount Collicott.

1st June.—Batman again landed, and travelled round the bay, and after crossing a neck of land fell in with a small river or creek, which he followed up for ten miles; ascended some hills and saw plains which he named Arthur's plains. He also states in his journal of this day that adjoining Mount Collicott there are two other hills, which he named Mount Cottrell and Mount Connolly, and also that at a distance of fifteen miles from Mount Cottrell, bearing N.W. from it, there is another mount, which he named Mount Solomon.

2nd June.—The vessel was taken to Hobson's Bay, at the mouth of the Yarra Yarra, near where Williamstown now stands, and endeavours were made to sail up the river but it was too shallow.

3rd June.—Batman proceeded in a boat up the Saltwater River some five miles. He there landed and joined others of the party on shore, who had

walked seven miles to meet him. He then followed the course of the river for twenty-six miles, its water being salt for the whole distance.

4th June.—The journal of this date is somewhat obscure. Batman would appear, from one portion of it, to have been at Mount Cottrell on this day; whilst the whole entry makes it clear that he was following up the Saltwater River, the distance travelled being over twenty-six miles.

5th June.—Leaving the Saltwater River on a W.N.W. course, he fell in with three freshwater creeks, one of which he called Eliza Creek, and ascended a hill about noon, which he estimated to be fifty miles from the bay. From this hill was discovered, in an easterly direction, the smoke of a native encampment, towards which he bent his steps, keeping on for some twenty miles over plains.

6th June.—The journal states, he made an early start to reach the encampment, the smoke of which had been seen the day previous. That shortly after he came on a chief, his wife, and three children. That this chief received some presents, and took upon himself the office of guide, stating he would conduct Batman to his tribe, of whose chiefs he gave the names. After proceeding eight miles Batman heard the voices of natives calling; looking round he saw six men armed with spears; he stopped and the natives threw aside their spears, and coming up in a friendly manner they all shook hands. The natives took Batman back a mile to their camp where there were eight chiefs belonging to the country over which he had travelled. The three principal chiefs were brothers. The object Batman had in view, viz., the purchase of land, was then explained to the eight chiefs; they appeared to understand the proposal, and agreed to grant "to him and his heirs for ever," in consideration of blankets, knives, looking-glasses, tomahawks, beads, scissors, flour, &c., 600,000 acres of their land, and signed two deeds to that effect, which the provident Batman had ready prepared in his pocket, and "a tree" (says Batman) "was marked in four different ways to define the corner boundaries." The whole group of natives consisted of forty-five—men, women, and children.

7th June.—Batman busied himself in drawing up triplicates of the deeds of the land he had purchased; and in handing over to the natives more property. He returned to his vessel, and in doing so came to the Melbourne, or Batman's swamp, between the Yarra Yarra and Saltwater rivers. On rounding the swamp and getting through the scrub, to his great surprise he came upon the bank of the former river, which he called "The Batman." Some of the natives he had with him swam across the Saltwater River to fetch a boat from the vessel, which was about seven miles distant; they returned in about three hours to the junction of the two rivers, which place Batman had reached.

8th June.—Batman went up the Yarra Yarra in a boat to the falls above the basin.

9th June.—He determined to return to Van Diemen's Land, and to this end proceeded in his vessel to Indented Head, near Swan Point, about twelve miles inside the Heads, where he left the three white men he had brought with him, and five of the aboriginal natives of Sydney, viz., Pigeon, Joe the Marine, Bungit, Bullet, and Old Bull; also a supply of provisions for three months, a quantity of garden seeds, stones and pips of fruit for planting, and six dogs, and gave directions to erect a hut and commence a garden. He also gave to one of the white men, James Gumm, a written authority to warn off all persons found trespassing on the land he had purchased from the natives.

14th June.—Batman quitted Port Phillip and arrived at Launceston, after a passage of thirty-six hours.

25th June.—Batman, on his arrival at Hobart Town, addressed a letter to Governor Arthur, reporting his proceedings at Port Phillip, describing the country he had traversed, and transmitting a chart, in which were defined the limits of the land obtained by him from the natives. The chart Batman stated he constructed from personal survey, and on it is partly traced the Yarra Yarra River. He also enclosed with this letter a copy of each of the deeds executed by the natives, dated respectively 6th June 1835.

3rd July.—Governor Arthur (through his Colonial Secretary, Montagu,) replied to Batman's letter of 25th June, stating, "That Port Phillip is not within the jurisdiction of this Government, and His Excellency would therefore only observe that the recognition of the rights, supposed to have been acquired by the treaty into which you have entered with the natives, would appear to be a departure from the principle upon which a Parliamentary sanction, without reference to the aborigines, has been given to the settlement of Southern Australia, as part of the possessions of the Crown. I am also to observe, that in reference to the application of Mr. Henty to be allowed, under certain conditions to locate, a grant of land on the southern coast of New Holland, His Majesty's Government declined to accede to his proposal, &c."

12th July.—William Buckley, one of the prisoners who had escaped in 1803 from Governor Collins, came to Batman's camp at Indented Head. He was unable to account for the men who had left the camp with him. J. H. Wedge however in a communication to the Geographical Society of London in 1836, mentions that Pye, one of them, was left behind at the Yarra Yarra River through exhaustion; whilst the other, Marmon, parted with Buckley at Indented Head, with the intention of returning to the camp. Early in this year John Pascoe Fawcner, then resident at Launceston, V.D.L., contemplated a visit to Port Phillip, for which purpose he purchased a schooner called the *Enterprise*, then on a voyage to Newcastle, N.S.W. On her return to Launceston, possession was given

to Fawcner on the 18th July 1835, when he proceeded to purchase provisions, blankets, tomahawks, knives, handkerchiefs, a whaleboat, horses, ploughs, grain for sowing, garden seeds, plants and fruit trees. He also formed a party consisting of Samuel and William Jackson, Captain J. Lancey, Robert Hay Marr, and George Evans to accompany him in the exploration of a reported unoccupied country fit for pastoral purposes across the straits.

27th July.—The *Enterprise*, Hunter master, put to sea from George Town, having on board (with the exception of Samuel Jackson) all the members of the party; as also Evan Evans, servant; James Gilbert, blacksmith, and his wife Mary; and Charles Wise, ploughman. After the vessel had been at sea some days, and almost all the time in sight of George Town heads, during which there was very tempestuous weather, Fawcner became ill from sea-sickness and other causes. In consequence, he caused the vessel to put back to George Town, where he landed, taking with him one of the horses from on board, with which he proceeded to Launceston. She again put to sea and entered Western Port on 8th August 1835; the weather being very rough and tempestuous during the voyage, a great many things had to be thrown overboard. The master of the *Enterprise*, Hunter, had recommended Western Port as a fit place for settlement, he being acquainted with it, having been there some years before procuring wattle bark. The party accordingly examined the land around Western Port, and finding it unfavourable, left.

15th August.—The *Enterprise* entered Port Phillip Heads, when a whale boat came off to the vessel, manned by some of Batman's Sydney natives. She proceeded up the bay by the Southern Channel, some of those on board landing each day to examine the country, until the vessel arrived opposite the Red Bluff, now Point Ormond, when William Jackson and others of the party landed made their way through the bush, and crossed the Yarra Yarra River some distance above the falls. Whilst on this journey they fell in with some natives, and ultimately camped on the banks of the Yarra Yarra, on the site of the future city of Melbourne, to await the arrival up the river of Captain Lancey, with the *Enterprise*. Directions had been given to those on board the *Enterprise* not to settle down except on a river, and they must have been aware of the existence of the Yarra Yarra, as Robson, the mate of the *Rebecca*, Batman's vessel, stated that on his return to Launceston he told Captain Lancey of its existence. The vessel proceeded to the mouth of the Yarra Yarra River, where she arrived on the 20th August 1835, anchoring clear of the bar in the channel of the river.

21st August.—Some of those on board proceeded in a whale boat to examine the river; they passed the junction of the Yarra Yarra River with the Saltwater River without taking much notice of the

former, and went up the Saltwater River until stopped by fallen trees. They then returned to the vessel exhausted, examining on their way back the junction of the two rivers.

22nd August.—The same party again went up the Yarra Yarra River in the whale boat and reached the basin; returned to the vessel, and brought it up the river to the present site of Melbourne, which they reached on the 29th August 1835. The vessel was got close to the bank of the river after cutting away some of the overhanging timber. Those on board landed by means of a plank, the horses (two) being hoisted out. There were also brought in the vessel two pigs, three kangaroo dogs, a cat, and provisions.

7th August.—J. H. Wedge landed at Indented Head in company with Henry Batman and his wife. Wedge made this visit to Port Phillip at the request of some of the gentlemen associated with John Batman, for the purpose of confirming or otherwise, the glowing account given by John Batman of that country. Wedge joined the party left by John Batman at Indented Head, around whom were encamped a tribe of natives, having with them William Buckley, who had joined the party prior to Wedge's arrival. This was the William Buckley who had absconded from the settlement near Point Nepean on 27th December 1803. Wedge proceeded to examine the country. His first examination was of Indented Head, embracing the Bellarine Hills. His second examination, accompanied by Buckley, extended over the Barrabool Hills, and southward towards Cape Otway. He discovered and named the Barwon, and saw another river joining it. He also saw and named the Leigh River, and saw a lake named by the natives Modewarre. His third examination, he states, was made "for the purpose of ascertaining where the principal rivers discharged themselves into Port Phillip Bay, with a view to determine the most eligible site for a permanent establishment." On this occasion he left Indented Head in company with one white man, James Gumm, two Sydney Blacks, and a Port Phillip aboriginal boy, and proceeded round by Geelong to the west of Station Peak, crossing the Werribee a little to the south of Mount Cottrell, and the Saltwater River about a mile above the flow of the tide, and reached the present site of Melbourne on the 2nd September, where, with no little surprise, he observed in the basin a vessel moored. For a moment he fancied he had come upon an unknown settlement. Wedge says, "She was certainly the first vessel that had ever worked her way up to where the Queen's Wharf has since been built." He advanced to introduce himself to those in charge of the vessel, which he found to be the *Enterprise*, belonging to Fawkner, sent over in charge of Captain Lancey. Wedge states that the vessel had crept into the port, and proceeded up the Yarra Yarra River, unobserved either by the party left at Indented Head by Batman, or by the

tribe of natives who were encamped with them. This statement differs from that of those on board the *Enterprise*, from which it appears that when she entered the Heads on the 15th August, a boat put off from Batman's party to the vessel. Perhaps this discrepancy may be accounted for on the supposition that Wedge had left Indented Head prior to the *Enterprise* entering. It is quite clear he was not aware of her coming, up to the time he arrived at the site of Melbourne. Wedge also states that he communicated to Captain Lancey, either verbally or in writing, that he, Lancey, had encamped on a portion of the land ceded, or at that time supposed to have been ceded, to Batman's party, by virtue of his treaty with the natives; and in doing so, he believes that he expressed a hope that Lancey would not interfere with Batman, and referred to the unoccupied land on the opposite bank of the river, as affording ample scope for the enterprise of Fawkner's party; that Lancey took this communication in good part, and apparently assented to the propriety of his suggestion; and Wedge thinks he said he would write to Fawkner on the subject, and asserts that in making this communication he was actuated by no unfriendly feeling towards Fawkner and his coadjutors. It was on the occasion of this visit that Wedge gave the river the name of the Yarra Yarra, from the following circumstance: On arriving in sight of it, the native boy who was with him, pointing to the river, called out "Yarra Yarra;" which at the time he imagined was the native name of the river, but he afterwards learnt that the words were those the natives used to designate a waterfall, as the boy afterwards used the same expression to denote a small fall in the River Werribee, when he crossed it on his way back to Indented Head. On Wedge's return to Indented Head, Henry Batman, by his directions, conducted a portion of Batman's party to the north bank of the Yarra Yarra, which encamped not far from where St. James' Cathedral now stands. Wedge left Port Phillip by the vessel in which he came. After Jackson and Marr had satisfied themselves as to the capabilities of the country for pastoral purposes, they returned in the *Enterprise* to Launceston, where the party was broken up; each member of it being left to choose his future line of action in reference to revisiting the discovered land. Captain Lancey, George Evans, his servant, Evan Evans, Charles Wise, James Gilbert and his wife, remained behind on the Yarra Yarra, and sowed with wheat five acres of land at the south-western extremity of Melbourne, and erected near Batman's Hill some tents or huts, as well as a secure place for the stores.

26th August.—Sir Richard Bourke issued a proclamation, notifying "that every treaty, bargain, and contract, with the aboriginal natives, for the possession, title, or claim to any Crown lands within N.S.W., is void, as against the rights of the Crown; and that all persons found in possession of any such lands, without license or authority

from Her Majesty's Government for such purpose, first had and obtained, would be considered as trespassers."

10th October.—Governor Bourke reported to Lord Glenelg Batman's proceedings, as well as the course he had pursued in reference to them. The *Enterprise* again returned to Port Phillip, having on board Fawknor and his servant Morgan. Fawknor removed the tents or huts which had been erected near Batman's Hill to the rise opposite the falls, and formed a cultivation paddock of eighty acres, on the opposite, or south side of the river. It was on this last voyage of the *Enterprise*, that the *Endeavour*, with John Aitken on board, followed Fawknor's vessel, and arrived at Melbourne some short time after it.

13th October.—John Batman addressed a letter from Launceston to J. H. Wedge, in reference to Fawknor's intrusion on the land, which he (Batman) had obtained from the natives of Port Phillip.

31st October.—The first publican's license was issued in Melbourne.

26th October.—Five hundred sheep were imported from Launceston, in the *Norval*, Captain Coltish, for Batman's Association, and landed at Point Gellibrand. This vessel also brought fifty pure Hereford cows, belonging to Dr. Thomson. Cowie, Stead, Steiglitz and Ferguson, also arrived in her.

December.—About this time, — Smith, who had been sent to Port Fairy early in the year in charge of Raby and Penny's whaling party, left that place in a whale-boat with a crew of five men, intending to enter the River Hopkins. The boat was capsized in the surf at the entrance of the river and all hands drowned, with the exception of a man named Gibbs. He swam to the shore in a state of nudity, and made his way back naked and on foot to Port Fairy. Raby and Penny sold the boats, whaling plant, &c., to Griffiths and Connolly.

1836.

1st January.—The first newspaper was published in Melbourne, by Fawknor, and was called the *Melbourne Advertiser*. It consisted at first of a written sheet; was distributed weekly for nine weeks; and was afterwards continued in a printed form to the extent of thirty-two numbers.

23rd January.—Lord Glenelg, in a despatch of this date, in reply to Governor Arthur's despatch of 4th July 1835, on the subject of the negotiations which had been entered into by Batman for the acquisition from some of the native tribes of a large portion of land, consisting of 600,000 acres in the vicinity of Port Phillip stated, "That all schemes for making settlements by private individuals or companies in the unlocated districts of Australia, have of late years been discouraged by His Majesty's Government, as leading to fresh establishments, involving the mother country in an indefinite expense, and exposing both the natives and the new settlers to many dangers and calamities. And there is so much of prudence

and of justice, and I think I may add of humanity in this policy, that I do not feel disposed to depart from it in the present instance."

26th January.—George Duncan Mercer, as agent for the Geelong and Doutagalla Association, addressed a letter to Lord Glenelg, from Edinburgh, enclosing copies of Batman's Narrative of his Excursion to and Proceedings at Port Phillip; the originals of two treaties (executed in triplicate) entered into with the aboriginal chiefs, possessors of the territory in the neighbourhood of Port Phillip; also a map of the territories ceded by the head men of the Doutagalla tribe and other documents, in which letter he states, "The object of the association is to obtain, in the exercise of the Royal prerogative, a recognition and confirmation by the Crown of the treaties executed by the aboriginal chiefs, occupants of the soil; or should His Majesty's Ministers see any legal objection to this recognition and confirmation, of which I am not at present aware, a Royal grant of the territories as feudatories of the British Crown." In conclusion, Mercer says, "Under such circumstances, I trust I may, without presumption, flatter myself that His Majesty's Ministers will be glad to find it consistent with their duty to the Crown and the country, to sanction and foster a colony founded upon principles of humanity and civilisation, and opening a new field for emigration and British industry."

15th February.—Lord Glenelg replied to Mercer's letter of 26th January, informing him, "That the territory on which it is proposed to form the settlement in question, is a part of the Colony of New South Wales, being comprised within the limits laid down in the commission of Governor Sir Richard Bourke; and consequently, that it is impossible for His Majesty's Government to acknowledge any title to lands acquired there, except upon the terms prescribed in that commission and the accompanying instructions."

March.—Captain J. B. Mills left Launceston and proceeded to Port Fairy in the cutter *Sarah Ann*, to take delivery of the boats, whaling plant, &c., for Griffiths and Connolly, which they had purchased last year from Raby and Penny. He took with him three boats and their crews. The oil produced this season was put on board the barque *Arabin*, Captain Cairns, and sent to London. Dr. Thomson arrived at Melbourne with his family. Mitchell left Sydney to explore Port Phillip. He crossed the Murray River on the 15th June, proceeded along its southern bank, and on the 20th June passed Swan Hill, subsequently Lake Boga, Mount Hope and Pyramid Hill; he crossed the Loddon and Avoca Rivers, explored Lake Lonsdale and Mount William, sighted the Grampians, crossed the Wimmera near Mount Zero, discovered the McKenzie and Norton Rivers, reached Greenhill Lake and Mount Arapiles; crossed the Glenelg, proceeded along its eastern bank, crossing the Wando and Wannon Rivers and leaving a dépôt at a spot which he called Fort

O'Hara, descended the Glenelg River in boats; saw Mount Gambier, and reached the mouth of the river and Discovery Bay, all of which rivers and hills he named. He then returned up the River Glenelg, crossed the Crawford, and followed it up; proceeded by Mount Eckersley; saw Mount Napier, crossed the Fitzroy, all of which he also named; and on the 29th August 1836 reached Portland Bay, where he saw a vessel, the *Elizabeth*, of Launceston at anchor, and visited the establishment of the Hentys. On his return he saw and named Mounts Clay and Rouse, The Grange, Mounts Sturgeon and Abrupt, Lake Linlithgow, Mounts Stavely and Nicholson, the River Hopkins, Mount Cole, Expedition Pass, Mount Byng, Mount Alexander and Mount Macedon; and from the latter he obtained a view of Port Phillip Bay. He then crossed the Campaspe, Violet Ponds, the Ovens at its junction with the King River; reached the Murray, and crossed it at Mount Ochertyre, and returned to Sydney. The land which he had explored on the south side of the Murray River, on this trip, he named Australia Felix.

13th April.—Lord Glenelg, in a despatch to Governor Sir Richard Bourke, in reply to his of the 10th October last, approved of the course he had pursued in reference to Batman's proceedings at Port Phillip.

April.—Captain Mills visited from Port Fairy the River Hopkins with two boats and their crews for the purpose of recovering the whaleboat lost the previous year by — Smith. He found the boat about one mile and a-half to the eastward of the entrance to the river, took it to the mouth of the river, and after several efforts to get out to sea on this and the following day (the party having no provisions beyond the usual lunch which they carried when on the look out for whales,) the project was abandoned, as the surf had set in very heavily, and filled the boats at every attempt. The boats were then hauled up on shore, with the intention of dragging them overland to Lady Bay, a distance of two and a-half miles. The crews began to suffer very much from hunger, and wished to leave the boats and return to Port Fairy. However, by alternate dragging and carrying the gear, they succeeded in launching the boats in Lady Bay, and reached Port Fairy very much exhausted, having had to pull against a strong westerly wind. Cattle were brought to Port Fairy in the latter end of this year, in the *Thistle*, by Captain Mills. At the latter end of this month Batman returned to Port Phillip in the *Caledonia*, accompanied by his wife and family and Miss Newcombe, his governess. James Simpson and the Rev. James Orton, a Wesleyan minister, were passengers by the same vessel, as also Major Wellman and his son, who were on their way to India. Batman conducted the remainder of his party from Indented Head to the Yarra Yarra River, and fixed his abode on a hill at the western extremity of Collins-street, called from the circumstance Batman's Hill. He

built a house there and opened a general store. His first sheep station was the present site of St. James' Cathedral, in William-street, where he had a shepherd's hut. Batman looked upon Fawkner as an intruder, as he (Batman) claimed a large extent of ground on the north side of the Yarra Yarra River, by right of his alleged purchase from the natives. About this time, the *Francis Freeling*, Captain Pollock, arrived from V.D.L., having been chartered by Joseph Sutherland to convey to Port Phillip 800 sheep, which he had purchased at Hobart Town for two guineas a head. The sheep were landed in Port Phillip Bay between Indented Head and Point Henry. Some 400 of the number after landing died from drinking salt water. The remainder were seized and taken away by the blacks, most of them being afterwards recovered by Sutherland and Fred. Taylor. Sutherland subsequently took up country and formed a station beyond Geelong, at a place called after him, Sutherland's Creek. He had visited Port Phillip in March of this year to ascertain the capabilities of the country.

1st June.—A public meeting of the residents in Melbourne was held, at which seventy-seven persons were present, amongst whom were James Simpson (chairman,) D. R. Pitcairn, G. McKillop, T. Roadknight, W. J. Sams, Jno. Aitken, W. Roadknight, Fred. Taylor, — McLeod, John Batman, Henry Batman, J. H. Wedge, J. P. Fawkner, J. C. Darke, J. Sutherland, J. Solomon, Michael Carr, Wm. Buckley and David Thomas. A resolution was passed, "That James Simpson be appointed to arbitrate between individuals disputing, on all questions excepting those relating to land, with power to name two assistants when he may deem fit." Other resolutions were also passed, including one, "That a petition be prepared to Governor Bourke, praying him to appoint a resident magistrate at Port Phillip, as well as other magistrates from among the residents." The revenue cutter *Prince George* arrived from Sydney, having on board George Stewart, who was a Territorial Magistrate, and also Police Magistrate at Goulburn, N.S.W. He was the first to exercise magisterial authority in Port Phillip, and was ordered to report on the place and on the condition of its inhabitants. A meeting took place between Stewart, as the representative of the Government, and the inhabitants, when it appeared that 177 persons from V.D.L. had settled in the neighbourhood of Port Phillip Bay, and had imported live stock and other property to the value of £110,000.

8th June.—Henry, Alexander, and James Brock imported sheep from V.D.L. and landed them at Gellibrand Point, near Williamstown, which they occupied for some few months as a station, removing afterwards to Emu Creek, beyond Sunbury.

10th July.—The brig *Chili*, Captain Nixon, arrived at Port Phillip. This vessel had been chartered at Launceston by Gellibrand, Swanston, Geo. Evans, and S. and W. Jackson, to convey stock to Port Phillip. Jackson and Evans on

landing explored the Deep Creek, and reached a place afterwards called Jackson's Creek, now Sunbury, where they determined to form a station. They then returned to Williamstown, and having got together their sheep and provisions, &c., again proceeded to Jackson's Creek, where they remained some time in company. Finding afterwards their sheep considerably increased they divided, and Evans removed two and a half miles up the creek to a place called Emu Bottom, where he formed a station, and eventually obtained a pre-emptive right of 640 acres. In this year stations were also formed by Charles Franks at Mount Cottrell; by Cowie and Stead, at Cowie's Creek; by David Fisher, on the Barwon; by Solomon, on the Salt-water River, at Solomon's Ford; by Roadknight, at the Barrabool Hills; by Simpson and Wedge, on the Exe or Werribee; by John Aitken, on the Deep Creek, and subsequently at Mount Aitken; and by John Gardiner, on the Yarra Yarra. In this year Charles Franks and his shepherd were killed by blacks, supposed to be of the Goulburn tribe of aborigines, at Franks' station at Mount Cottrell, near the River Exe or Werribee. Their remains were brought to Melbourne and interred at the Flagstaff Hill, which had been already selected as a burial place, where the child of a man named Goodman had been interred previously, the child being the first person buried by Europeans at Melbourne. The funeral of Franks and his shepherd was attended by all the residents of Melbourne.

29th September.—Her Majesty's ship *Rattlesnake*, Captain Hobson, R.N., arrived in Port Phillip Bay, having on board Captain William Lonsdale, late of the 4th Regiment of Foot, as resident magistrate. Captain Hobson surveyed the inlet at the head of the bay, which now bears his name. Mounts Martha and Eliza were named by one of the Lieutenants of the *Rattlesnake* in compliment to Mrs. Lonsdale and Mrs. Batman respectively.

September.—C. H. Ebdon formed a station on the Murray. He first established a crossing place at Albury.

5th October.—The brig *Stirlingshire* which left Sydney on the 24th September, arrived in Port Phillip Bay. This vessel had on board Robert Saunders Webb, officer in charge of the customs; Skene Craig, commissariat officer; Robert Russell, and his assistants; Fred. Robert Darcy and William Wedge Darke, of the survey department; Ensign King, with a detachment of the 4th Regiment; thirty prisoners, and Joseph Hooson as chief constable. Russell and his assistants were instructed to survey the shores of Port Phillip Bay; trace up the banks of the Yarra, noting its breadth and depth at various points; the extent to which it is navigable and affected by the tide; the nature of its banks and bed; the rapidity of its current; the height to which the permanent water flows, and that to which it rises in time of flood. Russell also made a survey showing the site of the present

city of Melbourne and the buildings then standing on the same.

October.—Charles Bonney, who had accompanied Ebdon to his station on the Murray, left the station, accompanied by two men, for the purpose of exploring a road to Melbourne. He crossed the Murray at Albury, and took a south-west course to the Ovens River, which he struck a few miles below the present crossing place. The flooded state of the river and the peculiar nature of its banks rendered it dangerous to attempt to cross at that place. On tracing the river down he came upon a newly-made track, which he found to be that of Mitchell's party, who were known to be out in that direction. He followed the track to Howlong, on the Murray, where Mitchell had crossed, hoping to overtake him, but was too late, as Mitchell had gone on, and the river could not be crossed at that spot. He then returned to Ebdon's station, intending to make a fresh start when the floods had subsided. After Bonney's return home, Hawdon's party passed Ebdon's station with stock on their way to Melbourne, which they reached in safety. Gellibrand and Swanston, accompanied by Dobson, a solicitor at Hobart Town, proceeded to Sydney, to urge upon the Government the claims of Batman's Association, and ultimately obtained for the association as compensation in respect of their claims an allowance of £7000 in the remission of the purchase of land at Port Phillip.

27th October.—Joseph Hawdon and John Gardiner, on their way overland from N.S.W. to Port Phillip with cattle, met at McArthur's station on the Murrumbidgee, called Nangus, Mitchell and his party returning to Sydney from their exploration of Port Phillip. Hawdon and Gardiner reached Melbourne at the end of November or beginning of December.

5th November.—Batman had a son born, who was subsequently drowned in the Yarra Yarra at the Melbourne Falls.

8th November.—A census taken in Port Phillip showed the population to be 186 males and 38 females.

December.—An aboriginal mission was established at Port Phillip. The station was on the banks of the Yarra, on the site of the present Botanical Gardens. George Langhorne was appointed missionary to the aborigines, and was joined by John Thomas Smith as his assistant. The aboriginal population at this time, within a circuit of about thirty miles round Melbourne, numbered 700, including men, women, and children, and were divided into three tribes, the "Wawoorong," the "Boonoorong," and the "Watourong." The Wawoorong inhabiting the district extending from the Yarra Yarra to Western Port, as far as the Dun Tin Bear Creek, now called the Ginger Beer Creek. It was with Jika Jika (a tall man and a member of this tribe) and his sons that Batman made his treaty for the purchase of land. The Watourongs inhabited the Geelong district,

It was with this tribe that Buckley dwelt. The Boonoorongs were a small tribe.

25th December.—Charles Bonney left Ebden's station on the Murray, with a bullock dray and several men, and proceeded to the Ovens river, the track then made being afterwards used as the main road. From the Ovens, Bonney kept Mitchell's track to the River Goulburn, where he waited for Ebden to come up with him. On the arrival of the latter, he and Bonney (leaving the dray at the Goulburn) rode on to Melbourne, which they reached on the third day after leaving that river.

1837.

In this year Thomas Bates imported from Launceston, in the vessels *Indemnity* and *Henry*, some sheep which he landed at Point Henry. Bates settled at Cowie's Creek, near the Bell Post Hill, so-called in consequence of Cowie and Stead having erected a bell on a high sapling to give the alarm in case of an attack from the aborigines. Bates subsequently removed to the Duck Ponds near Station Peak. He also occupied land at Batesford, so named after him.

7th February.—Henry Batman was appointed a district constable.

13th February.—Taylor, with John Ewart, arrived in Melbourne with cattle. This party was organised near Yass, by W. A. Brodribb, for John Gardiner and J. T. Gellibrand.

2nd March.—Charles Bonney left Ebden's station on the Murray with about 9000 of Ebden's sheep, and took up a run which he had chosen, south of the Goulburn. They were the first sheep brought by land to Port Phillip. After they were placed upon the run Bonney came to Melbourne with two drays for supplies, on which occasion he discovered the country forming the present site of Carlsruhe, which Ebden afterwards occupied.

4th March.—Governor Bourke arrived from Sydney at the settlement on the Yarra Yarra, in H.M.S. *Rattlesnake*, Captain Hobson. He was accompanied by Captain Hunter, military secretary; George Kenyon Holden, his private secretary; Captain P. P. King, as his travelling companion; and Robert Hoddle, surveyor in charge. The object of this visit was to fix the site for a township. Hunter placed the encampment of the vice-regal party at the west end of Bourke-street, near the present residence of Hoddle. One morning, shortly after their arrival, and whilst they were in camp, the shock of an earthquake was felt. Bourke expressed to King his apprehension that it would be unsafe to build a town on the spot, as it would be exposed to risks like those which then made N.Z. so unpopular a country for settlement. No repetition of the shock occurred, however, and the Town of Melbourne was laid out by Hoddle. The principal streets were marked to be 99ft. wide. The Governor at first objected to this width, but subsequently assented, and insisted that smaller streets should be made 33ft. wide, to be called mews.

He named Melbourne after the then Prime Minister, Lord Melbourne; Collins-street, after Lieutenant Governor Collins; Flinders-street, after Captain Flinders; Bourke-street, after himself; Lonsdale-street, after Capt. Lonsdale; Swanston-street, after Captain Swanston; and Russell-street, after Lord John (now Earl) Russell. Hoddle also marked out Williamstown and the Battery Reserve. Williamstown was named after the reigning sovereign. An address was presented to Sir Richard Bourke by the inhabitants, to which he replied, and he subsequently made a trip into the interior under the guidance of Jackson and Buckley; he visited Mount Macedon and Geelong, the latter of which he named after the native name of the hill on which it stands.

10th April.—Governor Bonrke named Hobson's Bay after Captain Hobson of H.M.S. *Rattlesnake*, and officially ordered the sites of Melbourne and Williamstown to be laid out.

30th April.—The first child baptised at Melbourne was the son of James Gilbert, who arrived with Fawkner's party at Port Phillip on the first voyage of the *Enterprise*. He was named John Melbourne Gilbert.

1st June.—The first land sale took place at Melbourne, Robert Hoddle, surveyor in charge of the district, acting as auctioneer. The average price realised for each lot of about half an acre was £35. Sylvester John Brown, Barry Alexander and Robert William Shadforth, arrived in Melbourne by land from N.S.W. with sheep and cattle. Brown and Shadforth on their way to Melbourne stopped at Ebden's station at Carlsruhe.

2nd June.—John Wood Fleming, who was mayor of Brunswick in the year 1870, was born on the site of the present fish market.

18th June.—The *James Watt*, steamer, Taggart master, left Sydney for Launceston and Port Phillip. Passenger, Langhorne.

July.—John and Joseph Hawdon brought cattle from their station at Howlong on the Murray to Melbourne, and took them to a station at Dandenong called Bigning, water holes adjoining, a station which Alfred Langhorne had formed on Dandenong Creek for Captain Lonsdale and himself. Langhorne was left in charge of these cattle with John Bourke as stockman.

5th September.—Foster Fyans was appointed police magistrate at Geelong.

12th September.—Patrick Cussen was appointed colonial assistant-surgeon.

14th September.—The *James Watt*, steamer, Parsons master, left Sydney for Port Phillip, having on board Fyans, late a Captain in the 4th Regiment; Cussen, Dutton, Campbell and Hodgson.

1st November.—A second land sale was held at Melbourne. Fawkner purchased the allotment at the corner of Collins and Market-streets for £10.

10th November.—James Backhouse and George Washington Walker, Quaker missionaries, arrived at Port Phillip in the *Edora*, Stephen Addison, master. They visited the aboriginal station on

the Yarra Yarra, then in charge of Geo. Langhorne; they also visited Captain Lonsdale and Batman, and left Port Phillip on the 17th November of the same year. About this time Gellibrand and Hesse were lost in the bush at the Cape Otway ranges. It is supposed that they were murdered by the aborigines. A skeleton, discovered some time after, was identified as that of Gellibrand, from the fact of one of the teeth being filled with gold. Two hills not far from Winchelsea were named after these explorers.

30th December.—A fortnightly mail by land was established between Sydney and Melbourne. Joseph Hawdon contracted to convey it between Melbourne and Yass. It was carried on horse-back by his stock-man, John Bourke, who acted as mailman. This venturesome man, notwithstanding the attack on Faithful's party in the course of the following year, and the determined hostility of the blacks, continued to carry the mail by himself through the uninhabited country at the imminent risk of his life, crossing his horses over the rivers as best he might, and camping out at night wherever he found it most convenient. On one occasion he had a horse drowned in the Murray River, and on another was surrounded by hostile blacks, from whom he contrived to escape. A bush-ranger named Cummerford having at Sydney confessed that he and a shoemaker, name unknown, and a man named Dignum, had murdered between Melbourne and Portland Bay six bushrangers whilst asleep, Governor Bourke sent Cummerford to Port Phillip to point out the place where the murder had been committed. On Cummerford's arrival in Melbourne he was sent for this purpose in charge of a sergeant, one soldier, and two constables. On arriving at the spot indicated, 200 miles from Melbourne, the police found one or two bushels of calcined human bones, some human teeth, and hair unburnt, and some shoe nails and buttons from the clothes of the murdered men. On their return they found the bones of a horse's head, which Cummerford stated had belonged to Edden, and which he and Dignum had shot. One constable and the soldier having turned back for some tea which they had left behind, whilst the sergeant, the remaining constable (Tompkins) and Cummerford went on. The party stopped to cook, the sergeant giving his musket to Tompkins whilst he made a fire. Tompkins having left the fire-arms, Cummerford seized a musket and shot him, and he died in three hours, the ball having entered the left side and passed out at the right breast. Cummerford then plundered the pack-horse and escaped, though pursued by the sergeant for some time. This took place on 30th December, and on 1st January 1838 Cummerford, whilst trying to steal a horse, was taken into custody by three of Wedge's men.

1838.

Early in this year the Rev. James Clow, Presbyterian clergyman, performed Divine service in Melbourne.

16th January.—Benjamin Baxter was appointed clerk of the bench of magistrates.

28th January.—The Rev. James Forbes, Presbyterian minister, arrived in Melbourne. Joseph Hawdon, in company with Charles Bonney and a party of nine men, started from his station on the River Murray (at that time known as the Hume) to drive to Adelaide about 300 head of cattle, which he had, towards the end of the previous year, brought from N.S.W. The cattle were first driven to a mail establishment on the Goulburn River, at which place they were met on the 23rd January by some drays conveying from Port Phillip supplies for the journey. Hawdon on this journey discovered that the Goulburn joined the Murray. He proceeded along the south bank of the Murray to within three miles of its junction with the Darling, when he crossed over, fording both rivers without difficulty. At the junction of the Darling, he found a bottle, buried by Mitchell on 30th June 1836. On the 5th March he came upon a lake, which he named Lake Victoria. On the 12th March he passed another lake, which he named Lake Bonney. The party also passed near Mount Barker, and arrived in Adelaide on 30th April 1838.

February.—Edward John Eyre and S. J. Brown started from Port Phillip for Adelaide driving a herd of cattle with them. Brown turned back; Eyre proceeded on to Adelaide, where he arrived on 12th July 1838. He attempted to take a direct route from Port Phillip to Adelaide, but coming upon a country impassable for want of water he abandoned that course, and getting on Mitchell's track, continued along it to the River Wimmera, which he followed down and discovered that it flowed into a large lake which he called Lake Hindmarsh. After a search of three weeks and the loss of some horses, finding nothing but a waterless scrub between the lake and the Murray, he was obliged to return to the route followed by Hawdon, and by which he reached Adelaide.

8th February.—Peter Snodgrass was appointed Commissioner of Crown Lands for the Port Phillip district.

24th February.—Governor Gipps assumed the government of the colony.

March.—About this time Fawcner commenced the printing and publication of a newspaper, which was called *The Melbourne Daily News and Port Phillip Patriot*. It was some time after edited by George Darly Boursiquot.

11th April.—A party of men in charge of William P. Faithful's sheep, travelling from N.S.W., were preparing to proceed from the Broken River to the Goulburn River in the Port Phillip district, where it was understood good sheep stations might be had. Whilst the bullocks were being yoked, the men with the drays heard the shepherds shouting for help; these latter, who were a short distance from the encampment herding the sheep, were presently seen running with great speed towards the drays, pursued by a body

of blacks throwing spears at them. Their companions at the encampment, three of whom were armed with guns, immediately ran to their assistance, with the intention of driving off the blacks, who were at that time within three or four hundred yards of the encampment. One of these men, named Bentley, fired his gun into the air thinking by this means to intimidate the Blacks, but the shot had no effect; the blacks still pushed forward, cautiously sheltering themselves in their advance behind the trees. When very near the whites, one came forward, and was in the act of deliberately poisoning his spear when Bentley shot him dead, and was himself immediately afterwards pierced with three spears; the contest then became general, and Bentley was last seen wounded and fighting desperately with the but end of his musket; the other men, at whom spears were hurled from all directions, fired several shots without effect, owing to the shelter of the trees of which the blacks had availed themselves. The blacks increased in numbers and pressed their advance, until the whites were in danger of complete massacre. Seven of the party of fifteen were killed, and one mortally wounded. The survivors joined in a final rush for escape; the blacks opened in two lines, and speared at the Whites as they fled between them. John Campbell, who escaped, died of his wounds. Crossley, the overseer of the party (subsequently a butcher at Kilmore,) was one of those who escaped. The attacking party appeared to the fugitives to be about 150 in number, as seen ranged up in the two lines through which they retreated. At about 100 yards distant another strong party of armed blacks was drawn up; but took no part in the contest. It is said there were not fewer than 300 fighting men present, and that not one old man was seen among them. The party in charge of the sheep and cattle had been awaiting from the Saturday previous to the arrival of George Faithful who was only a day's stage behind, and was momentarily expected. The sheep were dispersed, but with the exception of 130 were all recovered; some of the cattle were lost. Faithful and Colonel White were camped near the crossing place of the Ovens River, where one of the men who had escaped from the affray arrived some twenty-eight hours after, reporting that he believed he was the only man of the party saved.

April.—Alfred Langhorne left Melbourne for Sydney overland; on his way he fell in with the remainder of Faithful's party near the Broken River, on the morning after their affray with the blacks, and on the night of the same day camped with them near the Ovens River. John Murchison and Farquhar McKenzie brought sheep overland from New South Wales to Port Phillip; on the route they were joined by Peter Snodgrass, Dr. Dixon, Murdock, James Campbell, and Henry Kent Hughes, who were also on their way to Port Phillip with sheep; they all camped on a creek near Mount Piper. Some of the party fell in with

Colonel White and his son Edward, who had been driven from the Ovens River by the blacks. They all took up country on, or in the neighbourhood of, the River Goulburn. McKenzie selected the King Parrot Creek; Dr. Dixon, for McFarlane, the Cheviot Hills; Snodgrass, the Muddy Creek; Campbell, country on the north side of the Goulburn, and Hughes remained where they had all originally camped on a little stream which obtained the name of Hughes's Creek. Lady Franklin visited Port Phillip from V.D.L., of which colony her husband was Governor.

15th May.—A Government mail cart travelled between Melbourne and Geelong, the Saltwater River being crossed by a punt. The Rev. P. B. Geoghegan, a clergyman of the Church of Rome, arrived in Melbourne from Sydney.

5th August.—William Wright was appointed chief constable at Melbourne, in place of Henry Batman.

15th August.—A branch of the Bank of Australasia was opened at Melbourne in a small brick building on the north side of Little Collins-street, near Elizabeth-street, with David C. McArthur as manager.

September.—David Kelsh was appointed by the Governor postmaster of Melbourne; he opened a post-office in a small brick building on the north side of Little Collins-street, a little to the westward of Temple Court.

2nd October.—An Act (2 Victoria, No. 20) was passed by the Legislative Council of New South Wales to enable the printer and publisher of a newspaper to make the affidavit and enter into the recognisance required by law, before the police magistrate of the district in which such newspaper was to be printed and published.

17th October.—A branch of the Union Bank of Australia was opened at Melbourne in a weather-board building in Queen-street, with William Highett as manager.

27th October.—A second newspaper was printed and published in Melbourne by Strode and Arden, and was called *The Port Phillip Gazette*. It was issued twice a week. Strode had brought from Sydney, by the *Denmark Hill*, the type, and a wooden press of very ancient construction, with which this paper was printed.

2nd November.—A general fast was kept in Port Phillip on account of the long-continued drought. In this month Captain Tobin commenced taking charge of vessels as a private pilot, and brought the schooner *Industry*, drawing eight and a-half feet of water, up to the Melbourne wharf.

11th December.—George Augustus Robinson was appointed chief protector of aborigines, and Edward Stone Parker, William Thomas, Charles Wightman Sievwright, and James Dredge, assistant protectors. In this year the Port Phillip Bank was established in Melbourne, with a capital of £120,000. John Gardiner, and subsequently George Duncan Mercer, being successively the managing director.

1839.

1st January.—William Lonsdale was appointed police magistrate at Melbourne. The Melbourne Club was instituted.

3rd January.—The barque *Hope* arrived from Sydney with 130 immigrants, 2 officers, and 34 rank and file, 30 women, and 50 children. Parker, Thomas, Sievwright and Dredge, who had recently arrived from England with the appointments of assistant-protectors of aborigines, were on board.

17th January.—The minimum price of Crown lands, which had theretofore been 5s. an acre, was raised to 12s. an acre. In this month the barque *Thomas Laurie*, 300 tons, W. B. Price, master, sailed from Port Phillip direct for London, taking the first mail, and 400 bales of wool, valued at £6500.

13th February.—The members of the association formed by Batman, called the Port Phillip Association, having, as already stated, obtained an allowance of £7000, in the remission of the purchase of land, in consideration of the expenses they had incurred in the first formation of the settlement, exercised this concession in the purchase of 9416 acres of land to the west of Geelong.

14th February.—The petition of W. H. Burnard was printed by order of the House of Commons. In this petition reference was made to a correspondence which took place in October 1838 and January 1839, between James Graham and Co., and Lord Glenelg, in which the former solicited permission to purchase 20,000 acres of land at or near the Glenelg River, Australia Felix, with the object of establishing a colony there. The petitioner was informed that Australia Felix was a part of N.S.W. and that it must rest with the local Government, in the first instance, to determine the expediency of putting up for sale lands in that district.

26th February.—Charles Bonney left Port Phillip for Adelaide, with cattle; he proceeded by way of Glenelg, following the coast line near Mount Gambier. He was the first person who crossed to that colony by this route. Alfred Langhorne followed Bonney, keeping his track to the junction of Lake Alexandrina with the Murray River.

24th March.—A stone jetty was completed at Williamstown.

27th March.—Edward Jones Brewster, barrister-at-law, was appointed chairman of quarter sessions at Port Phillip.

31st March.—The first pound was established at Port Phillip.

28th April.—The ship *John Barry*, J. Robson, master, arrived from Sydney with 200 immigrants; E. J. Brewster, was a passenger.

6th May.—John Batman died at Melbourne, aged thirty-nine years.

May.—John Hunter and James Riley brought horses, by land, from N.S.W. to the Seven Creeks, where Hunter remained, he having purchased sheep of Rutledge, which the latter had brought from N.S.W.

13th May.—The first Court of Quarters Session was held at Melbourne, E. J. Brewster, chairman, and Horatio Nelson Carrington, Crown Prosecutor.

19th May.—The Rev. P. B. Geoghegan (subsequently Roman Catholic Bishop of Adelaide) celebrated mass in Melbourne.

17th June.—The barque *Midlothian*, George Morrison, master, arrived from Leith. This was the first merchant vessel direct from a British port to Hobson's Bay. John Hunter Kerr, a relative of Governor Hunter, came to the colony in her, as also thirty-one cabin passengers. On the same day, the barque *William Bryan*, Roman, master, from London, via Circular Head and Launceston, passed up the bay. Thomas Herbert Power was on board. Both vessels grounded on the passage up.

7th July.—A branch of the Colonial Treasury at Sydney, was established at Melbourne.

11th July.—Joseph Hawdon and Lieutenant Alfred Mundy, with their servant John Bourke, started from the Lamb Inn, Melbourne, on an overland journey to Adelaide, Mundy in a tandem, and Hawdon on horseback; they had six horses with them, and on the way overtook Joseph Holloway, who had left a week before them, in charge of cattle belonging to Hawdon. They accompanied Holloway to the crossing place of the Murray River, where they left him and drove into Adelaide, which they reached in twenty-seven days from the time of starting.

August.—Henry Fysche Gisborne who on the 21st May previously had been appointed Commissioner of Crown Lands for Port Phillip District, arrived in Melbourne by land, from N.S.W., in command of some police, and was accompanied by James Stein. Edward Curr, afterwards known as "the Father of Separation," arrived from Circular Head, V.D.L., in the schooner *Eagle*, bringing with him for sale some cattle descended from some of the best herds in England.

6th September.—The foundation-stone was laid of an Independent Chapel in Collins-street east, Melbourne.

10th September.—Robert Saunders Webb was appointed sub-treasurer at Port Phillip.

14th September.—Three allotments in the town of Melbourne, Nos. 5, 6 and 7, of block 14, situate in Collins-street, near Queen-street, each containing about half an acre, and which had been purchased by Charles H. Ebdon at the Government land sale on the 1st June 1837 for £136, were this day sold by auction, and realised £10,224.

30th September.—Charles Joseph La Trobe, who had been appointed Superintendent of Port Phillip by the Home Government, with a salary of £800 a year, arrived in Melbourne by the *Pyramus* from Sydney, and landed under a salute of nine guns. The district over which La Trobe had jurisdiction was bounded on the north by the 36th degree of south latitude, and on the west and east by the 141st and 146th degrees of east longitude respectively.

2nd October.—La Trobe met the inhabitants of Melbourne in the Auction Company's Rooms, Collins-street. His instructions were read to the public, and he was presented with addresses, to which he replied. John Carre Riddell and Thomas Ferrier Hamilton arrived in Melbourne from N.S.W. by land.

8th October.—An Act (3 Victoria, No. 16) was passed by the Legislative Council of N.S.W., by which the evidence of the aborigines might be taken under affirmation or declaration, and be received as of such weight only as corroborative circumstances might entitle it to, the witness to be liable to the usual penalties and forfeitures as in the case of perjury. The Act was not to take effect until it received the royal assent. It was subsequently disallowed by Lord John Russell's Despatch of 10th July 1840.

12th October.—The Rev. James Coud Grylls, a clergyman of the Church of England, arrived in Melbourne from Sydney, in the *Denmark Hill*. He had been appointed on the 5th September, bishop's surrogate for granting marriage licenses.

20th October.—Jas. Montgomery was appointed Clerk of the Peace at Port Phillip.

6th November.—The foundation-stone of St. James' Church, William-street, was laid by Superintendent La Trobe.

13th November.—James Croke who had been appointed by the Home Government Clerk of the Crown at Port Phillip, Sir Redmond Barry, J. B. Brewer, barrister-at-law, James Montgomery, Edward Sewell, Robert Dean and Richard O'Cock, solicitors, and Neil Black, arrived in Melbourne by the *Parkfield*.

22nd December.—Foster Fyans was appointed police magistrate at Portland Bay, and Nicholas A. Fenwick police magistrate at Geelong.

II. *Early Settlement*.—A writer in the record of the International Exhibition of 1881 published by the *Argus* gives the following picturesque description of the first settlement in Port Phillip in 1835:—"Upon one of the seven eminences spoken of above, and in a neighbouring hollow, both abutting upon the ever-flowing river which empties its waters into a noble bay, an association of enterprising settlers have founded a primitive village. Its population numbers only fifty men, women, and children, inhabiting eight or ten cabins, composed of sod walls and bark roofs, and a couple of weatherboard huts, which have achieved the distinction of possessing brick chimneys. The infant settlement possesses half a dozen horses, about a hundred head of cattle, 1400 sheep, and a few dogs, rabbits, and poultry. Some land has been broken up and placed under tillage upon the south bank of the river, and excepting that here and there some timber has been cut down for building purposes and fuel, the place retains its sylvan aspect, and oxen graze and sheep browse over what is little better than an extensive commonage, sprinkled pretty abundantly with trees. The villagers lead a rough life of it. They

have plenty of hard work, and a sense of insecurity, inspired by apprehensions of an attack from the aboriginal occupants of the soil, tends to promote a feeling of common sympathy. Nevertheless three adventurous settlers—Conolly, Swanston, and Solomon by name—have established themselves as sheep-farmers at different points ten miles distant from the little hamlet on the Yarra; and explorers who have pushed inland to the extent of twenty miles have brought back glowing accounts of the fine grazing qualities of the natural pastures. One of the pioneers of settlement, an active little man, with some tincture of imagination in his composition, proposes that the country shall be called Australia Felix; and prognosticates in moments of elation that it will become celebrated in the annals of the English nation some day, and that it was only necessary for so fair and fertile a region to be known and talked about in Great Britain to attract tens of thousands of immigrants. But the bystanders, who have gathered round a rude forge, erected under the shadow, if shadow it can be called, of an enormous eucalyptus, shake their heads at the enthusiasm of "Johnny Fawcner," and offer to wager long odds that at least a century will elapse before a second Launceston shall have arisen on the banks of the Yarra. But the enthusiast meets all such chilly remarks with a sarcastic "Ho, ho!" and confidently predicts that the day will come when a much larger town than that which stands at the head of the Tamar will occupy the site upon which they are then standing; and when, instead of an occasional barque, or brig, or schooner tacking up the bay, large merchantmen will float upon its waters, and warehouses—perhaps even docks—will be constructed alongside the stream which now flows so placidly at their feet. So extravagant a forecast however only exposes the little man to the banter of his neighbours, one of whom suggests in an undertone that "Johnny is a shingle short." Life is very dull and uneventful in this secluded settlement, but fortunately these pioneers, encamped on the edge of a wilderness, have so much strenuous work to occupy them all day, that when darkness settles down upon the little cluster of hovels their inmates are much more inclined to fall asleep than to sit down and while away the time by ineffectual attempts to engage in conversation, with an utter dearth of local materials, and with none at all procurable from external sources; and so the current of existence flows on with a monotony as unbroken as that of the sunshine in the summer months, or as that of the steady down-pour of rain at some periods of the winter, when the narrow valleys are filled with turbid streams or roaring torrents and the settlers stand at the doors of their cabins gazing disconsolately upward at the leaden sky and downward at the sodden earth." Five years later "the Settlement, as it used to be called by some, although others gave it the name of Beargrass, has grown from a diminutive hamlet into a straggling township, upon which the name

of Melbourne has been bestowed, in honour of the genial statesman who was Her Majesty's political preceptor. There is only one street really worthy of the name; and this, running from east to west, is as broad as if the surveyor who laid it out conjectured that it would one day become the leading thoroughfare of a populous city. The houses erected at irregular intervals upon its western eminence are mostly of wattle and dab, and are only one story high; but here and there a brick edifice, with an upper story, looks quite imposing by comparison with its lowlier neighbours. Jagged stumps of ancient gumtrees, that have been felled for joists and beams and battens, still deface the highway, and give a devious direction to the drays which conduct the traffic between the township and the interior; and the immediate environs of the place are almost as sylvan as they were five years ago. There is a good deal of activity observable among the inhabitants, for there have been two shiploads of immigrants from Sydney, and others are expected from England, to accommodate whom wooden huts are going up in many directions, and the public-houses and stores are doing a lively business. Melbourne has been declared a free port, and pastoral settlement in the interior covers a very wide area. In fact, the official returns show that there are 2372 horses, 50,837 head of cattle, and 782,283 sheep in the district of Port Phillip, which now numbers 10,291 inhabitants, and produces about £70,000 worth of wool per annum. The owners of these flocks and herds lead a rough life in the bush, occupying slab huts, feeding upon coarse fare, spending most of their time on horseback in the open air, and sleeping at night in rude bunks, copied apparently from those to which they had been accustomed on ship-board. At the close of the sheep-shearing season, when the annual clip has been packed and forwarded by lumbering bullock-drays to Melbourne for shipment, and when the annual supply of stores has to be purchased and sent back to the station, the squatters come down to town, and some of them indulge in what they call "a spree;" so that for a week or two perhaps the smooth monotony of life in Melbourne is broken in upon by the rough vivacity of its pastoral invaders, and the publicans are very attentive to the old maxim about making hay while the sun shines; but matters soon fall back into their former groove, and the last of the drays winds away in the distance, where its trail upon the bush track is obscured by a cloud of dust, and the place relapses into its normal condition. Judging from outward appearances its inhabitants are on a footing of social equality. The men wear blue serge shirts—very much like the "jerseys" of the fashionable ladies of 1880—moleskin trousers, confined at the waist by a belt of glazed leather, cabbage-tree hats, and boots resembling those affected by pirates in a nautical melodrama. The women do not ruin their husbands by the costly material or the expensive workmanship of their dresses, which

are mostly of homely print and of equally homely fabrication. A good many of the children run about barefoot. Much of the domestic work of the smaller households—washing, cooking, &c.—is performed out of doors, and the general aspect of Melbourne A.D. 1840 resembles that of a straggling bush township in the present year of grace. As for the townspeople, they might very well address a visitor in the words of welcome with which Daniel Peggoty greeted little David Copperfield on his arrival at the quaint habitation upon Yarmouth Sands—"You'll find us rough, sir, but you'll find us ready." But the settlement was not effected without great opposition on the part of the Imperial Government. When Batman was endeavouring to obtain a ratification of his grant from the aborigines of Port Phillip Governor Arthur was under the impression that the newly-settled territory would be attached to N.S.W., to which it naturally belonged. He had informed Batman, in reply to his first application, that the purchase of land from the natives might be confirmed, but that he did not consider Port Phillip was within his jurisdiction. There can be no doubt, however, that he took a considerable interest in the new settlement, and forwarded several despatches to the Secretary of State, in which he indirectly hinted at the propriety of attaching it to the V.D.L. Government. The matter was quickly decided by Sir Richard Bourke, who immediately issued the following proclamation:—"By his Excellency Major-General Sir Richard Bourke, K.C.B., commanding His Majesty's Forces, Captain-General and Governor-in-Chief of the territory of New South Wales and its dependencies, and Vice-Admiral of the same.—Whereas it hath been represented to me that divers of His Majesty's subjects have taken possession of lands of the Crown within the limits of the colony, under the pretence of a treaty, bargain or contract, for the purchase thereof, with the aboriginal natives: now therefore I, the Governor, in virtue and in exercise of the power and authority vested in me, do hereby proclaim and notify to all His Majesty's subjects and others whom it may concern, that every such treaty, bargain, and contract with the aboriginal natives as aforesaid for the possession, title, or claim to any lands lying and being within the limits of the Government of the Colony of New South Wales, as the same are laid down and defined by His Majesty's commission—that is to say, from the Northern Cape or extremity of the coast called Cape York in the latitude of 10° 37' S. to the southern extremity of the said territory of New South Wales, or Wilson's Promontory, in the latitude of 39° 30' S., and embracing all the country into the westward as far as the 129th degree of east longitude, reckoning from the meridian of Greenwich, including all the islands adjacent to the Pacific Ocean within the latitude aforesaid, and including also Norfolk Island—is void, as against the rights of the Crown; and that all

persons who shall be found in possession of any such lands as aforesaid, without the license or authority of His Majesty's Government for such purpose first had and obtained, will be considered as trespassers, and liable to be dealt with in like manner as other intruders on the vacant lands of the Crown within the said colony." This Proclamation is dated from Government House, Sydney, 26th August 1835. For a considerable period Bourke seems to have taken no notice of the new settlement, beyond the fulmination of the proclamation which has been already quoted; but hearing that persons were still proceeding thither, he directed Steward, a police magistrate, to proceed to Port Phillip in the revenue cutter *Prince George*, in order to report on the place and the condition of the people. This gentleman was the first who had legitimate magisterial authority in Port Phillip; but the people respected several colonists who had been in the commission of the peace in T., and obeyed them as implicitly as if they had been in reality magistrates of the territory. At this time, while people and stock were arriving almost daily from V.D.L., the population of the new settlement began to receive very important accessions from N.S.W. Mitchell having spread a favourable report of the country, many enterprising stockowners took the road, and pouring across the Murrumbidgee and Murray Rivers, occupied the fine country on the Goulburn, Ovens, Campaspe and Loddon Rivers. A fleet of small vessels were busy plying between Williamstown and V.D.L., engaged in transporting stock to the western districts of Port Phillip; so that by the month of August 1836 it was computed that 38,000 sheep had been imported from Launceston. The Secretary of State, Lord Aberdeen, and his successor, Lord Glenelg, followed the unfortunate course which had till then almost invariably been adopted by the Colonial Ministers. They began by saying *no*, and in a very short period were obliged to say *yes*—to acknowledge a fact! Lord Aberdeen in December 1834, and Lord Glenelg in July 1835, wrote elaborate despatches, the one against the occupation of Twofold Bay, the outlet to Brisbane Downs, on the borders of Port Phillip, as recommended by Sir Richard Bourke, and the other against the occupation of Port Phillip, as recommended by Colonel Arthur, objecting to measures "the consequence of which would be to spread over a still further extent of country a population which it was the object of the land regulations to concentrate," and declining on the ground of "expense to the mother country and danger to the natives and settlers," to sanction the proceedings of Batman and his associates. But before the despatches were unsealed the thing was done. The settlement was accomplished. Until the appointment of a Superintendent in 1839 there was no official representing the Government at Sydney of higher pretensions than the police magistrate. So great was the advance of the settlement however and so rapid the increase of

population, that the Imperial authorities were convinced that it would be necessary to establish a local administration, and in the early part of 1839 a Superintendent was nominated, into whose hands the local government was to be entrusted. The appointment of La Trobe was announced on the 28th March 1839, and he arrived at Melbourne in September of that year. It is at this period, therefore, that the political history of the colony may be said to commence.

III. *Governor La Trobe*.—It was a great misfortune to Port Phillip that it happened to be nominally within the geographical limits of N.S.W., and was consequently claimed by the Government of that colony. But for this unfortunate circumstance it would have been at once established an independent colony, like S.A. The Imperial Government had no desire that Port Phillip should be attached to N.S.W., but having been lawfully taken possession of, the Ministers of the Crown tacitly acquiesced in the act of Sir Richard Bourke. That Governor, indeed, considered he was only exercising his legitimate powers, and was little disposed to be either an oppressor or an enemy. But his successor was surrounded by the aristocracy of N.S.W., who viewed the fine lands of Port Phillip as lawful spoil; and he was to some extent influenced by those views, and could not act altogether according to his own judgment. A few years later, when the new settlement was rising into notice, an Order was issued, bearing the royal signet and sign manual, dividing the colony of N.S.W. for all purposes connected with the sale of land. At this time Sir George Gipps, who had succeeded Sir Richard Bourke, was anxious to become popular with the aristocratical Council of Sydney, and at their desire made every effort to retard or overturn the movement. The whole influence of that wealthy colony was brought into operation, and every effort was made by the Legislature (composed at the time of nominees of the Crown) to prevent even the territorial dismemberment of the colony. The Bishop of Australia, (Dr. Broughton) was particularly energetic, and his arguments evinced too clearly that the colonists of the middle, or Sydney, district looked on the revenues of Port Phillip as fair spoil. He said—"The revenue arising from the district of the colony, it must be remembered, would go into other treasuries, and the emigrants would be landed at other ports; and where the emigrants arrived there would be the greater demand for produce of all descriptions; there stores would be built and merchants congregate; where ships arrived there would the wool be carried for shipment, and there would the supplies be purchased for the stations, and there would the money circulate." The Bishop had as great a fear of Port Phillip receiving the benefit of her revenue, and in consequence becoming prosperous, and the rival of Sydney, as the temporal potentates. Hannibal Macarthur, the ablest man perhaps next to the Governor, in the Legislative Council at

this time, said the change had come upon them like a thunderbolt, but they resembled more the earthquake threatening to involve the colonists of N.S.W. "in universal ruin." The Governor was not only backed up by the Legislative Council, but by a public meeting of the colonists, and nothing loth, considered himself justified "in not obeying his instructions in reference to Port Phillip." It may not be out of place to glance briefly at the financial position of Port Phillip, with reference more particularly to her standing account with the Treasury in N.S.W. The following is the official return of revenue and expenditure from 1836 to 1842 :—

REVENUE.				£	s.	d.
1836	0	0	0
1837	2,358	15	10
1838	2,825	17	10
1839	14,703	5	10
1840	36,856	1	6
1841	81,673	10	4
1842	84,566	9	3

Total £222,984 0 7

In this period the actual expenditure for the Government of the Province of Port Phillip, exclusive of that on immigration, was as follows :—

EXPENDITURE.				£	s.	d.
1836	2,164	16	8
1837	5,879	2	4 $\frac{1}{4}$
1838	16,030	2	5 $\frac{1}{2}$
1839	24,034	10	4 $\frac{1}{4}$
1840	41,374	18	4
1841	74,324	19	4 $\frac{1}{4}$
1842	91,156	10	11 $\frac{3}{4}$

Total £254,965 4 6 $\frac{1}{2}$

This return exhibits a slight balance against Port Phillip, but the territorial revenue is not included. The following sums were obtained by the Sydney Government for land, a great portion of which (more particularly of the enormous sum realised in 1840) was from the southern district :—

				£	s.	d.
1836	126,458	16	0
1837	120,427	0	5
1838	116,324	18	11
1839	152,962	16	4
1840	316,626	7	5
1841	90,387	16	10
1842	14,574	10	4

Total £937,762 6 3

Of this the following sums were derived from the sale of land in Port Phillip :—

				£	s.	d.
1838	25,287	17	9
1839	50,986	11	11
1840	134,584	6	3
1841	68,435	7	0
1842	2,000	0	0

Total £393,911 11 1

EXPENDITURE ON IMMIGRATION.

Paid by Colonial Treasurer.				By Colonial Agents in London.			
£	s.	d.		£	s.	d.	
1838	...	29	4 0	...	555	0	0
1839	...	11,474	11 4	...	350	0	0
1840	...	23,296	15 4	...	4,622	17	2
1841	...	121,979	4 9	...	3,986	8	1
1842	...	37,747	6 1 $\frac{1}{2}$...	145	2	3

Total Expenditure £204,446 5 0 $\frac{1}{2}$

				£	s.	d.
Total Revenue from all sources,				616,895	11	8
Total Expenditure				459,411	5	0 $\frac{1}{4}$

Balance £157,484 6 7 $\frac{1}{2}$

This was the exact sum appropriated by N.S.W. from the legitimate revenues of the Port Phillip District. The following particulars of the census of Melbourne in 1841 will give a tolerable picture of the social condition of the people :—

Population—of Melbourne, 4479 ; of County of Bourke, 3241 ; of the District of Western Port, 1391 ; of Geelong, 454 ; of County of Grant, 336 ; of Portland, 597 ; and of County of Normanby, 1260.—Total, 11,728.

Houses—in Melbourne, 769 ; County of Bourke, including Newtown and Williamstown, 432, besides 67 huts ; District of Western Port, 110 ; Geelong, 81 ; County and District of Portland Bay, 100.—Total, 1559.

Religion.—Church of England, 6194 ; Church of Scotland, 2294 ; Wesleyan Methodists, 651 ; other Protestant Dissenters, 353 ; Roman Catholics, 1441 ; Jews, 59 ; Mahommedans and Pagans, 10.

Station in Life.—Employers of labour, including professions and trades, 1767 ; labourers of every description, 8926. Total, 10,693.

IV. *The Separation Movement.*—A public meeting on the exciting subject of separation, took place in Melbourne on 30th December 1840, in the store of Isaac Hind. The chair was occupied by William Verner, the first Commissioner of Insolvent Estates, a gentleman much respected at this period in Port Phillip, but who returned to England a short time afterwards. The leading merchants of Melbourne, as well as the lawyers, physicians, stock and land owners of the district, were present, and it was demonstrated in a gratifying degree that there existed a strong political cohesion amongst the colonists, and that public opinion was aroused on the all-important topic—the independence of Port Phillip. The best speaker on this occasion was Dr. Bernard, the author of *The Voyage of the Nemesis*, then resident in Melbourne ; he spoke about an hour. A correspondent thus mentions his address : "The language was good, pure, and energetic, and embraced every topic under consideration." The meeting was also addressed by Messrs. Barry, Cunninghame, Mollison, Arden, and one or two others, and the greatest unanimity prevailed. A petition to Her Majesty to allow a

separate Government for Port Phillip, and to preserve intact the boundaries as appointed by an Order in Council of 23rd May, was adopted and numerous signed. A great deal of public spirit was displayed by the colonists of Port Phillip at this period, and a strong effort was made to counteract the influence of the aristocracy of Sydney, which had been brought to bear on the Colonial Office in order to prevent the dismemberment of the colony. On 1st March 1841 another meeting was held in the store of T. McCabe, and a memorandum was unanimously adopted for distribution among Members of Parliament. It was carried to England by three colonists, Messrs. Yaldwin, Mercer, and Gardiner. This document was compiled with considerable ability, and was fully adequate for the intended purpose. It proceeded to controvert the misstatements in fact, and the fallacies in argument, which the inhabitants of the middle district had put forth in the course of their agitation for preventing the division of the colony. Those persons had objected to the dismemberment of the southern from the middle district of N.S.W. "because it would deprive the colonists of the advantages of social and political unity—they being at present like one great family, bound together by interest and sympathies." The Port Phillipians replied to this argument very happily. They said, "The inhabitants of the southern district recognise no force in this objection, no truth in the assertion which accompanies it; for what advantages can accrue to the inhabitants of a free colony from social or political unity with a penal settlement? Social unity does not now exist between the two portions of the colony, and it never can exist between two districts so widely different in their social origin. With regard to political unity, it is true that there is, *de facto*, a political unity, inasmuch as the affairs of both divisions of the colony are administered by the same Governor, and in the same Legislative Council, yet the political unity extends no further. It does not exist in sentiment, in opinion, or in interest. The colonists of Australia Felix care little for what has long been considered the great question by the elder colony that, viz., which respects the rights and social position of the emancipist population; they wish for no share in the supply of convict labour given to the middle district, and they are happily free from the violent religious disputes which disturb the peace of Sydney. The assertion that there exists between the two portions of the colony a community of interests and sympathies is a mere begging of the question at issue, and will not be conceded by the colonists of Port Phillip, who know that with the older colony they have few common interests, and no mutual sympathies." Another objection which the Sydney petitioners point out is "that the dismemberment would, in reality, leave the parent colony all but destitute of a land fund. The competing colonies would demand the application of their respective land funds to their own exclusive necessities;

immigration would therefore be drained from the parent colony, and be absorbed by the urgent necessities of her growing offspring." The colonists of the southern district joined issue with their opponents here, and showed the great injustice of the claim of the middle district to have any portion of the land fund of Port Phillip, particularly when, at this very time, there was not a single landowner and scarcely a single stockholder in that middle district who had not a certain number of convict servants assigned, while in the southern district assignment to private individuals was unknown, and there were so few on public works that many large landowners on the Sydney side had more prisoners of the Crown assigned to them than was awarded to the whole public service of Port Phillip. The middle district had lamented over their scanty land fund; in reference to this the Port Phillipians pertinently observed: "What, then, has become of those immense tracts of land in the middle district which were available as the source of a land fund? Partly they have been already sold and the proceeds applied to colonial purposes, and it seems scarce reasonable to expect both to spend these proceeds and to have them. Partly also they have been alienated in grants to the individual settlers of the middle district, and if this mode of disposal has not swelled the public coffers, it has at least served to enrich almost all the older settlers who now seek, at the expense and by the assistance of the southern district, to cultivate these very lands the free grant of which to themselves has deprived the older colony of these portions of its land fund." The Sydney petitioners had further attempted to show that the division of the colony would be a source of great inconvenience to some who resided in the middle district, but had sent stock up to graze in the southern province; they had moreover asserted a parental claim. But the Port Phillip memorial proves that they had nothing to do with the settlement of Port Phillip, and that the great bulk of the then colonists had not arrived from Sydney, but either direct from Britain or from V.D.L. It is of some consequence to history that the dispute, even at this early stage, should be set forth in its true colours. The Sydney people had more influence in Britain, but the Port Phillipians had the best of the argument. The concluding portion of the memorandum seems perfectly conclusive, and it is scarcely necessary to offer any apology for extracting it:—"But there is yet more to be said with regard to this question of separation. The Sydney petitioners affect to be taken by surprise by it, as if they had never before heard of the probability of such an event, as if they had seen no previous arrangements anticipative of such a course. Have they forgot that at the first Government recognition of the settlement of Port Phillip Governor Bourke announced for this district a new system of survey and land sales, viz., a system of continuous survey and periodical land sales—a system which was not

extended to any other of the newly-opened districts of the colony, but solely and peculiarly to the southern or Port Phillip district? And following up this peculiarity of regulation, Sir Richard Bourke announced, in repeated proclamations, that there should be no assignment of convicts to the new district, a proclamation which, with two or three individual exceptions, has been strictly adhered to. But if all this escaped their notice, how could they be blind to the fact that from the very outset the accounts of the provincial revenue and expenditure were kept distinct from the general revenue of the colony, and the burden of supporting the province during the first three years of its existence made a charge, not upon the colonial treasury, but on the revenue arising from the sale of the waste Crown lands? Did the petitioners, did the public of N.S.W., believe that all this speciality of regulation with regard to the new district was adopted without aim or object? or did they not perceive that this separated system which marked the new district was indicative and anticipative of a separated government, and that the colonists of Port Phillip were deprived of the advantages of convict labour only to save them as a future colony from the stain of having been a penal settlement?" The cause of the new settlement was warmly espoused by John Richardson, M.P., to whom the petition for separation had been entrusted. Lord John Russell however, and other persons of rank and influence, received the advances of the Port Phillip advocates rather coldly, and it was too evident that Sydney influence had been at work, and that it would be a hard struggle to obtain the boon so much longed for by the colonists of Port Phillip. In the early part of 1841 it was found necessary to appoint a resident judge to the Port Phillip district. It was anticipated that Mr. Stephen (afterwards Chief Justice of N.S.W.) would have been selected, but the choice fell on John Walpole Willis, at this time one of the puisne judges of the Supreme Court of N.S.W., a very accomplished gentleman and an unusually able lawyer. His father was the well-known Dr. Willis, rector of Wapping, who attended George the Third in his illness, and was celebrated for his skill in treating the insane. Judge Willis had been brought up to the legal profession, and had practised for some time in the Court of Chancery. He was afterwards nominated Puisne Judge of the Supreme Court of Upper Canada, from which office he was removed for expressing an opinion which was contrary to the legality of the constitution of that Court. The provincial Parliament of Upper Canada, after investigating the whole matter, adopted an address to the King, praying that he might be re-instated in the office of puisne judge. This document bears date 19th March 1829. He did not return to Canada however, but was soon after appointed Vice-President of the Court of Civil and Criminal Justice, and afterwards first puisne judge of British Guiana. In

1836 Willis was compelled to go to England in consequence of ill-health, and he was on the eve of returning to Guiana when he received the appointment of a puisne judgeship in N.S.W. He bore a good character in Sydney, but not being on the best of terms with his brother justices was very happy to be removed to Port Phillip to occupy the position of resident judge. Some indications of his peculiar temperament were received from the valedictory address he delivered from the Sydney Bench, of which the following will be a tolerable specimen:—"Here I have no near relation or connection whatever. I am not directly or indirectly concerned in any land or commercial speculation, or in any of the public companies of the colony, nor have I any relative or connection who is in any way interested in them. I have in fact no local connection or interest, save that which arises from a due sense of the sacred trust of duly and impartially administering that justice which I am sworn to discharge. I come not within the scope of Mr. Bentham's apprehensions. The danger and suspicion of partiality through private connections must cease when such connection does not exist. Fearlessly do I say, with Samuel, 'Behold, here I am, witness against me, before the Lord and before His anointed. Whose ox have I taken, or whose ass have I taken, or whom have I defrauded? whom have I aggressed? or of whose hand have I received a bribe to blind mine eyes therewith? and I will return it.'" From this quaint mode of expressing himself, it will be inferred that the first judge of Port Phillip was slightly eccentric in his behaviour. A writer in Sydney thus alludes to the appointment of Willis: "I have to congratulate you on the appointment of Justice Willis as Resident Judge at Port Phillip. His Honor is not the nicest observer of the proprieties of the world, but he is an able judge, and, what is still better, an honest man. As an equity lawyer his Honor has no equal in the Australian Colonies, and, though his opinions in common law cases have been frequently at variance with those of his learned brethren on the bench, they have always been such as to ensure the respect of the bar for his legal abilities, and the admiration of the public for his integrity." The above appears to have been the general impression entertained of the Judge in Sydney. He arrived at Melbourne on 10th March 1841 in the *Australasian Packet*. The limits in which the Supreme Court of Melbourne should exercise jurisdiction were declared to be the same as those in which La Trobe had been empowered to discharge the functions of Lieutenant-Governor, under the notice of 10th September 1839. Willis was a judge in some respects well adapted for the post for which he had been selected. The community had for some time been in existence without any court, and an amount of lawlessness had, as a matter of course, been engendered. A certain number of persons had pushed themselves

into prominence who did not very much regard either the law or the judge who administered it; money was beginning to be scarce, and those deeply indebted to their fellow-colonists were not always very scrupulous in their mode of evading payment; the lower orders had been drained from the neighbouring penal settlements, and a majority were expired, until the large free immigration of 1841 and 1842 gave the freemen an enormous preponderance; and the settlement required a judge of firm and resolute conduct. This Willis undoubtedly was; but he exhibited an unfortunate infirmity of temper that increased tenfold the animosities which, under any circumstances, would necessarily have been raised up against him. He had no sooner fairly entered on his duties and discharged some of the disagreeable functions of the bench than the newspapers began to criticise his conduct. He seemed very much to forget his dignity on such occasions, and condescended to enter into personal altercations with the editors. It was not unusual for his Honour to send for any delinquent of this kind and reprimand him. It must however be kept in view that the settlement was in a very peculiar condition at this period; that Willis saw a good deal of shuffling and knavery daily brought forward, and was doubtless actuated by the best motives. He was arbitrary, and disposed occasionally to interfere with the private concerns of individuals more than became a person of his exalted station. He reprimanded one of the members of the bar for keeping a stallion, and ridiculed another for sporting incipient moustaches. When he opened the Supreme Court he intimated that he would insist upon the attendance of justices of the peace at all future sittings of the Supreme Court in its criminal jurisdiction. He did this that they might learn something of their duties. The magistrates not attending as suggested, the Judge again stated that under the 9 Geo., 4 chap., 64 and 65, he had power to inflict a fine for non-attendance. He declared he would enforce this clause, and also have their names struck off the commission of the peace and others appointed in their stead if they did not obey him. In this manner did the Judge proceed, until he aroused a strong feeling of indignation against him amongst the gentry of the district, and which eventually led to his removal from the bench. The colony was at this time in some danger of being dismembered in a manner not very much in accordance with the desires of the people who then inhabited it. The Land and Emigration Commissioners, in a letter dated 7th July 1840, recommended that the Portland Bay District, including the fertile valleys of the Glenelg and the Wannon and the plain of the Grange, should be added to S.A. As might well be supposed, this proposition met with determined opposition, and was not carried out. The argument made use of by the Commissioners was, that unless the eastern boundary of S.A. was extended that dependency would not be able to support herself and pay off the debt she had already

contracted, and must come to be a burden on Britain. On 15th September 1841 a meeting of the colonists of Port Phillip was held in Melbourne, and resolutions embodying the general feeling against the proposed alteration were unanimously adopted. In opening the Legislative Council of N.S.W. in June 1841, the Governor said in his address: "I am not quite able to lay before you any documents respecting the separation of the two colonies." Alluding to the very large sum of £217,127 brought to the territorial revenue from Port Phillip, he stated that "this afforded to the older parts of the colony the means of replacing the labour and capital which the opening of Port Phillip had drained from them." The new settlement was indeed progressing with great rapidity. The Customs revenue for the first quarter of 1840 was £1597; for the first quarter of 1841 it was £5609. The total amount of ordinary revenue for the first quarter of 1840 was £3319; for the first quarter of 1841, £10,490. Matters progressed pretty much as usual with young countries till 1841, when its prosperity received a considerable check through a monetary crisis taking place, which operated injuriously on the colony, and which may be said to have lasted till 1848. At the same time the population continued to increase, and land settlement to extend, much greater attention being devoted to agriculture than formerly; so that in 1843 there were 12,973 acres under cultivation. In 1842 (12th August) Melbourne obtained a Municipal Corporation under 5 and 6 Vict. c. 66, Henry Condell, a brewer, being elected the first mayor. In 1841 an accident occurred to the passenger ship *Clonmel*, on her voyage from Sydney to Melbourne, which had no little influence on the fortunes of the rising colony. This ship left Sydney on 30th December 1840, and on the 2nd January following struck on the beach near Corner Inlet. There were ninety passengers on board at the time, including Goodwin, of the firm of Hamilton and Goodwin, Elizabeth-street; D. C. Simson, of the firm of Dutton, Simson and Darlot; Walker, an extensive miller in Hobart Town; and various other persons engaged in the usual industrial pursuits of the colonies. A boat left the vessel with the intention of proceeding to Melbourne, and was fortunately perceived by Captain Lewis, harbour master, who was returning from the wreck of the *Isabella* in the cutter *Sisters*. The circumstances which led to the wreck of the first-named vessel were never exactly ascertained; but it must have been an error in the compass. The *Clonmel* went ashore during a spring tide, and became imbedded in the sand at some distance from the outer edge of the sandspit. Several small vessels were despatched to Corner Inlet, and a regular communication by water was by this means established with that fertile district of V. An association to settle this district was formed, containing the names of several influential stock-owners, and a vessel named the *Singapore* was chartered

to convey the pioneers to the new country. The passage to Corner Inlet proved very tedious, and it was not until 13th February that the vessel arrived. The passengers attempted to effect a landing on the north-west side of Corner Inlet, but were unable to accomplish this; and after undergoing much fatigue were under the necessity of abandoning the attempt. They effected a landing in another quarter, and travelled along the shore in quest of a desirable spot to form a settlement, until they came to the wreck of the *Clonmel*. They traced the channel in boats and explored the country, which was discovered to be very favourable for settlement. The party, which consisted of Dr. Stewart, Messrs. Rankin, Kirsopp, Broadrib, Orr, Kinghorne, McLeod, and MacFarlane, landed their stock, and formed an encampment. They had a very narrow escape from the aborigines, but were saved by the adroitness of their aboriginal guide, Charlie, who had previously attended Count Strzelecki on his perilous journeys through the district. Gippsland had been discovered in 1839 by Angus Macmillan, who at a public dinner given to him at Port Albert in March 1856, gave the following account of circumstances attending the discovery:—"In February 1839 I arrived at Carravong, Maneroo, having received instructions from M'Alister to look out for stations. I heard from the natives that there was to the south-west of Buchan (a place discovered by Bayliss) a fine country. I got Jemmy Gibber, chief of the Maneroo tribe, to obtain all the information he could from the old black, who affirmed he was once there, and on 26th May 1839, Jemmy volunteered to accompany me. I provided myself with arms, and also provisions for four weeks; in four days reached a hill, which I named Mount M'Leod, now called the Haystack, from the summit of which I had a bird's-eye view of the country lying between me and Corner Inlet, and of the long beach stretching to the south-west. My friend was beginning to get alarmed, and wished to return, but seeing me determined to proceed he threatened to leave me. On this night I was nearly paying dearly for placing so much confidence in my companion. Whilst lying at the camp-fire I was aroused by the circumstance of his raising his club to strike me. I had just time to present my pistol to his breast. He begged hard for his life, saying he dreamt a blackfellow was taking away his gin, and he wanted to kill him. I was satisfied that he intended to kill me, and report that I had been killed by the blacks of the district. Next morning started for Omeo; arrived there in six days. It was a very rough journey: was more determined than ever to explore the country, and form a station as near to it as possible. While at Omeo gleaned the intelligence that Walter Mitchell, a nephew of M'Farlane, had been as far as Bruthen, but had discovered no country worth occupying. I then started for Clifton, the station of M'Alister, and received from that gentleman every encouragement to explore the country, and find my way

to Corner Inlet. After many unsuccessful attempts I again, on 9th February 1841, formed a party, with instructions from M'Alister to abandon the country unless I could find a road to the Inlet; and we started from our station—which we had formed on the Avon—this time with the determination to accomplish it or die in the attempt. On the 10th crossed the Thompson, and the Glen-garry on the 11th; on the 14th discovered the Old Port, and marked a road from thence to the Plains. In May following came down from the Avon with a dray. Great credit is due to the driver, James Lawrence, and in fact to all my companions, who whenever an expedition was talked of were always eager to accompany me. I am proud and happy to see one of them here present, who shared with me many hardships and privations. For sixteen months, during two years, we never slept on a bed, and were deprived of many comforts of life, even the luxury of a tent. In my expeditions I had no other guide than a pocket compass, and a copy of Flinders' chart of the coast. With regard to the natives, who at that time were numerous, I will mention that at first they were very terrified at the sight of white men. On one occasion some of them approached our party, and as I dismounted to salute them they all set up yelling, and ran away. Since then I have learnt that they imagined that the horse and rider were one. On another occasion, after saluting us by a shake of the hand, they conferred the same honour on the horse by shaking his bridle. After we had been at the station, which we formed on the Avon, some time, they attacked us in a body, compelling us to leave the district; we however by force of arms again regained our station, and kept possession. Count Strzelecki, a Pole, has also claimed the discovery of Gipps Land, but I leave it to the public to decide. On March 7th 1840 he called at my station, where he was supplied with provisions, and a camp kettle. M'Alister went a day's journey with him; told him the name I gave the country (Caledonia Australis) and described where he might cross the rivers." Under the new regulations already referred to, the special survey system, which had until 1841 been confined to S.A., was incorporated with the land regulations of Port Phillip. A person paying £5120 into the Treasury might fix upon any portion of the unreserved territory, and require the authorities to survey eight square miles, subject to the provisions as to extent of water frontage, and depth of back run. On 8th June of that year it was notified by the Superintendent that eight special surveys, of the size indicated, had been applied for in the Port Phillip district; and it shows the high opinion that the colonists of that day had formed of Gipps Land, when it is mentioned that three out of the eight special surveys were applied for in that locality. The whole eight were applied for between 17th March and 1st May 1841, and their boundaries were as follows:—(1.) F. W. Unwin, 5120 acres, county of Bourke, parish of Bulleen; bounded on

the north by the Yarra Yarra River ; on the west by portion No. 1, containing 1019 acres ; on the south by Koonung Koonung Creek ; and on the east by a line bearing north from the said creek to the river. (2.) H. Dendy, 5120 acres, county of Bourke ; bounded on the west by the sea-coast of the Port Phillip Bay ; on the north by the five-mile Melbourne reserve, and on the east and south by lines to include the quantity. (3.) W. Rutledge, 5120 acres, on Powlett and Green's runs, near the Sydney-road ; bounded on one side by a creek, and on all others by lines to include the quantity. (4.) J. Orr, 5120 acres, about fourteen miles from Corner Inlet, on the east bank of the River Albert, to include the quantity. (5.) W. Rutledge, 5120 acres, near Corner Inlet ; bounded on the west by the river known as the Albert by the gentlemen who have lately explored the Gipps Land country. (6.) H. Jamieson, 5120 acres, between Mount Martha and Arthur's Seat, including Hobson's Flats ; bounded on the west by Port Phillip Bay, and on all other sides by lines to include the area. (7.) H. Elgar, 5120 acres, county of Bourke, partly in the parish of Boroondara ; bounded on the north by Koonung Koonung Creek ; on the west by the section line which divides portions Nos. 2 and 3 from portion 1, in the parish of Bulleen ; on the east by the section line which divides portion 4 from portion 5, in the parish of Bulleen ; and on the south by a line to include the quantity. (8.) J. Reeve, 5102 acres, near Corner Inlet, situated on the east bank of the Yarra. The various localities where those special surveys were situated are still at the present day the chief sources of agricultural production. Unwin's survey at Bulleen, Dendy's at Brighton, Elgar's at Boroondara, and Rutledge's at Kilmore are all densely settled ; and the like may be said of Atkinson's at Port Fairy, and various other surveys taken up after this date. The success which has attended the efforts of capitalists to open up and civilise the country demonstrate too clearly the impolicy of the Government in long keeping the lands of the colony shut up among a few monopolists. Governor Gipps visited Port Phillip in October 1843. By this time a great change had come over the settlement. It had gone through a crisis. The land speculations by this time had all subsided, leaving the place none the richer for the general extravagance that accompanied them. The colonists had boasted of endless profits by their dealings with one another in land allotments. So sure seemed the basis, that not a few could and actually did clear out with the hard money, while most of the remainder had been spending their profits right nobly. But when the high prices proved only temporary, and these profits to be based on a fiction, the expenditure remained real and irrevocable, and was simply the loss of so much of the capital that had come into the place. The colonists however were in good heart withal, and they gave Sir George Gipps a public dinner, at which they made as imposing and creditable an

appearance as the accommodations of their juvenile capital would permit. The Governor commented on the change that had come over a scene so lately alive with speculation and reputed money-making. He said that he found the outskirts of Melbourne strewn with empty champagne bottles. The colony nevertheless was improving socially as well as materially. The writer in the *Argus* thus describes it in 1845 :—"The population of Port Phillip has risen to 31,280. Upwards of 25,000 acres of land have been brought into cultivation ; the imports have increased in value, until they have nearly reached a quarter of a million sterling ; and the exports have also expanded to nearly half a million. The pastoral tenants of the Crown possess 9289 horses, 231,602 head of cattle and 1,792,527 sheep. The export of wool has attained the respectable dimensions of 6,841,813 lbs., and we have discovered that by boiling down a portion of our redundant flocks we can produce large quantities of valuable tallow, of which we send away this year 846,155 lbs. There are fourteen post-offices in the province, and we have built three small vessels in the Yarra. On an average as many as five craft of 100 tons each enter the harbour every week, and altogether we are getting on, although this is by no means a prosperous year. There is more activity in the criminal court than elsewhere, for a great many ticket-of-leave holders have found their way to Melbourne from N.S.W. and T., and their depredations bring them into contact with Justice Therry and the four members of the local bar, Messrs. Stawell, Barry, Williams, and Croke, three of whom are subsequently elevated to the bench. Superintendent Latrobe occupies a cottage upon a pretty eminence some distance from the town which he calls Jolimont, and where he gives pleasant little dinner parties to a necessarily small and select circle of friends. One or two cottages have been erected amidst the sylvan seclusion of the Eastern-hill, and green paddocks stretch between it and the courthouse. Sheep are grazing upon the thick grass growing upon a portion of the town containing a few isolated houses, and exhibiting a signboard marked "This is Bourke-street." There is a diminutive theatre which is open for performances twice a week. Two branches of Sydney banks have established themselves in Melbourne, and there is a solitary jeweller's shop in Collins-street, furnished with "a scanty supply of second-hand watches and pinchbeck brooches." There is no cab-stand, but an enterprising townsman has two carriages on hire, the use of either of which may be had for a wedding or a funeral at the rate of fifteen shillings a day. If you walk down to Liardet's Beach, taking care not to tread upon one of the venomous snakes with which the ti-tree scrub abounds, you may see a couple of merchantmen, three brigs, and some smaller craft lying at anchor in the bay, and you may hear the voices of a good many sailors in the one hotel erected near the jetty. There is a little village

opposite called Williamstown; and there are the beginnings of a seaside township further down the bay on its north shore. Emerald Hill has also been selected as an eligible site for building on by persons to whom a low-priced allotment is an object. The Market Commission, which formerly controlled the town of Melbourne, has been replaced for the last three years by a corporation; and there are three newspapers—the *Herald*, the *Patriot*, and the *Gazette*, which contrive to fan the flames of party feeling, and are conducted very much in the spirit of the two journals in Eatanswill. National and religious feuds divide the small community, which has so little commerce with the outer world that it is driven to concentrate its attention upon local matters, and these naturally assume a disproportionate magnitude in the estimation of the quarrelsome townsmen. Fortunately, the two principal religious denominations are represented by exemplary and pacific clergymen—the Rev. Mr. Thomson, who is the minister of the Church of England, and the Rev. Dr. Geoghegan, afterwards Roman Catholic Bishop of Adelaide, and the latter divine more particularly conciliates the respect and esteem of men of all beliefs by the benevolence of his disposition, the suavity of his manners, and the unaffected goodness of his daily life.”

IV. *The Separation Movement.*—The Act 5 and 6 Victoria c. 76, which came into operation in 1843, provided that in N.S.W. there should be a Legislative Council to consist of thirty-six members; twenty-four to be elected by the colonists and twelve to be nominated by the Crown. The Governor, with the advice and consent of this body, had authority to make laws for the peace, welfare and good government of the colony, provided they were not repugnant to the laws of England. The whole management of the crown lands and the revenues derived from them continued still under the sole control of the Crown. It was provided by the new act that the inhabitants of every county of N.S.W., or such divisions or districts as the Governor should see fit, should be incorporated, and that councils should be established in every such district for the local government thereof. The town of Melbourne and city of Sydney were incorporated by Act of Council in 1842, so that the people were called upon nearly at the same moment to elect both legislative and municipal representatives. The district of Port Phillip was allowed six members, as its proportion in a council composed of thirty-six. “It would have been well for the people,” says McCombie, “if they had refused this sham representation, which instead of being of the slightest benefit, became actually the reverse, as the northern district now plundered Port Phillip with her own apparent consent.” The first representative members elected were Ebdon, Dr. Lang, Condell, Walker, Thompson and Nicholson. The first Town Council of Melbourne consisted of the following members:—Henry Condell, Mayor

and alderman; A. Russell, H. W. Mortimer, and W. Kerr, aldermen; D. S. Campbell, G. James, J. Orr, J. P. Fawkner, J. T. Smith, Dickson, Beaver, and Patterson. J. C. King, Town Clerk. The council was elected by £20 householders, and the Mayor by the Council. “The Corporation,” writes Westgarth, “were excusably alarmed as they, for the first time, with corporate official eyes, glanced over their field of labour. For seven years the streets of the capital had run riot in wear and tear, natural and artificial, excepting where, here and there, some small expenditure had been doled out by the distant Sydney Government. The stumps of huge gum trees still diversified the thoroughfares, and were the cause of many mishaps, by day as well as by night. On occasions of rain, a river coursed through the town, and meeting no drains or other artifices of later times, it tore up for itself a bed of most ominous dimensions, which was the terror of toppers and night-larkers. Commencing its casual course about a mile outside to the north, it careered unrestrained to the river Yarra, along the entire length of Elizabeth-street. This casual stream was of such noticeable dimensions and doings as to be identified by a name of its own—the ‘Williams.’ The streets generally were in a sad mess; and from the wharf at one side to the ‘bush’ at the other the ups and downs, the ruts and holes, were past all counting. Without the town too the state of things was in some directions worse than within, for the circumnambulations of the Williams and several of its lesser rivals had so rent the surface where the traffic had removed the original protecting grass, that to ride or drive into or out of Melbourne was as precarious a pilotage as that of the most dangerous of seaports. From all this confusion Melbourne soon emerged a most presentable specimen of the successful result of municipal labours, and a striking instance of the use and value of municipal institutions. A moderate and usual rating of from sixpence to one shilling per pound on the yearly value of town property, together with market and other customary dues, had been sufficient to meet the demands upon the corporation during the first eight years, until the era of the gold-fields. Then indeed these ordinary means were no longer adequate to keep pace with the requirements arising from the sudden and great expansion of population and business. The traffic of the existing streets increased tenfold; while the town, expanding in every direction, invaded the virgin grass outside with alignments for additional streets, which, within a few weeks or months of these preliminary projections, were ploughed up with the traffic of an entirely new district of Melbourne, occupied by a new roll of citizens. A climax of difficulty was involved in the fact that the riches of the mines, and the scarcity of labouring hands, made money to be comparatively powerless; so that a pound sterling could scarcely be computed at a value of five shillings, when its present position was weighed

in the balance of its former power and consideration. A wail of despair arose simultaneously from a thousand draymen, carters, and cabmen, or more properly from the public, that eventually makes good from its pocket any disadvantage to its servants. In the year 1854, when the crisis had reached its worst, the Government stepped forth to the aid of the corporation, and a public loan of £500,000 was negotiated on their behalf; at the same time there was a similar loan for £200,000 procured for Geelong, which town, with the great gold-field of Ballarat at its back, had fallen into the same chequered category of riches, expansion, and inconvenience. These large sums in spite of all obstacles accomplished marvels for the respective localities. In the neat and finished condition of its streets Melbourne now rivals any of the time-honoured capitals of the old world, and it greatly surpasses not a few, and among them most if not all the towns approaching its own dimensions in the mother-country." The battle of separation was a warm topic in its day. No man was inclined, but at any rate none dared, to talk lightly of it. Every elected member of Council sent up to Sydney was sworn on the altar of separation. Even Sydney residents could not escape this ordeal. They well knew the terms, and also that the Port Phillip doorway was an easy entrance to the legislature if they were sound, or passed as such, on "the main question." In fact, it very soon appeared that, owing to the inconvenience and expense arising from the great distance between the two parts of the colony, very few Port Phillip residents would ever attempt the representation of their District—a circumstance that was one of the best arguments in the case. Conversation and newspapers were daily replete with the question. One leading Melbourne citizen of the time literally gave up his life to it, and found so many "reasons for separation," that it was feared the Home Government would lose its way in the mazes of so long a document, and thus the case be lost through its very completeness. Edward Curr, a gentleman of good abilities, freely and disinterestedly devoted himself to public objects, or rather to this one public object of the time. He died but a short while before the completion of the object he had so earnestly toiled for. Although the colonists were thus impatient on this question, its successive phases were presented at no lingering pace. The separation movement was formally inaugurated by a public meeting at Melbourne only five years after Fawcner's party had inaugurated Melbourne itself; and after eleven years more the whole business was finally and successfully settled. The first public meeting, as already stated, took place in the year 1840, and was held in Hind's store at the south-east corner of the Market Square. The edifice, of enviable dimensions for its day, was of wood like nearly all its contemporaries. With the aid of various props and repairs, alterations and additions, the fragile

fabric lingered to a good old age far into the colony's history, and outliving by some years the controversy it had served to commence. It was swept away to make room for Goldsborough's wool warehouse. The next step of importance was four years later and proceeded from a Sydney resident, one of those who had been elected to represent Port Phillip. This was the Rev. Dr. Lang. Early in the session of 1844 Dr. Lang moved:—"That an humble address be presented to Her Majesty praying that she will be graciously pleased to direct that the requisite steps may be taken for the speedy and entire separation of the district of Port Phillip from the territory of N.S.W., and its erection into a separate and independent colony." This motion was seconded by Joseph Phelps Robertson, who had, on the resignation of Condell, been elected without opposition as member for Melbourne, and supported by all the Port Phillip members. On the vote being taken it was lost by nineteen to six; all the members with one exception voting against the motion, except those who represented Port Phillip. The exception was rather a marked one; the member who recorded his vote in favour of Port Phillip with the representatives of the Southern District was Robert Lowe, then a Government nominee and very little known, but who was afterwards returned by the constituencies of Cook, St. Vincent and Sydney as their representative, and distinguished himself in the Legislative Council of N.S.W. as the opponent of the squatting system. This vote was unmistakable evidence that the people of Port Phillip had nothing to expect from the Legislative Council of N.S.W. At the suggestion of Dr. Lang, a petition was prepared and signed by the six representatives of the district and early in January 1845 presented by them to Sir George Gipps, in order that it might be transmitted to the Secretary of State for the Colonies for presentation to Her Majesty. A letter was received from Lord Stanley in the month of December of the same year, addressed to the Governor, acknowledging the petition and stating that Her Majesty had received it very graciously; but directing him to cause the Port Phillip members to be examined before the Executive Council, as well as any other witnesses the Council might think fit to hear on the subject. The Executive Council did as desired and reported in favour of the separation. Port Phillip was much indebted to Dr. Lang for his indefatigable exertions on this occasion, and that gentleman happening soon after to visit the district, he was invited to a dinner, or "Separation Festival," as it was termed, which came off in the Queen's Theatre in Queen-street on 11th February 1846. In this ovation, men of all classes, creeds and countries willingly joined; and no guest ever received a more flattering reception than did Dr. Lang from both his political friends and opponents. The chair was occupied by Alderman Moor, and amongst the company were observed all the clergy of the

district and the editors of the local newspapers. The colonists anticipated that no delay would now prevent the consummation they so devoutly wished for from taking place; but time passed on and separation appeared as far off as ever. The petition of the Port Phillip members brought the subject prominently before the Imperial authorities at this time; but Lord Stanley went out and was succeeded by a Secretary of State to whom the question was new; so that very little progress was made until the non-election movement, several years later, demonstrated to the inert politicians of Downing-street that Port Phillip would not be any longer trifled with, and that unless her just claims to be formed into an independent colony were recognised, and she were entrusted with the direction of her own affairs, she would violently rend asunder the ties which bound her, without either the assent or assistance of the parent state. About the time that the motion of Dr. Lang was so rudely rejected by the Legislative Council of N.S.W., a great public meeting was held in Melbourne. This event took place on the 4th June 1844, and was termed the "squatters' meeting," because resolutions condemning Sir George Gipps's squatting policy were carried unanimously, and because the squatters mustered on horseback at Batman's Hill, headed by Captain John Harrison (who at this period occupied a station on the Plenty,) and as a demonstration rode in procession to the meeting, which was held in front of the Mechanics' Institution. The majority of the speakers on the occasion were squatters, and a gentleman who some years after violently opposed the squatting system, seconded a resolution. This meeting was remarkable, exhibiting that up to that date nearly the whole influence of Port Phillip, nay, of the colony of N.S.W. was bound up in squatting. The persons who took a part in the proceedings were Isaac Buchanan, William Hull, Edward Curr, Adolphus Goldsmith, Archibald Cunningham, Claude Farie, Captain Hepburn, John Aitken, John MacCready, C. H. McKnight, Dr. Kilgour, Alexander Sproat, Henry Kent Hughes, J. H. Pyke, Dr. Playne, Edmund McNeil, J. Montgomery, Captain Webster, James Johnstone, Captain Harrison, Laurence Rostron, and Major Firebrace. It had been the original intention of those who called the meeting that it should have been held in the lecture room of the Mechanics' Institution, but as a large number of squatters rode to the meeting, and as the numbers who attended far exceeded the limits of the interior of the building it was held in the open air, the speakers addressing the audience from the low parapet which at this time stood in front of the institution. The chair was occupied by A. P. Mollison, who desired that no display of physical force should be made, but that they should deliberate calmly upon their grievances. It singularly exemplifies the public feeling at this time, that the only opposition was from Kent Hughes and Pyke, who moved an amendment

to the effect that the disposal of Crown lands should be vested in the Legislature instead of the Governor. This amendment, which was a step in the direction of popular government, had scarcely a solitary supporter. A very strong resolution in favour of separation was carried unanimously. In October 1844 the Yarra river was flooded to a greater height than had ever been seen, even by aborigines. On the first of that month the waters were observed to rise very suddenly, and in the course of the following night they swept over the flats around the city. The utmost consternation prevailed amongst those who resided in the swamps on both sides of the river on finding their abodes insulated from the city and surrounding country. They began to remove such of their property as was portable. The residences of the settlers were swept away by the rush of water along the banks of the river; and the lower portions of Melbourne adjoining the Yarra were submerged, and all communication had to be carried on by boats. The steps on the old Custom House formed a jetty on which persons landed, and who passing through the building arrived on terra firma in a line with Flinders lane. The stores and foundries were flooded, and much damage was done to property. A boat starting from about Flinders-lane in the city, could be steered across the flats straight to Liardet's Beach, near where the Railway Jetty now stands at Sandridge. Several persons were missing, who it was supposed were lost in this great inundation. The Ovens and most of the other rivers overflowed their banks, and many lives were lost. Towards the close of 1849 Port Phillip was again subjected to severe inundations. The floods in the various rivers led to the loss of many valuable lives and much property. The lower portions of Melbourne and the flats and swamps around it were submerged. A person could on this occasion take his stand on the crest of Batman's Hill, and look on little else than a vast sea, turn in whichever direction he thought proper. Property of every kind was swept away, and the damage done by the Yarra alone was incalculable. The whole of the small farmers on the banks of this river were utterly ruined by the event. The following statistics of the capital of the district of Port Phillip in 1844 appeared in the *Port Phillip Gazette* of 11th May of that year; it is interesting as exhibiting the progress that it had made from its settlement to the period stated:—

12,073 acres land reclaimed, grubbed,			
fenced and cultivated, at £10	£120,730
Crop on do., at £5	60,365
4,540 horses, at £15	68,100
92,493 horned cattle, at £3	277,479
2,840 pigs, at £1	2,840
1,417,422 sheep, at 7s.	496,097
One year's clip of wool on its way to			
England, say 3,500,000 lbs., at 1s. per lb.			175,000
Buildings, fences on farms, stations, includ-			
ing Geelong, Portland, Richmond, &c.			600,000

Chattel property, goods, floating capital, shares, stores on stations, &c. ...	£450,000
Agricultural implements ...	3,000
Value of property in the town of Mel- bourne ...	385,235

Making a total of ... £2,638,846

This calculation was based on sufficient data, with the exception of the item "floating capital;" the stock, land in cultivation, wool, &c., were all taken from official returns, and the prices were fair at the period; the property in the town of Melbourne was taken from the valuation by the Town Council. The Sydney press were astonished at the wealth that a handful of settlers in the new district had accumulated in a few years, and endeavoured to make it appear a vainglorious boast; it was however undoubtedly as nearly correct as it was possible to frame such a return. In 1844 Port Phillip was selected as a proper field for an experiment in "secondary punishments;" and in the latter part of that year a number of exiles from the new model prison at Pentonville were landed at Melbourne. The punishment of criminals, by imprisonment in Britain in the first instance, and banishment afterwards to some of the colonies, was brought forward by Earl Grey, and it had come to be considered a matter of national importance, and was receiving the serious attention of those who had taken an interest in colonisation and the reformation of criminals. A wide difference of feeling existed amongst the colonists of Port Phillip as to the propriety of allowing such persons to be introduced; public opinion for the first time divided, and two parties started into existence; it was clearly demonstrated that the interests of the squatters and townspeople were very far from being identical. Previous to the considerable free immigration of 1841, there were comparatively few who had come to Port Phillip direct from Europe. The population consisted mainly of adventurers from V.D.L. and N.S.W. The tone of morality was pretty much on a par with that of the two colonies from which the first settlers had been drawn. A number of young men—sons of respectable settlers in N.S.W. and V.D.L.—had adopted Port Phillip as their home; and this class began early to receive considerable accessions from England. In 1841 and 1842 the large free immigration at the expense of the land fund took place; the majority of those who arrived at this period were of a superior order; they formed public opinion and gave a tone to the society of the district. From this time the decline of the influence of the expiree order is to be dated. Indeed it was soon the interest of all of them, who could conveniently accomplish it, to throw a veil on their career in the penal settlements. In 1842 the population might be thus described:—The educated and respectable classes, many of whom had settled on the Crown domains and in some cases on purchased lands; the free working classes and tradesmen,

introduced at the cost of the land fund; and the expirees and their families who had come from the neighbouring colonies. Many of the free immigrants were settled in industrious pursuits, and although originally introduced by the land fund as labourers were already in a position to employ workmen. There was at this time unlimited space for stock; and flocks and herds increased at an amazing rate; land was cultivated in favourable situations; and business was increasing in the towns; but the great want of manual labour began to be very generally experienced, and as the land fund had become so low as to be utterly inadequate for supplying the district with any immigration, there was no probability of any free labour arriving from England. The settlers were once more under the necessity of having recourse to the neighbouring convict colonies. There were generally expirees arriving in considerable numbers from V.D.L., but in several cases subscriptions were raised in order to give them free passages across Bass Straits. The population was again deteriorated by this impure stream, but it was found impossible to check the influx of felony by legislative influence. The *Royal George* anchored in Hobson's Bay on 16th November 1844 with the first exiles. This vessel had several respectable colonists on board, who had carefully watched these men and who gave them an excellent character. No sooner however was it known that they had actually been criminals than a portion of the press denounced the system in the most violent language, and the indignation of the working classes was aroused to the highest pitch at the prospect of a speedy reduction in the rates of labour. The Town Council of Melbourne commenced the agitation against the exiles by passing a resolution in which it adopted a petition to the Legislature praying protection from the threatened inundation of convicts. There were many of the most intelligent colonists however who deemed this sudden condemnation of these strangers quite unmerited. Messrs. Black and Yaldwin, who had arrived from England in the *Royal George*, and who had devoted some attention to the subject, were disposed to view the exiles as a far less objectionable class than the off-scourings of the penal colonies. The former gentleman had moreover an interview with Lord Stanley, the Colonial Minister, and had urgently pressed him to assist the colony with free labour until the land sales could be resumed. That nobleman had however replied that it was quite useless to ask anything that required money from the Home Government, as such requests could not be granted. Acting upon these impressions, a public meeting of the inhabitants was held on 17th December in the Royal Hotel in order to induce the Imperial Government to take such steps as were necessary for forwarding exiles accustomed to rural pursuits to the country districts of Port Phillip. The chair was occupied by Major Firebrace and the meeting was addressed by Drs. Bernard and Palmer

Messrs. Carr, Foster, Cunninghame, Black and Hughes, who advocated the introduction of the exiles, and by Kerr, Broadfoot and McCulla, who opposed the measure. The following resolution was carried :—"That in the absence of the ordinary means of obtaining free immigration and to check the introduction of expiree convicts from Van Diemen's Land, it will be beneficial to the province of Port Phillip to receive the exiles." But the opponents of the measure were not satisfied with the result and resolved upon holding an opposition meeting in the Royal Exchange hotel. The working classes mustered in great numbers on that occasion, and resolutions condemning the Government for sending exiles were carried almost unanimously. It was remarked that no class were so much against the introduction of exiles as the old convicts, who could hardly be expected to be actuated by purely moral motives; indeed the question assumed a good deal the character of a dispute between the employers and the employed. The Home authorities forwarded several vessels with exiles in the early part of 1845, but finding that the public feeling was still against the experiment, they ordered them to be sent to V.D.L. A sad catastrophe occurred in August 1845 in Bass Straits. The only emigrant ship that had been despatched from Britain that season was wrecked, and the whole of the emigrants amounting to 423 were lost with the exception of nine. So disastrous a shipwreck has seldom occurred, and as the emigrants were urgently required in the district the loss was incalculable, and the colonists were overpowered with regret at the event, which was instantly recognised as a great national misfortune. In 1845 two public meetings were held in Melbourne. The first took place on the 11th September, and was held to consider the propriety of petitioning the Imperial Parliament for the admission of Australian grain into British ports upon the same terms as had been conceded to that produced in Canada. It was but thinly attended, and all the resolutions were passed unanimously. The other meeting which was of very considerable importance, was held on the 28th September, and was attended by all the leading gentlemen of Port Phillip. It was convened by the Mayor, pursuant to a requisition signed by a number of influential colonists, and was for the purpose of taking into consideration the necessity of petitioning for separation from N.S.W. A committee of the most respectable colonists was formed to watch the progress of the movement. The meeting appointed Archibald Cunninghame as delegate, in order that he might proceed to England to carry out the views of the colonists; and a committee was appointed to frame the petition to Parliament, and instructions for the guidance of the delegate. Before separating the meeting instructed the chairman to forward a copy of the proceedings to Lord Stanley, the Secretary of State for the Colonies, with a request that he would not proceed to pledge the Crown

lands of Port Phillip jointly with those of the middle districts until the arrival of the agent who had that day been nominated to proceed to Britain. Cunninghame was a barrister at Port Phillip, and rather a prominent politician at this period. He did not return to the colony, but died at Thornton, in Ayrshire, Scotland, his native place, in 1856. In July 1846, a riot occurred in Melbourne which kept the citizens in a state of excitement for more than a week. The members of the Orange Society had resolved to celebrate the anniversary of the battle of the Boyne by a festival in the Pastoral Hotel. The building was decorated for the occasion, and Orange flags projected from the windows which fronted Queen-street. This display aroused the ire of the Roman Catholic population who assembled in hundreds round the hotel, many arriving armed. The Mayor having been apprised of the disturbance hastened to the spot. He ordered the door of the hotel to be opened and entered for the purpose of quelling the riot, but the Roman Catholics now finding an entrance, rushed through the hall-way towards the staircase, where they were met by the Orangemen, and a regular scuffle took place. Those in front fired into the hotel and were quickly replied to from the Orangemen in the building. At this moment the Rev. Dr. Geoghegan arrived on the spot and attempted to restrain the Roman Catholics. Perceiving that the reverend gentleman was in great danger, John O'Shanassy and Hurley went towards him to get him out of the situation he was in, when the latter was shot in the shoulder. Another man, drinking a glass of ale in the St. John's Tavern opposite, was wounded in the cheek; the shot having entered through the bar window. The riot was now at its height; the doors, windows and furniture of the hotel were demolished; the one party attacking the building and endeavouring to force an entrance, the other defending every inch of ground. Fortunately the military were obtained, and through their interference peace was restored; the Roman Catholics were induced to disperse by the promise of the magistrates that the dinner should not be allowed to take place that evening. There were three or four persons severely wounded in the riot. A number of Justices of the Peace assembled in the Police office, and several of the Orange party were taken into custody and were bound over to keep the peace. William Hinds, who was charged with firing the shot which wounded Hurley, was committed to take his trial but admitted to bail. The town was alarmed the whole of that night by skirmishings between the individuals attached to the various factions, and on the following day the two parties were assembled in different quarters of the city. The Superintendent and magistrates consulted on the best line of conduct to be adopted and agreed to disperse the rioters. The whole of the hotels were ordered to be closed; many of the shops were shut, and as it was a dense fog the town presented a dreary enough appearance. The

police and military were called out, and having formed in Market-street, proceeded along Collins-street and Elizabeth-street to a hotel in Flinders-lane where fifty Orangemen were assembled, who immediately dispersed. The cavalcade next marched out to the top of Elizabeth-street where the Roman Catholic party to the number of eighty were drawn up; after some hesitation, the whole were prevailed upon to disband and go back to their avocations. The town was put under martial law for the night, and the soldiers bivouacked in Collins-street opposite the Royal Exchange Hotel, where the Bank of New South Wales now stands. It was something new and striking to see their watch-fires blazing in the middle of the main street of the usually quiet town. Next morning a number of persons who were ringleaders in the riots were bound over to keep the peace; and in a few days Melbourne resumed its wonted quiet and orderly aspect. The magistrates were censured for their conduct upon the occasion, but probably they acted as well as any other body of men who had been so placed would have done. This fracas was the occasion of the building of the Protestant Hall, in which the Orange festivals are now held. There were public meetings in 1846 for obtaining a supply of labour from V.D.L.—against some proposed squatting regulations—to extend the jurisdiction of the Court of Requests to £30—for promoting immigration by rendering ship-building safer—and for the purpose of rescuing the white woman supposed to be detained as a prisoner by a tribe of aborigines in Gipps Land. The meeting in connection with the supposed detention of a white woman by the Gipps Land blacks resulted in a party being sent there in quest of the supposed prisoner. From an early period in the history of Port Phillip this rumour had prevailed. By many persons the unfortunate female was said to be a Miss Lord, the eldest daughter of John Lord, a merchant of Sydney, who in the course of a voyage from Britain to N.S.W. had been wrecked on the coast, and made a prisoner by the natives. A reward of £1000 was offered by her relations, but no authentic intelligence could be learned of her fate. As time wore on rumors were circulated by the other tribes that a young lady, answering to the description of Miss Lord, was a prisoner with the blacks, and a native trooper announced in 1836 that he had seen the lady, and that she was kept a close prisoner. Many persons on the other hand thought that the white woman was a Miss McPherson, who also was wrecked on the same coast about that period. The party however did not discover any traces of the prisoner, as unfortunately there arose a difference of opinion amongst its leaders in reference to how far the law would protect them in any engagement they might have with the aborigines. This was a most important point, which those who had organised the expedition had apparently overlooked. In consequence of having strong doubts about how far the law would justify them, the party never

actually attempted to rescue the unfortunate prisoner. On 28th April 1847 a severe shock of earthquake was felt at Port Phillip, about four o'clock in the afternoon. The sensation to those inside their houses was exactly like that of a heavy body being violently thrown down in the upper portion of the buildings. It was less felt in the open air. In the Supreme Court, where a squatting boundary case—*Taylor and McPherson v. Sutherland*—was being tried before the Resident Judge and a special jury, the panic was considerable, and the Court was adjourned. The shock was severely felt in the lower portions of Melbourne, particularly about Elizabeth-street. There had been a previous earthquake in this colony in April 1841. In anticipation of separation it was announced in the beginning of 1848 that Her Majesty had been graciously pleased to allow Port Phillip, when erected into an independent colony, to be named after herself, and that instead of continuing to be called Port Phillip the Southern District should have the popular and world-wide name of Victoria—a name endeared to every subject in her dominions. In 1847 the Rev. Charles Perry D.D. was appointed Bishop of Melbourne; he arrived in the *Stag* on 23rd January 1848, and was installed on the 28th of the same month in the cathedral church of St. James's, Melbourne. On 13th February Her Majesty's letters patent were read in St. Peter's Church, which constituted Melbourne a Bishop's See. On 9th March 1847 the celebrated Orders in Council, under the authority of an Act of Parliament (9 and 10 Victoria, c. 104,) were issued. The early squatters had to contend with many difficulties, dangers and privations. To succeed they had to be adventurous and to wander far away into the untrodden wilderness in order to obtain ground which was still unoccupied on which to graze their flocks and herds. They lived in semi-barbarous regions far from civilisation; they had no society, and generally speaking saw no person from year to year, with the exception of a few ignorant shepherds; their habitations were usually miserable huts of bark, hardly a protection from the intense heat of summer or the rains and cold of winter; they had to combat with the savage tribes of aborigines, and to guard against the depredations of the wild animals of the wilderness; they were ignorant of the character of the country and climate; they were unable to grapple with the strange diseases to which their sheep were liable, and often saw them die by thousands; they were on the verge of ruin from ignorance of the system of business carried on in new colonies, such as high rates, extended credits and scarcity of flour and other stores; and at last after a hard struggle many of them were irretrievably ruined by the severe financial derangements of 1842 and 1843. When the young settler had wandered about the country for months with his flocks, seeing abundance of fine country over which they grazed but which was all claimed, and after boundless trouble at last found a spot on

which to rest his weary head, he found no disposition on the part of his distant neighbours to befriend or oblige him. Instead of being gregarious like most other civilised settlers, the Australian squatters desired to be as far as possible from companions. Instead of affording information they were cool and uncivil, always jealous of new settlers as occupying country which they had hoped to keep and use when their flocks and herds increased. Those who were fortunate by caution and industry managed to overcome the preliminary difficulties, but very few of those who were the real pioneers of V. reaped much advantage from their exertions. Most of them had bought their sheep at from 20s. to 30s. and they started with the wool at 2s. a pound; in a few years sheep were at 1s. 6d. and wool had fallen to 9d. or 10d. Agents, merchants, bankers, were all alike unable to assist, and friendless and forlorn the great majority of the poor squatters were left to their fate. The pioneers of V.—the rough champions of the bush, to whom society is indebted for a new field for industry, who took the land and held it against all comers, like the knights at tournaments in ancient days, who opened and cleared the way to fortune for thousands—are nearly all forgotten. This country however is deeply indebted to them, and their remembrance ought to be held in honour. After the great crisis in 1843, and the application of the boiling-down system, squatting became a very lucrative branch of industry; not only did the boiling-down of the sheep into tallow place a steady value upon them, but wool again advanced; the new squatters had none of the incumbrances of the original settlers, who had purchased their sheep partly on credit, and at high prices; they had become acquainted with the climate and skilful in the management of stock. When they had overcome the preliminary difficulties of settlement they succeeded beyond their most sanguine expectations. The young man just from home and school, who had been able to start with a solitary flock, soon found himself the possessor of a large property in stock, and began to make himself comfortable; he was now independent, with nothing in prospective to alarm him, and in the possession of all the solid comforts of life. If he could only keep his flocks free from the three great scourges of A.—scab, catarrh, and foot-rot—he was on the high road to fortune. The squatters have mostly been a highly respectable, well-educated, and industrious class; nor did they originally betray the grasping disposition of the Sydney squatters, however anxious they may have been about the uncertain tenure on which they held their lands. They claimed no rights in the soil, otherwise than as squatters; and it was not until after Boyd, Wentworth, and other stock-owners in N.S.W. had commenced their great crusade in favour of fixity of tenure, that their compatriots in Port Phillip began to reflect on their actual position. The Orders in Council were not however

procured through any influence which the Port Phillip squatters had brought to bear on the subject; and the majority were quite as much astonished as the other classes of the community when they first appeared in the *London Gazette*. The Order in Council was hailed by the squatters with no ordinary gratification; but it in no way altered the position of the occupier of Crown land in reference to his tenure, nor was it intended that it should. To the Crown he was a mere tenant at will before the Order was issued, and his position was very little altered afterwards, for, as the report of the Select Committee of the Legislative Council of N.S.W. remarked, "It is the singular anomaly of these land orders that, while, as against his fellow-subjects, the actual colonist, or intending emigrant, they fortify the squatter with every muniment which can give permanence to possession, as against the Crown, they leave him as they found him—utterly defenceless." The official notification of the Order in Council was received by the Government about four months after it had been agreed to; and its provisions were partially acted on. Applications for leases were received at both Sydney and Melbourne; and regulations for the disposal of new and vacated runs, and for the transfer of runs already occupied, were issued. The Act 11 Victoria, No. 61, for appointing Commissioners to examine and report on disputes respecting boundaries of runs between claimants of leases was passed. The recognised claimants were allowed to occupy the Crown lands in all cases where the general interests did not demand their final appropriation for other purposes, and they were allowed to purchase under pre-emptive rights their homestead sections or other portions of their runs, but both the local and Imperial authorities were unwilling to issue leases. There existed so many debatable points, and the claims of the squatters had become so extravagant that the matter was allowed to continue in abeyance, both parties being unwilling to risk all on a final issue. Then the discoveries of auriferous wealth, and the great flow of population which followed, demonstrated that the colony must sustain a serious injury if the Orders in Council should be interpreted in the way that the squatters appeared to desire, which would in fact shut up the public lands from legitimate occupation by the people. At last an appeal was made to the Imperial authorities and the reply of the Duke of Newcastle virtually destroyed the sanguine hopes in which the squatters had for years indulged. Port Phillip was ready to assume her new name and the responsibilities of self-government. The material for forming a local legislature was at hand, and the people had respectfully petitioned the Throne and the Imperial Parliament for separation from N.S.W.; they had been amused by vague promises, and the year 1848 had been long entered upon without any definite arrangements for admitting of the dismemberment of the country and the erection of the southern district into an

independent colony. Nearly every class now exhibited symptoms of dissatisfaction; all the true friends of the district perceived that its best interests were being sacrificed, that its memorials were trifled with, and that it was the recipient of a much greater share of injustice than any other community had ever experienced, much as Britain had been in the habit of ill-treating and neglecting her colonial possessions. The systematic misappropriation of the revenues of the district was in a particular manner calculated to irritate and annoy the colonists, who were naturally most indignant that they were drawn out of their local treasury and forwarded to Sydney to be appropriated towards the advancement of public works there, while at the same time the money was most urgently required in the locality where it had been contributed to promote the development of its resources. In the previous year the monstrous injustice of this spoliation was more apparent, in consequence of the Legislative Council having refused a motion in the month of August for separate returns of the revenue and expenditure of Port Phillip; and the colonists believed that these documents were refused because they would have exhibited a series of injustices to their district which were unparalleled in the history of British colonisation. But it must be observed, that not only did the Legislative Council refuse to vote funds for public works in Port Phillip, but that even when sums were legally appropriated, the executive Government declined upon one pretext or another to expend them; and as the money did not lie over and accumulate for the benefit of the district, as it ought in accordance with constitutional law to have done, the impartial reader will at once perceive the unfair means adopted to plunder Port Phillip. The amount of the money thus voted and not expended for public works within the southern district may be correctly quoted from official returns at about £60,000 sterling. Superintendent La Trobe was, for some time, thought to be blameless in this system of injustice; and such an impression might have been entertained to the present time had not certain official papers been published, in which it was made apparent that he had used his interest to prevent many of those sums from being expended. In 1846 the City Council of Melbourne passed two resolutions having reference to the unexpended moneys due to the Port Phillip district. The Superintendent in handing the petition of that body into the hands of His Excellency, also gave in a letter written by himself, in which he argued against their prayer. This paper was dated Sydney, 22nd September 1846, and happening to be published in the following year, excited the utmost indignation in Melbourne. The following passage was particularly censured:—"And, lastly, possessing within herself, for the present, neither the experience nor the means of prudently devising, or properly executing, many important works highly conducive to the prosperity and comfort of the inhabitants,

she has had necessarily to await a period of greater maturity, and more settled and manageable principles of internal government, before the application of these funds, though actually at command, could be undertaken." It could not be expected that Port Phillip would rest satisfied with La Trobe as the chief executive official, after this letter had been made public. It was his duty, when the money was voted for a particular purpose, to appropriate it immediately; instead of doing this however he connived at the injustice of allowing those grants to lapse, and recommended that the illegal and unfair system should be pertinaciously continued. The colonists saw clearly that his mind and his policy were alike narrow, and there were none in the district who did not desire to see him removed from his office, unless, perhaps, the few government officials and the little clique who were countenanced and supported by him. On 15th June 1848 the following motion was submitted to the Town Council by T. M'Combie:—"That the Legislative Committee be instructed to prepare an humble petition to her Most Gracious Majesty the Queen, praying for the removal of his Honour Charles Joseph La Trobe, Esq., from the office of Superintendent of the District of Port Phillip, on account of his systematic mismanagement of the money voted for the service of the province; his neglect of public works of paramount consequence; and his repeated breaches of faith in his official transactions with this Council in matters of high public importance." A long and interesting debate ensued; and an amendment, moved by Armstead, and seconded by Moor, that the motion be considered that day six months was lost, and the original motion affirmed by nine votes to five. A full report of this interesting debate will be found in the *Port Phillip Gazette* of 19th June 1848; the charges on which the motion was founded were substantiated; and, although Moor, who was a clever lawyer, made as able a defence as could, perhaps, under the circumstances have been put forth, yet his attempts to excuse and palliate the conduct of La Trobe were unsuccessful. The vote of the Town Council, which was at this period the only representative body in the district, had very great weight; indeed, many of those who subsequently became prominent politicians in V. were at some period of their career members of that board. So completely were the sympathies of the people in unison with those of the majority of the Town Council, that a requisition signed by seven hundred colonists was presented about a week afterwards to the Mayor of Melbourne, requesting him to convene a meeting, in order to lay a petition for the removal of the Superintendent at the foot of the Throne. In compliance with this requisition, the Mayor convened a meeting for 3rd August, to take place opposite the Court-house, near La Trobe-street. This was the spot where the elections were usually held; and here a large hustings was prepared for the occasion. It was known beforehand that the meeting would be a

great success; and it was remarked that the Superintendent and his adherents should put up prayers for rain in order to damp the ardour of the indignant people. The day was all that could be desired by the most ardent supporters of the Superintendent; for the rain fell in torrents. The result was therefore the more mortifying to the Government, for at least three thousand persons arrived to take part in the proceedings of the day. The Mayor was present but the chair was occupied by T. M'Combie, and the following gentlemen took part in the proceedings:—Newman, Fawcner, Annand, Young, Johnston, Robertson and Bingley. The motion for the petition was carried unanimously; only one solitary hand having been held up against it. The meeting appointed a Committee to obtain signatures and transmit the document through the proper official channel to Her Majesty, and quietly dispersed. The Secretary of State for the Colonies returned a most courteous reply to the petitioners; but their prayer was not granted. The Superintendent had made himself so obsequious to his direct superiors in Sydney that the Imperial Government threw its protecting mantle over his shoulders. The only official in the Colonial Office who took much interest in the details of Australian affairs occupied no higher position than that of a clerk; he was an able man, but partial to prerogative, and did not understand that the *vox populi* could exist in a colony sixteen thousand miles distant from Britain. It was indeed impossible that a Secretary of State, who was often but a brief period in office, could make himself acquainted with colonial subjects. He was a Cabinet Minister, and had to attend to his parliamentary duties; and it was not surprising that the memorials from Port Phillip were treated with neglect. At this crisis in the history of the colony an event occurred, which aroused considerable interest in Britain, and hastened separation. It has been already stated that many of the most intelligent colonists were of opinion, at the time the representation in the Legislative Council of N.S.W. was granted to Port Phillip, that the people ought not to have accepted it. Events soon arose which demonstrated that this view was correct; when Port Phillip complained that she had been systematically plundered, she was curtly answered that the revenues of the entire colony were appropriated by the representatives of the people. The irritation of the public mind can be easily imagined at this particular period; the loss of their revenues was not a financial question alone—it was a social question as well. The money going away to Sydney was that portion of the hard-earned wages of the people which they had contributed to the common weal; and was the price of education, and in fact of everything that constitutes moral and physical progress. The just indignation of the colonists at this system of spoliation was further aggravated by rumours which had prevailed for a long time, to the effect that a considerable amount of corruption prevailed

amongst those who were connected with the local government. This charge had been clearly made by Fawcner, one of the speakers at the public meeting already noticed; and, upon a notification appearing in the *Government Gazette*, signed by the heads of the various departments, denying the truth of the assertion, that gentleman published a letter in the newspapers, asserting that one of the persons signing the said document, who had been Police Magistrate, and who was, at this time, one of the Commissioners of Crown Lands, was guilty of the charges. An action for libel was commenced; but, when it was tried, the charges were so clearly substantiated that no verdict could be obtained. The jury was divided in opinion, eight being in favour of the defendant, and only four for the plaintiff; and even the minority were only for giving nominal damages. The charges were therefore morally proven; and the official—whose name we refrain, for the sake of his family, from publishing—was compelled, by the force of public opinion, to leave the colony. It appeared that the Superintendent had been made acquainted with some of the charges previously to the meeting at which they were reiterated, and referred to by Fawcner, as a matter of notoriety; and that he had made no effort to stop such practices amongst his officials. The general election for 1848 arrived, the Legislative Council having been in existence the full legal term of five years. With the solitary exception of J. F. L. Foster there was no person connected with Port Phillip who came forward as a candidate for the honour of representing the district. Indeed, there was but one other candidate really before the public; and he had only just landed from England, and was connected with Sydney. The nomination took place on the 20th July; there were about four hundred persons present, when a great opposition was exhibited to sending any members to Sydney. Ebdon, who had been returned as one of the first representatives of Port Phillip, informed the electors that “he would have again solicited their suffrages, but that he could not any longer lend himself to the perpetration of what was only a farce; Port Phillip was not, in fact, represented; she was misrepresented.” The feeling was so strong against sending up members to Sydney that Foster, who had been nominated, was at the earnest solicitation of his friends and supporters induced to withdraw, and the meeting dissolved; and the people at length determined upon using every effort to break the degrading tie which had up to this time bound Port Phillip to the chariot-wheels of Sydney. The nomination for the Borough of Melbourne was advertised to come off on the 25th of the same month; but during the short interval that took place, the friends and supporters of the local Government had not been idle. It was resolved to place Foster in nomination, as it was contended by the friends of the local Executive that if only half-a-dozen votes polled for that gentleman—nay,

if he were only proposed and seconded—he must of necessity be returned. A consultation was held on the afternoon of the 24th, by one or two of the friends of non-election, and it was agreed to place some other person in nomination, in order to carry out the nullification principle; and Earl Grey was selected, as being a nobleman in so elevated a station that his nominal election must draw attention to the peculiar position of the settlement at Port Phillip. He was, accordingly, placed in nomination in opposition to Forster, and returned by an overwhelming majority. The adherents of the local Administration were very anxious to carry Foster's election; but every effort made was fruitless. It is a curious fact, moreover, that nearly every lawyer of eminence in the district stood forth opposed to this movement; and when the Mayor, as Returning Officer, declared the state of the poll, two protests were handed in against the return of Earl Grey, which had attached to them several eminent legal names. The reports circulated by the supporters of Foster made it necessary for the non-election party to clearly set forth their reasons for returning Earl Grey; and a meeting was held at the Royal Hotel for that purpose. It was agreed to forward a memorial to his Excellency the Governor, praying that during the pending of the reference made to the Secretary of State for the colonies, the whole revenues of the district be reserved for its own wants. The proceedings in the metropolitan city were not only opposed by Sydney, which under the circumstances might have been anticipated, but they were repudiated in Geelong, which was at this period next in importance to Melbourne; and a meeting was called there for the purpose of giving the electors an opportunity of expressing their disapprobation. By this time a very important question in reference to non-election had been raised; for the Constitutional Act was so worded that it was illegal for the Council to proceed to business if the number of members deficient by the non-return of writs was more than two. It was an object of the utmost importance to the Government to have members returned for the district of Port Phillip; and it was most adroitly managed by delicately flattering Geelong, and by taking advantage of its jealousy of Melbourne. The writ had been already returned without any names endorsed on it; and it was a considerable stretch of law to issue another, but the responsibility was incurred, and Geelong was appointed the place of nomination. Before the writs were issued it was reported that five residents would be found ready to go to Sydney as real *bonâ fide* representatives; but when the time drew near that was to test this it was found to be untrue, as only one or at most two residents ready to undertake the duties were found. The second writ having been received, a public meeting was called by requisition to the Mayor on the 13th September and about 150 electors met to consider what steps should be adopted. This meeting was addressed by Curr, O'Shanassy, McCombie, Colin

Campbell, Johnston, Cole, Duerdin, Williamson, Annand and M'Arthur. The resolutions agreed upon by the majority were in substance that, as representation in the Legislative Council of N.S.W. was an utter mockery it ought to be abandoned at once and for ever; that in order to prevent *bonâ fide* representatives from being returned, the meeting approved of placing five members of the British Cabinet in nomination to complete the returns of the writ and enable the Council to be legally constituted, and proceed to the ordinary business of legislation, while it would afford no pretext for oppression under the colour of representative government. The meeting appointed George Ward Cole, J. S. Johnston and J. P. Fawcner a deputation to proceed to Geelong for the purpose of supporting the election of five cabinet ministers; in the event of the non-election principle not being unanimously carried out. On 21st September the nomination took place at Geelong; when Drs. Dixon and Palmer, James Williamson, E. Curr, and Lauchlan Mackinnon, were placed in nomination by the one party, and the Duke of Wellington, Lords Palmerston, Brougham, Russell and Sir Robert Peel by the other; and the show of hands being in favour of the local candidates, the supporters of non-election demanded a poll. A great public meeting was also held in the theatre at which Capt. Fyans presided. It was addressed by Fawcner, Johnston and Curr in support of the non-election movement, and Wright, Harrison and Duggan against it. The meeting was discreditable to the opponents of separation; as, towards the conclusion, it became riotous, and the lights having been extinguished great confusion occurred. It is singular that Curr should have been one of those nominated, as he had up to this period been one of the most strenuous supporters of non-election, and had voted for Earl Grey for Melbourne. He certainly displayed no little inconsistency in thus allowing himself to be partially brought over to the side of the pro-electionists; at the same time it is but just to remark that Curr was honest, but vacillating and easily swayed by the arguments of persons very much inferior to himself in mental capacity. Another extraordinary circumstance was that Foster drew back from the ranks of the pro-electionists, and refused to be placed in nomination; the reason assigned at a public meeting held in Geelong by this gentleman was that he did not think four *bonâ fide* representatives would be found to proceed to the Council Chamber in Sydney; and that some gentlemen who had promised to allow themselves to be nominated had changed their minds, and found that their business engagements would prevent them from being so long absent from the district. The pro-electionists triumphed in the district and the local candidates were elected. This is not so very surprising when all the circumstances of the case are taken into account. The Government were anxious for many reasons to carry this election; the candidates were

anxious to be returned, with the exception of Curr who was most probably indifferent to the result; those who voted for the peers used no influence, and they were actuated to decline to vote for local candidates solely from principle. The district of Port Phillip however declared by a majority of twenty-one of the gross poll, that they were against misrepresentation in Sydney. The following table exhibits the numbers for election and non-election respectively:—

	Pro-Election.		Non-Election.
Melbourne	... 102	...	295
Port Phillip	... 230	...	58
	<hr/> 332		<hr/> 353

V. *The Anti-Transportation Movement.*—In the early part of 1849 the colonists of Port Phillip were warned by Mr. Jackson, who was at that period agent for the colony of V.D.L. in England, that Port Phillip was about to be declared a colony where ticket-of-leave men might be sent, and that arrangements had already been completed for forwarding the first cargo of them to Melbourne. This information was soon found to be correct, and the utmost indignation was immediately expressed by all classes. It is only fair however to state that the Legislative Council of N.S.W. had in April 1848 passed resolutions accepting the offer of the Home Government to send exiles and ticket-of-leave holders, to be followed by their wives and families, and an equal number of free emigrants—all at the expense of the Imperial Treasury. The members of the Council were led to accept these exiles by dire necessity, from the great scarcity of labour; and it was understood to have reference to the middle district, as Port Phillip had at this time only nominal representatives in the Legislative Council of N.S.W.—her members being Sydney men, identified with the northern portion of the colony. But while the Minister for the Colonies determined on taking the qualified consent given by the Council as an excuse for again deluging A. with prisoners, he seemed to have overlooked the other portion of the compact, and did not send one free emigrant at the expense of the British Treasury; and no attention whatever was paid to the resolutions of the N.S.W. Legislature. A public meeting was held in Melbourne a few days after the warning had been received—on the site of the present Town Hall—and a large number of citizens assembled to condemn this invasion of the rights of the free citizens of the district. The speakers were S. Stephen, R. Balbirnie, B. Reynolds, W. Hull, J. O'Shanassy, J. S. Johnston, W. Kerr, R. Heales and J. P. Fawkner, and the resolutions condemning the proposed introduction of felons as a breach of faith with the great majority of the inhabitants who emigrated on the distinct assurance that Port Phillip should never be a convict settlement, were carried; a committee which was appointed waited upon the Governor, who was at this time on a visit to Port Phillip, and impressed

on his Excellency the imperative necessity—for the preservation of the public peace—of prohibiting the landing of any convicts that might approach the shores of Port Phillip. A few days afterwards a meeting of the magistrates of the city and district was held, and very strong resolutions were passed condemning the attempt about to be made by Earl Grey, and a deputation waited upon his Excellency with a memorial on the subject. To both deputations his Excellency promised that no convicts should be permitted to land in Port Phillip until the feelings of the colonists were made known to the Imperial Government; and he directed the Superintendent to order any vessels arriving with felons of any class to proceed to Sydney. La Trobe's friends attempted to raise his character for patriotic feeling to Port Phillip on the occasion of ordering the *Randolph* to proceed to Sydney a few months later, but it was to Governor Fitzroy that the colonists were in reality indebted for the preservation of the fair fame of their province; and this forbearance rendered him very unpopular in Sydney. On 8th August 1849 the *Randolph* approached the Port Phillip Heads, where instructions had been left by the authorities that the captain should not allow her to enter, but at once proceed to Sydney. He thought fit to disobey this order, alleging that he was chartered for Hobson's Bay; to that port only was he insured, and there he was determined to go. The excitement was considerable, and the people resolved that if any attempt should be made to violate the promise made to the people, by landing the convicts on the shores of Port Phillip, they would oppose it by physical force. The Superintendent wisely averted bloodshed, and in accordance with the arrangement which had been entered into between the people and the Governor, directed the *Randolph* to proceed to Sydney. The Town Council of Melbourne, although it had some months previously petitioned for La Trobe's recall, at once passed a resolution conveying the grateful thanks of that body to His Honor for sending away the felons in the *Randolph*. A public meeting was convened to consider the steps rendered necessary by the issue of the Order in Council permitting the deportation of convicts in British colonies, in order to prevent the Home Government from sending convicted offenders to the district of Port Phillip. The Queen's Theatre in Queen-street, in which the people assembled on this occasion was densely crowded. The Mayor was voted to the chair, and the following persons took part in the proceedings:—L. McKinnon, C. Campbell, Dr. Thompson, Messrs. Kerr, Willis, Balbirnie, Ramsay, Marsden, Johnstone, McCombie, Langlands, Dr. Greeves, and Captain Webster. This meeting passed a resolution protesting against the right asserted by the British Government in the before-noticed Order in Council, dated 4th September 1848, of sending convicts to any of the British colonies contrary to the express wishes of the inhabitants, and claiming the protection

of the great constitutional principle—that Britain has no right to tax the people of the colonies for imperial purposes, which it was now attempting to do by requiring them to maintain a portion of its criminals. The second resolution declared that Port Phillip although joined for a short time to N.S.W., had never been in any sense a penal colony; and that the Secretary of State for the colonies had on the first establishment of the province, issued express instructions prohibiting the introduction of convicts; and that being a free colony, the people were prepared to undergo any extremity rather than submit to become the receptacle of felons. The third resolution expressed the sympathy of the meeting for the colonists of the Cape of Good Hope, and declared that Port Phillip would make common cause with it or any other free British colony in resisting the unjust and tyrannical edict. The fourth resolution declared that the people of Port Phillip desired to be free and virtuous; and that no motives of expediency would reconcile them to the moral evils that must arise from the association of the men, women, and children of Port Phillip, with the convicted felons of the empire. The fifth resolution declared, that the attempt to introduce felons would disgrace the fair name that Port Phillip had acquired in Europe, and deter the most eligible classes of emigrants from coming out, and thus cut off the main source of its future greatness and prosperity. The sixth resolution declared, that in carrying out their theories of criminal punishment at the expense of the colonies the Government was guilty of a gross breach of faith; that the meeting denounced those Ministers of the Crown who would insist on this obnoxious measure, and appeal to the Throne and the people of England against a system of injustice that would never be submitted to in Great Britain. A petition embodying the resolutions was then agreed upon and the meeting separated. The Legislative Council of N.S.W. passed a resolution about this time, which was brought forward by Cowper, declining to receive convicts upon any terms; protesting against any measure by which the colony would be degraded into a penal settlement; and earnestly entreating Her Majesty to revoke the Order in Council, by which N.S.W. was again made a place to which British criminals might be transported. On 11th June a violent meeting was held at the Circular Wharf, Sydney, in consequence of the arrival of the *Hashmey* from Port Phillip. A protest was solemnly made by the people against the landing of the convicts, and a deputation appointed to wait at once upon the Governor. On arriving at Government house the gates were shut, and the members were refused admittance, but after a parley six of the number were allowed to pass the gate. They found however that his Excellency was engaged with the Executive Council, and could not be intruded upon and they retired. The people severely censured his Excellency and passed resolutions condemning

him; on the other hand about six thousand colonists signed addresses of confidence which were presented to him; party feeling ran high, and at one period it was feared that the landing of the convicts from the *Hashmey* would give rise to an outburst of public indignation. The Imperial authorities could hardly have been blind to the danger which they ran in persisting in this course; indeed a new world of political thought seemed to have opened. At the great public meeting held in Melbourne, a clergyman openly talked about the independence of Port Phillip, and the sentiment was responded to and loudly applauded by thousands. The speeches might not perhaps have commanded much attention from their ability, but the speakers dealt with facts, and the expression of opinion upon them was unmistakable. They expressed their utter detestation of the effort to turn the fertile colony into a vast prison, and their resolution to resist by physical force, and rather die than submit to such dishonour—a Demosthenes or a Chatham could have said no more. The people were resolved to maintain the good name of their province at any sacrifice. It is only just to Earl Grey to state that in the beginning of 1850 a despatch was published in the neighbouring colony of V.D.L., addressed to Sir William Denison, in which his lordship stated that Parliament had granted a sum of money in order to enable the Government to send free emigrants to the colonies which received convicts. It is doubtful however if Earl Grey would have adopted this second portion of the proposal if he had not perceived the unpopularity of the intended deportation of exiles; it is more generous to give his lordship credit for good faith, but it cannot be denied that it was very bad policy on the part of the Colonial Office to send the bitter draught six months before the sweet potion. The effect was the rejection of the whole scheme by the colonies that were originally favourable to it. The Secretary of State was however wise enough not to drive the people to extremities; and in April 1850 a despatch was received, dated 10th November 1849, in which it was stated that, as the Imperial Government found that convicts would be more willingly received in Moreton Bay than in the other districts of the colony, it had been determined to direct all sent to N.S.W. to be landed there. The agitation had now abated in Port Phillip, but it broke forth in the middle of 1850 in V.D.L., in consequence of the arrival at Hobart Town of the ship *Neptune*, which had been unceremoniously driven from the Cape colony; thus demonstrating practically that that colony still continued the "dust-hole," of the empire. The colonists charged the British Government with a distinct breach of faith, having in 1848 promised to discontinue transportation to their shores; and they declared that this resumption of transportation was a positive violation of this pledge. Port Phillip had a special interest in this dispute; sending convicts to V.D.L. was indirectly sending them to the neighbouring settlements,

where they could obtain higher wages, and she at once expressed her sympathies with her neighbours on the other side of Bass Straits. In August 1850 the question of transportation was once more brought before the Legislative Council of N.S.W. by Lamb, who moved a series of resolutions to the effect that no more convicts ought, under any circumstances, to be sent to the colony. An amendment having been moved that the debate be adjourned for a month, the votes were equal, and the speaker gave his casting vote in favour of the amendment. A public meeting was held in front of the Police Office, Melbourne, on 19th September, and resolutions were passed in favour of Lamb's motion. A similar meeting was held at Sydney, and very strong resolutions carried against transportation in any shape. The result of the debate on Lamb's motion surprised nearly every person, for with the exception of Wentworth and Martin, none of the members appeared in favour of the resumption of transportation, and the motion was carried without a division. The Legislature of N.S.W. behaved with no little inconsistency on this great social question for in half-a-dozen years it gave nearly as many conflicting decisions. In 1846 it approved of the famous transportation report; the following year Cowper's resolutions against transportation were passed; in 1848 the Council agreed to Earl Grey's offer to take exiles if accompanied by their wives and families, and an equal number of free emigrants; and in 1850 Lamb's resolutions, declining to take convicts on any terms were passed. The last resource of the Imperial authorities was V.D.L., and here the battle continued to rage as fiercely as ever. The neighbouring colonies sympathised warmly with the Tasmanians, and in the beginning of 1851 it was resolved that all the Australian Colonies should make common cause, and enter into a league for the obtaining of the abolition of transportation to any portion of Australasia. The colonists of V.D.L. appointed delegates to proceed to Melbourne, to confer with delegates to be selected by the people of Victoria; and Aitkenhead, editor of the *Launceston Examiner*—Weston, a gentleman of standing residing near Hobart Town—and the Rev. John West, Independent minister, residing in Launceston, came across in the *Shamrock* steamer, and landed in Melbourne. They were received with enthusiasm by the citizens, and after a series of protracted and anxious deliberations on the part of the Tasmanian delegates and a sub-committee of the Anti-Transportation Association of Victoria, the 1st February 1851 was fixed on for the conference of delegates. An effort was made to give the ceremony an imposing appearance and a banner was unfurled in the old Queen's Theatre, where the ceremony took place, bearing four stars forming the southern cross. The object of the league was declared to be "to secure, by legal and moral means only, the abolition of transportation to the Australian Colonies." It was agreed that the league should be governed by

delegates from the various colonies, and that local councils should be appointed in each of the colonies, who should appoint the delegates, and manage the local affairs, and the money contributed in the particular colonies in which they were elected. The Australasian League was then agreed to, and a considerable number of persons came forward to attach their names to it. A public meeting was held immediately after the conference had been brought to a termination, and resolutions were passed strongly condemning transportation under any form and enunciating the necessity of the Australian Colonies uniting in a moral and legal resistance to the influx of criminals into any of them, and strongly recommending the objects of the League to the colonists generally. A great meeting was held in St. Patrick's Hall, Bourke-street, on 13th February, and resolutions of a similar character were carried unanimously. A large number of persons subscribed what might be termed munificent sums, considering the condition of the colony at this period for the purposes of the League. The Victorian branch of the League resolved upon sending a delegate to Britain, and the Council selected John Charles King, Town Clerk of Melbourne, to fill this office; and so far as education and talent went the gentleman was well qualified to discharge its important duties. He sailed in the *Sacramento* on the 3rd April for England, and was directed to endeavour to procure the total cessation of transportation to the Australian Colonies. On 7th April a great public meeting was held in Sydney, at which the people resolved to dissolve the N.S.W. Anti-Transportation Association and join the Australian League; and the delegates from V. and V.D.L. were received in that city with the greatest enthusiasm. The unanimous feeling of the colonies against transportation thus so plainly demonstrated in the League, and the great discovery of gold which immediately afterwards succeeded, fortunately prevented any attempt to thrust convicts upon the three colonies, and Britain had to look for other outlets for her felony.

VI.—*End of La Trobe's Administration.*—The treacherous conduct of the Superintendent of Port Phillip was brought rather unexpectedly under the observation of the public, in consequence of a private despatch, dated 10th August 1848, which was published amongst the documents attached to the Report of the Committee of her Majesty's Privy Council for Trade and Plantations, on the subject of the proposed Bill for Separating Port Phillip from N.S.W., and for other purposes. La Trobe's despatch professed to set forth the position of Port Phillip. It contained the following observations: "No doubt the erection of the (Port Phillip) District into a distinct colony will at once remedy much that is anomalous in the present state of things; but one fact, if not clear before, seems to be demonstrated beyond dispute by the past proceedings in the district that any form of constitution which may be proposed for the future colony

for some years to come, at least, which takes the Government out of the hands of a Governor, Executive, and Nominee Council, and substitutes for the latter a representative body, will be ill-suited to its real state and position, and will render the administration of its Government as a distinct colony upon whomsoever it may devolve a task of exceedingly great difficulty and responsibility." The indignation of all classes was aroused by the publication of this untrue picture of the position of the district emanating from its ruler. The Melbourne City Council passed a resolution to the following effect :—"This Council, as the only representative institution existing in the province, deem it in these circumstances to be a duty they owe to the citizens of Melbourne, and to the body of the colonists, to place on record their emphatic denial of the existence of any unfitness on the part of the inhabitants of this City and Province for the full enjoyment of all the rights and privileges of free-born British subjects; and they cannot refrain from the expression of their extreme astonishment and regret that an attempt should have been made by the Chief Officer of the Government to prevent the Colony of Victoria from obtaining a Representative Legislature, and such an extent of civil liberty as had previously been promised to the colonists by her Majesty's Government." In due course a reply was received from the Secretary of State for the Colonies in reference to the above resolution; and the public were again lost in astonishment at perceiving that La Trobe had sheltered himself from the burst of honest resentment which had been aroused against him by allusions to the opinion of a public meeting in Geelong as favourable to him, and inferring that the City Council of Melbourne did not represent the general feeling of the colonists. It was evident that a deliberate deception had been practised, and that his Lordship had been deceived; a fact which spoke pretty strongly as to the mode in which information was in La Trobe's time conveyed from the Colonial officials to the Home Government. There was no public meeting held at Geelong; and the only ground that the Superintendent could have for making such an allegation was that, at the period alluded to, there happened to be a meeting of a committee of inhabitants, who had been nominated to watch over the Geelong Incorporation Bill during its course through the Legislative Council; and on one occasion about six or eight of these committee-men felt injured in their dignity because the City Council of Melbourne had refused to recognise them as forming, at that stage, a duly constituted municipal and representative institution. They did pass a resolution cavilling at this; but it did not contain any expression of confidence in La Trobe or any attempt to justify his calumny against the people in his district. That gentleman, when he found Melbourne rallying to a man on the patriotic side, turned his attention to Geelong; he changed the place of nomination for the district from Melbourne to that town and

threw many little additional sops towards it; but the most he could obtain in return was quiescence. The western metropolis continued, under the system of misgovernment, subdued, but not contented. One or two perhaps of the natural leaders of the people had been bought; and La Trobe really exhibited a disposition to oblige that district, so that its cordial co-operation in any popular movement at this period was hardly to be expected. But the people of Geelong, notwithstanding their natural jealousy of Melbourne were sound at heart, and a very large number sympathised with the patriotic party in the metropolis. Earl Grey was therefore either deceived or he wilfully misrepresented the matter; the people of Port Phillip believed the former to be the true state of the matter. They arrived at such a conclusion in this manner :—While Earl Grey did not condemn La Trobe he certainly did not condemn the people; and in principle he admitted that the nullification of their privileges was not blameable. In one of his dispatches, written about this period, he said—"Local self-government if necessary for the good of the whole colony is not less necessary for a particular district. Port Phillip representation has become an unreal and illusory—not a substantial—enjoyment of representative institutions." Such language might not have been out of place in the mouths of those non-electionists so much condemned by La Trobe. When the election of Earl Grey for Melbourne was referred to in the House of Lords, the following remarks were made :—Lord Montague—"There was another point; it was thought desirable that Port Phillip should be divided from the main colony of Australia. As the returned member for Melbourne, in Port Phillip, he might ask the noble earl, the Secretary for the Colonies, what his views were on this question (laughter.) It appeared that the electors were so dissatisfied with the representation that although they had six candidates they chose to elect the noble Earl (Grey) as their sole representative" (laughter.) Earl Grey—"They complained of the hardship of being called on to elect representatives to an assembly sitting at a distance of 600 miles from their own habitations; they called such a scheme of representation 'a mockery,' and in order to show that they deemed it a mockery in fact, they had actually done him the honour to elect him as one of their representatives" (laughter.) Lord Stanley—"Are you going to sit?" (a laugh.) Earl Grey—"No. As I have had the honour to take my seat in this house I intend to decline" (a laugh.) Now, with reference to the measure then immediately under consideration, he objected much to its postponement, although aware of the difficulties which under present circumstances might be interposed to its progress this year. He was most anxious that it should be passed if possible during the present session. The sensible view which the Secretary took of the matter no doubt startled La Trobe, who considered the

conduct of the people in making free with his lordship's name as little, if anything, short of treasonable. Sir Charles Fitzroy had also adopted this impression, and had refused to insert the return of Earl Grey in the *Government Gazette*; he had even written a despatch to express his concurrence in La Trobe's views, in which he said—"Mr. La Trobe's remarks respecting the memorial, and the extraordinary course pursued by the electors on the occasion referred to, appear to me to be so clear and judicious that I feel it unnecessary to do more than express my entire concurrence with them, and particularly with the concluding portion, which throws a doubt on the expediency in uniting [erecting?] Port Phillip into a separate colony, or of granting it a representative Legislature." But the more discerning Secretary of State saw the affair in a very different aspect, and did not condemn the course adopted by the people of Port Phillip. Early in 1849 public meetings were held in both Melbourne and Geelong in order to petition the Queen and the Imperial Parliament to extend the elective franchise to the licensed occupiers of Crown lands and the tenant farmers. The propriety of allowing a fair representation to all classes of the community was unquestionable; but so great had the jealousy of all the other classes of the squatters become, that the proposition to allow them the franchise met with great opposition. Indeed, in taking a retrospective glance at the amount of ill feeling entertained towards the squatters at this period, the future historian or intelligent inquirer will be at fault in arriving at the true cause of such displays. No person could deny that at this period squatting was the main branch of industry, and that the gains of those who followed it made the colony what it was. The licensed occupiers did not, it might be said, buy the land which imported the labour, but they supported the merchants and tradesmen who were the principal purchasers of the land and the main contributors to the emigration fund; their success had been doubly advantageous, having enriched themselves and civilised the country. This was not to be denied; but the other classes began to discover amongst them a grasping spirit, and it appeared to be feared that they would endeavour to confiscate the great public domains which they occupied. In cases where they had erected dwelling houses of the annual value of £20 they already possessed the franchise; and many were opposed to allowing every licensed occupier to vote simply as a Crown tenant. The resolution was carried in the affirmative in Geelong, but lost in Melbourne, by a considerable majority. In March 1849 the district was honoured with a visit from Sir Chas. Fitzroy, who arrived in H.M.S. *Havannah*, Captain Erskine. He met with a most enthusiastic welcome; the *élite* of the city turned out to meet him on his landing at Sandridge and escorted him to the Royal Hotel Collins-street, where apartments had been fitted up for

his reception. Sir Charles remained ten days in the district; he received deputations from all the public bodies of Port Phillip, and held levées in Melbourne and Geelong which were most respectably attended. He deserved the good opinion of the future inhabitants of V. for the concession he made to the colonists—that no convicts should be allowed to land contrary to their wishes. On his return to Sydney he was severely censured for having made this promise; but Fitzroy probably saw that the people of Port Phillip would resist the landing of felons, and that they would repel any such attempt by force of arms. He gave however as the ostensible reason for his conduct that there would be a great difficulty in the absence of the requisite machinery for the registration and discipline of any convicts which might be landed. The Sydney Executive had been particularly niggardly in expending any of the money collected in the Port Phillip District on public works within its limits; but in 1849 it took advantage of the contemplated dismemberment of the colony to refuse to spend any more money on any public undertaking. The Colonial Secretary wrote in July to the Superintendent "that His Excellency had desired him to say that Her Majesty's Secretary of State for the Colonies having, in a recent despatch, incidentally intimated to him the immediate proposal of the separation of Port Phillip from New South Wales, it appears to His Excellency that the proper course will be to leave the initiation of all new works in that district for the consideration of the local Government and Legislature after it has been constituted a new colony." This would have been unfair even if the money had been about to be reserved for the use of the new colony. Such however was not the intention, as not one farthing of the surplus revenue thus wrung from the district was ever returned. The course thus proposed was flagrantly unjust. L. Mackinnon gave notice of his intention to move a series of resolutions upon the surplus revenue which Sydney had thus taken by the strong hand; and one of the number stated—"That, as well to do an act of common justice to the inhabitants of Port Phillip, as to vindicate the character of N.S.W. from imputations of an unpleasant nature which under existing circumstances may fairly attach to it, this Council declares it to be its deliberate opinion that the sum of £266,882 2s. 6½d. shown by the said returns to be the excess of revenue over expenditure in the said district of Port Phillip, from its first settlement in 1836 up to 31st December 1848, together with all balances that may accrue from 1st January 1849 up to the final separation of Port Phillip from N.S.W., be paid back to the said district of Port Phillip out of the general and territorial revenue of N.S.W. in the exact proportions in which each of these has been benefited by the surplus revenues of Port Phillip." The motion was however withdrawn, and for very extraordinary reasons. Mackinnon said—"At variance with his

own feelings and at variance with what he was sure must be the feelings of his constituents, he was compelled to withdraw the notices of motion standing in his name. He was forced to this step because he had reason to know that one of his colleagues would oppose him, and the other had not made up his mind as to which course he should take. What was the reason for this course of proceeding he was at a loss to say; for he was sure they would have thought the motions very proper ones while they resided in Port Phillip; and it could only have been the atmosphere of N.S.W. that had produced such a change in their ideas. His object in placing these motions on the paper was to elicit the opinion of the House upon every one of the points raised." A dispute, originating in this notice of motion, arose between Mackinnon and Moor, another of the representatives of the district, which occupied the notice of the public; but it merely showed that much ill feeling existed. Each of the members had a pet plan of accomplishing the desired object; they agreed to differ in opinion, and nothing for the benefit of Port Phillip was accomplished. Indeed as the money had most probably all been expended, Sydney had resolved not to pay back a farthing. The amount which the absentee Government of Sydney had squeezed out of Port Phillip was calculated to be about £400,000; it had been taken with the greatest effrontery, and every remonstrance treated with neglect; and the resolution which was now taken to expend no money on public works until separation irritated the public mind, particularly as there seemed little probability of securing any portion of the revenues which were being collected. These substantial evils were aggravated by others of a social character; the colonists were not represented; their political privileges were dormant; for the representation in the N.S.W. Council had at last come to be rated at its true value. The social and political condition of Port Phillip at this period was most unsatisfactory; the Executive department of the Government was administered by an officer who was responsible, not to the Imperial authorities, but to the Colonial Secretary at Sydney; the Superintendent had no constitutional method of explaining his measures to the people; he was condemned, often justly, and sometimes no doubt unjustly, without being heard in his defence. The men of education and influence felt that they had no means of explaining their wants, and they would not take any part in State affairs. The press of the district however continued indefatigable in its exertions to obtain justice; the claims of Port Phillip were urged; her unfortunate position, as a dependency of a dependency, daily commented upon; the weakness and wickedness of the Government was exposed; and although separation was delayed, upon one pretext or another, it was at last wrung from the reluctant authorities of Downing-street very much to the private chagrin of N.S.W. whose public writers could hardly speak in terms of

ordinary courtesy of the inhabitants of the southern district, who only struggled for their *independence* and just rights. The great boon so earnestly longed for had been promised in 1849, as the quotation from the letter of the Colonial Secretary of N.S.W. will show; but towards the close of that year intelligence was received that, although the principle had been conceded, there was great danger that, upon one flimsy pretext or another, it would not actually be granted for some years. A Bill for the Better Government of the Australian Colonies had it is true been introduced; one of the main features of that measure was the erection of Port Phillip into an independent colony under the name of Victoria; but several of its clauses provoked discussion, and the measure had to be withdrawn in order that it might be so amended as to meet the views of the various parties in the House of Commons. In the course of the discussion Earl Grey and Lord Stanley had expressed their desire that Port Phillip should be at once separated from N.S.W., and it was beyond measure disheartening to the colonists that a matter of such vital interest to their progress and prosperity should be mixed up with many questions on which those Whig and Conservative leaders could scarcely be expected to agree in opinion. A great meeting was held in the Mechanics' Institution on 26th November to consider the steps necessary to be adopted in consequence of the delay in separation. The chair was occupied by the mayor of the city, and the speakers were—Ebdon, Moor, Foster, McCombie, Haywood, Hull, Fawkner, Annand, Kerr, Stephen, Young, Johnstone, Langlands and Captain Cole. The resolutions pointed most indignantly at the wrongs which Port Phillip continued to suffer, and stated that in the event of separation not being at once conceded the people would be wound up to such a pitch of exasperation as must be highly detrimental to those feelings of attachment to the mother country and loyalty to the Throne, which ought to distinguish a British colony. So violent was the indignation that these strong resolutions were carried by a large majority over others of a milder character submitted to the meeting. A division of opinion having unfortunately arisen the meeting separated without adopting a petition; but a second meeting was held (opposite the Court-house) on 6th December, at which the greatest unanimity prevailed, and a petition to the Throne was adopted setting forth the injustice which Port Phillip had suffered, and praying that irrespective of the general Bill for the government of the Australian Colonies, a separate measure might be introduced for the separation of the Province from N.S.W. and its erection into an independent colony, bearing the royal name of Victoria. Meanwhile the trade of Port Phillip had been steadily increasing; the exports for 1848 amounted to £737,067, and the imports to £479,831. The ships inwards for 1849 were 484; and her pastoral pursuits had expanded

with great rapidity. The financial minute of his Excellency for the year 1850 was laid before the Council on 19th June, and in the estimated revenue and expenditure Port Phillip and Sydney were for the first time divided, in anticipation of separation. The estimated revenue for the year was—for Sydney, £204,448 7s. 2d.; for Port Phillip, £123,650. The estimated expenditure was—for Sydney, £242,886 6s. 7d.; for Port Phillip, £123,212 18s. 11d. For the first time, Port Phillip appeared, now, likely to reap the benefit of its revenues; instead of paring down the expenditure to the lowest farthing for all the departments, there was exhibited a judicious liberality, for it was contemplated that separation would be immediately granted, and the appropriation of the revenue had become a merely nominal act on the part of the Legislative Council of N.S.W. The Australian Colonies Government Bill went triumphantly through the second reading, and the clause which provided for the separation of Port Phillip from N.S.W. passed in Committee on the 22nd March. A warm debate arose on the constitution of the Legislature, and an effort was made by Mr. Gladstone, Sir William Molesworth, and several other colonial reformers, to have the mixed House of Legislature altered into two chambers. After an abortive attempt, on the part of Sir William Molesworth, to have the Bill recommitted, in order to change its character, and give the colonists responsible government, the Bill passed the Commons. It was discussed in Committee on the 10th June in the House of Lords; and Lord Stanley opposed the federal clauses, and had them erased. On the 11th of that month an attempt was made by the Hon. F. Scott and Robert Lowe to obstruct the measure in its course in the Lords. The proposal that counsel (Mr. Lowe, of course) should be heard against the Bill, at the bar of the House, was not however entertained. In proroguing Parliament, a few days after the measure had become law, Her Majesty said—"The Act for the Better Government of the Australian Colonies will, I trust, improve the condition of those rising communities. It will always be gratifying to me to extend the advantages of representative institutions, which form the glory and happiness of my people, to colonies inhabited by men who are capable of exercising with benefit to themselves the privileges of freedom." The public mind in Victoria, as the colony was after this officially named, had been on the very tip-toe of expectation watching for the intelligence of the passing of the Bill. The people cared but little that it had been materially altered by the Lords, that the clauses which had reference to the Federal Assembly had been expunged, that the powers of the colonial Legislatures had been abridged;—they were so happy at the prospect of emancipation from the thralldom of Sydney, that they would have welcomed almost any Separation Bill, however objectionable some of its details might have been in principle.

The Act for the Better Government of the Australian Colonies did not arrive until the 13th January following. It came into force in N.S.W. on that day; but the independence of Victoria actually dated from the day on which the first writs for the election of members to serve in the Legislative Council of Victoria issued, when, and not before, the District of Port Phillip was by the Act erected into and thenceforth formed a separate colony, known and designated as the Colony of Victoria. A great public meeting was held on 21st March in the Mechanics' Institution for the purpose of deliberating on the steps proper to be taken for securing a fair and equitable representation and also for providing for purity of election by means of the ballot. The following gentlemen took part in the proceedings:—Drs. Palmer and MacArthur, Messrs. Kerr, Johnston, O'Shanassy, M'Combie, Hull, Fawkner, Westgarth, Tankard, Bear, Watson, and Major Mercer. The discussion on the first question continued so long that the meeting could not entertain the second; and an adjournment was carried, in order that the ballot might be fairly entered upon. Several resolutions were put forward at the first meeting; but the one proposed by Kerr—"That this meeting regards population as the only true and safe basis of electoral power; and is therefore of opinion that the division of the Colony of Victoria into electoral districts should be determined in accordance with that principle, by the establishment of districts containing as nearly as may be an equal extent of population, each district to return one member only,"—was affirmed by a considerable majority. Dr Palmer argued in favour of giving only one-half of the representation to two-thirds of the population and wealth of the province; he proposed to accomplish this by giving the counties of Bourke and Grant one-half of the representatives, and to divide the remaining half amongst the other parts of the colony. This proposal met with little favour; indeed, the only question on which any real difference of opinion appeared to exist was, as to whether the principle of equal electoral districts should be applied, in the same way, to the towns as to the country; for some, who were in favour of the principle in general, were averse to cutting Melbourne, and other towns, up into electoral districts. The members who had been elected to represent Port Phillip were present, in order to acquire a more accurate knowledge of the wishes of the people, and took their departure the day after, to be present at the opening of the Council. The last session of a N.S.W. Legislature, possessing any authority in Port Phillip, was opened on 27th March by Sir Charles Fitzroy, who stated that the object for which he had called the members together was, the enactment of the measures necessary to give effect to the provisions of the Imperial Act for the Better Government of the Australian Colonies; that the necessary bills had been prepared, and would at once be submitted to the House. The

Victoria Electoral Districts Bill gave general dissatisfaction. The total number of members proposed was thirty, ten of whom were to be Government nominees, leaving twenty to be elected by the people; and Melbourne, with a third of the population of the whole colony, was only allowed three members. The people of V. petitioned against the measure, but the Council declined to make any alteration; indeed, the members did not wait for any remonstrance, but entered on the consideration of the Bill in Committee on 22nd April, at a quarter to four o'clock in the afternoon, and by seven in the evening they had settled the distribution of the representation of the colony. An amendment of Ebdens's, to give Melbourne four instead of three members, was lost by sixteen votes to eight, although supported by all the Port Phillip representatives, as well as by Dr. Lang, Lamb, and Oakes. A motion to give three members to Bourke, and another, to increase the members of the Legislative Council to thirty-six, were both lost, and the Bill passed without any material amendment. The Colonists of V. regarded it as a very objectionable measure, inasmuch as their desire to have population made the main basis of representation was not taken into account in the distribution. The electoral district of Melbourne had only a member for every 7714 people, whereas Belfast and Warrnambool, with a population of 1347, had one member, and Portland one, with 1025; North Bourke had only one member for 6546, and South Bourke but one for 5256, while Gipps Land had a member for 1770, and the Loddon for 1127. The last act of tyranny perpetrated by N.S.W. towards V. has now to be considered. By the division between the middle and southern districts, as settled by the Imperial Government in 1840, and announced to the colonists in a despatch from Lord John Russell, of date 1st May of that year, the large country known as the Tumut and Murrumbidgee district formed a portion of Port Phillip, and the Billibong Creek was supposed to be the proper dividing line. The Bishop of A. had moved an address to the Crown against this boundary, and the Imperial authorities were induced to adopt his Lordship's view in the new Act. An attempt was now made by the Port Phillip members, assisted by Dr. Lang, to have the matter adjusted in an equitable manner, but this Wentworth opposed, and the boundary for the time was left as settled by the Act; and V. was unjustly deprived of one of her most flourishing provinces. On 25th April 1851, a message was sent down by Sir Charles Fitzroy to the Legislative Council of N.S.W., transmitting the draft of a Bill for extending the laws of N.S.W. to the Colony of V. until they were altered or repealed by the Legislature of the latter colony; and on the 29th of the same month the Bill was read a first time, read a second time on the following day and passed without any discussion. The last session in which Port Phillip formed a part of N.S.W. immediately afterwards came to

an end. The Colonial Secretary of that colony expressed the good wishes of his government towards the new colony; but no financial explanation was given. During the long period that Port Phillip had been plundered there had been hopes continually held forth to the people that, when separation was conceded, there would be an account current made out between the two colonies, and the balance owing Port Phillip paid over to her; indeed, the superintendent had, upon several occasions, encouraged this impression, and his partisans had urged that all the surplus revenue taken to Sydney would be repaid. The colonists of V. were rather disappointed that the financial obligations of N.S.W. to the new colony were not even alluded to, and were apparently the very last thing which the Sydney politicians had in view. The good wishes of the Colonial Secretary were therefore taken at their true value both in Melbourne and Sydney. On 1st July the Governor-General issued the writs for the election of members to serve in the Legislative Council of V. That act constituted the legal separation of the new colony from N.S.W. and gave it a separate and independent existence. The increase of population had now rendered it necessary that squatting should be in some degree checked. The lands of the colony had, for the purposes of the Orders in Council, been divided into three classes, viz., the settled, intermediate, and unsettled. The first contained the lands most accessible to the people; and it was here that the first direct blow was dealt to the squatters. The orders had authorised the Governor in Council to grant leases of land (exclusively for pastoral purposes) for one year, and, if he deemed it expedient, to make general rules under which the holders of purchased lands within the settled districts might be allowed to depasture stock, free of charge, on any adjacent Crown lands. At this time the lands within the settled districts were held by three classes—the owners in fee, the holders of occupation licenses, and the holders under squatting licenses. The total annihilation of the latter interest at this period is an important event, and forms a landmark in the history of the progress of civilisation in the colony. The management of the unsold lands is intimately connected with the good government and prosperity of any new colony. The local administration at this period cannot be passed over without censure; in the management of the land it displayed a great deal of vacillation and incompetency. In attempting to carry out the spirit of the Orders in Council, a code of regulations had necessarily to be framed, and a considerable discretion had been left in the hands of the Executive; this power exhibited to the world that it was very incompetent to deal with the task which had been thus in all confidence left to it by the Imperial authorities. During the ten years that the province of Port Phillip had been settled it had been daily progressing in population and wealth. Vast interests had been

silently growing up, and new classes were beginning to emerge into importance. All depended upon the land. The first wealth of Port Phillip was acquired from pastoral pursuits, and nearly every person was either directly or indirectly engaged in squatting. The tenants of the Crown had been informed that they only held the land until required for a denser population, and that so soon as sheep and cattle could be replaced by people, it must be relinquished by the squatter in favour of the *bona fide* cultivators; but the evil day appeared distant and those in actual possession laid the flattering unction to their souls that a very considerable period would in all probability elapse before their right would be questioned. The first victims to progress were the squatters within the settled districts who had remained quietly in possession without observing the course which events were taking; indeed they appeared not to have reflected on their danger until threatened with instant and utter annihilation. Many of the class were amongst the first who had arrived with stock who had settled in close proximity to the coast and had not been so enterprising as some of their neighbours. Being in comfortable circumstances they had not desired to change their position, and hoped that they might not be disturbed in their life-time. They were however nearest to the advancing tide of civilisation, and had first to be swept away by it. The proclamation of 29th March, cancelling the regulations of 21st August 1841, for settlement within the bounds of location, and in pursuance of Her Majesty's Order in Council of 9th March 1847, establishing new regulations for occupying lands within the settled districts, fell like a thunderbolt upon the unsuspecting occupiers of squatting runs. By the new system the owners of land in fee were to be permitted to use the vacant Crown lands immediately contiguous to their properties free of charge; but this permission was not supposed to give any other than a right of commonage. Those persons however who owned a square mile of purchased land could demand a lease of three adjoining sections of a similar size, at the nominal rent of ten shillings a section; but no smaller quantity was, under any circumstances, to be let; and the land held under squatting license was to be immediately withdrawn on being either required for sale or applied for under the right of pre-emption. This may be regarded as the commencement of the great conflict between squatting and civilization, which divided colonial society for years into two bitter and contending factions—those who had got a share of the public domain, and those who had not been so fortunate. The Government found it necessary to introduce a change of system, and the squatters within the settled districts being, for the most part a weak and friendless class, their ruin created no great sensation. The rich and influential squatters in the intermediate and unsettled districts viewed the immolation of their poorer brethren without joining in any effort to avert it, deeming themselves

quite secure from molestation. It was anticipated that the new code of regulations would be inaugurated in the settled districts on 1st January 1849, and it was not until 11th October 1848 that the classes most interested aroused themselves, and shaking off that apathetic feeling which had been their distinguishing characteristic, entered the arena of public life in order to delay if possible the movement which threatened to engulf them. A meeting was held and resolutions adopted to the effect that the new regulations would depress the value of stock and totally ruin a numerous class of respectable colonists who had contributed large sums of money to the public revenue, and who had mostly been Crown tenants for the long space of ten years. A memorial setting forth the injustice and impolicy of the proposed measure was adopted and presented to the Executive. This would not perhaps have had much efficacy in that quarter had it not happened that a large class in the middle district was affected injuriously by these regulations, and the rules were found ambiguous, contradictory, inconclusive, and in some cases incomprehensible, instead of being simple, complete, and easily brought into operation. His Excellency resolved to modify them and a second notification appeared in the *Gazette*, dated 21st November 1848, directing that persons in actual licensed occupation of runs might purchase any portion of them not less than thirty acres; and that they might continue to occupy their stations as before. The new regulation was, in fact, only applicable in practice to the class who occupied land in the settled portions of the middle district, but it answered well the objects of the squatters in the Port Phillip district, by prolonging their term of occupation. They were allowed until January 1849 to forward their applications. The Government had then to send officials to mark out thirty acres, which, considering the small staff of surveyors, was a work of time. The land was applied for, but in few cases actually purchased. The time occupied in the surveys was very useful to those interested, as it gave breathing time to look about them, and decide upon the best course to pursue. A class will meet with little sympathy under oppression when the exigencies of a country render them necessary victims. The squatters in the settled districts had become exposed to ruin from the very cause by which they intended to make their fortunes. The land nearest markets and the sea, and of course the most valuable, was first required by the people, and there was no man bold enough to stand forward and say they should not have what was their own. The Government allowed those about to be deprived of their runs a period sufficient to enter into such arrangements for their future support as they could, and most of them were wise enough not to neglect the opportunity. Finding that the new system must ultimately be brought into operation, most of them managed to purchase sections

which entitled the holders to large pre-emptive rights. In the course of a few years when by the discovery of gold real property advanced, these purchases placed the whole of these quasi-squatters in a most independent position. The 6th February 1851 has obtained a place in history as Black Thursday. For two months preceding the country had been under desiccating winds, which appeared to be highly charged with electricity. The herbage was parched up, and everything that the eye could rest upon was dry, dusty and disagreeable. The 6th February dawned much as very hot days generally do: the roseate tints of the horizon were rather brighter and more lurid than usual—the glassed glare over the sky more vividly perceptible. The north wind set strongly in early in the morning, and by eleven o'clock in the forenoon it had increased to almost a hurricane. In the streets of Melbourne the heat was intense and the atmosphere densely oppressive. Clouds of smoke and dust hung over the city. The fires which blazed in the surrounding country no doubt increased the suffocating sensation which was generally experienced. It was hardly possible to go abroad; the streets were nearly deserted; and the few persons who were compelled to make the effort to traverse them stalked along with their faces closely enveloped in cloth; no man, however bold, appeared able to face the furiously-suffocating blast, which seemed to wither up their physical energies. By noon the inhabitants generally had shut themselves up in their various dwellings, too happy to have got out of the reach of the overpowering blast. They continued to sit until night listening in terror to the howl of this real sirocco. Had any portion of Melbourne ignited the whole of the city must have been reduced to ashes, as no effort of the inhabitants could have prevented the conflagration from extending and becoming general. The citizens were providentially preserved from so terrible a disaster. In the country the scene could hardly be portrayed. Early in the morning the wind increased to a hurricane, and bush fires swept across whole districts with the speed of lightning; crossing roads and wide streams; destroying men, women and children, cattle and sheep, crops, fences, houses, and in fact everything that stood in its way. The devouring flames spread everywhere, careering along the dried herbage on the surface, dancing up the large forest trees, and wantoning in the excess of devastation. When the flames first appeared many brave men attempted to impede their progress and avert the ruin of their hopes. They endeavoured to meet the devouring element and beat it back with green boughs. But these attempts were useless; for the fire swept over them with a giant's strength, as if in mockery of such puny efforts, leaving them charred and lifeless lumps on the ground where they had stood. The herds and flocks, the wild beasts and birds of prey, the reptiles, and other animals, endeavoured to flee, but were speedily overtaken, and fell a prey to the

crackling and roaring flames. The Black Forest was, on the morning, healthy and verdant (as the leaves of the trees, even in the summer heats seldom change their dusky green colour); in the evening nothing could be seen for fifteen miles, from Gisborne to Carlsruhe, but charred and blackened trunks. In the majority of cases it was impossible to know how these fires occurred. The whole country far and wide was filled with dense clouds of smoke; the thermometer ranged from 118° to 119° in the shade throughout the day. The settlers generally were not aware of their danger until the furious roar of the bush fires broke upon their ears, when they had to fly and abandon the whole of their property. Not a few escaped death by taking shelter in creeks and water-holes until the violence of the fire had abated and the atmosphere had become bearable. Some individuals were eighteen hours in the water, and in one or two instances died in consequence of this exposure, notwithstanding the intense heat. There were many persons travelling in the bush who had narrow escapes, as they became suddenly enveloped in the flames, and almost suffocated in the sweltering fumes of the surging blast. The craving for liquid in such circumstances was intense, and the thirst almost intolerable. The wind suddenly changed towards night-fall, and at ten o'clock the thermometer had gone as low as 80°. What a scene did the morning of the 7th present? The most fertile districts were utterly wasted: the flocks and herds had, in many cases, been abandoned by their keepers, who fled for their lives; the inhabitants of the country who had escaped were utterly destitute, and the greatest amount of suffering had to be endured by the ruined colonists. The people made very great exertions to alleviate the sufferings of these unfortunate colonists; a public meeting was held in Melbourne, and attended by all the leading men in the metropolitan district, and a large sum of money subscribed, which, under the direction of a committee, was distributed amongst the unfortunate individuals who had been left in a state of destitution.

VII. *The Gold Discovery.*—The history of the gold discoveries in V. is given under the proper heading. The first effects of the gold-mines produced the curiously abnormal effect of reducing the value of real property. In and around Melbourne and Geelong houses and land were for a time very difficult to be disposed of, and were actually falling to lower prices and rentals. There was for the moment too much reason for this effect. In the general impatience to be off to the gold-fields, and to provide an adequate outfit for the occasion, many were pressing their property upon the market, glad to take anything they could get. But this sudden depression soon passed away, and a noble harvest was reaped by all those who, having faith in the ultimate effects of gold, laid out their money upon the tempting bargains of that transition interval. But if one kind of property fell in value at the first, another

kind took the opposite course. Various articles of merchandise sprung at once into unwonted prices, as speculators came in and cleared and recleared the limited market. Beer and spirits went up to double and treble rates. Flour took a rapid rise from £25 to £45 per ton, but with proverbial inconstancy went down again to £16, and finally took with comparative steadiness, an intermediate range. There was an extraordinary pressure of demand for horse food, so that a bushel of oats brought nearly the old price of an entire quarter, while hay rose in like proportion. The fitful market jumping hither and thither in its wide quotations, showed all sorts of curious and unusual relations of price; for at one time oats were dearer, weight for weight, than oatmeal, and hay than the finest flour. Canvas was everywhere bought up at two or three prices for tarpaulings to endless relays of carts and drays, and for tents to the ten thousands at the mines. The towns were alive with new industries, and unheard-of wages were being earned at cradle-making and other novel occupations introduced for the goldfields. The first cargoes of American goods—mining tools, stout cheap furniture, and that world of small ware called “notions,” brought fabulous prices and profits. But as the outside world abounded with all these goods, the colony soon abounded with them too, for importation was indefatigable, and as usual ended in a glut. Those kinds of colonial property that could not be thus competed with from outside, enjoyed a longer career in the market. When many kinds of imported goods were selling below cost price, the shops and warehouses that contained them were maintaining a tenfold value, and the colonial land allotments were still on the rise, after reaching in many cases twenty, fifty, and even one hundred times the prices that were current before the exciting days of gold-mining. The first great accession of population came of course from the adjacent colonies. The earlier news from Ballarat had been fairly resisted by the *vis inertiae* in favour of home; but the reports from Mount Alexander were irresistible. This swelling tide of arrivals commenced in December. In October following the response to Mount Alexander and Bendigo was received from Britain in hundreds of ships and cargoes and ten thousands of emigrants. For a considerable time thenceforward the monthly immigration amounted usually to from 10,000 to 20,000 persons. Melbourne seemed pervaded by one continuous fair that extended almost alike to all its streets. The original citizens, a kind of antediluvian handful of humanity, were everywhere elbowed off their old familiar and peaceful pathways, or swept indistinguishably along in the flood of a new world. Strange indeed were many of these new accessions. The eccentricities of the occasion might have passed all but unnoticed, as they dribbled in handfuls through the crowds of Melbourne or along the great highways, but they were concentrated

in full force at the goldfields. Around these were gathered the representatives of the four quarters of the world. In many a busy and diversified scene, within the compass of a single square mile of her territory, might be heard the tongues of nearly all European nations, as well as the varied intonations of Anglo-America, a substantial detachment of Asiatic speech, a sprinkling of Polynesian, and even a representation of the African; for these negroes that we see here and there, “surfacing” and “tailing,” if they diversify their mother-tongues by an attempt at English, it is surely in a dialect that is all their own. In the first few days of 1852 any tenement in Melbourne might have been leased at next to a nominal rent; the great prizes had attracted the attention of all classes, rich and poor, and persons in trade left their shops and workshops because, in the general confusion, trade was nearly paralysed. The amount of wealth which was obtained on Ballarat and Mount Alexander, and which rumour much exaggerated, induced many persons from the neighbouring colonies to inter-emigrate, and the streets of Melbourne soon again exhibited the appearance of activity. Rents advanced as the demand for dwellings recommenced, until, in February, every house in Melbourne was let at a very much advanced rate. Trade now rallied, and as the crowd of diggers increased, the shops and stores began to exhibit a bustle which was wonderful to behold. Those who brought down gold squandered the proceeds in the shops and hotels, without sense or discrimination. The citizens who had gone to the gold diggings, finding that they could obtain fortunes more speedily in their usual avocations than in searching for the precious metal, returned, and abandoned the hard work and the chance of lucky prizes to the working-men; the merchant returned to his counting-house, the grocer to his counter, and the tradesman to his workshop. The extent and vast richness of the gold-fields became gradually developed; the stream of population flowed in upon the colony with increasing volume; the necessities and luxuries of life were much in demand, and, as money was abundant, the value of every article advanced to a most exorbitant price. Indeed, so high were the profits in trade, that no rent was regarded as too extravagant for business premises in first-rate positions in Melbourne; a long lease, at an ordinary rent, was a considerable fortune, and the good-will of an hotel often brought as much as five thousand pounds, and this, too, in cases where the lease had only two or three years to run. As wealth accumulated the exchangeable value of real property increased with unexampled rapidity; and the colonists began to make their calculations in thousands instead of hundreds. The price of all kinds of mechanical labour advanced in about the same ratio; bricks, which were wont to bring about fifteen to twenty shillings, could not be purchased at this time below from ten to fifteen pounds a thousand; and other building materials were high in proportion. A

building which previously might have been completed for three hundred pounds, could scarcely be finished for as many thousands. The limits of Melbourne were too small to confine the people, who began to scatter themselves over the adjoining country. Land in eligible situations was greedily purchased. The local authorities exhibited a supineness and apathy upon the occasion which cannot be too strongly censured. Instead of meeting the mania for land, in the first instance, with the proper antidote—viz., by putting up a sufficient quantity for public sale—the Government, by their injudicious conduct, which we have already condemned, brought disaster upon the trading portion of the community. The plethora of gold, and the great increase of population, combined to give this enormous value to land and real property. The squatters did not at first feel any of the good effects of the change, for they had very great difficulty in procuring servants, and they were unable to forward the wool, on which they depended, to market. After the first year however the demand for meat became so great that cattle and sheep began to advance with astonishing rapidity; and meat that had brought no more than 1½d. now advanced to 7d. and 8d. per lb. The sheep and cattle farmers were inclined, in the first instance, to believe that they would be ruined by the gold; but perhaps no class of the community ultimately reaped so great benefit from that event. Indeed, from 1852 to 1857 stations and stock were the most lucrative investments in the colony. The agriculturists, on the contrary, were far from being equally benefited; the produce of their farms could easily be imported from other countries, and the difficulty of procuring a regular supply of labour compelled the owners of many hundreds of acres to allow them to lie untilled. It is true that, in the first year or two after the discovery of gold, the supply of flour and other articles was far beneath the demand, and such as raised grain made small fortunes; but, for two or three years afterwards, the colony was literally inundated with provisions from every quarter of the globe, and the prices of produce fell to a ruinously low rate; many farmers were unable to live, and were under the necessity of abandoning the land which had taken them much capital to reclaim. The case was very different with the Australian squatters; the market for fresh meat was secure from foreign competition, and they were thus in a position to exact such rates as they thought fit to impose. The position of the trade of the colony at this period may not be unworthy of a passing notice. The branches of the two great Anglo-Australian banks nearly monopolised the exchanges, and did the greater portion of the business, as the merchants generally traded upon the resources of these establishments. The branch of the Bank of New South Wales had just been opened and was transacting a moderate share of business. The resources of the banks and merchants were well able to grapple with the

exports of the colony previous to the gold discovery, which only amounted to £700,000 per annum; but when, unexpectedly, and without any warning, an amount of trade something like ten times as great was thrown upon them, it was not very surprising that all the resources at the command of those classes were taxed to the very utmost. The gold escort was established in October 1851 and the suddenness with which the vast wealth of the diggings was poured into Melbourne will be gathered from the fact that in 1852 there was produced in V. 173 tons 19 cwt. 1 qr. 12 lbs. 3 ozs., valued at 70s. an ounce, worth £14,163,364. The majority of those who dug out large quantities of gold were most anxious to dispose of their treasure; some persons, there is little doubt, forwarded it to England at their own risk; but they were few in comparison with those who desired to sell on the spot. The means to purchase were not at hand, and yet the banks were called upon to buy; and so extraordinary a position were they forced into that one great bank could not have paid its depositors by at least two millions had there been a run upon it about this time; true, the establishment would ultimately have been right enough, as in time this foreign balance would have become reduced and the local creditors would have been paid. In the early part of 1851 the value of the gold had not been ascertained, and the merchants were very cautious in purchasing until a correct assay could be obtained from England. In January 1851 gold was disposed of at Bendigo as low as fifty-shillings an ounce; and in Melbourne it ranged from fifty-six to sixty-four shillings. About June of that year it was ascertained that the real value of Ballarat gold was from eighty-two to eighty-four shillings an ounce; Mount Alexander gold was not worth so much by about four shillings. From that period gold-dust has had nearly a fixed value in the colony. In the first instance the banks refused to purchase, but had no objection to advance at the rate of fifty shillings an ounce; and all those who bought at the rates which prevailed in 1851, and shipped to England by means of the money of the banks, realised large fortunes. These establishments soon perceived the golden opportunity which they were allowing to slip through their fingers; they entered the market, and since that time have nearly monopolised the gold trade. The stores of the merchants were quickly emptied, and even the supplies which could be obtained from the neighbouring colonies were found inadequate to meet the demand of the large population now on the gold-fields; indeed many began to fear that provisions would become scarce and that a famine would ensue. Those who had stocks on hand or who operated quickly in the market as importers, realised fortunes; but about 1852 supplies poured into the colony from all quarters of the world, and the merchandise increased so much in amount that in July 1853 a glut appeared inevitable. Persons in

every part of the United Kingdom who could not come to Australia to get gold engaged in a speculation of some kind or other to the golden city of Melbourne; and as a vast quantity of the goods were unfit for the market they threw agents and merchants into great perplexity and confusion. Many thousands of pounds worth of merchandise were allowed to remain untouched on the wharf at Melbourne, and must have become a total loss to the owners; the roads to the diggings and the inland towns were completely cut up by the severe winter; indeed there appeared no outlet for any kind of merchandise. The storage accommodation of Melbourne was very limited, and the rates charged most exorbitant; the carriage was paid at the rate of £160 a ton to the diggings, or 1s. 6d. upon every pound of flour or other article of consumption; and out of 60,000 persons, said to be on Bendigo in the winter of 1852, at least a third were not able to buy food sufficient to maintain themselves. The lesson was not however lost upon the population on the goldfields; and the succeeding winter found the people much better prepared: not only the store-keepers, but even the diggers, had laid in large stocks of provisions and general stores. A marked alteration was, moreover, visible about the end of 1852 in the social organisation of the great mass of the diggers; the colonists had, as we have already mentioned, rushed to the gold-fields expecting to pick up treasure in masses, and return at once with sufficient fortunes. Many set forth barely supplied with the necessities of life, intending merely to be out campaigning for a few weeks. They seemed to think that it would be a hard case if the old colonists should not obtain a share of the treasure, and with that view they started. But when it became apparent that digging was a pursuit which would only remunerate those who followed it with steady energy, they at once abandoned it and returned. The majority of the original colonists had some other mode of living, or were enriched by the rise of property, and therefore independent of so very laborious a pursuit. The gold fields were abandoned to those who had no other occupation, and who followed mining or gold-hunting as a means of earning a livelihood. The diggers formed a society independent of the other classes, and in 1853 they commenced agitating for the repeal of the license-fee, and, the Executive declining to accede to their prayer at the time, the foundation of that unfortunate spirit of discontent was laid, the results of which were so much to be deplored in the succeeding year. The fatal effects of the blundering incapacity of the Government at this period were exhibited in the Ballarat Riots, a narrative of which is given under the proper heading. The subsequent history of the gold-fields does not need to be repeated here.

VIII. *Independent Government.*—The separation of the Port Phillip District from N.S.W., and its elevation into an independent colony under the name of Victoria, was celebrated by the citizens

of Melbourne with rejoicings of three days. The date is already stated as the 1st July 1851. On the 16th Superintendent La Trobe was officially installed as first Governor of Victoria. The proceedings on the occasion were rather imposing; a salute was fired, and the commission was read by the Colonial Secretary, in front of the Government office. The whole of the officers of the Government were present, and His Excellency held a *levée* immediately afterwards, which was attended by a number of colonists. The former sub-treasurer, Captain Lonsdale, was now nominated Colonial Secretary, Ebdon was appointed Auditor-General, Stawell was Attorney-General, and Barry was Solicitor-General. Some discussion had antecedently occurred in the colony as to the consistency of British institutions and constitutional principles, with the concession of the franchise to Crown tenants. But as the colony could hardly be said to possess political privileges, when its chief interest did not participate in them, this discussion was promptly settled. And now approached the sounds of preparation for the first of the colony's elections. There had been no little grumbling in the chief centres of population at the stinted share of political power doled out to them by the electoral arrangements of the Sydney legislature. There were to be thirty members in the Assembly, of whom twenty were to be elective; and of these twenty, Melbourne, with nearly one-third of the colonial population, had but three. The great proportion of power had been thrown into the thinly-peopled regions, especially where squatting influences predominated, and with such good effect, too, that it was feared the Assembly would usually present a clear majority of members consisting unitedly of Crown nominees and Crown tenants. This anticipation, indeed, proved correct, and the Imperial arrangements were, in consequence, rendered somewhat illusory, if honestly intended, as they doubtless were, as gradations towards popular government. The position in the meantime was further unfortunate in protracting a settlement of the Land Question, and in arousing against the squatting interest a strong popular opposition which, when eventually victorious, pressed rather hardly in turn upon its foe. The Imperial authorities had already taken Conservative guarantees of the colonies in retaining the one-third of the nominee element, and it was reasonable to suppose that they had no intention of any further action in the same direction by any electoral manipulation in A., such as the local Crown Governments further fortified themselves with. The elections passed off with the pleasant excitement that attends an interesting but novel incident. The interest and the novelty alike conspired for the time to free them from those grosser features of popular elections that are but too soon superadded by partisan experiences and matured arrangements. Party questions were not much defined in the torrent of electoral addresses; in other words, the colonists had not as yet

sufficiently studied public affairs to be clear or copious in their political views. There was a strong denouncement against the transportation system to A., which was at the time being actively opposed by the Australasian League. The differences on the squatting privileges had not risen to the height which they shortly afterwards attained when the colony was overspread with additional population poured into it by the attractive influence of the gold-fields. There was everywhere an increased expression of loyalty to the parent state. The Council assembled on 11th November 1851, and elected Dr. Palmer as its Speaker. On the 13th the Governor opened the session in due form, and delivered his maiden speech; he referred to the great alteration which the discovery of gold would effect, and the possible difficulties that might arise in consequence. He informed the Council that bills on education, and the judicial arrangements of the colony, would be introduced by the Executive Government; and congratulated the House on the completed independence of the colony, and the representative institutions which it had received. On the 18th of the same month a message was sent down by His Excellency, with the Supplementary Estimate for 1851, amounting to £19,014 18s. 6d., and announcing that the estimated revenue for 1852 was £175,350; while the provision for services was £173,063 18s. 6d. The session was short; not only the Government officials, but the popular members, were rather inexperienced in their duties, and they followed pretty nearly the example of the Sydney House. The first question discussed was the propriety of offering up prayers on each occasion of meeting, which was supported by most of the adherents of the Church of England, but generally opposed by the members belonging to the other sects. The motion was lost by one vote; and another subsequent effort met a similar fate. This is a question upon which much difference of opinion has always existed in the colony; and after Responsible Government had been introduced the discussion was again renewed. The votes in favour of opening with prayer were fewer in the Assembly than those against such a course; but in the Council the votes were about equal; and a proposition to open the proceedings by reading the Lord's Prayer was subsequently carried. The most important matters which came on for discussion in this session were those arising out of the increased expenditure consequent on the rapid development of the gold diggings. On the 26th November, on the motion for going into committee on the Estimates being put, an amendment—"That it be an instruction to the Committee, that the public expenditure originating in the discovery of gold ought to be borne by the territorial revenue, and that no part of such expense should be taken from the general revenue"—was carried. On the 2nd December a message was received from the Governor, stating that the Estimates were framed at a time when it was

impossible to calculate the influence of existing circumstances on the price of labour; and that there should be such an advance of pay to subordinate officers as to place the Executive Government in a position to secure the public service from embarrassment. A long discussion took place on this message, as it was regarded as an indirect attempt to nullify the former resolution; this objection was taken by the Speaker, and criminal prosecution was even instituted, as the secret was divulged in confidence, on the principle of "telling the lawyer the whole truth: letting him tell the lies afterwards." Four men, named John Jones, James Morgan, James Duncan, and John Roberts, were indicted for the offence, and found guilty after a lengthened trial. The second session of the Legislative Council was opened on the 22nd June 1852, and extended over nearly eight months. At the commencement abortive efforts were made to have some settlement of the accounts between V. and N.S.W., in order to claim the balance due to the former, and to have the boundary line between the two colonies placed upon a more satisfactory footing. The Executive was called on to sell land, both town and suburban, for the use of the people near the cities, and large quantities of agricultural land in the neighbourhood of the goldfields. On the 7th September a most important despatch was laid on the table of the Council from Sir John Pakington, placing the gold revenue and the land fund at the disposal of the Legislature. On the 17th of the same month the House passed a resolution conveying the thanks of the Council to him for the kind and considerate tone of his despatch, and for the concessions he had made to the colony. In the course of this session a letter from J. C. King, the delegate of the Anti-Transportation League in England was published, announcing that Earl Grey was still determined to continue transportation to V.D.L., notwithstanding the gold discovery; the Council was petitioned to introduce a bill for the prevention of convict immigration. The measure was brought in, and notwithstanding great opposition from some of the officers of the Government, it passed the House, and was assented to by the Governor. On the 4th February 1853 the House carried a cordial vote of thanks to His Excellency for his prompt assent to this bill; it also severely censured the conduct of the Governor of V.D.L., and expressed its strong feeling against transportation to the Australian Colonies, and requested the Governor to transmit the resolutions on the subject to Her Majesty. The great influx of Chinese was first taken notice of during the course of this session, and the social evils which would flow from it appeared to have been feared even at this period. The Government promised to direct its attention to the subject. The Act to facilitate the apprehension and prevent the introduction into the colony of offenders illegally at large, imposed a penalty of £100, or imprisonment for six months, on any master

mariner conveying into V. any run-away convict, or any one under conditional pardon, ticket-of-leave, or indulgence of any kind other than a free pardon. This Act was very stringent, and informations under it were laid in the Water Police Office, Williamstown, against masters of passenger vessels trading to V.D.L., and in not a few cases convictions were obtained. The measure was denounced and condemned as unconstitutional by the Press of N.S.W. and V.D.L.; but when the peculiar circumstances of the colony at this period are taken into consideration, any impartial person will admit that the enormity of the provocation demanded such an enactment, in order that an intolerable nuisance might in some degree be abated. On the occasion of opening the first criminal sessions at Castlemaine, in the course of his opening address to the jury Mr. Justice Barry entered into various details respecting the number and nature of the crimes which had been previously brought before the courts of the colony; he stated that these crimes had been committed chiefly by runaway convicts from V.D.L., and that in one quarter there were no less than sixty-six persons of this class tried and convicted in V. And there appeared at this period every probability of the evil increasing to an almost unlimited extent; for a despatch from Sir William Denison to Earl Grey had been published, in which that perverse official actually attempted to argue that so far from the gold discovery being a reason why convicts should not be sent to A., it was exactly the reverse. The free labourers, he argued, would all desert to the diggings, and agricultural and pastoral pursuits be left dependant on convict labour. He observed, "In point of fact, for some years to come at all events, we must rely upon their labours to supply us with food; and although the temptations to the convicts to abscond would, *to a certain extent*, be greater in such a case than they are at present, yet I do not imagine that I shall find any difficulty in maintaining such an effective police as will check this tendency, or at all events prevent the evil effects which might arise from it." Of course, had Sir William Denison confined his observations and recommendations to V.D.L., he might have been excused on the plea of public duty; but he argued that convicts were necessary for the whole of the Australian Colonies; and he urged on Earl Grey the propriety of sending out annually, in addition to the number of convicts usually forwarded, two thousand probationers, and the like number of free emigrants. No wonder that the people of V. should have entered their protest against this scheme; that they should have condemned the proposal to inundate their colony with hordes of wretches steeped in crime. The Convicts Prevention Act was imperatively demanded to avert the threatened ruin of the colony. On the 8th February the Legislative Council was prorogued by the Governor, who made a lengthened speech. He congratulated the members on the success of the new tariff, which

was likely to increase the customs' revenue. He expressed his conviction that the establishment of county courts and general sessions would materially assist those entrusted with the administration of justice. In alluding to the Act to facilitate the apprehension of offenders illegally at large, he said he was satisfied that such a measure was imperatively necessary for self-protection. He alluded briefly to the Harbour Regulation and Pilotage Act, and the measure for general registration, and expressed his conviction that the enactment relating to the organisation of the constabulary force would be the means of securing peace and maintaining order in the cities and populous districts. He said that he had given a ready assent in Her Majesty's name to the bill proposing additional and liberal provision for public worship; and also to the bill for altering the Electoral Act of 1851, and increasing the number of members of the Legislative Council. He expressed his regret that no general postage act had been introduced; and said that a serious inconvenience and loss had resulted to masters and owners of vessels by the desertion of seamen; some measure to prevent the continuance of this system was necessary. There were forty-five bills passed during the session; the most important of these have been noticed in the above review of His Excellency's address. The Legislature had bestowed considerable attention on many subjects; but the most important, perhaps, of all had been next to neglected. It had blamed the Government freely enough when the sole responsibility of the management of the goldfields rested with it; but after the despatch from Sir John Pakington had been received, and the importance of the concession acknowledged, which virtually, on behalf of the Queen, abandoned the control of the goldfields, and invested the Legislature of the colony with the privileges thus voluntarily conceded, the Members of the Council made no effort to reform the abuses which they had so loudly condemned. The only attempt in this direction was made by W. Campbell, Member for the Loddon, who obtained a committee on the state of the goldfields, which commenced its labours towards the close of a very prolonged session, and only had ten sittings; the persons who gave evidence before it were, the Colonial Treasurer, S. J. Cooke, J. Harrison, G. Gilbert, and W. H. Wright, Chief Commissioner of Goldfields. The report was unworthy of the chairman, whose industry and intelligence were acknowledged; it was unconnected, inconclusive, and worthless for any practical use; it contained however a few interesting facts. It said, in reference to the Government officials, "The present staff of Gold Commissioners consists of eleven at Mount Alexander; seven at Bendigo; one at Korong; one at Daisy Hill; five at Ballarat; and two at the Ovens; making, in the aggregate, twenty-seven; which staff is considered insufficient for the collection of license fees, and a due co-operation with the police." And it quoted the

Chief Commissioner's estimate of the number of persons digging at about "15,000 at Mount Alexander; 15,000 at Bendigo; 1500 at Korong; 1500 at Daisy Hill; 10,000 at Ballarat; and 3000 at the Ovens; making 46,000 in the aggregate; and that about one-fifth evade payment of the license fee, which, under a more efficient system of subdivision, would not be so easily evaded; whereby a greater revenue would be collected, and better police protection afforded to the diggers." The report referred to the necessity of preserving water-holes, destroying butchers' offal, and compelling the diggers to discharge their washing stuff outwards from the water-holes, so that the muddy water might filter back through a stratum of soil or gravel. In treating of the license fee, the report exhibited the greatest want of thought and acquaintance with the subject; recommended its continuance, and stated "it was well adapted both for the purpose of revenue and police supervision." It concluded by recommending that an Act for the regulation of the gold-fields be passed in the course of the session. No action, however, was taken on the report; for the only measure introduced was the Export Duty on Gold Bill, which emanated from the Government, and was rejected by the Council; indeed, the popular representatives separated, leaving the gold fields in the same position as they were when Sir John Pakington's despatch was received. The population had doubled itself in 1852; those who arrived in that year (77,661) being, as near as possible, equal to the whole population in 1851. The number of persons attracted from the neighbouring penal colonies increased crimes against life and property, and the highways and public streets were unsafe at noon-day. The Police force was in a state of disorganization; and the members of it, which really could be termed effective, were under different heads. The new Act, which (in imitation of the Metropolitan Police Act) placed the whole body under one general chief, tended very much to restore order and security. W. H. F. Mitchell was appointed Commissioner; the pay was raised, and respectable men induced to enlist into the constabulary; the old adage, "set a thief to catch a thief," having been found to work but very indifferently. The Government, in their anxiety to rectify the error of giving insufficient pay, fell into the opposite extreme; the Council, that had previously found fault with the Executive for its parsimony, now complained of its extravagance, and cut down the estimate submitted for the support of a police force. The Act to apprehend offenders illegally at large had a most important and beneficial effect. Its provisions applied to escaped convicts, and even to those who had obtained conditional pardons, not available in England; and numbers of felons found at large were apprehended and punished. Amongst the number was the notorious bushranger, Dalton, who was fortunately arrested by the Melbourne Detective Police in so extraordinary a manner that

the facts appear stranger than fiction. One of the questions which early attracted a great amount of attention was the necessity of establishing a mint for the colony. At first the capital of the colony was totally unable to grapple with so great an export; for a long time the price was much lower than in Europe; indeed, from October 1851 to June 1852 it ranged from fifty-eight to sixty-three shillings and sixpence for virgin gold, which was worth about eighty shillings in London. This was a mere accident, which must have rectified itself in the course of events; for, when British merchants discovered that so great a return could be obtained upon capital, it was next to a certainty that the ordinary laws of supply and demand would have caused a sufficient influx of capital to buy all the gold there was to sell. The diggers would not, however, wait the effect of competition on the price of bullion, but began to argue strongly in favour of a local mint, in order that they might turn their gold into standard coin. These views were supported by several influential colonists, but opposed by others. The Imperial Government granted N.S.W. the privilege of having a mint in Sydney; but not till many years afterwards was a similar privilege conceded to V. The Legislative Council, which had been increased in numbers, in accordance with the expansion of the wealth and population of the colony, was opened in its third session by the Governor. The St. Patrick's Hall, where the members assembled, presented a more than usually animated sight upon this occasion. The new Colonial Secretary, J. V. F. L. Foster, made his appearance as the leader of the Government or official division of the House. He was one of the early colonists of Port Phillip, and had been returned as one of the members to represent the colonists in the old N.S.W. Legislature. He had after this returned to Britain, and by dint of perseverance and the exertion of such interest as he possessed, succeeded in obtaining the Colonial Secretaryship of V. The Governor, having congratulated the members of the Legislature on the general prosperity of the Colony and the augmentation in their number under the act passed in the former session, announced the intention of the Imperial Government to grant enlarged constitutional privileges to the Australian Colonies; and on proper safeguards being adopted, to make over to them the power hitherto reserved for fixing a civil list—controlling the Crown revenues—and managing the waste lands of the Crown. The only other matter of importance touched upon was the proposition for abolishing the license on gold diggers, and imposing merely a registration fee. On 1st September the new Colonial Secretary introduced the important question of this session, by moving for a committee to prepare a constitution in order to submit the same to the Council. The great point in dispute in reference to the proposed constitution was the double chamber. In the discussion on the former bill Earl Grey had stood alone in maintaining that one House

would be sufficient. Sir William Molesworth, Lord Monteagle, and Mr. Gladstone on the contrary were all favourable to two chambers. This was the opinion usually entertained in the Colonies, the nominee system being generally regarded as a partial if not a total failure. But a wide diversity of opinion prevailed as to the exact functions of the upper chamber and the basis upon which it should be constituted; and there can be no doubt this was a question of considerable difficulty. It was very desirable to have a second branch of the Legislature, less subject to influence than the Assembly of popular representatives, in order to guard against impulsive action and hasty legislation, and yet to create such a chamber as would possess puissance and influence was difficult. If the Council were to be composed of nominees of the Crown few men of respectability would enter it, and seats in the other branch would be held in so much greater estimation that the upper chamber would not command the confidence of the inhabitants of the colony or sufficiently influence public opinion. In the discussions which followed on the framing of the constitution under which responsible government was introduced, there were some who advocated the nominee and others the elective principle, and there were one or two who proposed a kind of compromise between the two, by what was termed the intermediate plan. This was simply that the Assembly should nominate the members of the Council and that they should not be members of the Assembly. After the subject had been discussed at some length, the elective principle was adopted as the least liable to objection; and in the absence of materials from which to form a chamber of hereditary legislators, it must be evident that no other basis would have sufficed to give the Upper House a sufficiently independent standing with reference to the Executive Government and the other branch of the Legislature. In the course of his opening address the Governor remarked on the probability that before the close of the session he would have surrendered the charge into other hands, and said that he could not but entertain some degree of personal pride in having being permitted to mark and record the advance of V. for so many successive years in importance and material prosperity; that he entertained the confident belief that the moral growth of the colony would be found fully proportionate to her physical expansion. The session extended over seven months, La Trobe still continuing Governor. His administration, disastrous for the colony in all respects, came to an end on the 22nd June 1854.

IX. Governor Hotham.—The arrival of Sir Charles Hotham was hailed by the colonists with extravagant demonstrations of delight. The most sanguine anticipations—which were doomed to be bitterly disappointed—were indulged in, of a firm, temperate, and equable rule. At his first public appearances the Governor, in reply to the addresses

of welcome he received, announced his intention of conducting his Government on the most broadly popular principles, adding—"In the present day a Government cannot be conducted with satisfaction to the people without the fullest and freest communication with the people." The Governor could scarcely have anticipated that the advanced intelligence of the colony, and the owners of property, would take alarm at such expressions. Such however was the fact; for Hotham was not in the same position as when sent out on diplomatic missions to foreign states, where what he said was deemed mere compliments; all his words were now deeply weighed and regarded by the colonists as an enunciation of his intended policy. The heads of the Departments were perhaps less sorry at the mistakes which His Excellency unfortunately made than any other class, for they must have at once perceived that he would have work enough upon his hands without making unpleasant investigations in the public offices, the result of which no man could well foresee. Hotham desired sincerely to do his duty to his sovereign, to govern the people well, and to deserve their approbation. No ruler could have been actuated by better intentions; he was far from deficient in ability, but he wanted tact and experience. He had no one to aid him, and he failed in accomplishing what he intended. The Government departments were at this period in a state of bewildering disorganisation. The high officials had been guilty of conduct which an officer like Hotham, who had said he would regard no man in his administration of public affairs, would probably have visited with the severest censure. The noble revenues of the colony had been squandered under the imprest system. The confusion in the public accounts occurred after the resignation of Ebden, and the introduction of the imprest system. This was tolerated, if at all, to a very limited extent, when Ebden was in the Audit office; but the money imprested was small in amount, and had to be accounted for to the Government before the department could obtain any more funds. In the time of Ebden's successor sums of enormous magnitude were allowed to the heads of the departments, and no correct account delivered for a long time afterwards. No proper account had even been kept of the manner in which they had been swallowed up. Enormous amounts had thus disappeared; in one department, that of the Civil Commissariat, a very large sum, amounting to nearly three hundred thousand pounds, was unvouched for. Regular statements were however prepared and submitted to the Legislature, which under the old system had no means of obtaining correct information on the state of the public accounts. La Trobe was plodding enough in composing despatches to the Colonial Office, but was wanting in the necessary energy to grapple with such an accumulation of abuses as had grown up within a few years. Hotham found that the revenue for the six months

previous to his arrival was short of the estimate by a sum that seemed incredible, and that his administration was plunged into monetary difficulties. He at once instituted a rigorous personal enquiry into the condition of the various public departments, and set about rectifying the manifold abuses he discovered with an unsparing hand. The result was that he found himself involved in bitter personal enmities with the official heads of the departments. With Foster in particular the quarrel was open and avowed. It soon became evident to those who reflected on public questions that Hotham was not receiving the cordial support of the officers under him, and that he must soon be in a serious dilemma, acting, as he appeared to be, on his own unaided judgment. He would have made a very good Governor had he found responsible government in operation, for he really had a warm desire to do justice to the people. He soon discovered that all who were nominated to governments in colonies under the despotic administration of the Colonial Office had good cause to know but too well that, in order to comply with the wishes of Downing-street, they would in some cases have to govern in direct antagonism to the views of those over whom they were placed, and who were alone interested in the measures they were called on to carry out. A short time after His Excellency had been enunciating the most liberal sentiments, and stating that "all power proceeded from the people," a despatch arrived from Sir George Grey in reference to the re-enactment of the Convicts Prevention Act during the preceding session. The Minister denied the right of the colonists to pass any law interfering with the Queen's prerogative, and instructed the Governor to release the criminals who had been imprisoned under the objectionable Act. There was no subject on which the people and the Legislature were so determined as the maintaining of this law in its integrity; and Sir Charles must have had his mistake, as to his position, corrected. He had acted as an independent ruler; he must have now seen he was but the nominee of the British Cabinet. There were but few colonists who understood this subject but would have spent the last drop of blood in their veins rather than admit the right of the British Crown to let felons loose amongst the free population, already cursed by too many of the refuse of society from the adjoining penal settlements. The comparatively small community of 1849 had solemnly declared that they would resist the landing of convicts even by an appeal to arms; and now that the population was quadrupled, and the people felt their strength, it was not likely they would allow the sanctity of their hearths to be violated. The almost simultaneous expiration of the Convicts Prevention Act by the effluxion of time with the arrival of this crisis on the Colonial Minister excited the public mind. The crisis had come, and no compromise could be allowed; indeed if so odious an exercise of the prerogative had been

insisted upon, and the doors of the gaols had been opened for those confined under the Act, the colonists would have resisted, and the connection between the colony and Britain would perhaps have been severed. A great public meeting was held in front of the Court House, at which resolutions were carried strongly condemning the measure, and protesting in the most solemn manner against it. The speakers were Westgarth, Michie, Ireland, Eades, Clowes, Blair, Marsden, Owens, Kent, Mackinnon and Newton. The meeting adopted a petition to the Legislature praying, "That in order to the protection of the colonists from further inundation with foreign crime, and in vindication of their own right of freedom of legislation, their Honourable House would re-enact the Convicts Prevention Act with such additional clauses as would prevent the introduction to Victoria of the convicted criminals of other countries or colonies under any pretext whatsoever." The popular indignation was increased by the great favour shown to Sir William Denison, the adviser of this unconstitutional effort to set the felons of the mother country loose on V., through the convenient convict colony of V.D.L. He had been raised to the rank of Governor-General of N.S.W., although notoriously unpopular in all the Australian Colonies, having almost excited the free people in V.D.L. to revolt. He appeared indeed to delight in advising the British Government to adopt measures which he must have been aware would raise the indignation of the Australian people. The resolute language at the public meeting held in Melbourne was re-echoed at another meeting held in Geelong; the people even pledged themselves at the latter to "go the length of extreme means in order to avert the threatened plague." Indeed, the Legislature scarcely kept pace with public expectation, for the Convicts Prevention Act had expired in October, and a measure of a more lenient character introduced by the Attorney-General had been referred to a select committee, which did not report on it until the beginning of November. The committee then simply stated that there were so great difficulties in carrying out the Government measure, and which was entitled "A Bill to prevent the influx of unreformed criminals," that it could not be adopted. The great demonstration of the 23rd October and the now unanimously expressed resolve of the people to resist at all hazards—to throw the consideration of all that was usually held sacred aside—the honour of the Crown—the respect for the Government—the desire for ease and social tranquillity—the aversion to violent measures—and, in short, to sacrifice all other considerations that they might maintain their character as a free people, so that the stigma might never be cast upon their offspring that their fathers had suffered such an outrage without displaying the indomitable spirit of the race from which they were descended, now encouraged the Legislative Council to adopt decisive

measures. The petition from the colonists was presented by the Mayor to the Legislative Council on the 24th October, and on 3rd November Nicholson obtained leave to bring in a bill to prevent the influx of criminals. This measure was even more stringent in its provisions than the act of the former year and it included the class of persons objected to arriving from Britain as well as from the neighbouring colonies. This important enactment, which may be deemed the fixed and inexorable resolve of the people of V. on the question at issue, passed into law on 16th November, and the Government, wisely perceiving the unalterable determination of the colonists, did not attempt to interfere with the course of legislation on this subject. The people were far in advance of the Legislature in patriotic feeling, and were indignant that their representatives did not affirm by a solemn declaration the right of the colony to enact whatever laws it deemed necessary for the good of society. The officials of the Government opposed the measure. This was not much to be regretted, as had they condescended to support the representative members they would have no doubt endeavoured to soften down its best, because its most decided, features. The colony was now forbidden ground to all convicted persons, who were liable to be arrested, and either confined or sent out of the colony. In the fourth session of the Legislative Council a bill was introduced by Captain Clarke, Surveyor-General, for conferring municipal government on country districts, with powers for levying rates for public purposes. This measure, framed after the American model, had a very beneficial effect in ameliorating the condition of the suburban towns and country districts, and has tended almost more than any other towards social and physical improvement. Hotham issued a commission on 2nd November 1854 to inquire into the laws and usages then existing by virtue of which the waste lands of the colony were occupied, and to ascertain what alterations in such laws would be for the public advantage, and the nature and extent of all claims which had arisen, and how they were to be adjusted. On 12th September 1854 the Hobson's Bay Railway was opened, in the presence of His Excellency and a large assemblage of the most influential persons in the colony. The Ballarat Riots which occurred in November 1854, led to the forced resignation of Foster, the Chief Secretary. They also ruined the popularity of the Governor. The more experienced colonists began to doubt his judgment and aptitude for administering the government; and totally unacquainted with the difficulties which he had then to contend with, held aloof. He required advice, for he had no cordial sympathy or assistance from his constitutional advisers, and he had too little knowledge of the state of affairs to govern without such aid. His Excellency, however, displayed considerable discrimination in selecting a successor

to Foster. W. Haines had been returned by the popular voice to the Legislative Council, and was an Englishman and a member of the Church of England, and, therefore, likely to be acceptable to a large portion of the community. Haines may be regarded as a Minister called to power by the favour of the Governor and the good opinion of the people. The events which had passed had taught Hotham a useful lesson; and from this time to his death he evinced a greater desire to govern the colony in a constitutional manner, and the consequence was that it continued prosperous and tranquil. Hotham had learned from practical experience—what he might have learned equally well from history, if he had bestowed any share of attention on that most useful study—that to administer the Government of any country in accordance with the interests and wishes of the community is comparatively easy and simple; but no authority can long exist without the confidence of the people. On 13th December 1854 the new Secretary was introduced to the Legislative Council by the Attorney-General and the Collector of Customs. In his first address he said that the Government contemplated great changes in the administration of the gold-fields, by conceding a proper representation in the Legislature and introducing amongst the people institutions for local self-government. The true method of tranquillising the diggers was at last adopted by granting them political privileges co-equal with the other classes of the community. The insurrection at Ballarat had a beneficial effect on the colony; it promoted social and political progress, and helped materially to place the relations of the Government and the people upon a proper and defined basis. The two bills for carrying into effect these necessary and conciliatory measures towards the people on the gold-fields passed the Legislative Council in May. The number of members of the Council Increase Bill gave Sandhurst, Castlemaine and Ballarat two, and the Avoca and Ovens one representative, being eight members, which gave His Excellency the privilege of nominating four. The Gold-fields Law Amendment Act provided for the issue of a Miner's Right which should give the holder power to work upon the Crown land for one year. A local court was also called into existence before which the miners were enabled to bring their differences for adjustment. The miners could sit as members of the local courts and vote at their election. The Government was empowered to issue leases for auriferous land subject to certain conditions to be framed by local boards. These important measures for extending the franchise to the diggers and introducing self-government amongst them had the desired effect. Tranquillity has ever since reigned at the gold-fields. The close of the session was marked by a partial vote of censure upon the Government. J. F. Strachan moved "That this House deems it inexpedient and impolitic in the Government introducing any new mode of taxation during the present session." A long debate

occurred on the question and it was affirmed by a majority of only one. In closing the session Hotham spoke very briefly and merely alluded to the ordinary topics; in reference to the vote we have just noticed he said, "I am compelled to stop such of the public works as are not under contract and to make further reductions in those establishments which the Council have resolved to be necessary for the performance of the public service." The colonists were deeply grieved at the death of Major-General Sir Robert Nickle, on 29th May 1855. This distinguished officer had entered the army in 1798 and served throughout the Peninsular war with great distinction. He had afterwards been in the States of America and Canada and in the East and West Indies, and was at this time Commander-in-Chief in the Australian Colonies. He had acquired some share of popularity in V. from the great temper and forbearance he had exhibited towards the digging popularity after the insurrection at Ballarat. Hotham had become so unpopular that it was seriously in contemplation to forward a requisition to the Governor-General in Sydney to come and investigate the position of the Government of V. The movement was not ultimately acted on; but it occasioned some sensation. The powers of the Governor-General were set forth at length in a despatch from Earl Grey when Secretary of State for the Colonies to Sir Charles Fitzroy, dated 13th January 1851 and published in the *Sydney Government Gazette* in the following June. The agitation of the matter was far from being agreeable to the Executive. Hotham, who appeared to have deemed Commissions the only method of attaining correct information on questions of public interest, appointed a Committee of three to inquire into the financial condition of the colony. Their instructions referred to the large sums under the head of imprests remaining unbalanced, the necessity of a searching inquiry into the finances of the colony, and also for devising a financial scheme suitable for the future. The gentlemen who formed this "Secret Commission" were the Auditor-General, William Hamilton Hart, and David Charteris MacArthur, and they reported on 11th September 1854. The Committee exposed some of the frightful effects of the imprest system; by returns they furnished it appeared that on the 28th August the sum of £1,682,328 had been imprested, and no adjustment of it effected; and, deducting £372,089, the accounts not due, there was the balance of £1,310,238 unaccounted for; of this balance accounts for £8093 had been received and passed for warrant; accounts for £157,835 were in course of examination; accounts for £182,599 had been received in the audit office; accounts for £677,964 had been received, but the authority for the expenditure was insufficient, leaving the sum of £283,745 wholly unaccounted for. Of the large sum of £1,310,238, which remains unadjusted, the Civil Commissariat, Police, and Public Works departments, represent £883,250. The Committee

recommended that the imprest system should be abolished, and accounts discharged after final audit only at the Treasury. The New Constitutions, as framed by the Legislatures of the different colonies, were brought before the Imperial Parliament by Lord John Russell, and passed with scarcely any remark. Robert Lowe opposed the nominated Upper House for N.S.W., but his opposition was ineffectual. The New Constitution Act was received by the *Shalimar* on the 16th October 1855. It was officially proclaimed on 23rd November by His Excellency, who had recommended a general holiday in honour of the event. The Government offices were closed, and business generally was suspended, but there were no public rejoicings. On the same day the Legislative Council was opened for its last session prior to dissolution, by a speech very different from the Governor's former efforts. This document evinced very considerable ability, and a skill which is seldom met with in the State papers of Hotham. He congratulated the Council upon the working of the new Acts for the regulation of the gold-fields, and upon his own financial reforms, and the improved aspect of public affairs generally. The new organ of the Executive received considerable credit on this occasion; but a movement which he, in conjunction with the other high officers of the Government, thought themselves called upon to make, in order to introduce responsible Government into the colony, lost him much of the popularity he appeared to be attaining. A wide difference of opinion existed as to the exact period when the various heads of departments should cease to be responsible to the Crown and become responsible to the popular Legislature. The officials felt themselves in a difficult position in framing the estimates; the doubtful point was this: should they regard the estimates as framed by his Excellency, and the Ministry as being responsible to him for the manner in which they carried them out as had hitherto been the case, or should they look upon the estimates of revenue and expenditure as their own, and introduce them in the approved budget fashion? The Colonial Secretary asked the Governor in what position as to responsibility he considered the officials to stand? and, after the subject had been duly considered, the high officials received a circular releasing them from office on "political grounds." Haines, the ex-Chief Secretary, was then sent for in the most approved form, and having been requested by His Excellency to form a Ministry, immediately appeared with the members of the Executive who had just resigned. The Council and the people concurred in thinking the members of the Ministry were actuated by a desire to secure their pensions. Under the 50th clause of the New Constitution Act, persons released from office on political grounds were entitled to pensions, but this clause was qualified by the next clause, which provided that pensions shall be granted subject to the regulations in force in Britain, which shut out all

who may not have been two years in office. The new Ministers only escaped a severe vote of censure for thus prematurely assuming "responsibility" by one vote. They had, moreover, anything but an agreeable task before them with the great bulk of the popular members decidedly hostile to their policy, and the Governor inclined to exact compliances hardly in accordance with their vaunted responsibility. On the 18th December 1855, William Nicholson proposed a motion for the introduction of the ballot. The terms of the motion were—"that in the opinion of the House, any new Electoral Act should provide for electors recording their votes by secret ballot." This resolution was not only opposed by the newly-appointed responsible Government, who contrary to Nicholson's express desire made it a Ministerial question, but by Mollison, Smith, Fawkner, Greeves, O'Shanassy, and O'Brien, who were opposed to the Ministry. It was, notwithstanding, affirmed by thirty-three votes to twenty-five, and the Cabinet had of course no alternative but to resign. They had made an error in consequence of their having over-rated the influence of those popular members who were notoriously antagonistic to the measure. They became the victims of this misplaced confidence. The advocates of the ballot had not anticipated this, and were scarcely prepared for assuming the responsibility of forming an administration. Hotham adopted the constitutional course of sending for Nicholson, who rather unwillingly accepted the task of forming a Ministry. With some difficulty he obtained the services of a gentleman competent to carry on the various departments. But when he had organised a Ministry he found that they were not likely to have that political cohesion and unanimity of sentiment which in his opinion were necessary to carry on the official business of the country. He therefore reluctantly abandoned the task and assumed the whole responsibility of this failure. In the short explanation he made to the House he stated that if he had desired office he might perhaps have got a Ministry together, but under the present constitution he had thought it difficult to find men capable of forming a Ministry; and the difficulty was this, that persons were not politically consistent, and it was hopeless to attempt to form a Ministry differing from him on almost every question." On a subsequent occasion he interrupted Chapman, who was proceeding to excuse the failure, and said "It would be better not to enter on details; he alone had failed and he was willing to take the responsibility of it." During the pending negotiations between Nicholson and the other supporters of the ballot in the House, Sir Charles Hotham's death occurred; and Major-General Macarthur, the officer who assumed the administration of the Government in accordance with the letters patent appointing the former to be Governor-in-chief of the colony, recalled Haines and the other members of his Ministry back to office. Had Hotham lived there is little

doubt that he would have endeavoured to construct a new Ministry out of such materials as were within his reach. Like Lord Metcalf, when Governor of Canada, he would have canvassed the colonists to become Ministers rather than be placed in a position which he deemed humiliating. Perhaps under the circumstances Major-General Macarthur adopted the wisest course which was open to him, and at any rate it was a step which relieved him from a considerable amount of responsibility and annoyance. In his explanatory speech to the House Haines stated that "Mr. Nicholson having had the opportunity of forming a Ministry and not being able to succeed, he thought the resolution which had been arrived at by the House in reference to the ballot no longer binding, and he should proceed as if it had never been passed." The House however agreed to the ballot clauses proposed by Nicholson, and they were incorporated in the new Electoral Act; and so well did they answer the purpose that the adjoining colonies adopted them. On 14th December Dr. Embling moved two resolutions in the Legislative Council condemning State-aid to religion, and recommending his Excellency not to take action on the 53rd clause of the Constitution Act until the colonists generally had had an opportunity of expressing their views in the forthcoming elections. These resolutions were negatived by a large majority. Hotham had commenced his career by enunciating the democratic principle, that power proceeds from the people. He had not been long in office before his opinions and measures were alike viewed as tyrannical. The Governor, who had been received with the most lavish demonstrations of satisfaction; who had been regarded as the model of perfection, the most liberal of rulers; was now viewed as a narrow-minded martinet, whose proper place was the quarter-deck. The people who had over-rated him now fell into the opposite extreme, and did not give him credit for the abilities which he unquestionably possessed. Hotham had under such adverse circumstances to discharge the difficult duty of introducing Responsible Government. There could hardly have been a task requiring more judgment, temper and discriminating firmness; and as he did not possess these in any eminent degree, it is not much to be wondered at that he succeeded but indifferently in his task. He was, by emphasis, the wrong man in the wrong place. The progress of the colony, meanwhile, had been unparalleled during the first five years of its independent existence. The city of Melbourne had been nearly rebuilt, and spacious warehouses and handsome dwellings occupied space which could previously boast little beyond mere hovels. The commercial relations of the colony had not, however, been by any means so satisfactory as could have been desired. The markets had been glutted with merchandise in consequence of the high rates which had been obtained in the first year of gold digging; prices

fell and severe losses were sustained. The progressive improvement of the colony, and the expansion of its own resources, restricted business. There were many persons engaging in supplying and distributing produce which began to be grown in the colony, and they soon found their occupation gone. Credit had been carried to an extent almost unprecedented. No merchant refused goods to any trader, and the idea of insolvent debtors had not startled them out of their false security. In 1854 the crash fell with great violence; many traders became involved, and there was wide-spread distress in the towns and on the goldfields. The low prices of most articles of foreign production ultimately tended to the increase of the national wealth, as the great proportion of the merchandise was sent out at the risk of persons who were not connected with the colony in business. It was now made apparent that too many persons had embarked in commercial pursuits, and that a considerable portion of the trade was of a forced and unnatural kind; and that numbers of those who expected to obtain a permanent footing as merchants must be disappointed, and compelled ultimately to look out for more legitimate pursuits as a means of living. The banking interest had emerged into very considerable importance. There had been branches of the two great Anglo-Australian establishments in Melbourne from its very infancy; and the Bank of New South Wales had opened a branch just before the date of separation. After the gold diggings had become a fact, the want of another bank became evident to many mercantile men, and the first local institution for banking purposes was launched into existence under the designation of the Bank of Victoria. It has been skilfully and carefully managed, and succeeded admirably, giving the public confidence in domestic associations. The Colonial Bank was commenced in 1855, and promised to be quite as successful as its predecessor. The London Chartered, the English, Scottish and Australian and the Oriental Banks opened branches in Melbourne. A considerable amount of attention began to be bestowed upon agriculture and stock-breeding. Several gentlemen imported "blood" of the first character from Europe. There had been two associations for the promotion of those objects for some years in existence—the Port Phillip Farmers' Society and the Industrial Association. Local societies began to be formed throughout the various districts of the colony, whose operations have been most beneficial. The gold had been obtained in the first instance from alluvial digging and by individual exertions. It was found that the inexhaustible quartz-reefs were all auriferous, and machinery and capital were soon brought to bear upon them; and a far wider field was thus opened for industry in combination with capital. The banks established branches on all the principal gold-fields. In the early phase of Victorian colonisation the want of a continuous stream of free immigration was

urgently felt. Such persons as arrived from the mother country, with very few exceptions, were agricultural labourers and tradesmen, with their families, whose passages were defrayed from the land fund of the colony. But the discovery of gold made a marked change in this respect. Vessels of the largest size crowded into Hobson's Bay, crammed with living freights, until six hundred ships lay at one period there together, many of them destitute of their crews. The sailors at this period usually deserted for the gold-fields. The people arrived in such numbers that no accommodation could be prepared for them, and much suffering and discomfort ensued. Had the government of the colony been better conducted, and the Crown lands been more accessible, the greater part of those persons would have remained. But unfortunately the agricultural lands were not easily purchased, and labour and other appliances were unattainable, so that many who acquired fortunes departed again with their wealth to other countries.

X. *Governor Barkly*.—Sir Henry Barkly succeeded Sir Charles Hotham on the 26th December 1857. The first parliament under the New Constitution had assembled on 21st November 1856. By the 3rd March following a crisis had arisen, and Haines and his friends resigned. The event was interesting, as being the first of its kind occurring after the New Constitution was fairly under way. The stumbling-block arose out of a vote for immigration purposes which had been taken for the sum of £270,000, while, as it afterwards came out, the Ministry's intention at the time, and in fact the arrangements they had made, involved an actual expenditure of only £120,000. The larger sum looked better in the face of some considerable expenses attending a new system of immigration; and besides the £150,000 of spare money might prove convenient to the wants of an uncertain future. But the House rebelled forthwith at this laxity of principle, and on its condemnatory vote Haines was succeeded by O'Shanassy. The new Minister, although himself an able and well-informed public man, was encumbered by a following of a miscellaneous character in a political sense. There was indeed a difficulty as yet in finding "workable" Ministries in the new political field, as Nicholson had already experienced. Public men, even if they had as yet emerged with fixed principles of their own from the race and agitation of the colony's politics, were still little disciplined into mutual co-operation. The new Government lasted hardly six weeks when Haines was again Premier; and as he was personally in general esteem and had brought with him on the whole a better following than his predecessor he succeeded in standing longer. In fact he held his ground, as his impatient opponents of these restless days might have said, for the unconscionable period of almost an entire year, when at last he was in turn upset upon a schedule of an Electoral Districts' Act,

and once more O'Shanassy "reigned in his stead." This last proceeding brings us to the 24th February 1858. By this time much had been accomplished in constitutional questions, notwithstanding what might seem to outside observers the slipshod aspect of the Government as indicated by the repeated ministerial changes. The Legislature that had closed the past order had been considerably pervaded by influences outside the parliamentary walls, and with so much effect that it passed with a fair majority a motion in favour of the ballot—a thing it had never shown any disposition to do previously. Indeed a large proportion of this majority, including even the mover himself, had formerly been opponents of the ballot. But the searching political ordeal of the new system had caused every one to re-examine his political views and to test the theoretical by the practical. In consequence the accustomed anti-ballot theories mostly disappeared. Subsequent experience more than confirmed all the anticipations from this measure both as to its nullifying effect upon bribery and intimidation, and even more, its influence in restraining disorderly excesses and violence during the exciting times of political elections. The first elections under the Ballot Act took place in 1856. The effect was quite extraordinary, the elections having passed off without the least confusion or disturbance, although there was immense popular interest felt in the results. The Ministry of that day too as well as the Assembly were prone to liberalities. Although they opposed the ballot they introduced and passed an Electoral Act which greatly equalised the previously imperfect representations, and thus gave a fairer starting ground for the new order. The Ministry continued the Government during the transition interval; and its leading members having addressed the new constituencies and been elected into the Assembly of the new parliament, they prolonged their administration into the new era. They pleaded strongly for a fair trial being given to the New Constitution, condemned although it now was for its restrictions. They however expressed themselves generally as disposed to accept the new conditions and ideas; and thus the colony enjoyed the advantage of starting on the new course with its old guides under a reciprocity to some extent of confidence and good-will. The development of the programme of the colony's new political career was very rapid. The manhood suffrage, a Government measure, was passed in 1857 with a conservative clause giving a non-residential vote in right of £50 of property or £5 of yearly rental. On the motion of an opposition member (Mr. Duffy) the property qualification as regards membership in the Assembly was abolished. The numbers of this body were increased from sixty to seventy-eight members, and the electoral distribution received on the occasion a further degree of accordance with the population-basis principle. Other measures

of the democratic programme were tried but they were less successfully dealt with. State-aid to Religion after being lost by one vote of the Assembly was still preserved by a majority of one vote in the Council; while all efforts to fuse the two existing Educational boards, representing respectively the rival national and denominational systems, and to introduce some general and truly national system, proved at that time futile although accomplished at a later period. Such were the attainments at the date alluded to. The colony had entered on a democratic course already far in advance of home example, and the proclivities (as an American would express it) were strong. As each Ministry was bowed out its successor braced itself better up to the democratic regimen which accordingly it administered with a more accustomed and less irresolute hand. Three more years elapse without any special results. But in 1861 there seemed to be a reactionary movement. More than one Premier had appeared and passed away in that busy and shifting interval. The Heales Ministry was in office; but Heales' call to the premiership was hardly announced ere the Assembly by a very decided majority pronounced its want of confidence. The House had its likes or dislikes to Heales and his following, or rather to the latter, for that was ever the high ministerial difficulty; and besides Heales was a protectionist. The democratic development had sensibly increased the strength of a colonial protection party which was previously of no consideration, and confined mainly to certain agricultural districts which had hoped for a reign of high prices during the confused prospects of the first years of gold-mining. Under these circumstances it was generally expected that the Governor, Sir Henry Barkly, would have called another Minister. He did not do so however but at Heales' request granted him the chances of a new Assembly. The new elections resulted so far favourably that they diminished the hostile majority; but as they did not remove it, the adverse votes being still forty against thirty-four, Heales and his party quitted office. The programme, as sketched by the Governor in his opening speech to the new Assembly on 30th August 1861, was more ample, perhaps, as well as more precise, than any of its predecessors, and illustrative of what may be called the advanced democratic school of the colony. First, as to the Crown Lands, which although termed "waste," were occupied by squatters. A plan was to be adopted by the Government of permitting occupation of any waste lands by simple license to persons who, with the purpose of settling and cultivating, took 160 acres, on the condition of paying 2s. 6d. per acre of rental. Next, the principle of Protection was to be adopted, partly with the view of increasing revenue by increased customs dues, partly to give the "incidental advantages" to home industries by directing the taxation of imports to those articles that competed with home production. In the same spirit colonial

distillation was to be encouraged by levying a less duty on colonial than on imported spirits. Thirdly, it was proposed to adopt a system of payment of members; and the plan, as understood, was that each member of parliament was to receive a salary of £300 a year. The other chief propositions were, a reduction of the export duty on gold from 2s. 6d. per ounce to 1s. 6d.; the introduction of the Torrens Real Property Land Transfer Act; the substitution of one Education Board for the present two divisions, with the twofold object of economy, and of giving a sound secular education; the abolition of State-aid to religion; and the reform of the constitution of the Council or Upper House. Regarding these proposed measures, the proposals generally were not unsuitable to the colony's circumstances, and were in fact likely for the most part to be carried out gradually in the quieter political procedure that seemed promised to the colony. Already the gold-duty was reduced, and the Torrens Land Transfer Act made law; while a Crown Lands measure, with greatly increased facilities to the purchasing public, was passed by Heales' successors. The State-aid and Education questions either had already taken, or seemed on the eve of taking, the issues indicated above; and the constitution of the second Chamber was to be reformed towards a less restricted qualification, unless that body was content to exist with a legal rather than an actual influence and consideration in the colony. On the other hand, there was evidently a strong prejudice with many at the time against the proposition of the payment of members, arising in the main from a feeling that members should be possessed independently of at least sufficient means of subsistence, so as not to trust to their politics for a livelihood. O'Shanassy succeeded Heales. This time he was aided by more promising coadjutors, as they included Haines and Nicholson; and the Ministry lived to the unprecedented term of nearly two years. The wants and aims of the colony were growing clearer, and thus permitted of more extended co-operation among its public men. The new Ministry applied at once a conservative check to the momentum of change and progress instituted by its predecessor. The "re-arrangement of the tariff" was to have operated protectively by means of duties to be levied on imported vehicles, furniture and other articles that competed with colonial production. An array of wharfage rates was, amongst other purposes, designed to give a slight protection to agriculture, which was not however to be otherwise favoured—to the disappointment of many farmers who themselves restricted in many things by the proposed code, hoped that their interest above all others would be reciprocally cherished. Some extra income derived from these arrangements was to have permitted of a reduction of the tea duty (6d. per pound) and of the duty on the lower qualities of sugar (5s. per cwt.) £20,000 a year was expected from a duty on bank-notes.

The new Ministry disowned all the protective projects and would let the tariff and minuter proposed changes alone for the present. Their attention was given to a final settlement of the long-protracted Public Lands question. That question was complicated by the many interests that had arisen under past and present systems. There was also the difficulty of dealing with the squatters, whose slight and surface use of the natural country, besides the comparatively large area that each sheep and bullock required, suspended that class in a sort of dubious mid-air as to the question of its pertaining to a fixed and permanent system of the colony. By the Imperial Act of 1855 the colonial lands administration was transferred to the colonial legislature. After five years discussion both within and without the parliamentary walls, Nicholson when Premier in 1860 ventured on the first exercise of the new colonial authority on the contentious subject by passing the Land Sales Act of that year, which prevented any further operations of the "Orders in Council," although not expressly repealing them. The other provisions did not embrace the whole land question. Heales' proposition too, besides the same defect, was deemed of an unsuitable character for a colony already well peopled, full of markets and municipal towns, and more or less settled throughout. In laying open all the squatting runs to the agricultural lessee as if they were literally a waste or empty territory it did much more than maintain the old doubts about the relative value of squatting settlements—it really excluded from consideration the very existence of squatting. These discussions and tentative efforts and propositions were not useless, and prepared the way for a comprehensive measure, the Land Law of 1862. The contention hitherto about agricultural settlement being impeded by the squatters must be set finally at rest. This could only be done by the Government reappropriating, as it were, all the lands suitable for agriculture. These the squatters must give up, using them on mere sufferance till wanted. On the other hand, they would enjoy the pastoral use of the rest of the colony, with all the reasonable security of possession that the public interests could afford them. At the same time, even as to these agricultural lands, the squatters were not to be exposed to the casual inroad of any intending purchaser or lessee; for there were to be no sales or settlements prior to the regular survey of the lands, and their proclamation as open to purchase. Regarding the rest of the public, the great object was to promote the permanent settlement of the country by giving encouragements and privileges to a residential agricultural population. Great exertions would be made with the surveys, so that the widest area of choice might be given to intending settlers. To such there would be no delay or uncertainty such as attends the public auction ordeal. Advanced as the colony now was, the price must be maintained at twenty shillings

an acre, but intending residents could select at will over the area surveyed, and they were facilitated in their payments by an option of buying one half of their section, and leasing the remainder at a yearly rent of 2s. 6d. an acre, with the understanding that, after eight such yearly instalments, the remainder was also their own. The land was to be surveyed in sections of from 40 to 640 acres, and no one was entitled to purchase under these regulations more than the latter quantity in any one year. The condition of the colonial lands had been ascertained to be as follows:—There were altogether in round numbers fifty-five and a-half millions of acres of colonial area. Of this extent four and a-half millions had been alienated from the Crown by sale, half a million acres existed in worked gold-fields; there were about two millions appropriated to commonage, and thirteen millions were sterile. There remained ten and a-half million acres suitable for agriculture, and twenty-five millions more that, although not suited to agriculture, were available for pasture. The long lane of the land question seemed about to be run to its final end under the O'Shanassy Administration when there came once more a change of Government. The Ministry had lasted twenty-two months. What were things political coming to? How were all the many expectants on either side the House to come in as Ministers in their day and turn, if any one set takes such a lease of the official seats? Even the fourteen years leases after being demolished in one shape might return in another on the colony at this rate. Nevertheless it was a good sign of the colony's political steadiness. But what caused the mishap? A decided mishap it was, for it was indicated by forty-two votes against twenty-six. It occurred on the occasion of discussing amendments to the New Land Act. The particular point was with regard to the assessments on the squatters. These dues as the Government had promised the Assembly were to yield an increased income, by the adoption of a system of arbitration for ascertaining the depasturing capability of the runs, instead of the previous plan of sworn returns from the respective squatters themselves. The unexpected result was however that the new mode yielded a less revenue, and as the arbitrations had been rather a costly business, the Ministry felt itself in an awkward position before the House. To get out of their difficulty Ministers preferred the course of abandoning the new and reverting to the old mode. This course was however opposed, as savouring of repudiation towards those squatters whose arbitration cases had resulted in the lesser amount. The new system was law for the time and they claimed their advantage accordingly. An opposition was organised in accordance with this view of the case headed by McCulloch, one of the principal merchants of the colony; and when O'Shanassy's Ministry after some consultation on on the subject had decided to resign, McCulloch was entrusted by the Governor with the formation of a

Ministry. These occurrences were in June 1863. McCulloch's Government was well supported, including in more than usual measure the social position, ability, and political experience of the colony. The new Ministry amended the Electoral Act of their predecessors by restoring the secrecy of the ballot, which had been to some extent invaded by a clause of the Act that connected the voter with his voting-paper by means of a number to be affixed to the paper by the returning officer upon taking the vote. There were improved arrangements made in the assisted immigration department, chiefly with the view of introducing from among the poorer classes of the mother country persons of a training suited to the colony's wants, and, in particular, female domestic servants. The suspension of land sales under the new Act, pending an amendment of some of its clauses, left comparatively small means at the Government's disposal for immigration projects. The Land Sales Act of 1860 had caused endless discussion both in and out of Parliament. Ministerial difficulties had occurred on the subject, and on the re-assembling of Parliament after the adjournment usual on such occasions, the excitement reached its climax. This was on 28th August 1860. Large public meetings had been, shortly before held, at which several of the members of the Assembly stirred up the populace, in effect, to make a physical demonstration in the open area around the parliamentary buildings, in favour of a popular and anti-squatting Land Act. In the afternoon of the 28th an immense assemblage had come together, who by degrees proceeded to violence, in breaking windows, throwing stones, by which many of the police were wounded, and shouting for a rush into the Assembly, where the members were at the time engaged in business. But at this threatening stage the Riot Act was read, and the area was cleared without difficulty by a small party of mounted troopers. This very unusual event in the capital greatly outraged the public feeling, and accordingly, on the following day, sixteen hundred of the citizens enrolled themselves as a special defensive force in case of future need. All the military force of the colony had shortly before been despatched to the aid of the N.Z. Government in the war with the Maories—a circumstance somewhat truculently alluded to in the exciting speeches of some of the leaders of the movement. A number of the rioters had been laid hold of and were duly brought before the magisterial bench of the Mayor. In most of the cases, as often happens in such occurrences, there seemed no evil purpose, but a mere excitement of the moment. The parties really blameable were sure to be out of harm's way. Those who had been arrested were only anxious to make all kinds of excuses. One had an order for admission to the Parliament House and merely tried to put it in force; while another was pushed on by those behind; and others had wives and families to think about instead of disturbances to

the peace. All were leniently enough dealt with, but a legislative Act was immediately passed which prohibited for the future any public meetings or gatherings within certain distances of the buildings of Parliament. One of the earliest duties of the new Governor Barkly after his arrival was to entertain an Act of the Colonial Parliament by which the salary of his office was reduced from £15,000 to £10,000 a year. There had been some disagreement between the home authorities and the colony in the preceding year on the subject of reducing the Governor's salary. The large amount of £15,000 had been agreed to eight years before, in consideration of the excessive costliness of everything at the time in Melbourne. Latterly however there had been such a complete change in this respect that the expense of living was now perhaps hardly more than one-third of what it had previously been. The Colonial Parliament therefore decided at first on a reduction to £7000 a year, with a proviso that the Act was to take effect after the current tenure of the office had run the customary term, understood to be seven years. Exception however was taken to this proceeding by the Imperial Government, and for this reason, amongst others, that the Queen might be pleased to prolong the Governor's viceroyalty, in which case the reduction of salary might be held as inconsistent with implied engagements. The Act therefore was not ratified at home, a circumstance that caused some slight dissatisfaction in the colony at the time. After an interval however, during which it was understood that Sir Henry Barkly was to be appointed elsewhere after the usual term, the salary for the future was fixed at £10,000, exclusive of course of a Government house, provided and kept in repair at the colony's expense. Sir Charles Darling reserved this Act for Imperial approval, according to the usual course in this question. The death of Richard Heales in 1864 led to the appointment of J. M. Grant as Minister of Lands. The new Minister framed and succeeded in carrying into law a popular Land Act, which still bears his name, and which virtually put an end to the squatting occupation, and threw the whole of the territory open to agricultural free selection. This Act has been since amended in some of its details, but it practically continues still in operation. Sir Henry Barkly's term of office, which had been extended by the Imperial Government for two years beyond the ordinary term, came to a close in September 1863. He took his departure from the colony amidst universal regrets. He was the first popular Governor V. ever had. His rule was mild, temperate, and just. He maintained the dignity of the Crown, at the same time that he was courteous and affable in his bearing towards all classes. A sharp contention on a point of constitutional form arose between Sir Henry Barkly and the Ministry of which O'Shanassy was chief. Popular feeling ran very high on the matter, but went entirely with the Governor, who received addresses

of sympathy from all parts of the colony. On the other hand, O'Shanassy became so unpopular that when his short-lived Ministry fell, he lost all chance of regaining power, and was subsequently exiled from the political arena for several years. During Sir Henry Barkly's Administration the material progress of the colony steadily increased. The yield of gold however had fallen in 1862 to £6,685,192, which was a little more than half the export of 1855. On 30th September, 1864, the total population was 596,529, of whom 343,525 were males and 253,004 females.

XI. *Governor Darling.*—Sir Henry Barkly was succeeded by Sir Charles Darling, who arrived in September 1863; he was nephew of Sir Charles Darling, who forty years before had been Governor of N.S.W. He was destined to troublous times, for he had not long arrived before another vexatious hitch took place in the working of the Constitution. A large part of the revenue in each colony was raised by means of duties levied upon certain goods on their entrance to the various ports. Now the list of articles subject to such duties was in 1864 shorter in V. than in any of the other colonies; but the Ministry then in power, headed by McCulloch, desired to place a duty on many articles previously admitted free. This change was agreed to by the Assembly, but the Council evinced a very decided hostility to the proposal; the Ministers determined to coerce it, and adopted a plan which had several times been successfully employed in England. According to the British Constitution—which was closely followed by V.—all bills dealing with money matters must be laid before the Upper House, which may pass them or reject them according as it pleases but has no power to make any alterations. Now the money required by the Government each year is voted by the two Houses in an Appropriation Act, which is a bill prepared by the Government, discussed and amended by the Lower House, and then sent up to the Upper House for its assent, which is seldom refused. But on this occasion the Government inserted its Tariff Bill as one of the clauses in the Appropriation Act for 1865. The whole was agreed to by the Assembly and passed on to the Council, which now found itself in a difficult position. If it passed the Act it would thereby give its assent to the obnoxious Tariff Bill; if it rejected the Act there would be no money forthcoming for the payment of the public debts; and any intermediate course was forbidden by the Constitution. It chose the alternative of throwing out the Act, and the affairs of the colony were thrown into confusion; all the officers of government, clerks, customs officers, gaol officials, policemen and seamen, together with all the workmen on the railways or public buildings could receive no wages, and the contest of the Upper House with the Ministry and the Lower House was watched by the people with intense interest. Matters were becoming serious when the Ministry discovered an ingenious device

for obtaining money. According to British law if a man is unable to obtain from the Government what it owes him, he sues for it in the Supreme Court, and then if this Court decides in his favour it orders the money to be paid quite independently of the Appropriation Act. In their emergency the Ministry applied to the banks for a loan of money; five of them refused, but the sixth agreed to lend £40,000. With this sum the Government servants were paid, and then the bank demanded its money from the Government; but the Government had now no money, and the bank then brought its legal action. The Supreme Court gave its order, the money was paid to the bank out of the Treasury; and thus a means had been discovered of obtaining all the money that was required without asking the consent of Parliament. Throughout the year 1865 the salaries of officers were obtained in this way; but in 1866 the Upper and Lower Houses agreed to hold a conference. Each made concessions to the other, the Tariff Bill was passed, the Appropriation Bill was then agreed to in the ordinary way, and the "Deadlock" came to an end. But in its train other troubles followed; for the English authorities were displeased with Darling for allowing such a state of things. They showed how he might have prevented it, and to mark their dissatisfaction they recalled him in 1866. He bitterly complained of the harsh treatment; and the Assembly regarding him as in some measure a martyr to the cause of the people determined to recompense him for his loss of salary. In the Appropriation Act of 1867 they therefore placed a grant of £20,000 to Lady Darling, intending it for the use of her husband. The Upper House owed no debt of gratitude to Sir Charles, and accordingly it once more threw out the Appropriation Bill. Again there was the same bitter dispute, and again the public creditors were obliged to sue for their money in the Supreme Court. In a short time four thousand five hundred such pretended actions were laid, the Government making no defence, and the order being given in each case that the money should be paid. Sir Charles Darling died shortly after his return to England; and the Assembly, with the consent of the Council, voted Lady Darling a pension of £1000 a year for life. During his brief term of office Darling was exceedingly popular, in fact the idol of the people; but his taking decided stand with the Ministry in their efforts to force the Tariff Bill through the Upper House incensed against him the whole of the commercial and trading classes, and Darling felt keenly their opposition. In May 1866 he took his departure from the colony amidst a tumultuous demonstration of popular sympathy.

XII. *Governor Manners-Sutton*.—Sir John Henry Manners-Sutton (who subsequently became Viscount Canterbury) took office in August 1866. One of his first official acts was to refuse to sign the judgments of the Supreme Court in favour of

Government creditors. The result was that the McCulloch Ministry resigned. A new Ministry was formed under Fellows and Sladen, which was met at once by a vote of want of confidence, the Ministry being in a very small minority in the Assembly. An attempt by the Ministry, backed up by the Governor, to carry on the business of administration in the face of an adverse majority, proved a complete failure. Eventually the "tack" was taken off and the Estimates and the Tariff Bill were passed separately by the Council. The Sladen Ministry resigned, and the McCulloch Ministry came back to power. The remainder of Viscount Canterbury's term was a comparatively quiet one for the Governor, who left the colony in March 1873.

XIII. *Governor Bowen*.—Sir George Bowen was transferred from the Government of Q. to that of V. on the retirement of Viscount Canterbury. He held office for the full term of five years, and it was well understood that he would have been granted an extension of the term but for his compliance with the act of his responsible advisers, in the wholesale dismissal of civil servants which signalled "Black Wednesday." The political history of the colony, from the institution of responsible Government to the present time, being mainly a narrative of changes of Ministries, and of political conflicts, is not capable of being condensed into a clear, continuous, and comprehensive story. The drift of popular feeling, up till the fall of the Berry Ministry in July 1881, may be best indicated by the term ultra-democratic; but, on the other hand, the Upper House has never shown a disposition obstinately to reject measures of a genuinely liberal character, including the reform of its own constitution. It has agreed to pass more liberal Land legislation, payment of members of the Assembly, the Education Act of 1871; and it finally accepted a compromise on the question of self-reform with the Berry Ministry in June 1881. This last concession was followed by the expulsion of the Berry Ministry from office, upon a motion of want of confidence, moved in the Assembly by Sir Bryan O'Loughlen. The Ministry subsequently formed by the latter gentleman was successful, with one exception, in gaining their re-elections, and met Parliament for the first time on 28th July 1881. The settlement of the reform question ensures political peace to the country for a long time to come. The strife of parties can scarcely ever again be as fierce as it has been in time past. All real causes of disagreement have been, in fact, settled. The material interests of the colony are at the moment in a flourishing state, and there is every reason to anticipate an extended period of both political peace and material prosperity for the Colony of Victoria. It only remains to add that the present Governor is the Marquis of Normanby, who succeeded Sir George Bowen in February 1879.

VICTORIA RIVER, a large river on the north-west coast of the continent which empties itself into Queen's Channel near the Cambridge Gulf.

It was discovered by Stokes in 1839. At its confluence with the sea, between Turtle and Pearce Points, it is 26 miles wide. It is guarded from the sea at its mouth by Quoin, Drift-wood, Observation and Clump Islands, and was named after Queen Victoria. The land at the entrance of the river is bold and well defined; a remarkable rocky elevation about 25 miles up the river is called the Fort, as suggested by its bastion-like appearance, now called Table-hill. Among the productions along the banks of the Victoria are the silk, cotton tree and the gouty stem tree. The principal reaches are Whirlpool, Holdfast, Shoal and Long reaches; it is navigable for vessels of burden for 60 miles from the entrance. This position is about 500 miles from the centre of the continent. The valley through which the river passes varies in its nature from treeless, stony plains to rich alluvial flats lightly timbered with a white stemmed gum; the banks are steep and high, thickly clothed with the acacia, drooping eucalyptus and tall reeds.

VICTORIA MOUNTAIN, in N.S.W., 70 miles from Sydney on the Bathurst-road. The passage was named by Mitchell after the Princess Victoria and was opened by Governor Bourke in 1832.

VLAMING, WILLEM DE, Dutch navigator. On 28th December 1696 three ships commanded by him reached the western coast of New Holland, and next day anchored under the island of Rottenest. On 5th January 1697 he went on shore on the mainland, accompanied by eighty armed men and proceeded inland. Nothing was at first seen but gum-trees and cockatoos, but after a three-hours march a small lake was reached where foot-prints were observed, but no natives were seen. Another expedition on the 6th was equally unsuccessful. The ships left Rottenest Island on the 13th and sailed away northward. On the 16th a landing was again effected but nothing was found. On the 23rd, when near Houtman's Abrolhos, some natives were descried walking on the shore. On 3rd February a boat landed on these rocks and found Dirk Hartich's tin plate, with the inscription commemorating his arrival and departure. Cruising about for a time the ships discovered the North-west Cape, and an opening which Vlaming called Willem's River. On the 21st the ships sailed for Batavia.

VOGEL, SIR JULIUS (1835—) is a native of London and was educated at the London University School. He entered the office of his grandfather, who was the head of a large house in the West Indian and South American trade. It was intended that Vogel should acquire a knowledge of mercantile pursuits, with the view of proceeding to South America, where through his connections good prospects would have awaited him. But when the Victorian goldfields became famous he was seized with the desire to visit them, and against the advice of his friends he proceeded to the new El Dorado. Before leaving he went through a course of study on the chemistry and metallurgy

of gold and silver at the Royal School of Mines in Jermyn-street. He was Dr. Percy's first pupil in the metallurgical laboratory of that institution, and from that gentleman took with him to Melbourne a certificate of proficiency in the art of melting and assaying the precious metals. Some time after his arrival Vogel was concerned in various business pursuits in Melbourne and on the goldfields. To oblige a friend who was ill he wrote an article for an up-country newspaper, and so first became connected with journalism, to which he afterwards devoted himself. He became editor of the *Maryborough and Dunolly Advertiser*, proprietor of the *Inglewood Advertiser*, and part proprietor of the *Talbot Leader*. When the rush to Otago, N.Z., commenced he went to Dunedin, and purchasing an interest in the principal weekly paper there, started the *Otago Daily Times*, the first daily paper in N.Z., and which for some years he edited. Before he left V. however he had contested an election for the Avoca district. He polled 2000 votes, but was defeated by Grant and Davies. Annoyance at this defeat did much to influence his departure for N.Z. He studied closely the politics of that colony, and within two years became a member of the Colonial House of Representatives, and of the Provincial Council of Otago. For some years he was head of the Provincial Executive, but in 1869 resigned, as, having disposed of the *Otago Daily Times*, he intended to reside in Auckland, where he became proprietor of the *Southern Cross* and *Weekly News* newspapers. In June 1869 Vogel joined the Ministry formed by Fox, taking the portfolios of Colonial Treasurer, Postmaster-General and Commissioner for Customs. He held these offices till September 1872, when Fox's Government was defeated. After the incoming Government had held office for a month they were defeated on a want of confidence motion, moved by Vogel. The Governor refused them a dissolution, and sent for Vogel, who formed a Ministry. Waterhouse was offered and accepted the Premiership, together with the leadership of the Upper House. Vogel took the portfolios of Colonial Treasurer and Postmaster-General, together with the leadership of the Lower House. Early in 1870 Vogel arranged in Sydney with Hall and the A.S.N. Co. the first Californian service. During the session of 1870, he introduced the Public Works and Immigration proposals which were so warmly adopted by the country, and to which vigorous effect has been and is still being given. After the session Vogel proceeded to Washington. He had already negotiated a postal convention with the United States, and he now visited America to arrange for a through service to supersede Hall's. The British Ambassador, Sir Edward Thornton, was instructed by the Foreign Office to give every assistance. After arranging the contract with Webb, Vogel proceeded to London, where he negotiated the first instalment of the Public Works Loan, and concluded an engagement with a firm of

eminent contractors to send out representatives to N.Z. Vogel's name is intimately identified with the Government Life Insurance system which he introduced, and which is working with very great success, and with the Intercolonial Reciprocity question, in which he has taken much interest. Vogel has also strongly advocated the confederation of the Australasian Colonies, and has written several papers on the subject. He was made Agent-General for N.Z. in London in 1876, received the honour of C.M.G. in 1872, and was knighted in 1875.

VOLTAIRE CAPE, a cape on the north of W.A., named by Baudin in 1801 after the famous French writer. It was surveyed by King in 1820.

W.

WAGGA WAGGA, a pastoral township in N.S.W., on the south bank of the Murrumbidgee, about midway between Sydney and Melbourne. It is 308 miles distant S.W. from Sydney, with which it is connected by the Great Southern Railway. The principal engineering difficulty has been the bridge over the Murrumbidgee and its approaches. On the north side there are 215 spans of 29½ ft., and on the south side 51 spans of the same width, varying from 9 ft. to 24 ft. in height. These are to allow for the escape of the flood waters. The main channel of the river is spanned by a bridge having two continuous wrought iron lattice girders of 636 ft. each in total length, 12 ft. 1 in. deep, and placed 14 ft. apart. These are divided into four spans of 150 ft., each span being supported on two cast iron cylinders 9 ft. in diameter. The population is 4500. The town does a large trade with the surrounding districts. It has been a municipality since March 1870. It has fifty miles of roads, and rateable property to the amount of £326,000. The country round Wagga Wagga is principally pastoral, though experience has proved it to be well suited for agricultural purposes, and a considerable area of land has been free selected. Wagga Wagga has become noted as having been the residence of the "Claimant" in the Tichborne case.

WALCH, GARNET, journalist (1843—) is a native of T., and son of Major Walch of the 54th Regiment. He was educated in England and on the Continent. On his return to A. he was employed as a writer for the leading papers of N.S.W. At Christmas 1871 he produced his original extravaganza "Trookulentos," which was very successful. A year afterwards he removed to V., and has since written several successful pantomimes and other dramatic works. In 1874 he published a volume of humorous verse and prose, "Head over Heels," most of which had appeared during the two preceding years in *Sydney Punch*; and in the year following he

published "On the Cards." He was for six years secretary of the Melbourne Athenæum but resigned the post in 1879.

WALHALLA, a mining township in V., 120 miles E. of Melbourne. It is situated in a valley enclosed by steep hills. The quartz reefs in the vicinity are very rich in gold, and Cohen's reef—one of the best in the colony—runs north and south through the hill to the west of the township. Since its formation, about eight or nine years ago, the Long Tunnel Company has paid £300,000 in dividends, all of which has been accomplished within five or six years. The Walhalla Company has obtained in eight years 77,573 ozs. of the precious metal, and paid £135,173 15s. in dividends. Walhalla has been thus described by a correspondent of the *Argus*:—"Walhalla—the Valhalla of Scandinavian mythology, the place of immortality for the souls of heroes slain in battle—and certainly a more romantic spot could not well be chosen for such a resting-place. The township is situated in a gully on both banks of the creek, closely surrounded and hemmed in on every side by hills fringed with scrub and trees to the very summit. The houses, perched on every conceivable spot, some seeming to be almost inaccessible, give a picturesque aspect to the place and bring to one's mind the nestling *chalets* of Switzerland. The gullies round Walhalla and along the creek are a little different from the usual, truth to tell, rather monotonous scenery of V. One does not see such a sight every day. Lofty hills stretching all round you—gum, eucalyptus and wattle growing in profusion, and even now looking fresh and green, while afar the wide-stretching azure slopes of Baw-Baw and Mount Look-out rear their massive forms to the sky. Here is a perfect feast for the lover of nature's beauties. Innumerable varieties of fern with their graceful fronds are seen on every side, the tree-ferns spread out their drooping leaves above your head, while on fallen decaying stems, moss most exquisite in its brightness of green, makes a study that would gladden the heart of an artist. While heroes might wish to find a resting-place in these romantic depths of cool green shade, the spot should also possess a charm for the many worshippers of Mammon. Could a more appropriate spot be found for a miser's bones to rest than in ground permeated by the glittering substance he loves, where he would literally be encircled with gold? For here, deep down in the bowels of the earth are hidden treasures which would satisfy the imagination of an Eastern monarch, and remind one of the gorgeous magnificence of the 'Arabian Nights.' The quartz reefs are among the richest in the colony. One of the mines, the Long Tunnel, since the working of it began, ten years ago, has yielded over one million sterling, and paid over three hundred thousand pounds in dividends, and still looks as productive as ever. Through the courtesy of the manager we get permission to go through this wonderful mine. Having donned an old coat and hat we take candle

in hand and follow the underground manager along the adit (some 700ft.) into the chamber. Here we enter the cage which is to take us down below. An improvement has been introduced in this mine in the working of the cages, as when they are lowered, the aperture is at once closed, while should the rope or chain break arms at once fly out from the cage and catch the sides of the shaft, preventing further progress. Noiselessly we descend to the third level 320ft. down (the shaft is 723ft. deep,) and follow the manager as he deftly leads the way through dark passages. Here a miner comes along with a truck filled with earth, and we stand aside till it passes. At length we come to where two miners are drilling holes in the quartz for the charge of powder. We examine the lode, and see here and there streaks of the precious metal and take up some of the pieces of quartz lying at our feet, in which also the golden gleam appears. We proceed along another passage, crouching often to get underneath the overhanging rock, and sometimes so low is the aperture that we have only room to get through stretched out at full length. And so on we go, descending further and further into the earth, seeing at each new drive a couple of miners hard at work with huge hammers driving the drills into the rock. No easy work this, as the sweat pouring down their faces testifies. Now we come to a place where they are prospecting for a fresh reef, where the pathway is full of water and the air close and heavy, though in the other parts of the mine the ventilation is very good. We descend ever so many feet by a ladder, and then after more creeping and occasionally sliding through shoots and going carefully over shafts, covered by a few planks, we come to what is called a "pass." This is a descent not very far removed from the perpendicular and formed by wooden planks, where the only hold is by inserting the foot a few inches at each step, holding by the hand to the step above, and where the least slip would result in a rapid involuntary descent to the bottom of the "pass." A muffled noise is now heard from a blast in one of the drives, but this is a good way off. Having at length reached the lower level of the mine, we wait the descent of the cage, which at the signal of the manager, is rapidly lowered (different signals being used for each level of 100ft.) and into this we step and noiselessly ascend to the chamber and then pass along the adit into the outer air again. The miners we find to be as a rule, brawny powerful-looking men, who seem as if working underground did not interfere with their health. This mine is however well ventilated, and enjoys great immunity from accidents. The miners work in three shifts of eight hours each—12 p.m. to 8 a.m., 8 a.m. to 4 p.m., and 4 p.m. to 12 p.m. The machinery in use is of the most recent invention, and we see the working of the pneumatic engine, the quartz-crushing machine and the various processes for extracting the gold. We also see and admire the process of extracting the

pyrites from the tailings, by which a quantity of gold is secured which would otherwise be lost. The quartz in the Long Tunnel mine contains silver as well as sulphur and arsenic, and the tailings have to be roasted before the gold can be eliminated from the mass. What a din there is in the engine-room! You might bawl your loudest and not a word be heard. It is a relief to get into the pure air of heaven again. Grand and almost majestic as these hills around Walhalla looked in the gloom of the evening, it was a more beautiful sight to watch the sun gleaming on their crests and the mist-wreaths curling from their slopes, while far below rushed the turbid waters of the creek. The two views were like the dark and bright side of human nature; though the shadows may often have pathos and majesty in them, we turn with a sense of relief to the rift in the cloud through which the sunlight streams."

WALLAROO, the seaport town of the copper-mining district of that name in S.A. near the shores of Spencer's Gulf, 91 miles N.W. of Adelaide. The famous Wallaroo mines were discovered in 1860. They gave employment to upwards of 833 men, but owing to the low price of copper this number had to be reduced, and at the end of August 1878 operations were altogether stopped. Operations were resumed in April 1880. Up to 1875 the total quantity of ore raised has been 290,669 tons, the yearly average being 26,000; the metal averaging about 15 per cent., being lower than the Burra. The lodes were found to increase in richness at lower depths. There are several other very productive mines in the neighbourhood. Smelting was carried on on a very extensive scale at Wallaroo Bay; the works are the largest in the colony and include 36 furnaces and 21 calcining kilns, at which 210 men were employed. The same proprietary have another smelting establishment at the Hunter River in N.S.W. By this arrangement the vessels which brought coal from N.S.W. to Wallaroo took back copper ore to the Hunter River smelting works, so that a saving of freight was effected. A railway connects the mines with the port; this gives ample facilities for shipment. The leases under which these mines were held expired a short time since, but were renewed by the Government on payment of a premium of £18,000.

WALLIS PONDS are situated in the district of Bligh, N.S.W.; they flow into the Macquarie marshes, and were named by Oxley after Captain Wallis of the 46th Regiment.

WALLSEND, the chief colliery township in the coal district of Northumberland county in N.S.W.; lies in a valley running in a N.E. direction from the head waters of Lake Macquarie to the banks of the Hunter, about eight miles from Newcastle. It is eighty-five miles W.N.W. of Sydney. It is the site of the Newcastle and Wallsend Coal Company's works, the pit being situated about a quarter of a mile from the

township. There is also a tunnel tapping the S.E. portion of the field; the seam is a continuation of the Borehole seam. This colliery employs about 500 men and boys, and is capable of sending out 2000 tons of coal per diem. A private line connects the collieries with the Great Northern near the township of Waratah. During 1878 the output was 114,908 tons. The Purified Coal and Coke Company's works are situated close to the tunnel. There is also an iron foundry situated in the borough where extensive castings are frequently done for the adjacent collieries. Wallsend was proclaimed a municipality in February 1874.

WALSH, WILLIAM HENRY (1825—) came to N.S.W. in 1844. In 1859 he was returned to Parliament for one of the northern constituencies. On the separation of Q. he retired into private life, until 1865, when he was elected for Maryborough, Q. He accepted office in 1870 as Minister for Works, but resigned in 1873 in consequence of a difference of opinion between him and his colleagues on the subject of education. In 1874 he was returned for the Warrego, and was elected Speaker of the Legislative Assembly. In February 1879 he was appointed a member of the Legislative Council of Q. Walsh was regarded as one of the best Ministers for Railways and Works in that colony; he introduced many reforms and an excellent system of organisation; and effected a large saving to the public.

WARATAH, a township in N.S.W., four miles from Newcastle, and eighty miles N. of Sydney. Coal mining is the industry of the district. The Waratah Coal Colliery has been a prolific one, but it is now nearly worked out. The Waratah Coal Company now raise coal from the new colliery at South Waratah, or Raspberry Gully, near Charlestown. Population is about 400. Two copper and one tin smelting works are in operation, and there are stone quarries in the vicinity. Owing to the large mining population, it is one of the busiest stations on the Great Northern Railway, both as regards passenger and goods traffic. Besides the coal-mining, copper-mining, and smelting industries, large quantities of fruit—oranges, grapes, bananas, &c.—are grown in and exported from the gardens of North Waratah. The municipality was proclaimed in February 1871.

WARBURTON, PETER EGERTON (1813—) explorer, is a native of Cheshire, England, and received his education at Orleans and Paris. He entered the Royal Navy in 1825, and served on board H.M.S. *Windsor Castle*. In 1829 he entered the East India Company's Military College at Addiscombe, and in 1831 sailed for India, where he was in 1835 appointed Adjutant of the Marine Battalion at Bombay. From that he was transferred to the General Staff in the Adjutant-General's Department and rose to be Acting Deputy Adjutant-General, which appointment he held for two years. He retired from the service in March 1853, with the rank of Major and the

pension of a Captain. In July of the same year he landed in W.A., but came to Adelaide in September. In December he was appointed Commissioner of Police and held that office until February 1867. He was appointed Colonel Commandant of the S.A. Volunteer Force in 1869 and resigned in 1877. Warburton started from Adelaide on an expedition across the continent on 15th April 1873, with seventeen camels, three Europeans and two Afghans. His route lay across the sand-hills that baffled the brothers Gregory; but with the aid of the camels, and by his own indomitable energy he arrived at length at a station belonging to some W.A. squatters from whom the party received every kindness and consideration. Nine months and a-half had been occupied in making the terrible journey of 900 miles. During the latter part of their wanderings the party subsisted on worn-out camel's flesh; and upon rare occasions on a few wallabies that they got from the natives. For his services as an explorer, Warburton obtained the Royal Society's medal, with a vote from the S.A. Parliament of £1000 for himself and £500 for his party. Sir Thomas Elder sent him to England and published the narrative of his explorations. Her Majesty created him a Knight Commander of the Order of St. Michael and St. George.

WARRNAMBOOL, a seaport town in V., pleasantly situated on an eminence on the shores of Warnambool or Lady Bay; it lies 170 miles to the S.W. of Melbourne, and is the nearest port to it on the Western sea-board. It was created a municipality in 1855 and a borough in 1863. To give facilities for loading and discharging vessels, the construction of a breakwater was begun, but owing to some doubts as to its answering the intended purpose the work has been suspended. It has since been condemned by Sir John Coode, who has recommended a breakwater pier 1800ft. in length; the cost of this would be £280,900. This scheme was highly approved of by the local authorities, but as its cost was almost prohibitory it has been suggested that a portion of the plan should be carried out. The population of the borough is about 5000. Warnambool is situated in a rich agricultural and pastoral district. A trade in pigs and bacon is carried on, and pease and barley are largely exported. The river Hopkins flows within a mile of the town.

WARRABUNGLE MOUNTAIN is the most prominent point of the Arbuthnot Range in N.S.W., named by Oxley after the Right Honorable C. Arbuthnot of His Majesty's Treasury.

WARRAWOLONG MOUNTAIN, a mountain of N.S.W. about ninety-five miles from Sydney. It is an important point in Mitchell's trigonometrical survey; it is cleared, with the exception of a few trees left on the summit which is 1700 feet above its immediate base. This mountain is well known at sea by the name of Hat Hill. From Warrawolong the mountain of Jellore, distant ninety-eight miles, may be distinctly seen.

WATSON, JAMES (1837—) is a native of Portadown, in Ireland, and received his education at the school attached to the Church of England in his native town. He arrived in N.S.W. in 1856 and entered Parliament in 1869, being elected for the Lachlan District in the general election of that year and has sat for the same constituency ever since. He was appointed Colonial Treasurer in Parkes Administration in December 1878.

WAY, SIR SAMUEL JAMES (1836—) Chief Justice of S.A., is a native of England. He arrived in S.A. in March 1853; and was called to the South Australian Bar in March 1861. He was appointed Queen's Counsel in September 1871. He was Member of the Education Board in February 1874; was appointed Member of the Council of the University of Adelaide in November 1874; elected Member of the Assembly for the district of Sturt in February 1875; appointed Attorney-General in June 1875; Chief Justice in March 1876; and was elected Vice-Chancellor of the University of Adelaide in April 1876. He has been Acting-Governor or Administrator of the Government of S.A. as follows:—1877, 29th January to 24th March; 17th May to 2nd October. 1878, 14th February to 15th August.

WEARING, WILLIAM (1816-1875) jurist, was a native of London and studied at St. John's College, Cambridge, where he took his degree of B.A. He was called to the Bar at Lincoln's Inn in May 1847, and arrived in Adelaide two years later. The following year he was admitted to the Bar in S.A. and was appointed a Notary Public. In April 1856 he received the appointment of Crown Solicitor, and in 1855 was made a Q.C. and J.P. In August 1867 he was appointed third Judge of the Supreme Court, and in the exercise of the functions of his office he went on a circuit to the Northern Territory, and was wrecked in the steamer *Gothenburg* off the Q. coast on the return voyage, on 25th February 1875.

WELD, FREDERICK ALOYSIUS (1823—) is a native of England, and was educated at Stonyhurst College, and at Freiburg in Switzerland. He chose for himself a colonial career, and in 1844 arrived in N.Z. There he formed stations, explored country previously unknown, and discovered passes through the Kaikora Range. Several of his explorations were undertaken on foot, with only one companion; and some of them he prosecuted alone. In 1848 Sir George Grey, then Governor of N.Z., offered Weld a place in the Legislature, then entirely nominated. He declined the honour, but took an active part in the movement for representative institutions. As soon as these were granted Weld was elected and sat for several years in the House of Representatives. In 1854 he was made a member of the Executive Council. In 1860 he was Minister for Native Affairs in the Stafford Ministry. That Ministry was defeated in 1861. In 1864 Weld was made Premier. When he came into office the country

was in a state of war; the General of the army and the Governor of the colony were at variance; escaped Maori prisoners held a fortified position within sight of the capital; Government debentures were unsaleable, and the banks refused advances, whilst the colony was exposed to what seemed a ruinous war expenditure. In the face of these troubles the Fox-Whittaker Government had resigned without meeting Parliament. Weld proposed to carry on the war without the aid of regular troops, by small bodies of trained bushmen, relying much on the effect of pushing roads through the country. He thus succeeded in turning back the tide of war. He advised and carried out the confiscation of the lands of the Waikato tribe, as a mark of its defeat, and it has never since taken up arms. He also sent an expedition of colonial troops to punish the murderers of the Rev. Mr. Volkner. His administration not only dealt some effective strokes in war, but took good measures for the establishment of peace. They opened Native Land Courts; carried the Native Rights Bill (introduced by Fitzgerald, the Minister for Native affairs;) and raised the question of Native representation. To secure the unity of the colony they brought about the removal of the capital to Wellington, a more central position, selected by Commissioners from the Australian Colonies. The credit of the colony was restored; the finances, in the hands of Fitzherbert, the Treasurer, were placed on a better footing; the Panama line was subsidised; an electric telegraphic cable was ordered so as to connect the two islands of N.Z.; and a scientific department was established under Dr. Hector. In 1865 Weld's Government was defeated on a vote for defence purposes, and resigned. Though his administration had but a short duration, their policy was emphatically approved by the Home Government. Cardwell, then Secretary of State for the Colonies, on receiving intelligence of the resignation of Weld, said in a letter to the Governor that Her Majesty's Government would continue to be guided by the policy initiated by him. On resigning the Government, Weld whose health had been broken down by over-work, went to England for rest and change. Soon after his arrival there, the Duke of Buckingham, then Secretary of State for the Colonies, expressed his intention of offering him a Colonial Governorship. A change of Ministry took place; and Earl Granville carried out the avowed intention of his predecessor, by appointing Weld Governor of W.A. At a public dinner in London, Earl Granville gave as his reason for selecting Weld for that appointment, that he believed him to be just the man to infuse a spirit of self-reliance into a colony in a state of transition from a condition in which it was used for the purposes of transportation and received the aid of Imperial expenditure, to one of freedom and self-support. During the period of Weld's Government various industries were developed, principally by concessions to capitalists from V.

and other colonies. A partially representative legislature was established; municipal institutions were introduced; an Education Act was passed which gave general satisfaction; a system was adopted which placed all religious denominations on a footing of equality, grants of land being made by the Governor to all of them, in proportion to their numbers, for churches, schools, glebes and charitable institutions; telegraph lines were constructed throughout the colony; steam communication was opened up along the coast, so as to promote the settlement of various parts of the territory; and important explorations were successfully carried out by John Forrest. Two of the last acts of Weld's Government in that colony were to cut the first sod of the first Government railway, and to plant the first telegraph post of a line which ultimately connected W.A. with Adelaide and the whole of Eastern Australia. In January 1875 Weld was appointed Governor of T., where his administration was equally successful. He filled the full term of five years, and in 1881 was succeeded by Colonel Strachan.

WELLINGTON, the capital of N.Z. and seat of Government, is situated on the shores of Port Nicholson, an inlet of Cook Strait. It is 180 miles by sea from New Plymouth, 150 miles from Nelson, about 1200 miles S.E. of Sydney, and 1400 miles N.E. of Melbourne. With both these cities there is steam communication. It was the first and principal settlement of the New Zealand Company; its convenient harbour, a noble sheet of water six miles in length by six in width, and central position, giving it many advantages. There are belonging to the port 37 sailing vessels of 5815 tonnage, and 18 steamers of 2035 tons. The principal buildings are—Government House, the Houses of Legislature, the Government Buildings (an enormous building of wood covering nearly two acres,) the Cathedral, and other churches and chapels, comprising three Episcopal (St. Paul's, St. Mark's and St. Peter's,) the last-named rebuilt and opened during 1880. The Imperial Opera House and many other buildings were destroyed by fire on 15th June 1879. Nearly five acres of buildings were devastated by this conflagration. The city is lighted with gas. There is a substantial wharf for the accommodation of shipping; also a patent slip, capable of taking up vessels of 2000 tons. The population of the city, with suburbs, is estimated at 21,000. Large water-works for the supply of the city have been constructed. A tramway extends from Adelaide-road to Thornton railway station. A railway has been formed to Greytown, a distance of fifty-three miles. Wellington is a city under the Episcopal supervision of the Right Rev. O. Hadfield. There is also a Roman Catholic Bishop, Right Rev. F. Redwood. In the municipal boundaries are 1100 acres, and 37 miles of streets, with 3629 dwellings, of the annual rateable value of £241,836.

WELLINGTON, FORT, on the north-east side of Raffles Bay, on the Coburg Peninsula, in

Northern Australia. A settlement was formed here by Captain Stirling in H.M.S. *Success*, on 17th June 1827, for the purpose of carrying on a traffic with the Malays from Maccassar in the Celebes, who frequent the coast of Northern Australia, in quest of the trepang or sea-slug. The settlement was named after the Duke of Wellington. It was found however to be impracticable, and Captain Stirling removed his party to Cape Leeuwin in 1829, and W.A. arose as a new colony.

WELLINGTON, MOUNT, a mountain of T., towering over Hobart, in T., and throwing its strange square-headed shadow across the still waters of Sullivan's Cove. It rises 4166 feet above the level of the sea. It is a favourite resort for summer tourists, and the grandeur of the view from the summit has been thus described:—"The vastness of the field of vision, the lucid transparency of the atmosphere, and the interchange of mountain, valley, sea, and river combine to fascinate your gaze at the time, and to haunt your memory for ever afterwards. And the very clouds which occasionally blur the scene confer additional beauties on it; for sometimes as they break away to seaward they disclose one of the islands in the estuary so completely detached from the line of the horizon as to appear as if suspended in the heavens; and sometimes a strong sunbeam striking on the valley of the Huon, while all around is mist and purple shadow, kindles the tract of country it illuminates into such a lustre that it appears to be absolutely transfigured, and recalls to your recollection the light which abode upon the Land of Goshen, when impenetrable darkness had settled upon the rest of Egypt. As it flashes in the sunlight, or fades in the shadow, the Derwent gleams like a sheet of burnished silver, or assumes the colour of a turquoise; while the undulating country inland seems to advance towards, or to recede from you, according as it vividly reveals itself in the light, or grows indistinct in transitory gloom. The city itself, sloping to the water's edge, looks like the collection of the tiniest of toy houses dropped by a child in careless play; and the altitude at which you stand, coupled with the amazing extent of country comprehended in the view, enables you to realise the prospect visible from a balloon." A waterfall of striking grandeur, if seen after heavy rains, is reached by following a track leading thither from the Springs, about six miles along the mountain.

WENTWORTH, WILLIAM CHARLES (1791—1872) "the Australian Patriot," was a native of Norfolk Island. His father, D'Arcy Wentworth, an Irishman, was Imperial surgeon on that island, and afterwards held the position of principal Superintendent of Police in Sydney, and was also Magistrate of the Territory. Norfolk Island being both geographically and politically a part of Australasia, Wentworth was always regarded by himself and his countrymen as a native of N.S.W. At the age of seven he was sent to England for

his education, and was for some time under the care of Dr. Alexander Crombie, of Greenwich, author of a standard work on etymology and syntax. After a few years he returned to Sydney. In the days of his early manhood, in 1813, he joined Blaxland and Lawson in an attempt to cross the Blue Mountains, which had till then bounded the enterprise of the colonists. They left Blaxland's farm on South Creek on 11th May 1813, and struck out for the westward. Having crossed the Nepean and traversed several thickly-wooded ridges and gullies they came on the 19th to the furthest point reached by Bass in 1796. Next day they went forward over a country entirely new to Europeans. Through great difficulty and danger they pushed on their way until the 31st. They succeeded in finding a pass through the mountains and descended a considerable distance on the western slope. They had thus accomplished a great work; they had marked out a track over what had been regarded as an impassable barrier; they had opened for their countrymen a way to new settlements of incalculable resources. They were all three suffering from dysentery; their provisions were nearly exhausted; and their clothes and shoes were in a very bad condition. They therefore determined to return, and succeeded in reaching home on 6th June. In 1816 Wentworth went to England again and matriculated at Cambridge. There he spent several years. In 1819 he published *A Statistical, Historical, and Political Description of the Colony of New South Wales*. This book was of much service to his country by dispelling to some extent the ignorance that had prevailed up to that time in the mother country concerning Australia. The work was well received, and as early as 1824 a third edition was called for and published. Whilst at Cambridge Wentworth wrote his well-known poem on Australia. The prize on that occasion was awarded to his competitor, W. Mackworth Praed, afterwards a distinguished member of the House of Commons; but it is now universally admitted that Wentworth's poem is the best. At the conclusion of his University studies, he prepared himself for the legal profession, and in due time was called to the Bar. He then returned to Sydney. In September 1824 he and his friend Dr. Wardell, also a barrister of the English Bar, were admitted by the Supreme Court of the colony to the practice of their profession here. Wentworth was from the first very successful in it. But he did not confine his energies to one pursuit. The social and political interests of the community early engaged his attention; and he took part, with much zeal, in the squatting enterprise of the colony. When he came out in 1824, he and his friend Dr. Wardell brought with them the materials for starting a newspaper in Sydney, and they succeeded in establishing the *Australian*. As a journalist and as a public orator he took up the cause of the oppressed; and one, imbued with sentiments of

humanity and justice, had no need to go far to find instances of oppression. Both soldiers and convicts were at the almost irresponsible disposal of the civil and military authorities. Some soldiers having sought to escape from the restraints of military life by committing offences which led to their being numbered with the convicts—a change which seemed to them, in prospect, desirable—the Government determined to put a stop to a practice so destructive of discipline. And in 1826 two soldiers, Sudds and Thompson, who had committed theft in order to be transferred to the convict *régime*, were sentenced to hard labour on the roads, with irons of unusual weight. Sudds died under the infliction, and as it was generally believed that the punishment was enormously severe, a cry of indignation rose against Governor Darling. Wentworth took the lead in the protestation, and in a pamphlet known as *The Impeachment* said he would follow General Darling to the gallows. From that time he was regarded as the champion of the oppressed, and many appealed to his powerful tongue and pen for protection. After the death of his friend Dr. Wardell, Wentworth withdrew in some measure from his professional and literary labours and entered into pastoral pursuits. But he continued to take an active part in political life. He was the leader of the Patriotic Association which was formed to promote the claims of the people of N.S.W. for civil and political privileges, such as were enjoyed by their fellow-subjects in other parts of the British Empire. One of the first of these privileges for which he struggled was Trial by Jury. On 1st November 1824, the first civil jury was empanelled in the Court of Quarter Sessions. This result was due to the enlightened spirit and resolution of Chief Justice Forbes. Wentworth took an active part in the agitation that was carried on to obtain a large increase of British rights. At a public meeting held in Sydney in January 1827 for the adoption of a petition to the Imperial Parliament, Wentworth said:—"The first topic contained in the petition is a request for trial by jury. We have already had in the Court of Quarter Sessions a two years' experience of that mode of trial, and notwithstanding a great part of the population is held not eligible to sit as jurors, it has gone on well and successfully; therefore we urge that if it were more extended in the colony its beneficial effects would be more generally known." The petition was adopted and entrusted to the hands of Sir James Macintosh, who on presenting it to the House of Commons, appealed to the evidence of Governor Macquarie, Sir Thomas Brisbane, Chief Justice Wilde and Chief Justice Forbes, in support of the assurance that N.S.W. was "fully as ripe for such a change as any other dependency of the British Crown." But the Imperial Parliament was not willing to agree to these representations; and an Act which came into force on

1st March 1829 again threw the power over the liberty and property of the colonists into the hands of military jurors in the Quarter Sessions as well as in the Supreme Court. In this untoward state of things, Wentworth nobly maintained his position in the van of the long-continued contest to secure British rights and privileges for his fellow-countrymen. On the accession of William IV. in 1830, Wentworth seized the opportunity of making a new appeal to the Crown for the concession of the rights so long withheld. An address couched in the usual phrases of loyal congratulation and prayers had been prepared, and was moved in a public meeting convened for the purpose by Sydney Stephen and seconded by Sir Edward Parry. Wentworth came forward and avowed his conviction that this was a fitting time to urge on the King and his Council the just demands of the colonists. He moved the insertion of a paragraph expressing the hope that His Majesty would "extend to the only colony of Britain bereft of the right of Britons, a full participation of the benefits and privileges of the British Constitution." Lethbridge seconded the amendment, which was adopted by the meeting. Whilst various public and professional objects engaged his attention, Wentworth did not neglect science. He was from an early period a good mathematician; and on one important occasion proved the accuracy of his knowledge in a practical manner. He had gone on a voyage to Tahiti and other islands; and having lost their captain the passengers and crew finding that the chief officer was not competent to take charge of the ship, entrusted the command to Wentworth, who successfully navigated the vessel back to Port Jackson. In private business, and in his own home, he was remarkable for his generous consideration towards all who were connected with him. All his servants, overseers, and superintendents retained a warm attachment to him. To many of them their employment under him was the stepping stone to success and independence. In public life he came into hostile collision with men of different political views and associations; and when thus provoked he was not sparing in his denunciations. But to judge fairly of his mind and heart, one must hear the terms in which all who served under him speak of the generous treatment they uniformly received at his hands. Wentworth generally supported the administration of Sir Richard Bourke, who went much beyond his predecessors in liberal measures. He did not however spare the extravagance of the Government in spending the money of the people for purposes not conducive to the public welfare. In 1833 he made a powerful speech at a public meeting in Sydney on this subject. He severely criticised the expenditure, and urged the adoption of a petition to the Governor which was resented as presumptuous, but produced some salutary effect. With the next Governor, Sir George Gipps, Wentworth came into collision on the subject of his land purchases in N.Z. He had

bought of the native chiefs, for goods of the value of £400 and a promise of a small annuity to each of the vendors, the whole of the Middle Island—that is the territory now comprised in Otago, Southland, Canterbury, Nelson and Marlborough—together with some 200,000 acres of the Northern Island. Sir George Gipps regarded the attempt of Wentworth and his partners to obtain this vast domain as a monstrous perversion of the forms of bargain and sale in taking advantage of the ignorance of a barbarous people; and all the efforts of Wentworth by legal argument and political influence to make good the purchase proved unavailing. In 1843 a new political Constitution with a representative element was introduced, and Wentworth thenceforward occupied a conspicuous part in the Legislature. The general election took place in June 1843. He was elected, together with Dr. William Bland, to represent the City of Sydney. He was described in a political journal of that day as one whose "principles were liberal to the utmost latitude of the term." One writer says: "Formerly indeed, he was to all intents and purposes a Radical; but latterly he has been gradually approaching towards Conservatism." If Wentworth had begun as early as 1843 to recede from the democratic sentiments to which he had given eloquent expression at an earlier time, he certainly continued to move in the same direction; and just in proportion as the people of N.S.W. came in the actual enjoyment of the political rights which he had boldly claimed for them, his ardour in support of those rights cooled down and gave place at length to deep aversion and earnest resistance to what he deemed the excesses of democracy. And as he receded from the standard of advanced Liberalism, the confidence of those who most admired his noble struggles for the rights of the people was naturally more and more withdrawn. In 1849 Wentworth took up the project of establishing a University in Sydney. On 2nd October in that year he made a most eloquent speech in support of a second reading of a Bill for that object. The Bill was passed not without much deliberation in Parliament and was assented to by Sir Charles Fitzroy in October 1850. His eminent services in the foundation of the University have been recognised by his fellow-countrymen in the erection of a statue in his honour in the great hall of that institution. His portrait has also been painted for the Chamber of the Legislative Assembly. The earnest desire of those who had watched his career to render him honour is remarkably shown in the very unusual proceeding of having placed, during the lifetime of Wentworth, these works of art in the halls of learning and of legislation. The next great subject of Wentworth's labours was the new Constitution, in which Responsible Government was to be embodied. Of course in seeking the privileges of Responsible Government he was hailed as the leader of the country. But when he came to the details of the Constitution, he again differed widely from those

Liberal politicians who had been associated with him up to a certain point. On 16th August 1853 he moved in a speech of great ability the second reading of the Constitution Bill which he had framed. The Bill was passed early in 1854, and Wentworth was appointed in association with Mr. E. Deas Thomson Colonial Secretary, to proceed to England to advocate the Bill before the Imperial Parliament. Their mission was successful; and in 1856 the new Constitution became the law of the land. Whilst the representatives of the people were engaged in extending the basis of the constitution by the Electoral Law of 1858, Wentworth was remaining in England; and from time to time expressed his dissatisfaction at the treatment which the Constitution he had drawn up received at the hands of other politicians. But when he again came out to his native country in 1861 all parties combined to welcome him. His reception was a grand demonstration of the high regard entertained for him. After the sudden dissolution of the Legislative Council by the celebrated marching out of Sir Wm. Burton and the whole House, Wentworth consented to assist Mr. Cowper in the formation of a new Council, and accepted the position of President. Towards the end of 1862 he returned to his family in England, and did not afterwards visit this country. In accordance with his own long expressed desire his remains were brought to Vancluse to rest by the waters of Port Jackson. A public funeral was decreed in his honour by the Parliament of his country.

WEST, JOHN (1808-1873) journalist, a native of England, was brought up as an Independent minister, and laboured for some years in this capacity in England. In 1839 he came to T., and was minister of the church in St. John's Square for sixteen years. West became a conspicuous writer against transportation. He wrote a *History of Tasmania*, in two volumes, which is still regarded as the standard work of reference on that colony. In November 1855 he went to Sydney to join the *Sydney Morning Herald* as chief of the literary staff, and held the position of editor up to the time of his death. West was an able writer, and possessed considerable tact and judgment.

WESTALL MOUNTAIN, a remarkable landmark on the east coast of the continent, named by Flinders after Westall, the artist, who accompanied him. It forms the highest part of the eastern shore of Shoalwater Bay.

WESTERN AUSTRALIA. I. GEOGRAPHICAL POSITION.—When Captain Fremantle hoisted the British flag at the mouth of the Swan River he took possession formally of all the land in the great island continent now known as Australia not included in the colony of N.S.W. Subsequently the colony of W.A. had its eastern limit defined by the 129th meridian of longitude east from Greenwich, and in 1861 that also was made the western boundary of the colony of S.A.; the whole area to the west of that meridian is therefore

within the limits of and subject to the Government of this colony. By the supplementary commission granted to the Governor in 1873 the boundaries of the colony were defined "as extending from the parallel of 13° 30' S. latitude to West Cape Howe, in the parallel of 35° 8' S. latitude, and from the Hartog's Island on the western coast in longitude 112° 52' to 120° of E. longitude, reckoning from the meridian of Greenwich, including all the islands adjacent in the Indian and Southern Oceans within the latitudes and longitudes aforesaid." The positions of the extreme points of the colony are:—

	S. Lat.	E. Long.
On the North, Cape Londonderry ...	13° 45'	126° 57'
On the West, Dirk Hartog Island (Cape Inscription) ...	25° 29'	112° 57'
On the South, Peak Head, south of King George's Sound ...	25° 13'	117° 57'

The extent and area of the colony as estimated in the Office of the Surveyor General are:—

Length from North to South ...	1490	Eng. miles.
Breadth from East to West ...	865	"
Length of line including the coast 3500 ...		"
And in English square miles ...	1,060,000	
" acres ...	678,400,000	

It is therefore the largest of the colonies of Australia, and more than eighty times as large as the United Kingdom of Great Britain and Ireland.

II. GEOLOGY AND PHYSICAL GEOGRAPHY.—The geology of W.A. is in its general features very simple. Upon an undulating surface of granitoid rocks, passing, as is common elsewhere, into gneiss and other forms of metamorphic rock, have been deposited strata, for the most part horizontal, of sandstones and limestones, the greatest thickness of which does not probably in any place exceed 700 feet. These form flat-topped ranges, and by process of denudation and consequent separation from the mass, detached masses and peaked hills, which are characteristic features of the country over a large portion of its area. The arenaceous and cretaceous deposits have, in process of denudation, been cut into valleys and gullies, in the courses of which the base rock is commonly laid bare; but as these deposits, even when obviously similar in formation, are found at different elevations, and as science has recently confirmed the possibility of similar deposits having been made at different periods under similar conditions, it will not follow that these are all of the same period in time, or that they have even been continuous. On the contrary, it would seem that the different positions in which such deposits are found are due to gradual or successive elevations of the land from its western coast, but in addition to these causes of the superficial formation, recent examination of the southern district of the colony has shown that its area has been traversed by elevations of eruptive rocks. The same features have been observed in the upper basin of the Murchison River, and the highest and most prominent hills and ranges throughout the country have been sq

formed; those on the south being granitic or schistose, while those to the north are described as basaltic, trappean, or volcanic. Those erupted rocks, both on the south and in the Murchison district, form well-defined ranges culminating in bold rocky peaks trending from east and north to south and west, and about the sources of the Murchison divide a series of parallel valleys forming the basins of its affluents. True basalt has been found in its crystalline forms in the south-western angle of the colony at Bunbury on the north, and Cape Beaufort on the south, but connection between these eruptive masses has not been determined. Two geological maps of the south-western part of the colony have been published; one by F. H. Gregory (Arrowsmith, London, 1860) including the Gascoigne River, which is now very scarce, and the other by H. Y. L. Brown, giving the result of his surveys when employed as Government Geologist during the years 1870-73, which will be found with detailed maps, sections, &c., in the volumes of Council papers published by the Government during the years 1872-73. This of course is the more valuable, as of later date, and the work of a professional geologist, but Mr. Gregory's map, including a much larger area both to the N. and E., and marking the appearance of granitoid rocks in the river courses and elsewhere, as well as many erupted masses not included in Mr. Brown's map, gives valuable assistance in considering the general geological features of the colony. Granitoid rocks appear in great masses, forming capes and headlands on the Southern coast, as also in dome-like elevations and bare escarpments on the summits and sides of the principal water-sheds of the country. These in many places and more especially from Champion Bay to the Murchison river, are traversed by dykes of greenstone and similar rocks in which rich lodes of copper and lead are found; and on the surface in other places, there are extensive deposits of brown hæmatitic iron ore. Silver exists in small quantities in the lead ores, and gold has been found both in alluvium and quartz reefs, but not as yet in quantities to make its working remunerative. Among the erupted schistose rocks on the Irwin, Phillips and Fitzgerald rivers have been found, as probably there will be elsewhere, strata containing a semi-bituminous deposit which has been taken for coal. Tin and zinc have also been reported as existing in several places, but have not yet been discovered in workable quantities. Brown attributes the argillaceous clays, shales and schists to the silurian period, the bituminous shales to the carboniferous, the sandstones and limestones to the oolitic, but the coast limestone, evidently a more recent concretion, must be excepted, which, with its accompanying beds of calcareous grit and sandstone, he attributes to the tertiary period. Some of the fossils which these limestones contain, differ but little from species still existing on the shores of the colony; but

Brown seems to think that the clays and laminated rocks found at the base of the hills may underlie them. This outline sketch of the geology of W.A. may be sufficient to account for its most apparent physical features, but some further geological notices will be required in considering them more in detail. On examination, the coast line of W.A. will be seen to present three deep indentations—at King George's Sound on the S., Shark's Bay on the W. and King's Sound on the N. coast, all trending to the westward of N. To the W. of King's Sound there is an extensive bight reaching nearly to the N.W. angle of the colony, while on the S. coast, the Great Australian Bight stretches eastward from Cape Arid; and lines drawn from Fowler's Bay (beyond the eastern limit of the colony) to King's Sound, and parallel to it, northward from Cape Arid and southward from Shark's Bay, will divide the colony into three districts, trending about N.N.W. and S.S.E.

1. The Desert district, continuous beyond the eastern limit of the colony.
2. The Lake district, extending to the head waters of the Greenough and Murchison.
3. The Coast district, including the basins of all rivers south of the Greenough.

To these must be added the Coast districts of the N. and S., including the basins of all rivers falling into the sea in those directions. These divisions accord well with what is known of the geology of the colony, as a line drawn N.N.W. from Point Culver at the western end of the Great Australian Bight will pass along the western limit of the granitoid rocks on the edge of the great desert, and strike the mountains at the head of the Fortescue; while a similar line drawn from Fowler's Bay, at the head of the Bight, where Delisser found granite, will pass between Mounts Elvire and Fort Mueller granitic rocks, on Forrest's track, near the eastern edge of the great desert. It is also apparent that a similar line drawn from the eastern shore of the Great Bight would come out on the northern coast in the deep indentation to the east of Cape Londonderry. These lines, and others drawn at right angles to them, will also be found to correspond generally with the coast line, so that within a parallelogram of 1000 miles in length by 700 in breadth, which may form the normal figure of the colony, its area to the W. of a line drawn from King's Sound S.S.E. would be included. If however the southern limit of such a parallelogram were to be a line drawn through Point Culver, the western coast limit of surface granite in the desert district, it would pass to the N. of that great mass of oolitic rock which appears on the shore of the Great Bight; and this exclusion would be consistent with the fact that this formation is exceptional and differs from all other known geological formations in the colony; the coast of the Great Bight extending at the foot of a limestone range of perpendicular cliffs named after Governor Hampton. The limestones here found are of various qualities, and have never

been sufficiently examined, but from the fossils they contain, which in all are numerous, and of which some entirely consist, they may probably be classed as approximating to the great oolite of England. They are too dense to contain water, unless in fissures or caverns, which are common in them. Their surface is grassed, but waterless, though water fit for stock is found in Roe's Plains, at their base near the sea. Their northern limit has not been observed. They present materials for building, for lime burning, and for such ornamental uses as marble is applied to. A similar line drawn from N.W. Cape S.S.E. would exclude the projecting mass to the E. of King's Sound, which has also its own characteristic difference. The Desert District, which had only been entered from the E. and W. until it was in the present decade crossed by Warburton, Forrest, and Giles appears, so far as our present knowledge extends, to be a level expanse of sandstone with some granitic elevations and depressions forming hills and pools, the surface covered by what is locally known as spinifex, thinly wooded with belts of mulga and other shrubs, and with scattered white gum trees near the pools of water. To the S. Giles found it waterless, but Forrest found water nearly throughout his whole route across the centre. It is therefore probable that water may exist in many places, but the district, so far as is known, offers no inducement even to further exploration; yet Forrest, in 1853, found a sandstone range extending into it under the parallel 28°30' S. latitude, and reports many natives and much game in its interior; it may therefore possibly be more varied in character than is commonly supposed. Of the Lake District more is known, but by no means as much as is to be desired. It presents an irregular undulating surface of granitic rocks, very varied as is usual in composition and structure, traversed by dykes of dioritic quartzose and schistose rocks, the general direction of which may be found to correspond to the normal lines already indicated. Masses termed indifferently trap or basalt by explorers, and cairns of granite form isolated hills and ranges, the relations of which have yet to be determined. Quartzose and schistose dykes in erupted masses appear to be most common in the S., and trap or basalt in the N. Upon the undulating surface of the primitive rocks of this district horizontal strata of sandstone, but of no great thickness have been deposited; the elevations are separated by broad irregular shallow troughs, the depressions in the surface of the primitive rocks, in which are deposited clays and sands disintegrated from them, which act as receptacles for water, and form lakes of greater or smaller extent, according to the amount of the rainfall, and which uniting in very wet seasons may have given rise to the report, once prevalent, of an inland sea. The lakes or swamps thus formed may probably cover one-third of the entire area of this district south of the sources of the Murchison River. The

disintegration of the surface rocks, even of the granite, from the quantity of feldspar contained in it, but more especially of the sandstone and schistose rocks, is effected with great rapidity both here and elsewhere in the colony, and is not confined to wet periods, but is continuous from atmospheric action during the whole year; and it may be assumed that where sandstones predominate the process of evaporation, by which only the surface waters are diminished there being no known outfall for them, not only leaves in deposition any saline matters that may be present in them, but also may cause the formation of crystals of gypsum as Mr. Brown supposes, and consequently the lakes so formed are salt; while those of which the clay basins are formed by the disintegration of granitic or erupted rocks are fresh, as are the springs commonly found at the bases or elevations of those rocks. A considerable portion of this district is after rains richly grassed, and has been utilised for grazing sheep and cattle; but as rain falls at very irregular periods and often at long intervals, it is therefore unfit for agricultural purposes. Long belts of a thick but low growth of small Eucalypti are found traversing it at intervals. It may probably be found hereafter rich in those minerals which accompany or are contained in granitic transition or erupted rocks. The lake district may be considered as a shallow basin on a plateau of 300 miles square, and is buttressed up on three sides by elevations which form the watersheds of the rivers, the valleys of which open to the coasts of the colony. The superior ranges, which separate the river basins, commonly present bare surfaces of granitoid rock; the inferior are for the most part covered with a concretionary rock, frequently appearing as a conglomerate, known in the colony as iron-stone, which is also common in the valleys and on the flanks of the ranges on the W. coast, while to the N. and S. sandstones predominate. As is commonly the case, the highest points project in front of the main mass, but it is not probable that any attain to 2000 feet above the level of the sea, and the greatest elevations will be found in the S.W. and N.W.; in the former about the middle of the river basins, and in the latter near the sources of the rivers. As the basins of the larger rivers naturally divide the coast districts into areas having characteristic differences they may be best considered separately, and as the principal settlements are on the W. coast, it may claim priority in description. A line of about 300 miles, from the sources of the Blackwood to those of the Irwin, may represent the south-western watershed of the colony. This great mass of granitic rock—the western escarpment of which is known as the Stirling Range, which forms the watershed of the rivers of the S. as well as W., and the spurs from which separate their basins—has its greatest elevations to the S. and W. The height of but few of these has been correctly ascertained, but Mount William,

at the source of Meares River, to the S. of the Murray, rises 1685 feet above the level of the sea. To the W. and S. another range has been thrown up, forming a sort of terrace below the main range, and this is marked by Roe's Range, of which Mount Lennard on the Collie is the culminating point. Beneath this, as has been noted, on the coast, both to the W. and S., basaltic columns have been protruded at Bunbury and at Cape Beaufort; and beyond, about thirty miles to the W., the Coast Range, some points of which are nearly 800 feet above the sea, has by its elevation directed the course of the Blackwood to the S. This is also granitic, but has deposits of limestone and saliferous sandstones upon it. The former, probably of the same formation as the coast limestone, are hollowed into numerous caverns, containing fossils and fossiliferous deposits, while in the lowlands at the base of the main range to the E., there are superficial masses of gravel containing fossil bones of large animals which have not yet been examined. The line of this coast range is apparently continued in the reefs which fringe the coast, the outer one being known as the Five Fathom Bank, possibly terminating in Houtman's Abrolhos. The great granitic mass of the south-western ranges slopes downward to the N., where the strata of sandstones and limestones about Moore River and the rivers of the Victoria district to the N., and which rest upon it, give a distinct character to that portion of the colony. The formation of these is not sufficiently well known, but it would seem that they are related to the schistose deposits on the Irwin and the S. coast. The Blackwood, having had its lower course directed southward by the interposition of the rock masses on the W. coast, from Cape Leeuwin to Cape Naturaliste, assumes an intermediate position in the S., as the Gascoigne, falling into Shark's Bay, does to the N. The rivers Murchison, Greenough, Swan, and Murray, the basins of which open to the W. coast, have their sources in the main watershed, and mark the principal divisions of the coast district; while the Hutt, Bowes, and Chapman, the Irwin, and Moore, the Serpentine, Harvey, and Collie, have their sources in the outer slopes of the ranges which form the upper basins of the larger rivers, as other inferior rivers, so called, have their sources still nearer the coast line. The rivers of the colony are indeed for the most part water courses, down which torrents rush in wet seasons, which occur only occasionally and sometimes at long intervals; and their courses are at other times marked by sand and gravel, brought down by the floods, and pools formed in the bottom rocks in which, as being below the general level of the river bed, water remains after a flood, and in some of which it is maintained by natural springs; these are fresh or saline—too frequently the latter—according to the conditions in which they are found. The lower course of the

rivers commonly opens into lakes, lagoons, or, as they are termed, estuaries, often formed by elevations or depressions in the rocks near the coast, and shut in from the sea by a bar of rock and sand, a passage through the latter being opened in time of flood, to be immediately closed by the action of the sea, when the force of the current of the river is no longer sufficient to keep it open. Some few of the rivers have, however, a stream continuous throughout the year, and of fresh water; these will be found on the south-western and northern coasts of the colony. It will be seen that the main, as well as the lateral valleys of the river basins, are generally in the direction of the normal lines already indicated.

III. RIVERS.—The Swan River, as the centre of the population and industry of the colony, and as having on its banks the capital, Perth, and at its mouth the principal port, Fremantle, may claim precedence in description. Its name was, moreover, that at first given to the new surface, broken by small lakes, and crossed by numerous rivers. The coast limestone ranges, which in some places appear to have been deposited upon the tertiary strata, in some others may be clearly perceived to rest on granitic rocks. About the mouth of the Swan they have been found below the bed of the river resting on solid cretaceous sandstones. The superficial limestones, however, form ranges of low hills along the coast, between which are extensive lagoons, two of which only, Peel and Leschenault inlets, communicate with the sea, but neither are accessible to vessels; the former will not, but the latter will, admit the entrance of boats. Peel Inlet extends twenty miles to the S. in Harvey Inlet and receives the waters of the Murray, with the smaller streams of the Serpentine and Harvey, which have their sources in the valleys in the face of the Darling Range, and with other rivers of the same class to the S., run a rapid course, broken by falls before reaching the plain at the foot of the hills. The falls of the Serpentine and Meares are most remarkable for their height and the picturesque scenery about them. The Murray has its northern sources—the Bannister and Hotham—near those of the Avon and Canning; while its southern, which unite in the Williams, interlock with the Hillman and Arthur, the northern affluents of the Blackwood. The lateral valleys of the Murray extend about forty-five miles, and its main valley is in a direct line from its watershed to the confluence of the Williams and Hotham, about fifty miles in length, and from thence to Peel inlet about fifty more. It receives the N. and S. Dandalup, from the base of the range on the N., in its lower course. Upon these, as on all the rivers of this coast, there is much fertile land which however has been in occupation since the early days of the colony. The mouth of the Murray is obstructed by sandbanks, but its lower course is navigable for small craft to Pinjarrah. The area enclosed between the Murray and Blackwood is drained by the Collie, which receives the Brunswick and

Wellesley from the foot of the range in its lower course; the Preston, with its affluent stream, the Dardanup, flowing into Leschenault Inlet from the S., as the Vasse and other small streams do into Geographe Bay. The valley of the Margaret opens the coast range to the W., as Turner's River does to the S., the interior being accessible from those points. The Blackwood drains the largest area of all the rivers in the S. of the colony, but, in consequence of the secondary elevation of the ranges to the S.W., is confined to a narrow valley in its middle course of some sixty miles in direct distance, through a mountainous and well-wooded country, in which there are, however, many fertile flats and well-grassed banks. Its lower course for forty miles is of the same character as the rivers of the W. coast; but it has a much greater breadth and depth, and when in flood rises more than twenty feet above its ordinary level. The lateral valleys of the upper basin have an extent of about seventy-five miles, and from the sources of the Beaufort on the S., to its confluence with the Arthur from the N., may be fifty miles; about fifteen miles below this it is joined by the Balgarup, also from the S., from whence to the sea it has no affluent stream worthy of notice, though it is fed by numerous torrents from the mountains on either side. As the lateral valleys of the Murray are separated from those of the Swan, so the head waters of the Arthur and Hillman are separated from those of the Murray and Collie by narrow watersheds, thus dividing the hill district of the S.W. into their several basins, and, in like manner, the basins of the rivers of the S. coast open from the reverse of the watershed of the sources of the Blackwood. These are the Gordon, formerly called the Frankland, the Kent or Macquoid, Hay, Kalgan, and Palinup, which drain the area from Cape Chatham to Point Henry at Dillon Bay on a coast line of about 180 miles, all having their sources in the flanks of the great granitic mass of the S.W.; as has the Warren between Cape Beaufort and Point D'Entrecasteaux, near which are the smaller rivers Donnelly and Gardner, formerly known as the Gordon, and the Shannon and Chesapeake, which fall into Broke's Inlet from the N.W. On these there is much good land, and the country about them is well grassed, and consequently has been taken up by stock-owners. The forests are from fifteen to twenty miles from the coast, but there are groves of peppermint and other trees on the low sandy ranges between the inlets. The Gordon, rising between the sources of the Palinup and Beaufort, has a westerly course of sixty miles, when it is joined by the Frankland from the N., which formerly gave its name to the whole river; from thence it has its course through a narrow valley to the rapids at the foot of the hills, and is from thence navigable for small craft to its mouth in Nornalup Inlet, which is, however, obstructed by sandbanks. There are many fertile flats and well-grassed

slopes throughout the valley of this river. The Kent and Kalgan have their rise in a district of small lakes on the outer slopes of the basin of the Gordon. The former has a course of about seventy miles, with no considerable affluents, to Irwin Inlet, and is on a smaller scale similar to the Gordon; as is the Hay, falling from the southern slopes of its watershed, which is about thirty-five miles from its source to its mouth in Wilson's Inlet; this also receives the smaller streams of the Denmark on the W., and the Sleeman and Teutor on the E. The Palinup and Kalgan are intermediate in character, for on their courses the granitic hills and forests die out; the Porongurup extending in solitary grandeur to the E. and culminating 2145 feet above the sea, while between them the schistose peaks of the Stirling Range rise in rugged masses for thirty miles; Tolbrunup near the centre rising 3341 feet; Ellen's peak to the E. 3420 feet, and the highest points between the two 3640 feet above the sea, as recently estimated by Captain Archdeacon. Across the lower course of the Palinup, a comparatively level plain extends to Doubtful Island Bay, formed by sandstone deposits on the granitic floor, which is apparent in the channels of the rivers, and has its surface partly covered with timber to the W., and numerous fresh water lakes, those to the E. being marked by the belts of yeast and tea-trees which surround them. The Kalgan has its course of seventy-five miles round Porongurup Range, and falls into Oyster Harbour, which opens into King George's Sound. It is, like the rivers to the W., a constantly flowing water, but the Palinup is, except in rare seasons of flood, marked only by occasional pools. It has its outlet after a course of about 100 miles, during which it receives only two small affluents from the N., in an estuary of about five miles in length, which lies in a very beautiful valley surrounded by lofty hills, but it is closed from the sea by a bank of sand. The sandstone rocks are well developed on either side of the estuary of the Palinup, presenting steep escarpments to the sea of some sixty feet in height, but they attain their greatest elevation on the Fitzgerald River, which flows (when it does flow, which is at intervals of several years) between lofty cliffs in its middle course, having its sources beyond the granitic outcrop to the S. of the district of the lakes which crosses the Palinup in its middle course extending towards Cape Arid. The sandstones occupy less of the valley of the Phillips, and it is therefore more fertile; but the erupted schists, which are so largely developed in parallel lines near the coast of Doubtful Bay, cross the lower course of both rivers, and culminate in the three Mounts Barren. All the waters of the Fitzgerald are saline, but Hamersley's River, an affluent of the Phillips, on the north of Eyre's Range, is fresh. There are also deep and large fresh water pools on the Nicolay and Gardner Rivers, which traverse the centre of the plain,

and have their estuaries in Bremer and Doubtful Island Bays. St. Mary's River drains the eastern and northern slopes of West Mount Barren, and is remarkable for the beauty of its estuary, and the romantic development of the schistose rocks at St. Mary's crags, on its middle course. There are also fresh water pools on the lower course of the Palinup, where the granitic rocks appear on the surface. Price's recent survey of the coast from Bremer Bay to Eucla has given accurate knowledge of its physical features. Granitic rocks present themselves in ragged peaks at intervals to Cape Arid and Cape Pasley. The Steere falls into Cullum Inlet to the E. of the Phillips, some twenty miles beyond which the Judacup communicates with a chain of lakes; twenty-five miles further E. is the Oldfield. The Young and Lort fall into Stoke's Inlet, and here limestones begin to appear above the granite floor. At Barker Inlet the limestone cliffs are 250 feet in height, beyond which Gray's River communicates with the lake of the same name; and other lakes and lagoons, both salt and fresh, are continued to the eastward. At Esperance Bay the granite is again developed in high peaks, rising at Cape le Grand 1040 feet above the sea level. Thomas River to the E. and the Weanenginup Creek are the last waters on the S.E. coast of the colony, the latter being between Capes Arid and Pasley. The limestone cliffs of Hampden Range extend to Wilson's Bluff seven miles beyond the landing place at Eucla; and Ross Plains, beneath these, have an extreme breadth of twenty-five miles; they are covered with samphire bushes and afford only water fit for stock. The western coast of the colony presents a range of low sandhills, varied with occasional points of limestone rock, to beyond the Moore River; but the southern rises in bold granitic headlands at Cape Chatham on the W., 820 feet above the sea, and at Mount Manypeake, to the E. of King George's Sound, 1855 feet; Warricup and Bald Island are both 1020 feet high; Bennet's Range to the N. of Parry's Inlet culminates in Mount Lindsay, 1469 feet above the sea; and Kalganup to the N. of Nornalup at 1384 feet. Between W. Cape Howe and Cape Chatham are many extensive inlets,—Burke's $7\frac{1}{2}$ miles long, Nornalup $2\frac{1}{2}$, Irwin's and Parry's and Wilson's 8 miles long, of which Nornalup alone is accessible to small craft. There are, however, at Point D'Entrecasteux, Capes Leeuwin and Chatham, the mouth of Nornalup and Point Hillier, as well as in Tor Bay anchorages sheltered by islets and reefs; but as the Admiralty survey now in progress is complete only in the coast line without soundings, nothing can be said certainly respecting them. King George's Sound, however, in the centre of this coast, is accessible to vessels of any class and at all times, and has a circular area of some six miles in diameter, protected to the east by Michaelmas and Breaksea, rocky islands, and surrounded for the

most part by granitic hills; on the N. it terminates in a sandy beach of three miles in length, on the E. of which is Oyster Harbour, accessible to vessels drawing fourteen feet and carrying that depth to the mouth of King River, having a small area of deeper water within; to the S.E. is an inner harbour named Princess Royal, of which, though a great portion to the W. is as in Oyster Harbour, shallow, it is on the N. capable of receiving the largest vessels; and here, at the town of Albany, at the base of Mount Gardner, a granitic mass rising 860 feet above the sea, the mail steamers deliver their mails and passengers, and take in coal for their further voyage. This harbour is entirely landlocked, a long point crossing it to the E., rising in Quarantine Hill, 260 feet, and the entrance being only three cables broad. The survey of King George's Sound is completed and published, as are those of the ports of Fremantle and Champion Bay. A chain of fresh water lakes stretches to the north of Perth Water for thirty miles towards the Moore River; and from thence to the Bowes River, beyond Champion Bay, the granite floor has a more even surface, and the sandstones and limestones are more largely and regularly developed, so that the ranges throughout this district, of which the principal near the coast are Gardner and Moresby's flat-topped ranges, have a level surface, varied only by the valleys of the rivers and by detached conical hills. Granite, however, forms elevated masses to the N. of Moore River in Mounts Peron and Lesneur, which rise to more than 1000 feet above the sea, and on the Greenough River, and forms the surface of the greater portion of what is known as the Mines district, to the N. of Champion Bay; it also appears in the Victoria Plains, where the Moore and Arrowsmith Rivers take their rise about fifty miles from the coast. The rivers of this district are therefore mere watercourses, with occasional deep pools in the rocks, but in rainy seasons are filled with broad, deep, and rapid torrents. On and about their banks occasional flats of rich land are found, but the country is obviously more fitted for pastoral than agricultural pursuits. To this there are, however, two marked exceptions; one in the plains along the base of the hills below the upper valleys of the rivers, and the other in the lacustrine basins between the Irwin and Greenough, in which there is a large extent of rich alluvium, in the latter mostly under cultivation. The Moore, Arrowsmith, and Irwin have their sources in the western slopes of the northern spurs of the Darling Range, but the sources of the Greenough are in the N.W. angle of the Lake district, and overlap those of the Irwin. The Chapman has its sources in the outer slopes of the basins of the Greenough, as the smaller rivers of the coast, the Buller, Oakagee, and Bowes, have from without the valley of the Chapman. The Greenough may have a direct course of more than 150 miles, and its lateral valleys may extend 100, but this part of the colony

has not been surveyed, although triangulations have been carried from Perth to the Weld Range, beyond the Murchison, under the direction of the Surveyor-General, from which it appears that the principal elevations are Mount Dalgeranger, to the E. of the sources of the Greenough, 2100 feet, and Mount Lulworth, the culminating point of Weld Range, 2330 feet above the sea. Forrest found Mount Hale, under the 26th parallel, composed of magnetic iron ore with brown hæmatite, similar to the peak in consequence named Mount Magnet by Austin; and several other peaks in this and the Lake district are of the same formation. The Murchison River is exceptional both in size, position, and character. It is the longest river of the colony—has its upper basin in the N.W. angle of the Lake district, to the Greenough and Gascoigne, and on its banks the first specimens of the fauna and flora of the north coast are apparent. It has a deep channel above its mouth. The river in its middle and lower courses winds, through an irregular valley, rich in minerals, for more than 100 miles in a direct line without an affluent. The upper valleys of the Murchison have not been mapped, but it has several affluents, the Sanford, Impey, and Roderick, the valleys of which have an extent of from 100 to 200 miles. Forrest found the eastern watershed under the 120th meridian, after passing over some 100 miles of undulating well-grassed country, traversed by numerous watercourses, the most important lateral valley being that of the Sandford, the waters of those to the N. being fresh, and those to the S., for the most part saline. Mounts Bartle and Russel, at the eastern source, are in latitude 26° 5' S., and the valley lies to the S. of Robinson Range. In ordinary seasons the course of this river is only marked by its bed, either of rock or sand, or by occasional pools; but in times of flood a vast volume of water is poured down to the sea, into which it passes through cliffs of limestone. The plains about the head waters of the Murchison and to the E. of the Greenough are being rapidly occupied by sheep farmers, especially those of the Champion Bay district, to whom they have proved a most valuable means of extending their runs and increasing their flocks. Mr. Forrest discovered large surfaces of well-grassed land and many pools and fresh water springs on the main source of the river. The Gascoigne and its affluent, the Lyons, form the connecting links between the rivers of the W. and those of the N. coasts, the head waters of the one interlocking with those of the Murchison, and of the other with those of the Ashburton. The Lyons flows at the foot of the S. face of Barlee Range, as the Ashburton does at the N. of Capricorn Range, under the southern tropic, the Spinifex district of the coast line extending to the eastward between them. The basin of the Upper Gascoigne is marked by lofty hills of erupted rock, trap, and basalt, as well as by schists and slates. It is rich in minerals, has many available arable and pastoral locations; it may

present an irregular curved area of 200 miles in length by sixty in breadth. The Lyons joins the Gascoigne about seventy-five miles from the sea, at the base of the sandstones, which have here their escarpment on the N. face of the Kennedy Range, through which the course of the river passes to the sea in Sharks Bay. About the mouth there is much good pastoral land, which has been taken up and is in course of occupation. The mouth of the river covered by Babbage Island forms a harbour accessible by the southern channel to vessels drawing fourteen feet. Sharks Bay will probably become the centre of the trade of the Upper Murchison, as well as of the Gascoigne; it is a vast sheet of water, having a low eastern coast of about 130 miles, covered by mangrove flats on the S. of the Gascoigne, and rising in the sandhills of Lyell's Range to the N. unbroken, save by the mouth of that river. This great gulf is divided at its southern extremity into two large bays or sounds by Peron Peninsula, extending seventy miles to Cape Peron. The eastern is again divided into two parts by Point Petit and Faure Island. Durham Sound, on the west, is broken into several deep inlets, and terminates in Freycinet Harbour. Sharks Bay is covered to the west by Dirk Hartog's Island, about seventy miles in length by six in breadth, to the N. of which Doore and Bernier Islands, with their connecting reefs, extend fifty more. The Naturaliste Channel, between Dirk Hartog and Bernier Islands, is fifteen miles broad, and the Geographe Channel, to the N., fifty. There can be no doubt that this must become hereafter an important naval station. Dirk Hartog's Island has been long occupied as a sheep station by Mr. F. von Bibra. These islands are all rocky. Dirk Hartog's rises 435 feet above the sea at the northern extremity. From the Murchison a barren sandstone plain extends to the coast near the mouth of the Ashburton, broken only by the lower course of the Gascoigne, and supposed to be waterless. With the valley of the Ashburton the pastoral district of the N.W. coast commences, and extends for 300 miles to the DeGrey. Throughout this district from Exmouth Gulf the coast is generally low and covered with mangroves, while to the W. it is bold and rocky, yet granitic rocks appear in many places. The principal rivers—the Ashburton, Fortescue, and DeGrey—have their sources among the granitic ranges of the interior, and their middle in the sandstone ranges which flank them, and from which the surface descends gradually to the sea, and below which the inferior rivers—the Cane, Robe, Maitland, Harding, and Yule—have their rise. F. H. Gregory describes three distinct terraces rising from the sea to the S. Although much of the land is very fertile, yet, as the rainfall is uncertain, and often at long intervals, this district is not well fitted for agriculture; but as there is water for stock, and the natural grasses are permanent, it has become one of the most important grazing districts in the

colony. The sources of the Gascoigne and Ashburton may be 1500 feet above the sea, and there are many points of considerable elevation about them. Mount Augustus, on the Lyons, was estimated by Gregory to be 3480 feet in height; here he found porphyritic, schistose, and metamorphic sandstone rocks; and the ridges, which separate the head waters of all the rivers, are commonly highly siliceous. Plutonic and erupted rocks, diorite, trap and basalt have been also noticed by explorers in many parts of their valleys. The Ashburton has a course of nearly 200 miles to the sea, and is 100 yards wide at the mouth with deep water, but has no safe anchorage. It receives two considerable affluents on the right, Hardey River and Duck Creek, and has good alluvial land and well-grassed plains throughout its course. The upper basin may be seventy-five miles in width. The Fortescue may be in extent equal to the Ashburton, but has no considerable affluent; this river has much richly grassed country throughout its course, especially below Hamersley Range, which culminates in Mount Pyrtou 2700 feet above the sea, and from the flanks of which a stream of fresh water known as the Mill stream, debouches through a gorge. Here first are seen the palm-trees of the N. coast. To the N.E. of this river, about the sources of the Sherlock and Yule, plains covered with spinifex are found, which again extend beyond the DeGrey, limiting the area of the pastoral land; but Cowle saw splendid country to the S., and there is good land in patches on the DeGrey and its affluent, the Oakover; but the valley of the Strelley is closed in by granite ranges, with volcanic ridges appearing through them (F. H. Gregory,) and similar rocky hills limit the valley of the Shaw to the W. On the Sherlock the sandstone hills rise in bold bluffs 300 feet above the pools of permanent water, and sandstone forms the surface of the spinifex district towards the E. Throughout this district scattered trees are found on the plains, and white gums in many of the river valleys, as well as about the sources of the Sherlock. The long low coast-line is broken near the centre by the promontory which forms Nickol Bay and its adjacent islands; but neither Cossack on its south-eastern side nor Tien Tsin, beyond Cape Lambert its eastern boundary, afford good accommodation for trade. Port Robinson has however been recently opened in Hampton Sound to the W.; it is protected by Enderby and other islands to the N., and is accessible by Mermaid Passage, between them and the Legendre Islands, to the N.W. of Nickol Bay. Beyond Cape Latouche Treville, to which the plains of spinifex extend, the face of the country changes its character, presenting an aspect totally different from that of any other part of the colony. The coast becomes rocky; the points and headlands are extended in numerous islands, of which also there are many outlying the coast, which is indented with bays and harbours throughout its entire length, many of the first class, with

deep water close to the shore. Beyond Cape Leveque King Sound opens to the S.E., and is about ninety miles in depth by twenty-five in greatest breadth, and further eastward Prince Regent's River and many other narrow but deep inlets, with steep rocky sides stretch deep into the land. This coast will be found clearly detailed on the Admiralty chart, but is too intricate and broken for general description. The only portion of the interior at all known is the valley of the Glenelg, which was examined by both Grey and F. H. Gregory; and if it may be taken as typical of the rest the future importance of this part of W.A. can hardly be over estimated. The Glenelg has its sources in the sandstone precipices of Stephen Range, the limit of Grey and Lushington's explorations to the S. of the 16th parallel of S. latitude, and has its final outlet to the sea in Doubtful Bay, some thirty-five miles to the W. under the same parallel; and the line between these points forms the chord of the irregular arc of the course of the river. After descending from the rocky gorges of the sandstone range it flows with a deep and rapid current for about twenty miles in a N.W. direction, through a valley rich with the disintegrations of the basaltic hills which now bound its valley to the E., and from which descend numerous streams of fresh water, to the base of the hills of the same character, rising at the foot of the sandstone range which separates it from Prince Regent's River, from which at this point it is distant only about twelve miles. These ranges trend N.W. and S.E., as do the inlets of the coast, showing a change here in the axis of elevation, and in consequence the valley widens to the N.W., so that its affluent, the Gardner, which drains this part of the valley, has an extent of fifteen miles, and the northern portion is a net-work of running waters. From its N.E. angle, where it falls over rocks, the course of the Glenelg is westerly at the base of Mounts Eyre, Sturt and Lyell, basaltic peaks rising 700 feet above the plain, which is everywhere fertile and rich in vegetation, and for the most part thinly wooded with large timber. This plain rises gradually to the N. to Harrington Downs, which are well grassed and watered. The sandstone ranges to the N.E. are clothed with a forest of pine timber. From the rapids at the N.E. angle the Glenelg is broad and deep and navigable for twenty miles, but its mouth in Maitland Bay is divided by an island into two narrow channels, accessible only to vessels of about 100 tons. It was entered by the *Flying Foam* schooner, thirty-two tons, in 1864. George water is about seven miles long and four broad, and is probably connected with Brecknock harbour some fifteen miles to the N.; it opens by two narrow channels into Doubtful Bay which has an area eight miles in length by six in breadth, with deep water and sheltered to the W. by islands forming a safe and commodious harbour. The eastern shores are however formed of mangrove swamps, and it is separated from the valley of the Glenelg

by rugged sandstone hills rising 700 feet above the sea. Prince Regent's River may be taken as an example of others on this coast. It opens to the sea in Brunswick Bay among numerous islands which, with the indentations of the coast, form many large and safe harbours. Its entrance is covered to the N.W. by a group of islands, which also protect Hanover Bay to the E. Below these it is four miles wide with thirty fathoms water; about five miles further it narrows to about three-quarters of a mile, and then expands in St. George's Basin, a noble sheet of water ten miles long and nearly seven broad, with two islands to the N.W., and from eight to fourteen fathoms water. Beyond the basins the river is continued through a narrow gorge for fifteen miles, with water shoaling gradually to two fathoms. From the extremity, and from every gorge and ravine on either side perennial streams of fresh water pour down. These are clothed with luxuriant vegetation (forests of pine trees were found by Grey on the hills on the S. side,) among which the pandanas and fern are most notable; and the whole country is not less rich in animal than in vegetable life both by land and water. The tides on this coast rise from twenty-five to thirty-five feet.

III. CLIMATE.—As the geological conformation of the colony divides it into districts distinct in character, so in connection with their position it has determined their climate and productions. The great granitic masses of the S.W. are covered by forests, the trees to the S. being of gigantic growth, showing not only the fertility of the soil but the greater humidity of the climate, of which also the greater abundance of fresh water gives sufficient proof; moreover, the forest growth prevents the great rapidity of evaporation which is experienced on the plains of the N., centre, and S.E. of the colony; these causes determine the distribution and occupations of the inhabitants. The S.W. must ultimately prove the most populous and generally productive portion of the colony, having the most varied surface, the best climate, and affording agricultural as well as pastoral districts. No country is capable of producing a greater abundance of fruit and vegetables. It is, emphatically, a land of corn, wine, oil, fruits, flowers, milk, and honey. The more extensive pastoral districts must necessarily prove less populous, yet in them there are agricultural areas as at the mouths of the Greenough and Irwin, and mineral districts as at Northampton, near Champion Bay, which can afford occupation for large numbers of people. The agricultural areas of the pastoral districts, although comparatively small and scattered, may be estimated as sufficient to provide food for any future population. The settled districts of the colony are connected with the coasts by the rivers, and it is of these only that the climate and productions can be stated with any certainty. The results of meteorological observations in the different districts are given in the following tables. The average temperature and atmospheric

pressure taken from the observations made by the late W. H. Knight at Perth, are during the years 1867-8-9:—

Barometer,	Max.	30.47	May, August, 1868,
			and June 1869.
Do.	Min.	30.13	January 1869.
Thermometer,	Max.	107	March 1868.
Do.	Min.	day	40 July 1867, Aug. 1869.
		night	38 August 1867-69.
Daily Mean,	Max.	79.8	February 1867.
Do.	Min.	57.1	July 1869.

The greatest rainfall was in the month of June, having been 13.91 inches in 1868, the average of the three years being 10.85 inches for that month. The least rainfall was in December 1867 .01, and in January 1868 .01 inch; in the months of February and March no rains fell. The average number of days of the year on which rain falls is 102.3, and the average total rainfall 34.57. The prevailing winds are on the S. coast from S.E. to S.W., variable, but more easterly during the summer. On the W. coast from November to March; easterly in the morning and blowing fresh from the S.W. in the afternoon; the southerly winds are cold; and during this period the easterly winds are hot. A hot wind sometimes blows from the E. for two or three days in succession. During the winter months the easterly winds are cold, the winds are variable, calms frequent, generally preceding gales with wind and rain from the N.W.; these commence in the E. and die out when they have worked round to the W. Exceptional gales are experienced from the E. as well as from the W. On the N. coast hurricanes have been experienced in December, February, March and April. The most destructive on record, that of 20th and 21st March 1872, commenced from the S.E., and having veered to N. there was a calm for about half-an-hour; it then began to blow from the N.W. and by W. to S.E., when it dropped to a calm; the greatest force of the storm was at the middle points, E. and W. The climate of the N.W. is for the most part dry, with occasional tropical rains and strong winds from December to April inclusive; exceptional rains with moderate winds in June and July. Ice has been seen on the Ashburton and from thence to the S. coast, especially in the upper valley of the Murchison River, but in no part of the colony has it been observed to last many hours. Hail is rare, but occasionally, even on the N. coast, severe. Thunder storms are not frequent, more common towards the N., where damage has occasionally been done by lightning; they are periodical in the summer in the Murchison district. There are of course in W.A., as elsewhere, the usual differences resulting from locality, but the healthfulness of the climate of W.A. will appear from the following facts:—In 1869 the population was 24,785 persons, the deaths only 334, or 13.47 in 1000. This may be taken as a fair average year. In 1875 the population was 26,709, and the deaths 473, or 21.0 in 1000. This was an unusually

unhealthy year. Comparing the death rates of England and the other Australian Colonies with that of W.A., it appears that—In England the death rate is 22·40 in 1000; in N.Z., 11·38; in T., 13·76; and in W.A., 13·47. Although exposure at all seasons and for a long period must necessarily prove more or less injurious to man, yet there are few countries where less protection from the elements is required. Disease has been almost unknown among the explorers, who have traversed the country in all directions, and who, in the early days of the colony at least, seldom carried any shelter with them. In the towns, as well as in the country, the healthy appearance of the children cannot escape notice.

IV. PRODUCTIONS.—The most important natural productions of the vegetable kingdom are the grasses and "scrub" which cover the plains, and form the food of the kangaroo and of the sheep and cattle pastured on them; the timber, which forms the forests of the S.W.; the pine timber of the N.; sandalwood, which is found scattered over the hilly districts in most parts of the colony; and lead and copper ore, which, abounding in many other places, are at present worked only in the Champion Bay district, the Murchison River, and on the N.W. coast. The district of forests is estimated by the Commissioner of Crown Lands to have an area of 30,000 square miles, and extends over the hill country from the N. of the Moore River to the S. coast, as well as on the plains to the S.W. and to the E. of King George's Sound, where it dies out. The forest trees are of the genus *Eucalyptus*; the approximate areas covered by the principal species are given as follows:—White gum, 10,000 square miles; Jarrah, 14,000; Karri (blue gum,) mixed with Jarrah, 2300; Tooart, 500; red gum, 800; York gum, 2400. The York gum, though of smaller size, is common as far N. as the Murchison River. The Jarrah is becoming well known for its good qualities, strength, durability, and especially for its immunity from the attacks of submarine animals and the white ant, if cut at the proper age, and time of year, and well seasoned before using. For ship building, bridges, wharfs, jetties, &c., it is therefore of great value, and the more so, as iron bolts and nails driven into it do not loosen from rust as in most other woods; it is in consequence one of the most important staples of the trade of the colony. The Karri or Karrie tree is confined to the extreme S. and W.; its gigantic proportions excite the admiration of all those who see them; indeed the Karri timber is so huge that, though of much value, it is comparatively little used. Captain Bannister in 1830 measured trees eighteen feet in circumference, and estimated the branches at 100 feet; since then many of much larger dimensions have been observed. Governor Weld measured some 150 feet to the branches; they are commonly six feet in diameter, and have been observed of double that size. White gums are found for the most part in the

beds and on the banks of all the rivers of the colony. The tea tree or paper bark is characteristic of the water-courses and lake margins, as the yeast is found in and about the shallow lakes to the E. of King George's Sound; belts of mulga and other shrubs intersect the plains in the E. and centre of the colony, and marlock thickets cover the flanks of the sandstone ranges of the S.E. There are many other smaller trees, the wood of which is useful for the several purposes enumerated below, and some yield valuable resins. At the Inter-colonial Exhibition held in Sydney in the year 1873, Mr. George Whitfield exhibited specimens of fourteen different sorts of *Eucalypti* found in the Toodyay district, viz., Jarrah, twatta, a small kind but very valuable for wheelwright's work; coolan, growing in moist ground, a soft wood; morral, growing to three feet in diameter and ninety feet in height, straight, heavy, close in grain, and useful in house building and cabinet-maker's work; wandow grows to a large size, splits well for fencing, is very hard, and does not warp; Worlock growing to three feet in diameter and eighty feet in height, splits well for fencing and hurdles; dardeback is rather smaller, tough, but does not split well; mallet is light, splits well, and is much used for making hurdles; melyerick grows to six feet in diameter and seventy in height, and when seasoned is the hardest of the timbers of the colony; marlock is of small growth but very tough; of coorup, the largest of all, the young timber is much used in coach building, and the gum valuable as a powerful astringent; this is probably nearly related to the red gum, the gum of which is very bitter to the taste and has the same valuable medicinal property, as it is specific in cases of dysentery and diarrhoea; parral grows to the height of 100 feet, is sound, light, and splits well for fencing; wanderock grows to two feet in diameter and forty in height, splits well, is long in the grain, and valuable especially for dray shafts; hardham forms large thickets in the interior, seldom exceeds six inches in diameter, is very tough, and said to be equal to lance wood. The wood of the mangar or raspberry jam tree, so named from its peculiar scent, is extremely hard and excellent for turning, and for furniture, as is the native pear; the tea tree, or paper bark, is useful for boat and carriage building; the peppermint and swamp banksia for cabinet work; shea oak and Jarrah are used for shingles; the latter will not easily take fire; white and red gum are most commonly used in carriage and cart building, and the bark of the black wattle for tanning. In 1873, a slab of Tooart, or white gum, was exhibited, sawn from a log cut in 1862, and which had been lying exposed to the sun and rain near Capel Bridge from that time; also four plates, and four columns used in making a platform for the exhibition of the ores of the colony: these were cut from piles which had been thirty-three years partly under water in the sea and partly exposed, and all were still sound and had

resisted the attacks of the sea worm. A baulk of karri timber had been in the wash of the tide at Augusta for twenty-six years and was still sound. It may therefore be safely asserted that few, if any, countries have a greater variety of valuable natural woods than W.A. In addition to these the pine timber of the N.E. coast is large and of good quality, and would supply logs, boards, and spars. Pine of smaller growth is also found in the Murchison district. Jarrah timber is placed on Lloyd's list of timbers for ship building in table A line 3, and as it does not require sheathing, with these two timbers ship-building might become one of the most important and lucrative industries of the colony. The timber trees of W.A. have less development of leaf than those of most other countries, and do not consequently afford the same amount of shade, or beauty of outline, but some of the larger, especially the karri, red gum and peppermint, are very ornamental; and the jam trees, when scattered over pastures, are not only extremely pleasing to the eye, but afford grateful shade. The black boy, grass trees, and zamia are characteristic of the vegetation of W.A.; they are indigenous and connect the present flora with that of the carboniferous geological period, and may be described as built up of the successive vegetation of every year. The black boy, so named from its appearance, has the thicker and shorter stem with tuft-like rushes on the crown; the grass tree is taller, thinner, and the tuft more grass-like. The zamia is like a gigantic pine apple, with a crown of fronds like a palm tree. The black boy and grass tree yield oils of carbon; and their crowns, which are composed of long rush-like grass, are used for thatching. Black boy gum may be used with advantage for the same purposes as pitch, and will protect wood from the attack of the sea worm. Arrowroot can be made from the zamia. Banksias and wattles are also characteristic of Australian vegetation. West Australia does not possess native fruits of any importance, but there are some roots used by the natives for food which might prove worthy of cultivation if those introduced from Europe did not supersede them. There are, however, plants which must be noted as more or less dangerous or fatal to sheep, cattle, horses, &c., eating them, and which are commonly known as the poison plants. Four of these are small shrubs—the York road poison, which is the most common and most dangerous, the box, heart leaf and rock (the latter being found usually near granite,) and the Kandinup poison, a small herbaceous plant with a blue flower, common near the S. coast. The former are most dangerous in the spring of the year, especially after fires, when their green shoots tempt the cattle, or when proper food is scarce. They are easily distinguished from other plants, and may be destroyed in enclosed lands. The vegetation of the N. is of course tropical, and has its own peculiar characteristics. Of these the gouty stemmed tree, in this similar to the Adansonia and to the Barriguda of Brazil,

is remarkable for the swelling of the trunk, giving it a clumsy, deformed appearance, yet it is valuable as affording fruit enclosed in a rind about the size of a cocoanut; the seeds closely resembling almonds are very palatable, and commonly used by the natives for food; the bark yields a nutritious white gum which Grey says in taste and appearance resembles maccheroni, and which when soaked in hot water affords an agreeable mucilaginous drink. Pine trees fit for spars and timber grow on the hills and in the gorges and ravines, through which the surface waters descend from them in clear and rapid streams. Lofty eucalypti with paper bark and graceful pendent foliage rise from a matted undergrowth, above which pandanas and wild nutmeg trees form a dense forest with rich grasses and climbing plants. The calamas or rattan is common on this coast and leguminous plants are numerous, one at least of which is well known and cultivated in other parts of the colony. Grey describes the trees in the valley of the Glenelg as the largest he had seen in Australia; and from the fertility of the soil and abundance of water everywhere, there can be no doubt that rice, cotton, coffee, tobacco, and other valuable productions, with all useful tropical fruits and vegetables, might be cultivated there. The pine forests would afford timber, boards and spars for use and exportation. There are also in the N. vegetable fibres of bark and grass, used by the natives for making lines and nets for fishing, and which are remarkable for toughness. The mangrove, which is found on all the shallow parts of the coast, supplies firewood, and is otherwise much utilised for domestic purposes. All the fruits and vegetables of sub-tropical and temperate regions flourish when cultivated in the S.W. parts of the colony. The stone-pine may be found by the side of the araucaria, and the apple by the loquat; but the vine, fig tree, olive and orange, the almond and its congeners, seem peculiarly adapted to the soil and climate, as indeed are mulberry, tobacco and cotton. The castor oil plant grows freely on rubbish or in any neglected corner. The melon tribe and all leguminous plants flourish in great luxuriance. Of the cereals wheat will not probably be found to flourish N. of the Murchison, but maize may be cultivated throughout the colony; in the S. and W. the rose and geranium are naturalised.

V. FAUNA.—The native animals are the dog; the kangaroo of which three species are found in the open woods, the thickets and on the plains. The red kangaroo, a smaller kind, is found only among rocks so barren of vegetation as to make the means of its subsistence doubtful; the wallaby, a still smaller species, is found in the thickets near the coast and on the plains; the existence of wallaby on the Abrolhos, more than thirty miles from the coast, suggests the probability of depression as well as upheaval of the coast line; the opossum is plentiful in the woodland districts,

Of reptiles the guana and lizard are found, with several species of snakes, both land and water, the bite of which is poisonous; and some, especially to the N. are constrictors. The principal land birds are the emu, the bush turkey, a species of bustard, the gnow, a gallinaceous bird remarkable for piling its eggs in a conical heap with leaves, and not sitting to hatch them. The great eagle-hawk frequents the rocky cliffs and smaller birds of prey the rocky plains, cockatoos, black and white, parrots and paroquets, pigeons and quails are common, and in the N. the pheasant cuckoo. The birds of the colony are more remarkable for beauty of plumage than for their powers of song, yet the wattle birds and some others have melodious notes, but the bush is more often disturbed by the screeching of parrots, cockatoos, and magpies, and at night by the sad note of the weelaw. The water birds are: the black swan, still numerous in some of the southern waters of this colony, formerly throughout it. The British officers who first visited the Swan River were astonished at their number, but suggested that the time might come, as indeed it has already, when their absence would make it doubtful why the river should have been so named. The pelican, several species of duck, and many sea fowl frequent the coast and islands; to the N. these are so numerous that there are large deposits of guano. Gallineaux are abundant in the Lake District, and sometimes migrate westward, and there are several kinds of waders. Fish are abundant in all the waters; mullet, bream, taylor, cobblers, schnappers, whiting, herring on the coasts and in the estuaries of the rivers; whales and seals are still found, though not so abundant as formerly; sharks are common, especially on the N. coasts, where alligators are also said to be found occasionally; crayfish are abundant on all the coasts, and a small species in the fresh waters; oysters in many places; pearl oysters from Sharks Bay, northward, where also the dugong is found, a marine animal yielding oil of especially good quality, and having its skin of great thickness, and very valuable for making leather. The trepang or *bêche-de-mer* is abundant on the N. coast.

VI. MINERALS.—The mineral wealth of the colony is undoubtedly very great. The precious metals have not yet been found in any considerable quantities, though gold has been in many places, as at Kendenup, in the upper valley of the Palinup, and near Glengarry on the Greenough in quartz reefs, and at Peterwangy on the Upper Irwin in alluvial deposits. Silver is found in some lead ores. Specimens of tin have been found, and it may probably be discovered in large quantities among the red granites of the interior. Coal often searched for and still more often reported has not yet been found though veins of lignites and semi-bituminous substances have. The most important metals are lead and copper, the ores of which, especially the former, are abundant and widely diffused over the surface

of the colony from N. to S., but are worked now only in the Champion Bay district; iron ores, specular and hæmatitic, are found in abundance in many places; salt is deposited in large quantities in the lakes of the interior and the lagoons of the coast, and might be made a profitable article of export. In these also gypsum is found, as it is on the flats in the valleys of the sandstone ranges. Materials for building are abundant everywhere; in some districts clays for brickmaking as well as finer sorts for pottery and kaolin for porcelain, as also fire clay in others; various rocks, granitic, gneissose, siliceous, calcareous, and cretaceous, the latter for lime burning, are abundant on the coasts and are found in many parts of the interior.

VII. POPULATION.—On the 31st March 1870, the population was 24,785, of whom 15,375 were males, and 9410 females; of this number Perth and Fremantle contain, the former 20·20 per cent., and the latter 12·96 per cent., or together one-third of the entire population. The houses numbered 5000. The number of births during the year 1879 was 977, the number of deaths was 411. The departures from the colony during the same year were 278, the arrivals numbering 214. During 1879 there were 215 marriages, and at the end of that year the population numbered 16,628 males and 12,040 females, making a total of 28,668.

VIII. EDUCATION.—The educational system is framed under the clauses of the Education Act passed in 1871, which is based upon the principles of the Act now in operation in the mother country. By this Act, schools are divided into Elementary and Assisted. The former are largely subsidised at the cost of the colony; the latter are private, but a capitation grant is given on condition of submitting to Government inspection for secular results, and to the observance of a strict conscience clause during the four hours of secular instruction insisted upon by the Act. The Elementary schools are under the control and supervision of a Central Board and the Local District Boards. The Central Board, consisting of five members laymen, no two of whom can be of the same religious denomination, is appointed by the Governor, and the Local District Boards are elected by the general body of electors every three years. Compulsory attendance of children can be enforced by the Local Boards and of late has been, many of the parents being fined for absence of their children from school. In the Elementary schools four hours a day are devoted to secular instruction, and half an hour, under the provisions of a conscience clause, to reading the Bible or other religious books approved of by the Board; but no catechism or religious formulary of any kind may be used; and the Bible, if read, must be read without note or comment. The school fees vary from 2d. to 1s. per week, according to the circumstances of the parents. On 31st December 1878 there were 62 Elementary schools, and 20 Assisted schools, and 18 Provisional schools, making 100 in all; the

average attendance for the year being, Government schools 2668, Assisted schools 1332, and Provisional schools 325, making a total of 4325 children attending school. A Government inspector makes periodical visits to the schools, National, Assisted, and Provisional, throughout the colony; and the salaries of teachers of the schools established and conducted under the new system are dependent upon his report of regularity of attendance and proficiency on the part of the scholars. The Roman Catholics have educational establishments throughout the colony. Some of their schools coming within the provisions of the Educational Act of 1872 are subsidised, or "assisted" by the Government. A High school has also been established in Perth by an Act of the local Legislature, and has made as rapid a progress as could be expected. The Right Rev. Dr. Parry has founded a Ladies' College, which has proved most successful. An Amended Education Bill was passed during the second session of 1877, giving a more even distribution of salaries to teachers, without interfering with the principles of the original Act. Under this new Act, no teacher in a minimum school will receive less than £60 fixed salary, to which will be added "results" increasing such salary to £80 or £90.

IX. AGRICULTURE AND LIVE STOCK.—The principle crops are wheat, barley, hay, and potatoes. Vines are also extensively and successfully cultivated. Excellent wine is made in the colony, and each year witnesses alike an increase in the quantity manufactured, as well as an improvement in the quality. The returns for the year 1879 show that there were altogether 65,491½ acres of land under cultivation in the colony, viz.:—25,762 wheat, 7238 barley, 1734 oats, 846 rye, 362½ potatoes, 35 maize, 717½ vineyards, 608 kitchen gardens, 43¼ beans and other pulse, 19,085 hay or green crop. The average yield of wheat was 15 bushels to the acre, of barley 18, of oats 19, and of maize 14. The number of live stock in the colony in 1879 was:—horses, 32,411; horned cattle, 60,617; sheep, 1,109,860; pigs, 20,397; and goats, 4694.

X. THE PEARL FISHERY.—The pearl fishery year by year becomes of more value to the colony. In 1874 fifty-four ships and 135 boats were engaged in it. The value of shells exported in 1872 was £25,890, against £12,895 worth exported in the previous year, and the estimated value of pearls and pearl shells sent from the colony in 1874, representing the take of the season, is about £72,162. The exports for the following years were 1875, £65,000; 1876, £74,143; 1877, £12,450; and 1878, £24,000; 1879, £96,525. But this is an estimate from only very imperfect data. It is probable that the value of pearls exported, £12,000, far exceeded this amount. The value of the pearl shells exported was £84,525. The aboriginal natives are now almost exclusively employed in diving, the cost of introducing the Malay divers being too great. The value of shells in the colony

averages from £5 10s. to £8 per cwt., or even higher. These shells, the home of the *meleagrina margaritifera*, weigh on the average 2lbs. per pair, and measure from six to ten inches in diameter. It is to the intrinsic commercial value of the shells, rather than to the pearls they contain, that the N.W. fisheries owe their importance; although, occasionally, pearls of considerable value are obtained—one supposed to be worth upwards of £1500, was found in 1875; in 1878 one was found weighing forty grains at Sharks Bay; and another weighing 234 grains, obtained at Nickol Bay, realised £715. A lucrative pearl fishery exists in Sharks Bay, a large inlet, extending in the south-easterly direction from Dirk Hartog's Island, about the 25th degree of S. latitude, to a distance of 150 miles. The shells found in this region are those of the true pearl oyster, the *avicula margaritifera*, an oyster only slightly larger than its European congener, and valuable from the pearls it bears. The shells have been introduced to the European and Indian markets, but have assumed no considerable commercial value as yet. The fishing season of 1879 was a very successful one, but no returns have been received of the quantities procured by vessels engaged in the pearl, whale and other fisheries. The other fisheries, which produced in 1877 value to the extent of £23,808 10s. are the whale and miscellaneous fisheries. No returns have been received of quantities procured by vessels engaged in the pearl, whale and other fisheries, but the following marine products were exported during 1879; whale oil, £185, and mullet, &c., £139; hitherto the whale fishery has been conducted by vessels which come from Boston and other ports in the N. of the United States. Lately however the industry has been prosecuted with success by a few vessels, the property of local speculators, in consequence of the large results of American enterprise in this industry.

XI. IMPORTS AND EXPORTS.—The value of the imports into the colony during the year ending 31st December 1879 was £407,299 0s. 6d. The exports during the same year were valued at £494,883 10s. As usual wool was the largest item of export; the amount shipped was to the value of £175,284 8s. Next to this come sandalwood and pearl shells, the export value of which was £119,525 12s. 6d. The value of the pearls sent from the colony was estimated at £12,000, and jarrah timber £63,901 15s. Horses, sheep, fish, flour, gum, hides, leather, oil, ore, tallow, guano and tortoiseshell, also figure among the articles of export.

XII. THE REVENUE from all sources, including Customs, for the year 1879 was £196,315 0s. 11d., the expenditure being £195,812 4s. 5d. In the land sales there was an increase, owing to increased occupation, and a small decrease in the postal and telegraph receipts. The public debt was £361,000, bearing interest at the rate of five and six per cent.; the indebtedness per head of population being

very nearly twelve guineas a head. The revenue for the first quarter of 1880 was, including a payment of £3000 from the Imperial Treasury, £56,037 17s. 3d. Of this the Customs amounted to £16,340, and the land revenue £25,143. The expenditure during the quarter was £55,670 17s., including a remittance of £10,000 to the Crown agents. The revenue for 1881 is estimated at £192,154, and the expenditure at £172,215.

XIII. SHIPPING.—In 1879 the number of vessels which left the various ports was 162, tonnage 85,086, with crews of 5403 men; 162 vessels, of a total of 84,951 tons, with crews amounting to 5366 men, were entered inwards.

XIV. SAVINGS BANKS, &c.—In 1878 the Post Office Savings Banks numbered thirteen, with twelve branch offices for the transmission of money, with 1332 depositors. There are also twelve Friendly Societies in existence, with which are connected about 1000 persons. On June 30th 1879 the assets of the three banks doing business in the colony were £518,489. Liabilities £352,092, the deposits not bearing interest amounted to £108,362, bearing interest to £126,125.

XV. GOVERNMENTAL.—The administration of the colony is under a Governor appointed by the Crown, who is assisted by an Executive Council composed of certain office-holders, namely,—the senior officer in command of the forces, the Colonial Secretary, the Surveyor-General and the Attorney-General. In the absence of the Governor the Commandant is the Administrator. There is also a Legislative Council composed of official and nominee and elected members. The official members are the Colonial Secretary, the Surveyor-General and the Attorney-General. The nominee members are four in number. The elected members number fourteen. Two each are returned by the electoral districts of Perth and Freemantle, and one by the districts of York, Geraldton, Greenough, Wellington, Vasse, Swan, Albany, Toodyay, Murray and Williams, and N. District. The qualification for an elector is a householding of £10 annual value. A member must be possessed of landed property to the value of £1000 or of an annual income of £250.

XVI. HISTORY: (1.) *Governor Stirling*.—The history of a colony so isolated as W. A. is rather that of social than of political change and progress. Captain Stirling landed from the *Parmelia* on 1st June 1829 with a staff of eight persons and ten artisans and mechanics, with their wives and families and servants, 51 head of cattle, 200 sheep, 33 horses, some pigs and poultry. A large supply of fruit trees, plants, and seeds had been contributed by the Horticultural Society of London and at the Cape of Good Hope, which were immediately planted on Garden Island. The names and offices of these founders of the colony were Captain James Stirling, Lieut.-Governor, and family of six persons, and George Eliot aged eleven years; Peter Brown, Colonial Secretary; Mrs. Brown and two children; Lieut. J. S. Roe, R.N., surveyor,

and Mrs. Roe; C. Sutherland, assistant-surveyor, and Mrs. Sutherland; H. Morgan, storekeeper, and Mrs. Morgan; W. Shilton, clerk to the Secretary; J. Drummond, agriculturist; also the widow and five children of Assistant-Surgeon Tully Daley, 63rd Regiment, who had died on the passage out. In July the *Sulphur* arrived with a detachment of a light company of that regiment and shortly after the Rev. J. B. Wittenoom, the first colonial chaplain, landed. The first emigrant ship the *Calista* arrived on the 5th of August, bringing about 100 passengers of all classes, men, women, and children, among whom the names of Leake, Samson, and Scott have prominence; and from that time many vessels followed in rapid succession, bringing immigrants of all classes and occupations, stock and goods, so that in January 1830 the Governor was able to report a population numbering 850 persons, property of the assessed value of £41,550, 39 locations effected, 204 head of cattle, 57 horses, 1096 sheep, 106 pigs, &c. The year 1830 witnessed a still larger immigration. Captain Stirling acted at first as Lieut.-Governor under instructions but with almost unlimited authority. On his return to England in 1831 however, a commission under the Great Seal was issued appointing him Governor and Commander-in-Chief of H.M. Settlements on the west coast of Australia or New Holland, and by letters patent Vice-Admiral; the limits of his authority being from Cape Londonderry lat. 13° 44', to West Cape Howe lat. 35° 8' S., and from the Hartog's Island long. 112° 52' to 129° E. from Greenough, thus including the small settlement of military and convicts which had been established at King George's Sound by the Governor of N.S.W. in 1827. These limits as already noted were corrected by a supplementary commission granted to Governor Weld in 1873. By his commission Governor Stirling had authority to appoint an Executive Council, to make provision for the defence of the colony, to divide it into districts, counties, and townships, to dispose of the land according to instructions, in which also those who might act for him in his absence, according to seniority, were named; any one sitting as judge being excepted. At first a Board of Council and Audit, to assist the Governor in the assessment of property brought into the colony as an equivalent for land was established, the members of which were nominated by him from time to time as might be convenient; but the Executive Council consisted of the officer commanding the troops (Captain Irwin,) the Colonial Secretary, the Surveyor-General, and the Advocate-General. This Council, with slight changes in its constitution, has been continued to the present time. The law was administered by W. H. Mackie, a name still remembered with honour, as Commissioner of the Civil Court and Chairman of Quarter Sessions, with G. F. Moore as Advocate-General; an arrangement continued against the expressed opinion of the Commissioner as to the validity of his jurisdiction in certain criminal

cases until 1851, when his successor, now Sir A. P. Burt, affirming that opinion, was appointed the first Judge of the Supreme Court, and G. F. Stone, Crown Solicitor and Attorney-General. Governor Stirling also appointed resident magistrates in the more settled localities, as G. Leake at Fremantle, H. Whitfield at Guildford, Colonel J. Molloy at Augusta, and Sir R. Spencer at Albany, and these have been continued, and their number from time to time increased, and their functions extended, especially since the introduction of convicts in 1850. A mounted police force was enrolled, which has been also continued, and by its means the law enforced throughout the colony. A Legislative Council was formed of the members of the Executive Council with two nominated members, the Governor presiding. The nominated members were afterwards increased to four, and ultimately to six, but in 1870 the Legislative Council became elective, and since then the official members have been the Colonial Secretary, the Attorney-General, and the Surveyor-General. A Speaker was at the same time elected in the person of Sir L. S. Leake, who still holds that office.

(2.) *The Land Regulations.*—The history of the colony is at first principally that of the Land Regulations and their consequences. The Imperial Government being anxious for the settlement of the country to anticipate any such measure being taken by that of France, offered land in return for property introduced at one shilling and sixpence for an acre, as well as allotments for every immigrant; and on these terms in the year 1832, 1,349,209 acres had been allotted, of which three lots exceeded 100,000; ten 20,000; eighteen 10,000; and fifty-two 5000 acres each. Thomas Peel and others had 250,000 acres; Colonel Latour 113,100, and Governor Stirling 100,000 in consideration of his not having any salary attached to his office, but his salary, afterwards fixed at £800 a year, was ultimately paid from the date of his appointment. The necessary consequence of this extravagant distribution of land was that the small population was widely scattered from Albany and Augusta to the Avon Valley. Much difficulty, confusion, and waste of time by the surveyors, also resulted from the instructions under which the Surveyor-General had to divide the country into counties, townships and sections of equal fixed dimensions, and by the selection of reserves for public purposes. Moreover, the sparseness of the population soon provoked attacks from the natives, who, though originally peaceable and friendly, could not view with indifference the occupation of their hunting grounds by strangers without any compensation being made, and the boldest soon found able and dangerous leaders, so that the small military force in the colony was found scarcely sufficient for the protection of life and property. Very severe measures were therefore adopted—many natives were killed and some executed. Besides these other causes operated

disadvantageously, for although property had been introduced to the value of £94,281 of which £21,655 was in stock, very much was unsuited to the wants of an infant colony. Mr. Peel, Colonel Latour and others, had not been so careful as they should have been in providing for the shelter, maintenance, employment, and supervision of the labourers introduced by them; the selection of sites for their residence was in some cases unwise, and the consequences were in too many instances distress and disorganisation, disease and death; hence arose disputes between master and men; and as hired labour was both scarce and dear, there was every temptation for servants to free themselves from their contracts, which indeed the masters were not always able to fulfil. The rapid increase of immigrants, and the general want of system and providential arrangements for their shelter and maintenance, exposed many to privation and hardships which they had not anticipated, and for which they were unprepared and unfitted. Food became scarce and dear. For the supply of animal food, flour, potatoes, &c., the settlers were dependent principally on the Cape of Good Hope and T. Kangaroo flesh was for many years commonly sold and its provision became a regular occupation; and this again caused distress among the natives for want of their ordinary food and clothing which those animals had supplied. Those families whose hunting grounds had been occupied by the settlers, intruded on the territory of others, and contests, retaliations and permanent feuds were consequent among them. Kangaroo meat sold for 10d. when beef was 1s. 6d., and mutton 1s. 5d. the pound; bread was at one time 2s. 2d. the 4-lb. loaf. The number of vessels which arrived at Fremantle made proper mooring and accommodation for them and their cargoes impossible, and the loss of many in consequence gave the port a bad name; it ceased to be a place of call for those trading to other ports, and ship-owners in England became shy of sending vessels there. These unhappy conditions tended not only to check immigration, as did the price of land (which had been raised to five shillings an acre,) but led to the emigration of such as Henty and many others, who sought elsewhere a better market for their capital and labour, but who might have been of the greatest service to the infant colony. Henty had taken up 62,035 acres of land and introduced, with his two brothers, twelve labourers and mechanics, six women, and fifteen children, with much valuable stock, as a first instalment on his estate. Peel had claimed land on account of 170, and Colonel Latour on account of eighty-five persons introduced by themselves. Governor Stirling had commenced by making settlements at Augusta, Leschenault, Kelmescott, Guildford, and in the Avon Valley. He fixed on the N. instead of the S. side of Perth water, as had been originally intended, for the site of the capital of the colony, thus placing the estuary of the river between it and the port of Fremantle. There were as yet no roads,

and though the river afforded a water-way, there were no vessels or boats fitted for the transport of cargo. The land on the Swan, and between the Swan and the Vasse, had been for the most part taken up, and the time and labour of an increasing staff of surveyors, and even of the Governor himself, soon became occupied in finding new locations for settlement and means of communication between already inhabited places. The want of system and concentration of strength tended greatly to neutralise the strenuous and persevering efforts of the colonists, who had to labour on for many years under depressing circumstances. It is not therefore surprising that in the early days of the colony there should have been some discontent, and a desire for change in the land laws, and for the protection of colonial produce, which could be undersold by that imported; and these conditions obtained more or less for many years. These causes continued in operation, and the land in the settled districts of the colony being all taken up, and servants and labourers who had saved money being unable to purchase, emigration increased; and as many as forty-two left the colony at one time. Governor Stirling had discovered in the course of his explorations that the greater part of the land in the colony was more fitted for pasturage than agriculture; and it soon became necessary for the settlers who were sheep and cattle owners to seek more extended runs for their stock, beyond the settled districts of the colony. This caused a still greater dispersion of the already small population, which in 1840 amounted only to 2354 persons. The price of land had now been raised to £1 an acre, in pursuance of the then fashionable Wakefield system, which however was not fully carried into effect; and so during Governor Hutt's tenure of office the attention of the colonists was mainly directed to reducing the price of land, making it more available for the depasturing stock and the obtaining labour. Small efforts at immigration were made, and in the interest both of the settler and farmer, in 1841 remission on the purchase of land was granted to anyone who succeeded in training a native to be a useful farm servant. A society was also formed for diffusing knowledge respecting the colony; but the most important effort to develop its resources by increasing its population was made by the W.A. Company at their settlement of Australind, near Leschenault. The Company had purchased Colonel Latour's property there, which they now proposed to re-sell at £1 an acre, in farms of 100 acres, and M. W. Clifton was sent out with a sufficient staff of surveyors, &c., to prepare for the reception of the first immigrants. The Colonial Government however proposed to resume those lands in forfeiture, and Clifton sought another location in the country discovered by Grey about Champion Bay; this proved in his estimation of inferior value, and by agreement with the Local Government he returned to his original location to prepare for the reception of the new settlers who

arrived to the number of 457; but the company in London broke up, the work was stopped, and the fair promise of the commencement was not fulfilled. The settlement had been named Australind, in anticipation of its becoming a place of resort, if not residence, for invalids and others from India. At this time also the application of the Wakefield system on a large scale in N.Z. and S.A., where it was carried out in its integrity, directed the attention of intending emigrants to those colonies, and as the depressed state of the agricultural interest had caused a corresponding collapse in trade (in 1848 there was no sugar in the colony,) and there was no hope of obtaining labour by immigration, on the accession of Governor Fitzgerald to office, a large number of the colonists petitioned for the introduction of convicts to bring labour and money into the colony, and supply a market for produce—not however without opposition on the part of the few, who thought that these benefits would be more than neutralised by the evil influence which the presence of a large number of convicted felons might exercise on the morals of the people. To this petition the Imperial Government, then in want of a place to which they might transport convicts, acceded, and the first body arrived on the 1st June 1850. The result has proved the correctness of the anticipations of both parties; the colony has profited much by convict labour and by the money spent on the convict establishment, and on the military and pensioners who were sent out simultaneously. The criminal calendar will show the less pleasing consequences of this measure. During the ten years from 1860 to 1869, inclusive, the convictions in the Supreme Court show 254 of the convict class against fifty-three free persons; in 1875 thirty expirees, eleven free men, and two ticket-of-leave holders; but probably more evil influence was exercised at this time by the sealers who had established their head-quarters on Middle Island, at the Recherche Archipelago, in the Great Bight on the southern coast, and who seem to have rivalled in their habits those recorded of pirates and buccaneers. It had been part of the agreement in making W.A. a convict colony that free immigrants should be sent from England in number equal to the convicts, and in July 1850 the first instalment of 219 persons arrived in the *Sophia*, and a detachment of sappers and miners the next year, some of whom remained in the colony and proved valuable members of society. In this year also juvenile immigrants, fifty-one in number, were first introduced, some of whom afterwards proved adepts in crime, though many became useful members of society; and 125 more were sent, but at the request of the colonists that plan for immigration was abandoned. Some Chinese were also introduced, who proved as usual thrifty and industrious. The depressed state of affairs in the colony had not been less felt by those in the employ of the Government than by the settlers, and many had

supplemented their insufficient salaries by trading. Notwithstanding all drawbacks the colony had gradually increased in population and production. The white inhabitants numbered 6661 persons; the area of land under cultivation in cereals was 4122 acres; there were 141,123 sheep, 10,919 head of cattle, 2095 horses, some 3000 pigs, and 1431 goats; the imports had reached the sum of £45,411 6s., and the exports of £29,598 9s. The labours of the colonists had been most successful in horticulture by the production of most of the valuable fruits, vegetables and flowers now under cultivation, most of which had been introduced by the Government and by the first settlers.

(3.) *The Penal Settlement.*—The introduction of convicts forms so important an era in the history of the colony that the effects produced by it require separate consideration, but, pursuing the course of general history, the most important event during Governor Fitzgerald's term of office was the opening up of the Victoria district, now so largely occupied by sheep stations and so productive in mineral wealth; a convict dépôt was formed there and subsequently at Lynton, Port Gregory. In visiting that district the Governor was attacked and wounded by the natives near White Peak. This district was also rendered attractive by the report of coal having been discovered on the Upper Irwin by Messrs. Gregory (who in consequence received a grant of 2500 acres of land) as well as by the lodes of lead and copper also found by them on the Murchison River. Guano was also discovered on the islands, and exported from Shark's Bay, as also shells supposed, and which proved to be, those of the pearl oyster. The discovery of gold in other parts of Australia induced the offer of rewards for its discovery in the colony, but though claims have been made from time to time they have never yet been admitted. The goldfields of Victoria attracted many emigrants to that colony from W.A., but other sources of trade were opened. 1851 saw the first shipment of horses to India, and the rich alluvial deposits about the lower course of the Greenhough became known; an export trade in timber was also commenced. A more regular and intimate intercourse with the outer world was now established; in August 1852 the first vessel of the Australian Royal Mail Company, the *Australian*, Captain Hoseason, arrived in King George's Sound, and an overland mail service was arranged from Perth to Albany. The first steamboat was placed on the Swan River; a Savings Bank was established. The productions of the colony did not however keep pace with the requirements caused by the presence of the convicts and military. In 1854 the cost of imported breadstuffs amounted to £40,000.

(4.) *Governor Kennedy.*—In 1855 Governor Kennedy arrived. There had been for some time a growing dissatisfaction on the part of the colonists with the Executive—there was an outstanding debt and an export of specie consequent

on difficulty in obtaining treasury bills; interference with magistrates and officials, and with publicans' licenses was complained of; and the land regulations, especially the high price for land, were thought to be detrimental to the interests of the colony. It was spoken of as "a land of corn, wine, and oil, copper, lead, iron, and coal—held by few, but requiring occupation by many." It was considered that the Legislative Council did not represent the opinions of the colonists, and that the natural and proper remedy would be the establishment of a Representative Council. The farmers in the eastern districts also complained that they did not derive their fair advantages from the introduction of the convict system, the Commissariat having purchased flour from S.A., and in consequence a protective duty was desired. The Government claimed the right to obtain supplies in the cheapest market. One farmer however soon followed the example of Government by purchasing flour to fulfil a contract. The removal of convict depôts from the agricultural districts was also objected to; but the camps of the kangaroo hunters had become the resort of vagabonds of all classes, and were a refuge for runaway convicts. The demand for a Representative Council was dropped for fear that it might lead to the removal of convicts altogether. Nevertheless the colony was progressing, the imports of 1857 exceeded those of 1850 by double the amount, and the income by £8498; yet there was illicit trade carried on in the S.W., principally with American whale ships. The Champion Bay district was filling, and a cattle company had located on the Irwin River; surveys also in contemplation of railroads, were made by Lieutenant Chapman from Perth to King George's Sound, and by Surveyor Evans in the mining district of the N. In 1859 the regular troops were withdrawn, and a force of enrolled pensioners organised. Volunteer companies were also formed at Perth and Fremantle, and a corps of mounted rifles at York. The corps at Pinjarrah was not formed till 1864.

(5) *Governor Hampton.*—In 1862 Governor Hampton succeeded Governor Kennedy. This was a year of unprecedented floods, the Swan River rising seven feet above its usual level; many bridges were destroyed, and the lowlands at the back of Perth were inundated, causing much loss and expense both to the Government and to individuals, and Lieutenant Oliver was drowned crossing the Causeway near the Swan at Perth. Prospecting for gold was now commenced, and Hargraves from V. was employed, but without success. From V. also came a proposition to form a settlement on the N.W. coast, but the *Mystery* was first sent there with sheep and cattle by Padbury. In 1864 the settlements were farther extended; Dempster took sheep to Esperance Bay, on the S. coast; a company was formed which sent sheep and cattle to Camden Harbour on the N.W., as Messrs. Brown did also to Sharks

Bay and F. Von Bibra to Hartog's Island; the next year an attempt was made to form a station on St. Magnus River, Doubtful Bay. The pearl fishery which had been commenced in Sharks Bay was now extended to Nickol Bay. Emigration had continued at intervals, but now many mechanics left the colony unable to compete with convict labour. Governor Hampton gave great attention to public works and to economising the cost of Government. By the former he obtained a lasting reputation, and by the latter he secured an excess of income. Among other important works he commenced, what Governor Weld completed, the bushing the sand-hills to the S. of Geraldton, which threatened in their northward progress to overwhelm the houses. In 1867 he was able to report that during the past year 371 miles of road had been repaired, 132 cleared, and thirty-two made; thirty-three bridges built, seven repaired, and three in course of erection; five jetties constructed, two extended, and two repaired; besides the works on the Government House, Perth, Residency at Champion Bay, Lunatic Asylum, Post and Police Offices, Schools, &c., in many places. At this time a step was made towards the representation of the people by permitting the selection by vote of persons for nomination by the Governor to the members of the Legislative Council, and accordingly J. G. C. Carr, J. G. Lee Steere, W. Bateman, S. Phillips, and J. W. Hardey were so nominated. In 1868 the desire that the unofficial members should be elected by the people was strongly expressed, and this was followed by a report on the division of the colony into electoral districts, and by a petition for a Representative Constitution under 13th and 14th Vic. c. 59. In that year also the last convict vessel arrived, having on board some Fenians, which raised fears, subsequently proved to be just by the escape of several so assisted in 1876, that the "Yankee brotherhood" would endeavour to rescue them. 1869 was marked by efforts to ascertain the existence of gold and coal; borings were made near Perth to the depth of 200 feet, as subsequently in 1874, but without success; £5000 were offered for the discovery of a gold-field, and money voted for a geologist to examine and report on the colony.

(6.) *Governor Weld.*—The arrival of Governor Weld in September 1869 gave an impulse to further efforts in favour of Representative Institutions, it having been concluded from words spoken publicly and officially in England that he was fully prepared to further them with the consent of the Imperial Government; and accordingly in 1870 an Ordinance, No. 13, was issued for the division of the colony into electoral districts and the election of members to the Legislative Council under the provisions of 13th and 14th Vic., c. 59, which was accordingly constituted. It consisted of five nominee members, three being official, viz.: the Colonial Secretary, the Attorney-General, and the Surveyor-General, and two unofficial; the number of elected members was ten; subsequently

two were added and one nominee member. The Council met the same year. It did not however realise fully the anticipations which had been formed respecting it, for although the control over the finances and freedom of voting of nominee members were conceded the ultimate decision in all cases was still reserved to the Imperial Government. An opposition was accordingly organised, and the forms of the Imperial Parliament having been adopted the Colonial Secretary assumed the duties of Prime Minister and Chancellor of the Exchequer. The constitution of elected Town Trusts and Road Boards was another step towards self-government made at this time. By the Education Act all denominational religious teaching was made optional in the Government Schools, and by the transfer of the stipends of Colonial Chaplains from the accounts of the establishment to the miscellaneous services, the Church of England in the colony was placed on the same footing as other religious communities which led immediately to Synodical action and government. The operation of the Government at this time was very energetic; a loan for public works of £100,000 was proposed, but only £25,000 permitted by the Imperial Government; a survey of the coast of the colony was commenced at the joint expense of the Imperial and Colonial Governments; a steam vessel was subsidised and placed on the coast to carry mails and passengers; an electric telegraph, which had been commenced between Perth and Fremantle by a company, was bought up; and in 1873 a loan bill passed for £100,000 to be employed in telegraph extension and a railway in the mining district. Red rust having destroyed the grain crops seed was procured and employment on public works provided for those who were in need. At the meeting of the Legislative Council in 1874 the desire for Responsible Government expressed itself by a petition, *venime contradicente*, from the Council to the Governor, requesting that he would bring forward a Bill for its institution, in accordance with which a Bill was presented by the Colonial Secretary, contemplating a Legislature of two houses, one to be nominated and the other elected, with a civil list to provide for the Executive. As however the Bill was not accepted in its entirety the Governor dissolved the Council, and on re-election three members were found in opposition to the establishment of Responsible Government in the colony, but the majority held to their former opinion. The extension of the timber trade by the formation of new companies and by grants of land, the erection of crushing machinery and working a quartz reef at Kendenup by the Plantagenet Gold Mining Company, the commencement of sericulture, the placing establishments on the Abrolhos for fishing, and on Barrow Island for turtle catching, the commencement of a system of assisted immigration and of the mines railway, and of the extension of the telegraph line to Eucla in connection with the Government of South Australia mark this period.

(7.) *Governor Robinson*.—On the arrival in 1875 of Governor Sir Wm. C. F. Robinson, K.C.M.G., the Imperial Government decided against conceding Responsible Government to the colony, considering that it was not prepared for so great a change. The removal of the convict prisoners from all other places to Fremantle had given warning of further change in that department, and in 1877 it was intimated that there would be a reduction in the Imperial grant for police services. The year 1876 witnessed the necessity for a further loan of £26,000 for the completion of the Mines railway, in which great alterations and improvements were obviously necessary. The appropriation of £18,000 out of revenue for the completion of the telegraph to Eucla was the more satisfactory, because the line from Bremer Bay to Eucla was in process of survey by Mr. Price and a sufficient party, and was progressing rapidly. The decision as to harbour works at Fremantle was now also brought to an issue. From the earliest days of the colony it had been in contemplation to make at the principal port a more secure harbour for vessels than nature had provided, and numerous suggestions and plans had been made from time to time for that purpose, but all resolving themselves into four principles. The first in time, originating indeed with the officers of the *Success* in 1827, was to make the estuary of the Swan between Perth and Fremantle accessible by cutting a canal from Rocky Bay to the sea, a distance of about a quarter of a mile; the others were to enclose an area by a breakwater to the south of the mouth of the Swan; at the mouth of the Swan; or to obtain access to the mouth of the river and make it available as a dock or harbour. In 1871 Doyne, and in 1873 Wardell, had reported on these, but unfavourably; their different plans were at last submitted to the judgment of Sir John Coode, and his report is still under consideration. Now also the schemes which had been ventilated for a long time for a railway from Fremantle to Perth and Guildford were formally brought forward, and it was proposed to bring in a Bill for providing a guarantee of six per cent. on the amount of capital necessary for its construction; this was delayed till the next year that surveys and estimates might be made which were accordingly proceeded with, but the Bill was ultimately withdrawn, pending the decision of the Imperial Government on the question of guarantee. This year, also, supplementary regulations were published respecting grants to pensioners and volunteers; and cutting timber and mining by which the land regulations of the colony were completed; a Commissioner of Public Works was appointed; immigration continued; Sunday diving forbidden in the pearl fishery; the money order system extended; the free list tariff extended to articles necessary for food, ship chandlery, &c.; the light-house on Point Moore, at Champion Bay, contracted for of iron instead of stone; a deep sea telegraph suggested from Point Galle to Western Australia

with Cocos Islands for an intermediate station; a vote taken for the establishment of a high school; the ballot proposed as a preventative against bribery; and a jetty at Owen's anchorage determined upon. These many and considerable works occupied the period of Sir Wm. C. F. Robinson's Government, who left the colony 1st September 1877 to proceed *via* Sydney to his new Government at Singapore. He was succeeded by the present Governor, Major-General Sir Harry Saint George Ord, K.C.M.G., C.B.

XVII. EXPLORATION.—In 1801 the French corvettes *Geographe* and *Naturaliste*, with the galliotte *Casuarina*, which had been attached to the expedition at Port Jackson, made Cape Leeuwin in the month of June, and the names of the three vessels and their officers still maintain, on the western coast, many reminiscences of their visit. The Vasse River was so named after a Dutch sailor who accompanied the expedition and was drowned off its mouth. The coasts of Endraght land, De Witt's land, and Sharks Bay were examined and named; returning southward the Swan River was entered by boats 17th June and explored as far as the islands above Perth Water, which were named after M. Hierrisen, Enseigne de Vaisseau. M. de Peron, the historian of the expedition, gave a very particular account of the river, which, however, was not confirmed in its details by the officers of the *Success* in 1827. A large number of names given by the French are still retained and familiar to the ears of Western Australians, but some have been replaced by English appellations, as the Moreau, now the Canning, while others have undergone a process of translation, as Port Two-people. The northern coasts were surveyed by Captain King in 1820 to 1824, and his work was supplemented by Captains Wickham and Stokes in the *Beagle* between the years 1837 and 1843; the latter completing the survey of Sharks Bay. The coasts of W.A. being then sufficiently known, and it having been ascertained that the French had determined to establish themselves there, the Governor of N.S.W. in 1826 sent a party of about seventy-five persons, principally soldiers and convicts, to occupy King George's Sound, and the next year H.M.S. *Success* to select a place for a settlement on the west coast, with special reference to the Swan River, off the mouth of which that vessel dropped her anchor on the 6th March, and the next day the gig and cutter were sent with their crews well armed and with provisions for a fortnight, to examine the river, to proceed if possible to its source, ascertain the nature and productions of the country, and fix on an eligible sight for a settlement. The boats having reached Hierrisen's islands, were hauled over the flats, and ascended the river until stopped by fallen timber. In returning the gig was sent to examine the Canning River, and during the absence of the boats the shores and waters of Gage's Roads had been examined. Mr. Frazer, the colonial botanist, accompanied the

expedition, and he notices with much pleasure the beauty of the scenery, the vivid green of the foliage, and the astonishing luxuriance of the herbaceous plants which he described as exceeding anything he ever saw on the E. coast. Indeed the river, still beautiful, must, before its banks were denuded of the forest trees which then clothed them "so magnificently" to use his own expression, have afforded "a great treat" to one accustomed to the ever brown eucalyptus of Port Jackson." The reports made by Captain Stirling and Mr. Frazer on the return of the *Success* to Sydney, determined the Governor to recommend that a settlement should be formed on the Swan River, and Captain Stirling was, in consequence, sent out in 1829 to give effect to his recommendation. Hitherto, nothing had been known of W.A. but the coast line, and that imperfectly, with the lower course of the rivers Swan and Canning, and the lake or estuary into which they have their outlets. On his arrival, Captain Stirling lost no time in obtaining further knowledge both of the coast and of the interior of that country which it had become his duty to develop for the advancement and future prosperity of the colony of which he was the founder; indeed, even before Stirling's arrival, Captain Fremantle (H.M.S. *Challenger*) had already hoisted the British flag at the place which now bears his name, and had explored the country lying between Cockburn Sound and the Canning River. While James Drummond, the botanist who accompanied Captain Stirling, was at his work near the coast, Ensign Robert Dale, of the 63rd, explored the country to the Eastward, and reached the valley of the Avon at Mount Bakewell; and afterwards, starting from thence, proceeded eastward for about sixty miles to Mounts Stirling and Caroline, returning by a more southern route past the mount which bears his name. Meanwhile Lieut. William Preston, R.N., with Dr. Alexander Collie, had reached Leschenault to the S.; and Lieut. Archibald Erskine examined the Darling Range. Dale again in the end of the year 1830 went to trace the course of the Helena River, and Captain Thomas Bannister started from the Swan River to cross the country to King George's Sound. On the S., Captain John Molloy had discovered the Blackwood, and Governor Stirling with the Surveyor-General, Lieut. J. S. Roe, R.N., having visited Leschenault and Augusta, military detachments and settlers were established at both places. Nor had those at King George's Sound been idle, and the names of Lieut.-Col. Lockyer, Captain Wakefield, Lieutenants Tollemache and Kent, and especially that of Dr. Wilson, Resident Magistrate at Albany, will not be forgotten. In the work of exploration none were more active than the Governor himself, who, with the Surveyor General, examined the course of the Collie and Preston Rivers, and the latter explored the country beyond the range of hills, which the Governor named after him, Roe's range; but the first

exploration of any length, or presenting any serious difficulty, was that made from the Swan to King George's Sound, by Captain Thomas Bannister, who, in consequence of the inaccuracy of the calculations of the surveyor sent with him, only succeeded in reaching, after much hardship, the coast near the mouth of the Frankland, having discovered in his journey the Bannister and other affluents of the Murray, as well as those of the Blackwood and Frankland. He first noticed the gigantic growth of the trees near the S. coast. The next year Collie and Dale, removed to King George's Sound, proceeded to explore that district; Collie from Oyster Harbour, about the King and Kalgan or French River, as it was then called, and the Porongurup Range, while Dale was sent to Tood-e-rup, a part of the Stirling Range, to search, but without success, for a cereal plant said to be used as food by the natives. This year also (1831) J. G. Bussell examined the country between the Blackwood and the Vasse, as well as the coast to the W. of those rivers. In 1833 Alfred Hillman, a surveyor in the employ of the Government, explored the S. coast from Albany as far as Nornalup Inlet. In 1834 G. F. Moore made the junction of the Avon and Swan; Thomas Turner ascended the Blackwood; John Butler explored the Lake district to the N. of Perth; C. R. B. Norcott, Superintendent of Police, the Murray River valley; F. Ludlow traversed the country between Augusta and the Swan River; and W. K. Shenton, a draughtsman attached to the office of the Surveyor-General, examined the Collie River. In 1835 Hillman visited the Avon, Hillman, and Williams Rivers; Patrick Taylor examined the upper course of the Kalgan and Hay; Surveyor Thomas Watson the Murray; and Moore the Upper Swan; but that year is most notable for the expedition under the command of the Governor himself, attended by the Surveyor-General, which, traversing the country about the head waters of the Murray and Blackwood, struck the course of the Palinup or Salt River, and returning from the W. of the Stirling Range (so named after Governor Stirling,) descended the valley of the Kent and proceeded along the coast to King George's Sound. From thence they went in H.M.S. *Sulphur* to Cape Knob and Dillon Bay, and on their return Roe went back by York to the Swan River. In 1836 further exploration was made by Hillman and Williams between the Avon and Williams Rivers, by Moore and Drummond about the sources of Moore River, and by Lieutenant Banbury in the valley of the Williams and between the sources of the Dale and the Murray. In 1837 the Governor went by the valley of the Murray to Kojonup; and that year is notable for the landing of Lieutenants Grey and Lushington on the N. coast, and for the discovery by them of the beautiful and fertile valley of the Glenelg River. Grey however, having been severely wounded in a skirmish with the natives, returned with his party to

Mauritius to restore his health and prepare for a fresh descent on the N. coast. Meanwhile Hillman with his party was surveying the country and laying out a road from Perth to King George's Sound. It was indeed for the purpose of connecting the scattered settlements in the new colony that most explorations were now made. The settlers in the S.W. very naturally desired that the road from Perth to Albany should pass near their locations, and the journeys of W. Nairn Clarke, R. H. Bland (afterwards Colonial Secretary,) F. C. Singleton, and Lieutenant Egerton Warburton, were continued for the three following years with that object. At this time also Captain John Scully made further exploration on the Moore River, as did surveyor H. M. Ommaney (formerly a lieutenant in the army,) on the coast to the W. of Busselton, while Clarke examined the coast and its inlets between King George's Sound and Point D'Entrecasteaux. Grey, by the advice of Sir William Nicolay, then Governor of Mauritius, had come to the Swan River to re-organise his party for further exploration on the N. coast; but as it was supposed that the main drainage of the interior would prove to be to the W., the rivers of the N. coast being apparently of sufficient magnitude, and the limits of the basin of the Glenelg being known, he went by sea to Sharks Bay, into which a considerable river had been reported to flow from the E., and was landed with three whale-boats and stores on Bernier Island, where he made his dépôt, and from thence proceeded across the bay, and after much danger and difficulty succeeded in tracing its eastern shore and entering the mouth of the Gascoigne River; but returning to his dépôt one of his boats was broken up, the others shattered, and his stores destroyed in a violent storm, so that he was obliged to attempt to return to Swan River by sea in two boats, now unfit for service, and with a very insufficient stock of provisions. Attempting to land near the S. of Gantheaume Bay, his boats were destroyed in the surf on the beach, and it only remained to reach, if possible, the Swan River, on foot. In this terrible journey the party separated, but Grey and a faithful native named Kaibor, having reached Perth, sent back assistance to the rest, who, with the exception of Frederick Smith, a young volunteer who had attached himself to Grey, and Walker the surgeon, who had reached Fremantle unassisted, were picked up by a party sent to their relief under the Surveyor-General. Smith died of exhaustion near the small river which bears his name, after having shown himself, by his courage and patient endurance of hardship and famine, worthy of his cousin Florence Nightingale. In this journey of nearly 300 miles, Grey discovered and passed over all the rivers of the W. coast, from the Murchison to the Swan, and his description of the country led ultimately to its settlement. His accuracy was much disputed by some, but subsequent knowledge has fully confirmed his report. It was in this year that Eyre arrived at

King George's Sound, having lost all his party except his native guide in his journey along the coast from Port Lincoln. Captain Stokes in the *Beagle* this year surveyed the Abrolhos and Champion Bay, which had been previously entered by Lieutenant Helpman in the colonial schooner of that name. The views of the early settlers had been directed principally to agricultural pursuits; but after this time, as it had appeared from the explorations of Governor Stirling and Roe and their followers that a large portion of the interior country was more fitted for pasturage, their attention was turned more especially to that industry, and with this object Drummond and Scully made explorations to the Victoria Plains, as did Henry Lander to the S.E. of Beverley, and in 1843, with H. Maxwell Lefroy, he made an excursion into the Lake district to the E. of York, where their names and discoveries are still perpetuated. During 1847-8 Dr. F. Von Sommer, who, having a reputation for knowledge in natural science, had been taken into the employ of Government, examined and reported on the geology of the Victoria, Moore River, and Avon districts, and the country about Capes Riche and Naturaliste. In the latter year the Surveyor-General, accompanied by Augustus Gregory, started on a journey of exploration to the E. of the Stirling Range. Gregory had just returned from an expedition to the Murchison, on which river he had discovered lead and copper lodes (thus first directing attention to the mineral wealth of the Champion Bay district,) as also the small harbour which bears his name; and on the Irwin River his brother, F. H. Gregory, had found what has since been commonly known as the coal seam, and this with the reports of Von Sommer led to the supposition that there were vast deposits of that mineral extending from the Irwin along the base of the Darling Range. Roe, descending the Palinup, crossed to Cape Riche, and returning on his track to the N.E. reached Bremer Range, whence directing his course to the S. and E., and crossing the sources of the Fitzgerald and Phillips Rivers, he proceeded as far as Russell Range, near Cape Arid, at the western extremity of the Great Australian Bight; and returning to Cape Riche, he found on the middle course of the Phillips, and lower course of the Fitzgerald, deposits similar to those found by Gregory on the Irwin, and in consequence, another discovery of coal was proclaimed. On reaching Cape Riche, he made a direct course to Bunbury and thence to Perth. The same year Helpman and Gregory returned by sea and land to make further examination of the reported coal measures, but the result was not satisfactory. They were again very carefully examined in 1875 by the Rev. C. G. Nicolay, who was sent by the Government for that purpose, but without the least indication of coal measures being perceptible. It will appear from this record that before the year 1850 the coast of W.A., from Sharks Bay to the Great Australian Bight,

had been explored, and a general knowledge obtained of the basins of the rivers from the Moore to the Phillips. The names of the early explorers, by whose labours this knowledge was acquired (and to those given in the above list several more might be added,) should be familiar to those who enjoy the benefits resulting from them. From 1850 exploration has been continued on a more extended scale, in a more systematic method, with more definite ends, at longer intervals, and for the most part by professional surveyors. A. Gregory was occupied during the years 1852 and 1853 in the valleys of the Blackwood and Gordon, and made a short expedition from the Murchison to Sharks Bay. In 1854 surveyor Robert Austin with a large party, including several young volunteers since well known in the colony, left the valley of the Avon, and proceeding E. and N., reached Mount Magnet in the Lake district, nearly 300 miles due E. from the mouth of the Murchison, and thence by a N.W. course entered the upper basins of that river, and (after making vain attempts to reach the Gascoigne, where G. Phillips, with supplies sent by sea, awaited him) was obliged, with much suffering, to return, and with great difficulty reached the river. It was from this journey that some knowledge of the country about the head waters of the Murchison, now being so rapidly taken up for pastoral purposes, was first obtained. F. H. Gregory was on the Murchison in 1857, and the next year traced the courses of the Lyons and Gascoigne rivers to the sea, and by his discoveries, opened an easy route overland to the N.W. coast, along which both sheep and cattle were driven by E. T. Hooley without difficulty in 1865. In 1861 F. H. Gregory, landing with a party at Nickol Bay, explored the valleys of the Fortescue, Ashburton, Shirlock, Yule, and DeGrey rivers as far as Mount Macpherson at the source of the Oakover; this led to the settlement of the N.W. coast, as it is still called. This year also the brothers Dempster made explorations to the E. of Northam, and from the S. coast to the Lake district, in which H. M. Lefroy made a still more extended exploration in 1863, in consequence of which Surveyor Hunt was sent with a party organised for well-digging and to make a road by which cattle might be taken into it. Cook and Clarkson were exploring its northern limits at the same time. In 1864 Austin, with Dr. Martin and others, entered the mouth of the Glenelg and explored the western portion of the basin of that river as Grey had the eastern; and a settlement having been formed at Roebuck Bay, Surveyor James Cowle traversed the country between that place and Nickol Bay. In 1870 Surveyor John Forrest traced the coast from Albany to Eucla, and proceeded from thence to Adelaide, without suffering from want of water as Eyre had done. Of the interior of the country nothing was known as yet beyond the Lake district, but in 1856 A. Gregory, with a party from Q., entered the territory of W.A. from the N.E.,

and found Sturt's Creek in a sandy desert; and reports respecting white men, supposed to relate to Leichhardt and his party, of whose fate nothing is known, having been received from the natives of the Lake district, in 1869 John Forrest extended his search to the eastward of Champion Bay as far as the 123rd meridian, and in 1871 his brother Alexander somewhat further beyond Hampden Plains. In 1872 Surveyor W. C. Gosse attempted to cross from S.A., but was driven back by want of water before reaching the 126th meridian. Warburton however the year following succeeded in reaching the Oakover, the northern branch of the DeGrey River, by the assistance of camels. It was reserved for John Forrest to cross the centre of the colony from the Murchison, and thence to the northern telegraph line of S.A., with the ordinary equipment of a bushman.

WESTERN PORT is a beautiful harbour in V., formed between two islands called Grant and French islands, in rather a remarkable manner: two great bays lie one within the other, the inner being nearly filled up by French Island, whilst the outer is sheltered by Grant Island stretching across it almost from point to point, leaving a wide channel on its west side. The east passage is narrow and fit only for small vessels. On the east shores of Western Port rises a range of woody hills between 500 and 700 feet high. This harbour presents a curious feature, a sort of canal that fronts the east side of Grant Island; its depth varies from six to seven fathoms and the width is half a mile. The most remarkable object is the helmet-shaped headland rising 480 feet above the sea, forming the southern extreme of Grant Island, called Cape Wollamai, discovered and named by Bass, "Western Port," from its relative situation; as from Sydney then it was the westernmost extent of the straits known on the north side. An account of the settlements attempted here in the early days is given in the article "Port Phillip."

WESTPORT, a township in N.Z. at the mouth of the river Buller, on the south-western coast of the province of Nelson. It is the best port for every class of vessel on the west coast of Middle Island, there being deep water always on the bar and easy entrance. The headland of Cape Foulwind lies about ten miles to the westward, the city of Nelson about 140 miles to the N.E., and the town of Greymouth about forty miles S.W. The population of the town is about 1166. The Westport and Mount Rochfort Railway Line is completed specially for bringing coal to the port from the Rochfort and Ngakawhau coal-fields which extend for miles. The Westport Colliery Company has its operations here; the ground they are working is believed to have an almost limitless supply of the fuel which stands, for quality, high among colonial coals. The Government has provided commodious wharves, affording every facility for loading and discharging vessels. Extensive river protective stone works are also in progress.

WHANGAREI HEADS, a headland in N.Z., about seventy-five miles S.E. of Auckland and about fifteen miles by the river from Whangarei township. The harbour of Whangarei is situated about midway between Auckland and the Bay of Islands. On the northern side the land is very mountainous and capped in places with rocky peaks of the most grotesque and fantastic appearance. Especially so are those on the top of the Manaia mountain as seen from the inside of the harbour, which according to the Maori legend represents the old chief Manaia, his wife, and two children turned into stone. The residents are principally Canadians who rear cattle and sheep, and live partly by this occupation and the tillage of their land, and partly by fishing.

WHANGAROA, a township in N.Z., 150 miles N.W. of Auckland, situated on one of the most magnificent harbours in N.Z., whether as regards its anchorage accommodation or the beautiful and picturesque scenery lining its shores. It is approached by a narrow passage of about half a mile in length and opens into magnificent bays, thoroughly land-locked on every side, presenting to the view a wonderful range of varied and beautiful scenery. The harbour is about five miles in length, at the upper end of which is situated the township. This place has had notoriety from being the scene of the massacre in 1809 by the natives of the crew and passengers (sixty-four in number) of the *Boyd*, a large homeward-bound ship that visited the port for a cargo of spars. The vessel was burned to the water's edge, and her remains still lie imbedded in the mud near the upper end of the harbour. A number of the natives who took part in the massacre were killed by the explosion of the gunpowder when the *Boyd* was burning.

WHITSUNDAY PASSAGE lies on the N.E. coast of the continent, and was so named from its having been discovered by Captain Cook on Whitsunday 1770. The islands which form it to the E. were named Cumberland Islands in honour of the Duke of Cumberland.

WICKHAM RIVER, in Q., was discovered by Leichhardt. It is a branch of the Limmen Bight River, and was named in honour of Captain Wickham, the successful explorer of the N.W. coast of A.

WIDE BAY, a deep indentation on the coast of Q. to the N. of Moreton Bay. A river empties its waters into this beautiful bay called the Mary, after Lady Mary Fitzroy. The capital of the district is Maryborough, and the Gympie gold-mines are not far distant from the shores of the bay.

WIGHT POINT, on the south coast of V., was discovered by Grant in 1800, and was named from its fancied resemblance to a point in the Isle of Wight, England.

WIGHT'S LAND is that portion of V. lying between Cape Danger and Cape Paton in the

district of Portland Bay. It was named by Grant in honour of Captain Wight R.N., son-in-law to Commissioner Schank.

WILLIAMS, SIR EDWARD EYRE (—1880) jurist, a native of England, was admitted to the bar in England in 1833, and shortly after the foundation of Port Phillip came to the colony. For ten years he practised his profession in Melbourne, having as contemporaries two gentlemen who subsequently became his colleagues on the bench, Sir William F. Stawell and Sir Redmond Barry. In 1844 Williams was elected a member of the Bourke District Council—a local body constituted under the N.S.W. Act, 5th and 6th Vic. c. 76—with which he remained connected for some seven or eight years. On the separation of Port Phillip from N.S.W. Williams thought of obtaining an elective seat in the Legislative Council of V. With that view he solicited the suffrages of the electors of the Loddon district, but his efforts to obtain a seat did not extend beyond the publication of an address. Probably a reason for this may be found in the fact that in the list of official appointments rendered necessary by the realisation of Victorian independence, and published on 15th July 1851, the name of Williams appeared as Commissioner of the Court of Requests for the city of Melbourne and the County of Bourke. In January 1852 he was created Chairman of Quarter Sessions. This appointment he held in conjunction with that of Commissioner of the Court of Requests, but he was not debarred thereby from continuing practice in the Supreme Court of which he appears to have had at that time the lion's share. In April 1852 he took office as Solicitor-General, by virtue of which position he became a nominee member of the Legislative Council; but the time during which he was permitted to enjoy these honours was too short to enable him to leave any mark on the legislation of the country. A greater distinction awaited him. The increase of business in the Supreme Court rendered the appointment of a third judge an imperative necessity. The honour was conferred on Williams, of whom nothing was afterwards heard in public life save in connection with his judicial duties. Early in 1859 having obtained leave of absence, he visited England and returned in 1861. From that date till 1874 he continued to act as judge of the Supreme Court. For some years before that he had not been in very good health, and in the early part of 1874 his medical advisers recommended that he should immediately retire from the bench. He accordingly forwarded his resignation to the Government which was accepted. On the day when he last presided in the Supreme Court there was a large attendance of the members of the bar, and on their behalf the Attorney-General, J. W. Stephen, expressed regret on account of his Honour's retirement, and referred to the courtesy with which he had treated all the members of the profession. Judge Williams shortly afterwards left the colony for

England. In 1878 he was created a Knight Bachelor in recognition of the services he had rendered to the colony in the various public positions that he had filled. As judge, Williams was patient and assiduous, and his intimate knowledge of that branch of the law known as pleading was especially recognised by those who practised before him.

WILLIAMS, HARTLEY (1841—) jurist, is a native of V., and son of Sir E. E. Williams, late Supreme Court Judge. He was educated in England, took the degree of B.A. at Trinity College, Oxford, and was called to the bar in the Inner Temple in April 1867. In the same year he returned to V. and was admitted a barrister of the Supreme Court on 4th April 1868, his admission being moved by Mr. Ireland Q.C. The number of what are known in the profession as common law pleaders at the bar was at that time, owing to a variety of circumstances, limited. Williams had devoted himself as a student to this branch of the law, and his ability in this respect was speedily recognised. Briefs began to pour rapidly in upon him. He took no part in public life till the year 1872, when he became a member of an education league, whose objects were to establish free secular and compulsory education. This league ceased to exist when the present Education Act became law. In 1874 the Francis Government proposed a measure for altering the constitution under which the Government of the country had previously been carried on. This bill was popularly known as the Norwegian Scheme. It was not generally accepted by the Constitutional party, and at the invitation of a number of electors Williams decided to oppose the then Attorney-General (J. W. Stephen.) Stephen's popularity in connection with the Education Act however was such that numbers who did not believe in the constitutional alterations proposed by the Government voted for the Attorney-General, and Williams was defeated by a large majority. Shortly afterwards Mr. Justice Williams retired from the bench, and the office of Supreme Court judge was conferred on Stephen. This left a vacancy in the representation of St. Kilda in the Assembly, and again Williams was brought forward to contest it. Webb also determined to stand for the seat, and as no arrangement could be arrived at by the friends of these candidates for the retirement of one of them, the result was that E. J. Dixon was elected. After 1874 Williams took no part in politics, though he had been asked several times by different parties to allow himself to be nominated for election. In 1881 he was appointed a Supreme Court Judge. This appointment of a native of the colony to the Judicial Bench gave universal satisfaction to the Victorian people.

WILLIAMS, THOMAS (1815—) Wesleyan Minister, was one of the first seven ministers elected to commence the Fiji Mission. On reaching the South Seas he divided his time between Lakemba and Somosomo, and then opened the

mission at Mbua, where he had considerable success. In 1854 he left Fiji and went to Adelaide, where he remained until he left for V. in 1857. In 1858 he published an illustrated book on *Fiji and the Fijians*. At the Australian Wesleyan Conference held in Melbourne in January 1872, he was nominated president for 1873. His nomination was confirmed by the British Conference; and that over which he presided was remarkable as being the last of its kind embracing the whole of the colonies, N.Z. and the South Sea Islands; provision having since been made for holding annual conferences in N.S.W. and Q., V. and T., N.Z. and W.A., and one triennial conference including all.

WILLIAMS, WILLIAM (1800—) Bishop of Waiapu in N.Z., is a native of England, and was educated at Magdalen Hall, Oxford, where he graduated B.A. in 1824, and D.C.L. in 1851. He became Archdeacon of Waiapu in 1842, and was consecrated Bishop in 1859. He has compiled a *Dictionary of the N.Z. Language*, and has written *Christianity among the New Zealanders*.

WILLIAMSTOWN, a port and municipality in V., on the S. point of estuary of the Yarra Yarra River and S.W. shore of Hobson's Bay, immediately opposite Sandridge, eight miles from Melbourne. Like Sandridge, the business of the place is principally with the shipping. There are commodions piers, alongside of which ships of the largest burden can be berthed; there is also ample provision for the repairs of vessels, there being patent slips and ship-building yards. The P. and O. mail steamers berth here. The Alfred Graving Dock, which was several years in construction, was opened in March 1874, H.M.S. *Nelson* being the first vessel to enter it. The dock is 450 feet long, but will admit vessels of 500 feet. The caisson, in the construction of which over 230 tons of ironwork were used, was manufactured at Fulton's foundry. At the extreme end of the peninsula on which Williamstown is situated, called Gellibrand's Point, is a tower formerly used for lighting vessels coming up the bay at night, but which has been superseded by a light ship, placed about a mile and a-half farther down the bay. There is also a line of batteries mounted with heavy guns, extending from the breakwater along the shore facing St. Kilda. Several quarries of superior basalt are worked within a short distance of the town. The population of the town is 8300.

WILLIS, JOHN WALPOLE (— 1877) first Resident Judge of the Port Phillip district, was a son of the well-known Dr. Willis, who attended George III. in his illness, and was celebrated for his skill in treating the insane. Willis was a man of eccentric character, and when he opened the Supreme Court at Melbourne in 1841 he intimated that he would insist upon the attendance of justices of the peace at all future sittings of the Supreme Court in its criminal jurisdiction. He did this that they might learn something of their

judicial duties; the magistrates not attending as suggested he threatened to fine them and have their names struck off the Commission, and have others appointed in their stead. In this manner the Judge proceeded until he aroused a strong feeling of indignation against himself amongst the gentry of the district, which ultimately led to his removal from the Bench in 1843.

WILSON, EDWARD (1814-1878) journalist, was a native of London, and came to Melbourne in 1842. He at first engaged in cattle grazing in partnership with J. S. Johnston, but his disposition was strongly towards journalism. His first contributions to the Press were a series of letters criticising the administration of La Trobe. In 1847 he purchased the *Argus* newspaper, and also the *Port Phillip Patriot*, which was merged into the former. In 1852 he also purchased the *Melbourne Daily News*, which was similarly merged in the *Argus*. That journal thus became the leading paper in V., and as Wilson warmly advocated the rights of the people as against the blundering maladministration of La Trobe, and the independence of the colony against the tyranny of N.S.W. and the despotism of Downing-street, his journal became a very powerful organ. When the gold discoveries caused the great influx of population in 1852-54, and the social condition of the colony became thoroughly disorganised, Wilson fought energetically on the side of good government, law and order. The difficulties experienced in carrying on the paper from day to day were almost insurmountable, but Wilson's unflagging energy carried him safely through all his troubles. For nearly twelve months the *Argus*, as to its literary department, was sustained by the united exertions of Wilson and David Blair; and in the mechanical department by the unwearied diligence of Josiah Frencham. It is almost incredible the amount of personal labour, self-devotion and energy which Wilson exhibited while carrying the journal through this critical period. He was foremost in the great movement for the separation of Port Phillip and its erection into an independent colony. He was an ardent advocate of the anti-transportation movement. He was one of the framers of the Convicts Prevention Act, and to him more than to any other man it was owing that this most beneficial measure was placed upon the Statute Book, despite the strenuous opposition of the local Government and the repeated refusals of Downing-street. Wilson carried to an extreme length his uncompromising denunciations of the feeble and vacillating and most mischievous policy of La Trobe. He was equally severe in his condemnation of the tyranny exercised both by La Trobe and Hotham towards the miners, and his powerful writing in the *Argus* was certainly a strong incentive to the course of action which culminated in the Ballarat revolt. But when the riots actually broke out Wilson as strongly supported the Governor in his measures to restore peace and order. This change of front

was the turning point in Wilson's political career and the fortunes of the *Argus*. But prior to this time Wilson had always been the zealous advocate of the popular interests against the petty despotism of the Government and the monopoly of the dominant section. He was incessant in his demands for the introduction of a popular land system, and for the overthrow of the squatting monopoly. He it was who formulated the popular demand in the famous watchword, "Unlock the lands!" It may be said of him that there never was in any British colony at any period a more thoroughly disinterested, patriotic, high-minded journalist, or one of greater earnestness of purpose and energy of character. But this character of Wilson applies to his career prior to the era of the Ballarat riots. At that point he ceased to be a leader of the people, or even an effective journalist; he probably felt that his work was in that line accomplished. But in the meanwhile the character of the *Argus* as a political organ had been completely changed. It was now the organ of the rapidly-developing trade and commerce of the colony, the exponent of the free-trade principles, and the determined foe of everything that savoured of Radical principles. Its success as a commercial enterprise was assured, and in a few years Wilson and his fellow-proprietors became very wealthy men. In 1857 Wilson visited England; his health was declining and his sight was failing. He established and superintended the London agency of the *Argus*, the supervision of which he maintained with some intervals till his death. He returned to the colony in a year or two, and travelled through the continent and the adjacent island-colonies, embodying the result of his observations in letters to the *Argus*, which were subsequently published in a small volume. He purchased the estate of Hayes in Kent, where he chiefly passed the last years of his life, taking an active interest in all matters relating to the progress of the Australian Colonies, and favourably influencing by his writings and personal advocacy the action of the Colonial Office. Wilson was a genuine philanthropist, a man of large and liberal views, possessed of great abilities for suggesting and advocating measures of social and political improvement; but he was wanting, from personal temperament, in the faculty of directing and guiding others. He was never married, and at his death he bequeathed much of his private fortune to purposes of private benevolence and public charity.

WILSON, JOHN BOWIE (1820—) is a native of Scotland, and was educated at the Edinburgh and Aberdeen Universities. He arrived in A. in June 1840. He first entered the Parliament of N.S.W. in the session of 1859, representing the southern goldfields; was afterwards elected for Patrick's Plains, and subsequently for East Sydney. He first accepted office in the Martin Ministry as Secretary for Lands in October 1863, and retired with that Government in February 1865. Wilson

again accepted office in the Martin Ministry in January 1866, retiring in October 1868. For the third time he accepted the portfolio of the Lands Department in the Martin Ministry in December 1870, and retired when Martin went out of office in 1872. Wilson distinguished himself by his successful efforts to secure to the people of Sydney extensive parks and recreation grounds, and voted for the abolition of State-aid to religion. During his administration of the Lands Department great improvements were made in the Sydney Domain and in Hyde Park.

WILSON, SIR SAMUEL (1832—) is a native of the North of Ireland, and came to V. in 1852. He worked for some time as a miner at Bendigo, and had some success. At that time his brothers had a sheep station on the Wimmera. Wilson joined them, and was given the management of Kewell station, with 20,000 sheep. Having obtained a knowledge of sheep-farming, he sold a small estate in Ireland and joined his brothers in the purchase of Longerenong on the Wimmera for £40,000. This purchase was so successful that in about four years the profits paid for the station. Afterwards the Yanko station on the Murrumbidgee was bought, and in a few years so improved that the clip of a single year exceeded the original purchase money. He next bought the Ercildoune estate, celebrated for its breed of merinos. He extended his operations to the Darling district in N.S.W. and Peak Downs in Q., and still further W. in that colony, where he holds large cattle stations. He was twice elected a member of the Legislative Assembly for the Wimmera, and since 1875 has represented the Western Province in the Upper House of Legislature. He has devoted £1000 to the introduction of salmon into Victorian waters. He has also been successful in introducing the Californian salmon, and in the introduction by him of sea fish into the salt waters of Lake Corangamite. He has written a work on the Angora goat and a paper on ostrich farming. In 1874 he presented the University of Melbourne with a donation amounting with accumulated interest to about £36,000. In 1875 he was knighted, as an acknowledgment of the services rendered to the colony.

WILSON'S PROMONTORY, the most southern point of land in V. or in Australia. It consists of a mass of granite rock, twenty-four miles in length by nine miles wide, connected with the mainland by a narrow sandy isthmus. It contains several mountains of considerable height, the highest of which, Mount Latrobe, attains an elevation of 2590 feet. The bases of these mountains, and nearly the whole of the promontory, are covered with timber, some of which grows to a considerable size. There are several bays on the coast, the principal of which is Waterloo Bay in the S.E. The cliffs are however rocky and precipitous, and these bays are only available in calm weather. There are numerous rocky islets lying off the

coast. There is a lighthouse, burning a fixed white light, at the extreme S. point of the promontory. To the N., and lying between the promontory and the mainland, is the large harbour called Corner Inlet, the entrance to which is by a narrow channel between Mount Singapore in the N.E. of the promontory, and Snake Island. The promontory was seen and named by Grant in 1800 after Admiral Wilson.

WINDEYER, RICHARD (1806-1847) jurist, was a native of London, and began life in England as a writer and parliamentary reporter for the *Morning Chronicle*, *Times*, and other London papers. He originated Todd's *Parliamentary Companion*, and as a friend of Colonel Peronett Thomson took part in the first agitation against the Corn Laws. He was admitted a barrister of the Middle Temple in 1834, and on the death of Dr. Wardell and the retirement of Wentworth from the Sydney bar he emigrated to N.S.W. with the intention of permanent settlement. He arrived in Sydney in 1835 and became a leading barrister. He was elected to the first Legislative Council as member for Durham in 1843. He took an active part as a member of the popular party in its struggles for political freedom and was the intimate associate of Wentworth, Bland, Lowe and Dr. Lang. He contested at law the right of the Government to enforce the payment of quit-rents, and suffered an execution to be put into his house in his resistance. Windeyer was prominent in questions of financial and educational interest, and from his unflinching advocacy of retrenchment was regarded as the Joseph Hume of the party. He introduced the present Libel Act and other measures, and was the writer of the *Monetary Confusion Report* of 1843.

WINDEYER, WILLIAM CHARLES (1834—) jurist, is a native of London, and came to N.S.W. with his parents in 1835. He was educated at Cape's School, and at the King's School in Parramatta. He entered the University of Sydney in its opening in 1852, and immediately took a general scholarship and afterwards a special scholarship for proficiency in classics. He won every year the English essay prize first given by Dr. Woolley and afterwards founded by Wentworth as a medal. He graduated with distinction in Classics at the head of his year in 1856, taking also a first class in Mental Philosophy, and is the senior of all Australian graduates, having taken the degree of M.A. in 1859. He studied for the Bar in the Chambers of Broadhurst, Q.C., and was admitted in March 1857. He became a writer and law reporter for the *Empire* newspaper, then conducted by Parkes. He was appointed Crown Prosecutor for the whole of the country districts in January 1859. At the call of a public meeting Windeyer resigned his Crown Prosecutorship and contested the electorate of Paddington with Sir D. Cooper, who defeated him by forty-seven votes. At the same general election

he was elected for the Lower Hunter, defeating the former Member, Captain Williamson, by a large majority. He was elected to Parliament in August 1859, as a Member of the first House returned under the Electoral Act of 1858. Windeyer advocated the abolition of State-aid to religion, the limitation of Chinese Immigration, and the introduction of the Free Selection principle. On the dissolution of Parliament in 1860, he was elected for West Sydney. In 1860 he initiated the volunteer movement by calling a public meeting at the Victoria Theatre at which resolutions favourable to its formation were passed; and was afterwards elected Captain in the Force, and gazetted Major in 1868. He was wrecked in the *City of Sydney* whilst returning from Melbourne, where he had shot as one of the champion team of N.S.W., and falling into ill-health resigned his seat for West Sydney. In January 1866 he was against his wishes, and in his absence from Sydney, elected for West Sydney, defeating John Robertson on his seeking re-election when taking office as Secretary for Lands. He became a supporter of the Martin-Parkes Administration, and warmly advocated the Public Schools Act of 1866. Having declined six overtures of office made to him by Cowper, Plunkett, Forster and Sir J. Robertson, on the formation of different administrations, he accepted office as Solicitor-General under Sir James Martin in December 1870. He was defeated for West Sydney on the dissolution of Parliament in 1872; but was elected the first member for the University of Sydney in September 1876. He accepted office as Attorney-General in the administration of Sir H. Parkes in March 1877, and was again elected without opposition as member for the University. He resigned office in August 1877, and was again elected for the University without opposition on the dissolution of Parliament in 1878. He took office again as Attorney-General in the coalition Government of Parkes and Robertson in December 1878. He was elected a member of the University Senate at the first convocation in 1865, and as a Senator carried resolutions on which the public examinations of the University were established. In 1878 he carried a resolution in the Assembly for the establishment of Grammar Schools in Bathurst, Maitland and Goulburn, and the founding of the Public Exhibitions enabling poor but clever boys to proceed from the Public Schools to the Grammar Schools, and thence to the University, and also carried resolutions affirming the justice of extending the advantages of higher education to girls, and the expediency of founding a Girls High School in Sydney. He was elected a trustee of the Sydney Grammar School in 1873, and President of the Sydney Mechanics' School of Arts, in 1874. He was President and drew up the report of the Public Charities Commission in 1873, and took an active part as a member of the Commission appointed to revise the Criminal Law in 1870.

He introduced the Act enabling members of the Australian Bar to hold the judicial office, the Carriers Act, the Married Women's Property Act, and the Copyright Act. In 1862 he moved resolutions in the Assembly preserving Belmore Park, Church Hill, and Flagstaff Hill, as reserves for public recreation, when the first was advertised for sale by the Government; and in 1878 he moved a similar resolution with regard to Clarke, Rodd and Schnapper Islands, and all the land at the head of Long Bay, on the destruction of timber on Clarke Island being commenced. In 1874 he originated the Discharged Prisoners' Aid Society, and in 1876 was appointed an Acting Judge of the Supreme Court for two circuits.

WINDSOR, a township in N.S.W. on the Hawkesbury river, thirty-four miles N.W. from Sydney, with which it is connected by railway. It was proclaimed a municipality in March 1871. It is one of the oldest settled places in the colony, and but for the frequency of the floods in the district would hold a much higher position than it now does. The town itself is built on a hill and is therefore not much affected by the floods that occasionally sweep over the district. The soil is of unrivalled fertility and produces the cereals and other farm products to perfection. The population is estimated at 1732. The Windsor bridge, built on iron cylinders and spanning the river Hawkesbury, is a fine substantial work.

WINE GROWING IN AUSTRALIA.—I. M. Peron, naturalist and historian of Baudin's expedition in 1802, makes the following remarks:—"By one of those chances that are scarcely conceivable Great Britain is the only one of the great maritime powers which does not cultivate the vine, either in her own territory or in her colonies; and yet the consumption of that beverage is immense on board her fleets, and throughout the whole extent of the vast regions subject to her empire. Constrained to draw that enormous quantity of alcoholic liquors from France, from Spain, from Portugal, and even from Holland, she sees with regret a large portion of the capital of the nation annually absorbed in purchases of this kind, and ardently aspires for the means of freeing herself from this burdensome tribute. It was principally with this view that during last war she attempted the conquest of the Canary Isles; and this was one of the great motives that determined her twice to attack the Cape of Hope. That which she has been unable to obtain, or which, if she does obtain it, it will only be momentarily by the force of her arms, she solicits and hopes for from her Australian Colonies; and in spite of the obstacles I have just mentioned, everything announces that she will obtain her end." Whether M. Peron's historical deduction, that it was the desire of Great Britain to obtain a supply of wine for her fleets and armies, that induced her to contemplate the conquest of the Canary Isles and of the Cape of Good Hope, it was certainly a remarkable instance

of the foresight of that gentleman to predict with confidence so long as half a century ago that the British colonies in A. would eventually become wine-growing countries. The first to introduce this article into A. was Macarthur, to whom the establishment of the great wool-growing industry of A. is also to be attributed. In 1816 he established the almost equally profitable pursuit of vine-growing. Having visited France in 1815 he acquired information as to the rural economy of the provinces of Southern Europe, particularly as regards the cultivation of the vine and olive. He collected cuttings from the most celebrated vineyards of Burgundy, Champagne, and Languedoc, as well as olive trees of the finest varieties, and planted the first Australian vineyard in his estate at Camden Park. Australian wine soon became favourably known, and, says Therry, "at the great exhibition in Paris in 1851 wine made from the muscat grape of Camden ranked high among the best wines of the continent." It is stated that some Greek prisoners assigned to Macarthur at Camden were the first to produce this important article of commerce. In 1823 several vineyards were planted in N.S.W. In 1831 wine grown and made by Mr. Hawkins at Bathurst was sold at Sydney. Dr. Lang, writing in 1852, says:—"The district of Hunter's River has taken the lead in this branch of cultivation. There has been a Vineyard Association in that district for years past, which has proved very serviceable, not only to the district, but to the colony generally, and the success of which has recently called into existence another association of a more ambitious character for the whole colony, which has its head-quarters in Sydney; the Hunter's River Vineyard Association holding its meetings annually in the provincial town of Maitland. At these meetings papers—sometimes of superior ability—on vine cultivation and wine making are read, reports are received from the different members, specimens of wine and brandy are examined and tested, and premiums are adjudged, the whole proceedings being duly reported in the provincial papers. The County of Durham, which is situated on the left bank of the Hunter, and which includes the trap country of the Patterson and William's Rivers, is the principal seat of this branch of colonial industry. The following is a statement of the produce of the three principal Hunter's River counties, as compared with that of the metropolitan County of Cumberland:—Cumberland, 303½ acres of vines, yielding 19,710 gallons wine, 388 gallons brandy; Durham, on left bank of Hunter, 205½ acres of vines, yielding 34,148 gallons wine, 660 gallons brandy; Northumberland, on right bank of Hunter, 151½ acres of vines, yielding 16,299 gallons wine, 450 gallons brandy; Gloucester, on left bank of William, 104½ acres of vines, yielding 9071 gallons wine. Cumberland being the metropolitan county of the colony, a larger proportion of the grapes grown in that county may find their way to the Sydney

market, for the supply of the capital; but as there is daily steam communication between Sydney and Hunter's River, perhaps as large a quantity may be disposed of in the same way from that district. It is the character of the soil however that constitutes the chief ground of difference, the sandstone formation of the county of Cumberland being much less favourable for the growth of the vine, and especially for the production of wine, than the trap formation of Hunter's River. My brother, Andrew Lang, whose estate abuts both upon the Hunter and the Patterson, where both of these rivers are large navigable streams, obtained from the Horticultural Society of Sydney, of which he was a member, the prize—a silver cup—for the best grapes produced in the colony two or three years in succession; which proves sufficiently that the soil and climate of Hunter's River are admirably adapted to the growth of the vine. My brother's vineyard, which has acquired some celebrity in the colony from the extraordinary results it has exhibited, not only as compared with those of other vine-growing countries, but with those even of N.S.W. generally, is situated on the banks of the Patterson River, and consists of about eight acres. It was planned and formed by George Schmid, a highly intelligent Wirtemburger, from the neighbourhood of Stuttgart, who still superintends it. The soil consists entirely of rich alluvial land which has been deposited from the inundations of the river in the course of many successive ages; and as the country through which the river flows is a trap country, the general basis of the soil is decomposed trap. In regard to the average produce of the vine in other vine-growing countries I am not possessed of the requisite information to speak confidently. James Busby, a highly respectable colonist, who has written on the subject, and who had previously travelled in the South of Europe to make inquiries respecting the cultivation of the vine and to procure a number of valuable cuttings for the colony from the best vineyards of France and Spain, states that in France the vintage yields on an average 247 gallons per acre; and adds that W. Macarthur's produce had one year been 250 gallons, although a considerably larger quantity was expected in future. Clement Hodgkinson however thinks Busby's estimate much too low an average for the central and western portions of France, in which he had himself resided. The Spanish vineyards around Xeres, where the wine called 'Sherry' is made, yield it seems from 300 to 800 gallons per acre; and Hodgkinson assumes 400 gallons as a fair average for N.S.W. In a published letter to Earl Grey, of date 26th September 1849, by James King, of Irrawang, William's River, one of the ablest and most successful cultivators of the vine in N.S.W., that gentleman observes:—"As to the quantity, I may mention that under ordinary circumstances the produce of the vines whence my red wine has been made averages from 250 to 300 gallons per

acre, that of those producing the white from 400 to 500 gallons per acre.' The following however has been the produce of three different varieties of wine in my brother's vineyard:—One acre of Black Cluster or Burgundy has produced 500 gallons the first year of bearing, 500 the second, and 400 the third. The Lambrusquat or Black Spanish grape has produced 800 gallons per acre. In regard to the third variety, the Black Hamburg grape, I quote the following passage from King's letter to Earl Grey:—'It may not be uninteresting for your Lordship to learn that Mr. Lang's vineyard here, on the Patterson, has this year (1849) produced 1800 gallons of wine and a ton weight of fruit besides from a single acre of that variety of grape called Black Hamburg.' The formation of a wine-growing population in a country whose inhabitants have not been previously accustomed to the culture of the vine, is a matter of no small difficulty; and from what had actually taken place in this respect in the colony of the Cape of Good Hope, a few of the more respectable colonists, including my brother—whose unsuccessful attempt to introduce a colony of German vine-dressers I have already related—were led to believe that the introduction of a number of families from one of the winegrowing districts in the south of Europe and their settlement in some favourable locality in the colony would tend more than anything else to form such a population in N.S.W. A few families, both of Portuguese from Madeira, and of Germans from the Rhine, have accordingly been at different times introduced into the colony, and their influence has certainly been in so far favourable." In his letter to Earl Grey Mr. King writes:—"In August 1832 and the following year I planted in this colony an experimental vineyard, of a few acres extent, with vine cuttings of the most approved varieties which I could then procure, consisting of about 6000 plants. The soil (the debris of pudding stone and porphyry,) was trenched, broken, and turned over with the spade to not less than thirty inches deep. The vines grew vigorously; some of them produced fruit abundantly; and all now in the vineyard are in good health. I rooted up such varieties as did not perfect their fruit or were in any way liable materially to be injured by the peculiarities or vicissitudes of the climate. I planted in 1834 a greater variety of sorts, many of which had shortly before been imported into this country from France by Mr. Busby to whom the colony is consequently much indebted. When they came into bearing, I was thereby enabled to select those particular varieties which appeared to be best suited for this climate, as many of the kinds were unfit for cultivation in the colony, at least in this part of it. The sorts so selected were planted more extensively; and the samples of wine now submitted to your lordship's examination are the result. The process followed in the manufacture of the wine is so simple that it need scarcely be mentioned; besides it would only be troubling

your lordship with irksome detail, unnecessary in the present communication. The first wine produced by this vineyard was in February 1836 from plants then only eighteen months old. A better wine has not been produced since. A few bottles of it are yet in my cellar, now upwards of thirteen years old. Up to the present time it has continued to improve in quality, and is now a very superior high-flavoured red wine, resembling first-growth Burgundy, which good judges of wine say would command a high price even in London or Paris. Mr. Busby's valuable importation, consisting of some hundred varieties of grape, many of them only two cuttings of a sort, arrived here in such excellent preservation that they nearly all grew on being planted in the colony, while a case of fifty cuttings each, of a few of the most select German varieties of grape, which I afterwards imported from Frankfort on the Maine, all perished during the voyage to this country. From the experience thus acquired as to the capabilities of this colony for the production of wine, I have no hesitation in predicting that N.S.W. will yet become a wine-growing country on a very extensive scale, and be enabled profitably to export its vinous product all over the world. Even the time required for its transit from here to Britain, or to any other distant market is less a consideration than with any other species of merchandise, since wine will be improving on the voyage, and even more rapidly on ship-board than in the cellar. The soil and climate of this colony are calculated to produce wine of superior quality, and that to an almost unlimited extent." The following is a translated extract from a letter to Mr. King from the celebrated Professor Liebig, of Giessen, to whose scientific researches the science of agricultural chemistry is so highly indebted.

"Giessen, 1st November 1849.

"Dear Sir—It is a long time since my thanks are due to you for your friendly letter, which has afforded me the more pleasure, as I have learnt from it that even in the remote part of the world which you inhabit, the scientific principles of agriculture and of the cultivation of the vine, have met with reception and extension. I wish that all English colonies had the good fortune of possessing men like yourself; for then the mode of extracting sugar for instance, would soon be carried to that degree of perfection from which it is so remote in Jamaica and elsewhere. Since the time that our producers of wine have convinced themselves that the best wine in France (the Bordeaux wine or Claret) is obtained by fermentation in conjunction with the admission of atmospheric air—since that time, our wine producers on the Rhine have bestowed on open fermentation that attention which it merits. Everywhere the syphon has disappeared; and in many places the wine is allowed to ferment in casks in which an opening of six inches square is cut—apertures which, during fermentation, are lightly covered with a coarse cloth. It has been experienced that

these wines retain more sweetness and are sooner fit for drinking. I have heard from Dr. Dieffenbach, who spent two years in N.Z. and now resides at Giessen, that he has visited your estate, and that the wine which you cultivate possesses an excellent quality. If it were not so far I would request you to send me a bottle to analyse, even on account of the great singularity. I should wish to taste the wine cultivated by our antipodes. Science and your country are indebted to you for the ardent zeal with which you have devoted yourself to its true advancement. Sooner or later this must bring forth the best of fruit. Do not allow yourself to be deterred by the opposition you meet with; for a newly-discovered truth has ever to contend with old-established errors; but truth at last obtains the victory.

"With the expression of the greatest regard,

"Entirely yours,

(Signed)

"DR. JUST. LIEBIG."

In June 1828 Gregory Blaxland, whilst on a visit to England, was presented with the Gold Ceres Medal by the Society of Arts, London, for wine the produce of his vineyard in N.S.W. In 1846 some of the produce of the Macarthur's vineyard was sold at Calcutta, being the first appearance of that new Australian export in that market. In 1860 Mr. Blake introduced N.S.W. wine into V. In November 1875 the first real champagne made in A. was exhibited at Fallon's cellars at Albury. The extent of land under vines in N.S.W. in 1879 was 4266 acres, and the total produce 733,576 gallons.

II. WINE GROWING IN VICTORIA.—In 1846 vineyards began to be formed in the Geelong district by French settlers, amongst whom the name of Belperroud is celebrated. In 1849 a number of German settlers came to the same district and began the cultivation of the vine. Several of them formed themselves into associations and carried on the cultivation on the co-operative principle with much success, but many circumstances combined prevented for a time their rapid development and extension. In 1856 there were only 279 acres under the vine in V., from which 11,000 gallons of wine and 340 gallons of brandy were obtained. In 1860 there were 1138 acres, which five years later, in 1865, had increased nearly four-fold, viz., to 4078 acres, on which 8,199,618 vines had been planted, producing 176,959 gallons of wine and 795 gallons of brandy, as well as 18,063 cwt. of grapes sold as fruit. It is worthy of remembrance as a fact, in the early history of this important colonial product, that the well-known poet, R. H. Horne, planted with his own hand the greater portion of the vine cuttings at Tabilk vineyard on the Goulburn. Westgarth mentions that J. P. Bear was one of the earliest wine producers in the colony, and in 1847 presented him with some bottles of still champagne which were of excellent quality. The Murray district had by 1862 become a scene of yearly vintages, and in conjunction with the

district of the Murrumbidgee has commenced the methodical plan of public auctions of the wine produce. The first of these auctions took place at the town of Albury, in November 1863, when ten and a-half hogsheads were sold at prices varying from 5s. to 13s. per gallon. In Geelong also regular auction sales began to be held in 1863. The first sale came off in October, with the encouragement of a good attendance, and the comparatively large stock of one hundred hogsheads of wine. The prices of the occasion varied from 3s. 11d. to 6s. 9d. per gallon, showing the advantage of the Albury market due to its distance from the seaports, and the competition of imported wines. During the last fifteen years the progress of this industry in V. has been very great. The produce of the vineyards at Lilydale, Sunbury, Tabilk, the Great Western and other localities are fast rising into celebrity, and a large export trade is springing up. There were in 1879 4284 acres under vines in the colony which produced 574,143 gallons. The fame of the Victorian wines was crowned by the circumstance that, at the Melbourne International Exhibition of 1881, the grand prize of the Emperor of Germany for the most striking exhibit of developed native industry was awarded to Messrs. De Castella and Rowan of the Saint Hubert's Vineyard, Lilydale, for their samples of Victorian wines.

III. SOUTH AUSTRALIA.—The extent and success of vine-growing in S.A. is due, in a great measure, to a considerable immigration of the Germans, who began to arrive in the colony at an early period of its history. The suitability of the soil and climate to the growth of wine was soon discovered by the early settlers, some of whom had brought from Europe a variety of high-class vine-cuttings. The slopes of the hills produce wines of a full-bodied character similar to those of Spain and Portugal, whilst those made in the more elevated districts resemble the lighter wines of the Rhine. Whilst the local demand is fully supplied at very cheap rates, a considerable export trade in wines of a higher character is carried on. In 1862 the quantity shipped was 20,574 gallons, or sevenfold that of the previous year. In 1863 it was 27,705 gallons. The acreage under vines is returned as 4777 acres, against 3918 in the previous season, and the number of bearing vines, 2,929,756, with 2,920,941 not in bearing. The former produced 472,797 gallons of wine, and 26,551 cwt. of grapes were disposed of in Adelaide or sent to Melbourne and T. So abundant are grapes that they are retailed during the height of the season at one penny or twopence per pound. There were in 1875, 5050 acres of land devoted to this purpose, the total number of vines being 5,155,988, of which 4,874,507 are in bearing. The produce of these vineyards for the year ended March 1875 was 648,186 gallons of wine, about 130 gallons per acre. That the wines of S.A. are, as a rule, of a high character, is proved by the fact that they have always been awarded prizes at the several Great

International Exhibitions. The extent of land under culture of vines in 1879 was 4117 acres, and the produce 459,468 gallons. Q. has not yet made much progress in vine culture. In 1879 there were 743 acres under vines, producing 104,674 gallons.

WISDOM, ROBERT (1830—) jurist, is a native of England, and arrived with his parents in N.S.W. in 1834. He was educated at Maitland and at the Sydney College. He studied for the Bar and was admitted in 1861. He entered Parliament in 1859 for the Western Goldfields, being the first member for that electorate, after the passing of the Act to give representatives to gold-diggers, having for this purpose resigned his office of Gold Commissioner (which he had held only for a few months) in response to a numerously signed requisition. Wisdom has been continuously a member of the Legislative Assembly except during one Parliament. He represented the Western Goldfields in two Parliaments, the Lower Hunter in two Parliaments, and also the Northern Goldfields. He was for a short time Crown Prosecutor, but in response to a requisition he resigned in 1874 for the purpose of contesting the election for Morpeth, which he twice represented, being at the latter election returned unopposed. He held the office of Chairman of Committees in the Assembly for nearly four years. In the formation of Cabinets the offer of portfolios as Attorney-General, Minister for Justice, Minister for Lands, Minister for Works, and Colonial Treasurer were made to Mr. Wisdom on six occasions, but he persistently refused acceptance, preferring independence and attention to the duties of his profession to the position of a Minister of the Crown. He was proposed for the Speakership of the House, but was defeated by one vote by Sir G. Wigram Allen. In 1878 he was appointed a member of the Council of Education. Wisdom joined the Parkes Ministry as Attorney-General in 1879.

WISE, EDWARD (1818—1865) jurist, was a native of the Isle of Wight and was educated at Rugby Grammar School. He studied for the Bar and was called in 1844. He travelled the Western Circuit for several years, during which time he edited the Law Reports of the Court of Queen's Bench and a work on the Law of Riots and on Bankruptcy. He came to Sydney in 1855; was appointed Solicitor-General in 1857, Attorney-General in 1859, and in February 1860 was made a Judge of the Supreme Court. His health giving way he went in September 1865 for change to Melbourne, but too late to benefit by it. Wise was an earnest promoter of the diffusion of literature amongst the working classes. He presented his valuable collection of books to the Sydney Free Public Library.

WOLLONGONG, a seaport town in N.S.W., on the coast of Illawarra, ranks in tonnage and number of shipping the third seaport of the colony. It is distant sixty-four miles S. of Sydney. The harbour has been greatly improved by the

construction of a breakwater and the excavation of the Belmore Basin out of hard rock to fourteen feet and under the coal staiths eighteen feet at low water, and the enlargement and deepening the old Basin. The area of both these basins which now form one is about three acres, giving a wharfage accommodation of 1700 feet. The Osborne-Wallsend and Mount Pleasant collieries, about three miles distant, are connected by railway with the port and ship their coals there. These collieries are situated 600 feet above sea level. A circular iron lighthouse is erected at the end of the breakwater. The town has a population of about 1500. It is well built and prettily situated at the base of Mount Keira (1450 feet high) one of the highest points of the Illawarra range, and its environs for beautiful scenery will compare with any part of the world. The district has deposits of kerosene shale worked by the Pioneer Company. Extensive seams of fire clay and iron ore abound. There are five seams of coal from five to seventeen feet thick which collectively are estimated to yield marketable coal at the rate of 52,000 tons per statute acre. The mines are principally worked by adits or tunnels. The population of the district is about 6500 souls. It has long been noted for its dairy farming and is one of the principal sources whence the metropolis and the greater part of the colony is supplied with butter. The town was proclaimed a municipality 22nd February 1859.

WOODS, REV. JULIAN E. TENISON (1832—) geologist, is a native of London, and studied at Newington Grammar School. He studied theology in France; was ordained a priest of the Roman Catholic Church in 1856. He came to A. in consequence of ill health, and was employed as travelling missionary from 1857 amongst his co-religionists and the then wild natives in the little known country between S.A. and V. Woods next became Vicar-General in Adelaide. He is the author of *Geological Observations in South Australia*; *History of the Discovery and Exploration of Australia*; *Geology of Portland*; *Not Quite so Old as the Hills*; *North Australia, and its Physical Geography*; *A Geography for Catholic Schools*; *A Grammar for Catholic Schools*; *Australian Essays*; *Australian Bibliography*; and has sent many papers to various learned societies on the geology, botany, conchology, and natural history of A., and especially of T. Woods has long been a contributor of scientific reviews to the journals of N.S.W. and V. He was editor of the *Southern Cross* and then of the *Chaplet*, religious serials of his own denomination. He furnished geological plans and sections to the Government engineers of S.A. for railways between V. and Adelaide. He is an Honorary Member of the Royal Societies of N.S.W., V., T., and the Adelaide Philosophical Society, Queensland Philosophical Society, and many others.

WOODS POINT, a mining township in V. on the Goulburn River, 120 miles N.E. of Melbourne.

The population numbers 550 persons. Much of the carriage of goods over the mountains between Melbourne and Woods Point is done by pack-horses, the tracks being almost impassable for wheeled vehicles. The whole district is very mountainous and taken up for mining operations, the quartz reefs being numerous and rich. Expensive machinery is employed in obtaining the precious metal. The auriferous area is estimated to be eighteen square miles in extent, and ninety-five distinct gold-bearing reefs have been proved in it.

WOOL-GROWING IN AUSTRALIA.—"The first introduction of the domestic sheep into A. naturally took place in N.S.W., the oldest of all the Australian Colonies. There is no mention of any British sheep having been brought out by the first fleet of vessels, but as they touched on their way at the Cape of Good Hope, and there took in live stock, it is highly probable that some of the hairy sheep of South Africa were landed at Botany Bay when the first settlement was formed. In an enumeration of the live stock, both private and public, at Port Jackson in 1788, the number of sheep is stated at twenty-nine head. The ship *Atlantic* which arrived in June 1792 brought twenty Indian sheep from Bengal, and at the end of that year there were only 105 sheep in the infant settlement, a fact which shows that the importations of sheep must have been very small. Sheep were then so highly valued that these hairy cross-bred animals were sold at £10 10s. per head. Captain Macarthur, whose fame as the first sheep-farmer of A. will ever be held in remembrance by Australian sheep-breeders, commenced stock-farming in 1793 with about thirty ewes of the Indian breed. These he crossed with Cape sheep, and thus effected considerable improvement in the size of the progeny. After this he used some woolly sheep which are said to have been imported from Ireland, and it was from noticing the great improvement in the stock from the woolly rams and the mixed Cape and Indian sheep that he was induced to turn his attention to breeding sheep for wool. At this time and for many years afterwards sheep were bred merely to supply the colonists with food, the production of wool was entirely neglected, and no one believed that wool would ever become an article of export. The stock increased very rapidly, and in 1796 the number of sheep in the colony was 1531 head. The price of ewes was quoted at from £6 to £8 per head, and mutton, when it could be obtained, cost 2s. per lb. In 1797 there occurred an event which will have an influence on the production of wool throughout the Australian Colonies for all time. This was the introduction of the pure Spanish merino into N.S.W., which occurred in the following manner: Captains Kent and Waterhouse were despatched to the Cape of Good Hope for supplies, and Macarthur being anxious to secure wool-bearing sheep asked those gentlemen to bring back any woolly sheep they

could obtain. On their arrival at the Cape they were offered a small flock of pure Spanish merinos which had been bred by Colonel Gordon, then lately deceased. Acting on the request of Macarthur they purchased the lot at what was considered a very high price, and brought them on to Port Jackson. A good many of these sheep died at the Cape and on the voyage, so that at the distribution of what remained only three rams and five ewes fell to Macarthur's share. Macarthur had the foresight to appreciate the immense benefit the breed of merino sheep would prove to A., where the conditions of life are so well suited to rearing this breed of sheep in perfection. Kent and Waterhouse also bred pure merino flocks. We have no knowledge what became of the former gentleman's flock, but it is known that Waterhouse held his sheep till 1800, when he sold them on leaving the colony to Cox, grandfather of the gentleman of that name at Mudjee. His little flock at the time of the sale only numbered about 100 in all. Macarthur kept a strict record of the history of his flock. They were bred separately from all other sheep till the year 1804, when a few pure Spanish merinos purchased by Macarthur at the first sale of sheep from George III.'s pure merino flock were joined to them, and from that time to the present day the celebrated Camden flock has remained without the intermixture of any foreign blood, and it is to this flock that the high quality of many of the leading stud flocks of V. is mainly due. The effect of the Australian climate on the Spanish merino sheep appears to have been strongly exhibited from the first, and the few early settlers who took any interest in such matters noticed with surprise that the pure merino sheep which were born in the colony produced wool that differed greatly from that of their parents. It was softer, brighter, and longer in the staple, and already exhibited something of that beauty which has since rendered the merino wool of A. famous all over the world. In spite, however, of the actual proof that merino wool could be grown in the colony, no one or rather only one person believed it would ever become an article of export. The colonists preferred the sheep of the mixed Indian and Cape breeds to any other, and Macarthur, when in England from 1802 till 1805, had the greatest difficulty in inducing the British Government to believe that merino wool equal to the very best that could be obtained from Spain could be readily grown in N.S.W., even though he produced samples of such wool shorn from his own sheep, bred in the colony, in support of his statement. During his examination before a select committee of the House of Commons, he incidentally mentioned that his heaviest fleeces of merino wool weighed three and a-half lbs. in the grease, which was valued by experts in London at 4s. per lb. At this time Macarthur was waited on by an eminent manufacturer in the woollen trade, who produced a sample of his wool, and asked him if it was

really grown in the colony. On being assured that such was the case, he urged Macarthur to persevere, and in order to encourage him he explained that when such wool as that sample could be sent to England in quantity there would be a great revolution in the woollen trade. He stated that from such fine combing wool there would arise a new class of fabrics of the most delicate texture. This prediction was fully realised about twenty years afterwards. Macarthur eventually succeeded in arousing the attention of the British Government to the fact that fine merino wool could be grown in large quantities in A., but it was many years before the colonists could be induced to abandon the worthless sheep of the mixed Cape and Indian breeds. The first notice we get of an export of wool from A. is in 1807, when the English Custom-house returns show that during that year 245 lbs. of wool were imported from N.S.W. From this small beginning the export of wool gradually increased till 1822, when it had reached to 172,880 lbs. At last the colonists became aware of the value of the merino sheep. Macarthur's wool had been sold at auction for 7s. 6d. per lb., and on one occasion it reached as high as 10s. per lb. The mongrel sheep hitherto bred were abandoned for the merino, and A. wool began to take that position in the estimation of the wool manufacturers of England that had been predicted of it so many years before. In this year (1822) two large gold medals were voted to Macarthur by the Society of Arts for importing into Great Britain wool, the produce of his flocks, equal to the finest Saxony. These medals were presented to Macarthur by the Duke of Sussex at a large meeting held in London. In order to still further encourage the production of a commodity which promised to be a source of wealth to the whole empire, the Parliament enacted that no higher duty than a penny per pound should be charged on wool imported into England from N.S.W. Of the quality of the merino wool grown in N.S.W. at this early period, the following instance will give some idea:—In 1828 T. Ebsworth, a woolbroker, in giving evidence before a committee of the House of Lords on the state of the British wool trade, stated that Macarthur's wool had improved to such a degree that a portion of it had made the finest cloths that had ever been seen in England. But N.S.W. was not the only portion of A. that was now supplying wool to the English consumer. Adventurous pioneers had crossed the sea, and established themselves in the Island of V.D.L., whither they had been attracted by the beauty of the country and the perfect climate. In 1804 a permanent settlement was made on the River Derwent, and with other stock sheep were brought from the mainland. These sheep consisted of the mongrel race already described as the result of a cross between the Cape and Indian breeds. Colonel Paterson, observing how well these sheep thrived and how rapidly they increased, conceived the idea of

establishing a better breed in the island. He imported some woolly sheep from Sydney, supposed to be of the Teeswater breed, which are said to have thriven remarkably well. Wool however was looked on by the colonists as of not the slightest value. It was cut off the sheep merely to relieve them of an encumbrance, and remained where it was shorn for years, till in some instances hillocks of wool were formed. Afterwards this wool was collected and sent to England, but it was in such a filthy and decayed condition that it did not repay the cost of transit. The crossed Cape and Indian sheep appear to have been to some extent kept separate from the woolly sheep. They were for many years known under the name of "native" sheep. As the value of Australian wool became more generally recognised, these "native" sheep were abandoned for the more profitable woolly breeds, among which the merino held the first place in the estimation of the farmers. According to the general muster-books taken in November 1819 there were 172,079 sheep in T., of which 116,074 were ewes. Governor Sorell at this time became strongly impressed with the necessity of improving the character of the wool produced in the colony, and he communicated with Macarthur as to the best means of effecting his object. After some correspondence, an arrangement was entered into by which Macarthur undertook to deliver at Sydney 300 lambs of the improved merino breed, for which he was to receive in exchange a certain quantity of land in N.S.W. The sheep were put on board ship, but owing to long delay in port and to their being overcrowded, a large proportion of them died on the passage and soon after arriving at Hobart Town. The sheep thus obtained were distributed among the settlers in June 1820, the number then alive being only 181. They were estimated at the value of seven guineas per head, and security was taken for repayment at that rate to extend over several years. The quantity of wool exported from T. to England up till 1827 cannot be definitely stated, as in the Custom-house returns all the wool received from the Australian Colonies was credited to N.S.W. In the year named we have the first notice of Tasmanian wool being imported into England. The quantity is stated at 192,075 lbs. In 1829 the export had increased to 925,320 lbs., while the export from Sydney in the same year was only 913,322 lbs. By this time T. had attracted the attention of Englishmen as a suitable country for colonisation. Many well-to-do farmers had arrived in the country bringing with them the finest domestic animals to be procured in Great Britain, and what was of quite as much importance to the country they possessed a knowledge of husbandry of which the older colonists appear to have been lamentably deficient. The greater number of these colonists brought with them small shipments of the finest British and German merinos, the latter predominating. Among the earliest founders of pure merino flocks may be mentioned Gilles,

Horne, Willis, Archer, Wedge, Anstey, Bethune, Leake and Cox, all of whom imported pure merino sheep, mostly of the German type. The V.D.L. Company made very large importations of the best German merinos. This company was founded in 1825, the principal object being to relieve England from dependence on foreign countries for fine wool. By the year 1830 the company had expended £30,000 in the purchase of high-class sheep for the purpose of stocking their vast estate on the north-west corner of the island. The introduction of such a large number of German merinos into T. gave to the wool of T. a very pronounced character which it still retains. In 1830 the clip of the V.D.L. Company realised an average price of 1s. 7½d. per lb. for brook-washed wool. The fleeces of the company's merino sheep, though beautifully fine, were very small as compared with the fleeces of merino sheep of to-day. In the year named they only realised 3s. 5d. per fleece. Soon after this date it began to be rumoured in T. that there was a boundless extent of magnificent pasture-land on the other side of Bass Straits, and as the best land in the island had been secured and grants of land to colonists were abandoned, the thoughts of adventurous pioneers were turned to that unknown land now the colony of V. The first to establish a sheep-farm on Victorian soil was Thomas Henty. This gentleman was a farmer at West Tarring in Sussex, where he bred a flock of merinoes of such acknowledged merit that he was paid the exceptional compliment of being barred from competition at agricultural shows. In 1829 he sent three of his sons with a portion of his merino flock to W.A., but as the sheep did not thrive there they re-shipped them for T., where they were joined by Henty in 1832 with another draught of his celebrated flock. Being disappointed in obtaining a grant of land he resolved to seek a home on the mainland, and in November 1834 he landed at Portland Bay and established the first sheep-farm on Victorian soil. One of the earliest flocks brought to V. from T. was a very celebrated lot of sheep imported by John Aitken, which were long celebrated as the best merino sheep in the colony, and the descendants of which are even now among the finest in the land. On one occasion he paid as much as £250 for a ram bred by Prince Sichnowski in Prussian Silesia, which was imported by J. P. Rowe, of Mount Battery, who had searched Europe to obtain the finest specimens of the merino breed of sheep. Another famous flock in the early days of the colony was that of Forlonge, the originals of which were purchased from the Elector of Saxony, whose flock had the reputation of being the finest in the world. They were brought to T. in 1829, and remained there for some years, when they were imported into V., and with them was founded the celebrated Ercildoune stud flock. During the years from 1836 to 1839 many respectable emigrants arrived from England, bringing with them capital and experience in stock

breeding. They first visited T., but not finding the opening they expected the majority of them settled in V. They brought with them drafts of merinos from the finest flocks in T., and mostly settled in the Western district. The sheep they brought with them in some instances cost as high as £2 per head, and it is to the introduction of such highly-bred animals that we may attribute the fame that the wool from this part of the country has always enjoyed. It has been described by those engaged in the trade at the time as being a well-grown, healthy, fine-haired clothing wool. The average weight was about 2 lbs. of cold-water-washed wool to the fleece. The wool produced in V. was at first sent to Hobart Town and Launceston for sale, but as the produce increased ships were laid on for London direct. The first direct export took place in 1837, when 154,200 lbs. of wool was exported from V. In 1840 the export had increased to 831,000 lbs., and in the next ten years it had risen to 15,962,700 lbs. The climate had a considerable effect on the fine-haired clothing wool of the sheep from T. It became stronger, deeper stapled, and more robust in character. The sheep in V. increased so rapidly after its settlement that there was soon no outlet for the surplus stock, and the price of sheep rapidly declined from the high rates ruling when stock was wanted to take up land, till they were worth but little more than 1s. per head. The boiling-down of sheep for their tallow altered the state of affairs by establishing a minimum price for stock, and averted the ruin with which the whole country was threatened. By this time the Victorian wool had taken the first rank in the European markets, not for its fineness, for it was inferior in this respect to the Tasmanian wool and to that from the Mudgee district of N.S.W., but for its brightness, elasticity, length of staple, and soundness—qualities in which it was superior, not only to the wool of the other Australian Colonies, but to that of any part of the world. The sheep breeders in the Western district had ceased importing rams from other colonies, and they dignified their sheep with the name of the "Australian merino," as if they were of a distinct race, and the introduction of any European merino, no matter how aristocratic might be its pedigree or how beautifully fine its fleece, was looked upon as a degradation. It must be admitted that these enthusiastic sheep-breeders had good reason to be proud of their sheep. There was something extremely attractive in the wool from these old flocks in the Western district; it was so bright and healthy, so soft, and of such fine staple, that all other wools seemed poor in comparison. It was the natural product of merino sheep reared in a climate perfectly suited to them, and in a pasture without stint, for the crime of over-stocking the runs was then unknown in the land. The steady progress that was being made by the sheep-farmers of V. received a check on the discovery of gold in A. The sudden rush of thousands of people to the gold-fields, leaving

no labour to work the sheep-farms, was productive of the most disastrous consequences to the wool production of the colony. New sheep-farmers appeared who had no reverence for the "Australian merino," and to the horror of the old settlers they introduced German merinos with the view of giving greater density to the wool. In some instances the English breeds of sheep were used, and tempted by the success of the first cross, some sheepowners kept up the breed to the utter ruin of the character of their flocks. The best sheep-farmers however declined to have anything to do with either the English or the German rams, and their judgment has met with its reward, for their stud flocks are now among the most celebrated in A. Gradually the sheep-runs became converted into freeholds, and as they were fenced in and subdivided a change took place in the management of the flocks. Tempted by the prospect of large profits, many landholders overstocked their land, to the great detriment of the character of the wool. The fencing and subdivision of the runs however led to greater improvement in some of the leading flocks than had been attained previously. The possession of numerous paddocks enabled the sheepowners to pay more attention to selection than had been possible when the country was unenclosed, and the sheep were shepherded. The improvements made by some of the leading stud flock owners became so marked that sheep farmers from all the Australian Colonies, except Tasmania, sought to improve their sheep by the use of Victorian rams. The last change that was made in the breeding of merino sheep in V. was the large infusion of merino rams from the leading stud flocks in T. The breeders of merino sheep in T. had been gradually lengthening the staple of their wool, and at the same time retaining its fineness and density. Several leading stud flock owners had used Tasmanian rams with exceedingly good effect, and at last they became so much the fashion that the celebrated ram Sir Thomas, bred by James Gibson, of Bellevue, T., was sold by auction in Melbourne, in 1874, for the sum of £714, the purchasers being Wm. Cumming of Mount Fyans, and T. F. Cumming of Stony Point. The success of this grand ram at the stud has fully justified the large outlay in his purchase. Many owners of celebrated stud flocks in the Western district have followed the example of the Messrs. Cumming, to the great improvement of their sheep. At the principal shows in V. nearly all the leading prizes are taken by sheep having a large infusion of Tasmanian blood. A few sheep-breeders, however, still cling to the old "Australian merino," and decline to follow the fashion and use Tasmanian rams in their flocks. It is only fair to say that in the sale-yards their sheep hold their own against all comers, as witness the averages realised by the rams bred by J. L. Currie, of Larra, at our annual ram sales. Though British sheep were imported into A. at a very early period in the history of the colonies, they were not much fancied by Australian

sheep farmers. In T. flocks of Leicester sheep were kept, and in a very few instances these sheep were bred in V. In time it was found that the rich soil, damp climate, and luxuriant herbage of the country bordering on the S.W. coast were unsuited to the merino, and about 1870 the sheep farmers in that locality began to turn their thoughts towards the long wool breeds of sheep, as being more suitable to their country. The Messrs. Austin led the way by importing high-class Lincoln sheep. The fancy for these fine animals soon became very pronounced, and in 1873 over 900 Lincoln sheep were imported from England, at a cost of about £36,000. The export of long wool from V. must now be very large, but it is difficult to arrive at an approximate estimate of the quantity. Victorian long-wool rams have been sent to all the Australian Colonies, and are used even in Riverina, where they succeed, notwithstanding the heat of the climate. The pioneers in the great stretch of country to the N. of V., known as Riverina, experienced great difficulties in acclimatising the merino sheep. These difficulties were at first so great that many settlers abandoned sheep-breeding, and stocked their runs with cattle. A few resolute, patient men, struggled on in spite of constant failure. The appearance of Riverine wool, when sheep were first bred in that country, was most disheartening. It was coarse in fibre, fuzzy, impregnated with earthy particles which absorbed the yolk and rendered the wool tender, and it was entirely wanting in lustre. The only advantage the sheep possessed was that they were grandly developed, and always commanded a good price in the market. The wool at first realised about 10d. per lb. washed in cold water, and its condition was as bad as its quality. Gradually however by the use of first-class Victorian rams, and judicious selection on the part of the flock-owners, the Riverine sheep improved to such a degree that a few years ago one flockowner exhibited Riverine ewes at Skipton against the best merinos in Victoria, and took an honourable position in the prize-list. At the present time the wool of Riverina can hardly be recognised by those who knew what it was when sheep-breeding was first attempted there. It is remarkably long in staple, well-grown, and an eminently useful wool; more robust in character and less lustrous than the Victorian wools. Within thirty years they have added more than double the weight to the fleece, and more than doubled the price per pound. The success that has attended the efforts of the Riverine sheep-breeders has stimulated the pioneers in the far north in the endeavour to acclimatise the sheep in the northern districts of Q. Already the sheep-farmers have invaded the tropics, and so well have they succeeded that the line of sheep-walks now stretches from Bass Straits to the head waters of the rivers that fall into the Gulf of Carpentaria, a distance of over 1200 miles. From an experience of over three years, we may fairly anticipate that the great

extent of elevated downs in this part of A. will at no distant date produce immense quantities of excellent wool. The most important exhibitions of wool held in A. were given by two firms of wool-brokers in Melbourne, the first by R. Goldsbrough and Co. in 1878; the second by Hastings Cuninghame and Co. in 1879. At the former show the conditions under which the wool was exhibited did not seem to be thoroughly understood, and consequently many flockmasters sent in wool for quality alone. The prizes were for the greatest value per fleece, and to the intense astonishment of all sheep-breeders S.A. stood first in the list. W. E. Pitts, of The Levels, exhibited fifty fleeces in the grease unskirted, valued at £29 0s. 8½d., being an average of 11s. 7½d. per fleece. Riverina was placed second, the exhibit of Lachlan McBean, of Woorooma, being valued at £28 11s. 6d., equal to 10s. 5½d. per fleece. J. L. Currie, Larra, V., was third, his exhibit being valued at £26 18s. 7½d., equal to 10s. 2½d. per fleece. At H. Cuninghame and Co.'s show the conditions were better understood. Prizes were given for the highest value per lb. as well as the highest value per fleece. W. Gibson and Son, of Scone, T., took first place for the most valuable fifty fleeces of washed wool unskirted. It was valued at 2s. 7d. per lb. and gave an average value per fleece of 13s.; when sold at auction it realised 2s. 9d. per lb. Philip Russell, of Carnham, V., took the prize for fifty fleeces in the grease at the highest value per lb. His exhibit was valued at 3s. 9d. per lb. and realised 4s. 1d. at auction. Thos. F. Cumming, of Stony Point, V., was placed first for the most valuable fifty fleeces in the grease unskirted. They averaged a little over 8 lbs. 14 ozs., which was valued at 1s. 4½d. per lb., averaging 12s. 2½d. per fleece. W. Gibson and Son won the prize for the most valuable wool per lb. in the grease. It was estimated by the judges at 1s. 7½d. per lb. and sold at 1s. 6½d. at auction. Rutledge Bros., of Farnham-park, V., were placed first for the most valuable fifty fleeces of long wool. This wool was valued at 7½d. and weighed 15 lbs. per fleece. The price of long wool was at the time exceptionally low. The wool trade of V. has advanced to the first place in A. The position of Melbourne as a central point offers many advantages that have not been lost sight of by her enterprising business men. European firms are always represented at our wool sales, and the tendency to purchase wool in Melbourne is becoming more pronounced every year, and of late American buyers have been among our best customers. Now that large steamers are running to England *via* the Mediterranean, it is expected that a considerable trade will spring up with the ports in the south of Europe. The warehouses erected in Melbourne for carrying on this great trade are not surpassed, if indeed they are equalled, in any part of the world. Foremost among these grand edifices stands the wool warehouses of R. Goldsbrough and Co., possessing

a storage area of nearly five acres, and capable of storing from 40,000 to 50,000 bales of wool, and giving efficient access to the bales for inspection. This substantial pile of buildings, constructed of the everlasting bluestone, is one of the sights of Melbourne. In the season of 1879 there were 78,000 bales of wool passed through these stores, of which the firm sold 63,000 bales, and forwarded the remainder to London and America for sale. These warehouses have cost the proprietors about £110,000, and have been fitted with every invention for carrying on the business with convenience and despatch. The other wool warehouses in Melbourne are those of H. Cuninghame and Co., J. H. Clough and Co., and Monckton D. Synnot Bros., all of which are admirably constructed. The sales of wool effected in 1879 in these warehouses amounted to 125,000 bales, representing a value of about £2,500,000. The annual wool sales in Geelong also show an improvement during the past few years. Last year 34,573 bales were catalogued, of which 26,563 bales were sold. This vast business, like the production of wool in V., has been developed without the slightest encouragement on the part of the Government of the country. In fact, the restrictions imposed on the industry would almost lead to the conclusion that the various Governments had been averse to Melbourne becoming the central wool mart of the Australian Colonies. In 1879 the Australian Colonies exported 313,274,336 lbs. of wool, which was valued at £15,901,789. This return includes N.Z., which contributed 62,220,810 lbs. of wool, valued at £3,126,439—a good return from a country that only commenced exporting wool in 1848. The export from V. was 47,973,091 lbs., valued at £2,653,528. It is not only by increasing the number of sheep that Australian sheep farmers have increased their export of wool. The weight of the fleeces has been nearly doubled by improvements effected in the breed of sheep by the use of high-class rams. In 1860 the average production of wool per sheep in A. was 2·94 lbs. greasy and 1·70 lbs. washed. In 1870 the yield per head had increased to 3·52 lbs. per head greasy and 2·05 lbs. per head washed. In 1877 the yield was 4·29 lbs. per head greasy, and 2·36 lbs. washed. So that in less than twenty years the average yield of wool per sheep throughout A. was nearly doubled, and in connection with this increase in the yield it must be taken into consideration that the fleeces, both washed and greasy, were sent to market in a much better condition in 1877 than in 1860. With the enormously-increasing production of wool that is going on in many parts of the world it is feared that the time will soon arrive when the markets of the world will be overstocked; but this fear appears to us a groundless one. Side by side with the increased production of wool there is not only an increase in the consumption but an increase in the channels for its distribution. The consumption of wool in the United Kingdom in 1860 was 8·6 lbs. per head of the population. In

1870 it had increased to 10·1 lbs. per head, and in 1877 it had risen to 11·1 lbs. per head. On the continent of Europe the consumption of wool has been steadily increasing, and countries that till a dozen years ago hardly used this material, are now becoming customers for woollen materials for clothing. We may rest satisfied, therefore, that there is no danger of the production of wool overtaking for any length of time the demand; while on the other hand we may fairly look forward to the time when the beautiful wools of A. will be manufactured into equally beautiful cloths, that will carry the fame of the great island continent to every part of the world. The Spaniards have a proverb to the following effect:—‘Sheep have golden feet, and wherever the print of their footstep appears the land is turned to gold.’ If this proverb was applicable to old Spain it is a thousand times more applicable to young Australia, than which no country has gained more by the cultivation of the sheep. Australia needs no other blazon than the Golden Fleece to which she is more justly entitled than any other land.”

[The foregoing article is extracted from the Exhibition Supplement (1881) of the *Argus*, to which paper it was contributed by George Brown.]

WOOLLEY, REV. JOHN (1816—1866), was a native of Hampshire in England, and entered the London University in 1830. In 1832 he went to Oxford, where he gained an open scholarship at Exeter College. Whilst there he wrote a work on logic which was for some years very generally used, and was referred to by Sir William Hamilton in one of his works. At Oxford a warm friendship arose between him and Dean Stanley, who was a contemporary Fellow of University College. Amongst his pupils at Oxford was Rawlinson, afterwards Camden Professor of Ancient History, a man some years older than himself. In 1842 he was appointed head-master of King Edward the Sixth's Grammar School at Hereford. In 1844 he was elected head-master of the Northern Church of England School at Rossall, in Lancashire, corresponding to Marlborough for the South. Whilst at Rossall (in 1846) he applied for the headship of the University at Corfu, and obtained the appointment. The Greek priests, however, petitioned against the appointment of an English clergyman, and he therefore resigned it, Sir George Bowen (who stood next on the list) succeeding him. In 1849 he succeeded to the head-mastership of Norwich Grammar School, and in January 1852 having been appointed Principal of the Sydney University, he arrived in N.S.W. colony in June 1852. He delivered an inaugural oration at the opening of the University in October 1852, in the hall of the new Sydney Grammar School; and from that time till his leaving the colony in 1865 on a visit to England, he discharged the duties of Professor of Classics and Logic in the University. In 1866 Dr. Woolley was elected President of the Sydney Mechanics' School of Arts. In 1862 he published a volume entitled *Lectures delivered*

in Australia. He was one of the original trustees of the Sydney Grammar-school, in the organisation of which he spent much time and labour. He was the first propounder of a scheme for connecting the primary schools of the colony with the University, to which practical effect has since been given in the establishment of the public examinations. He was lost in the steamship *London*, which foundered in the Bay of Biscay in January 1866. His untimely death was greatly lamented, and a public testimonial of £2000 was raised as a tribute of admiration for his services in the cause of education, and presented to his widow. Portraits of Dr. Woolley are in the University of Sydney and the Mechanics' School of Arts.

WOOLLS, REV. WILLIAM (1814—) botanist, is a native of Hampshire, in England, and was educated at the Grammar School of Bishop's Waltham and at Winchester College. At an early age, or about a year before he left England (in 1831,) he had published a poem on his native city; a second juvenile effort, entitled *The Country*, and a small volume of miscellaneous pieces in prose and verse; whilst on the passage to the colony he composed a poem on *The Voyage to New South Wales*. Having a taste for literary pursuits, he was led to accept from the Rev. Robert Forrest, first head-master of the King's School at Parramatta, the offer of an appointment in that institution in 1832. Whilst Dr. Woolls was at King's School he published a poem on *Australia*, dedicated to Sir Edward Parry, and a volume of *Miscellanies*, dedicated to his brother-in-law, the Rev. Peter Hall. On leaving King's School Dr. Woolls was engaged for some time in private tuition, which had been provided for him by the Rev. R. Forrest, and in writing for the Sydney Press; but at the request of W. T. Cape, head-master of the old Sydney College, he was induced to accept the situation of classical master in that institution. Whilst in that capacity Dr. Woolls wrote occasional papers for the *Colonist*, the *Temperance Magazine*, and other periodicals. Owing to some misunderstanding with the Committee of the College, he resigned the situation of classical master, and on leaving the institution received from the boys a handsome recognition of his services. From that period until 1865 he had a scholastic establishment of his own, which he carried on in Parramatta, with the exception of two short removals to Blacktown and the Glebe; he also at that time contributed occasional papers to the *Atlas* and the *Christian Standard*, the latter of which was then conducted by the Rev. W. Boyce. His claims to public notice and sympathy rest principally on his botanical works, by which he has laboured to develop the vegetable resources of the colony, and to make them known in Continental Europe. Having become acquainted with the Rev. James Walker, formerly Head Master of King's School, an eminent naturalist as well as a classical scholar, and subsequently with Baron F. von Müller, Dr. Woolls followed up their assistance and

co-operation so successfully that he published from time to time many elaborate papers on the botany of A. His work entitled *A Contribution to the Flora of Australia* is well known in the scientific world. As President of the Cumberland Mutual Improvement Society, he delivered in Parramatta numerous addresses on varied subjects, and several before the Horticultural Society. A paper on *Introduced Plants* was communicated to the Linnean Society by the President, and received a flattering acknowledgment. Dr. Woolls was elected Fellow of the Linnean Society, and through his brother-in-law, who transmitted his work *Species Plantarum Paramattensium* and other publications to Göttingen, that celebrated University conferred on him the honorary degrees of Doctor of Philosophy and Master of the Liberal Arts, and printed the former work for distribution amongst European botanists. On the especial recommendation of the Rev. Samuel Marsden, Dr. Woolls was offered ordination in the Church of England by Dr. Wilson, Bishop of Calcutta, and subsequently by the first Bishop of A., but for a long period preferred scholastic duties. His *Life and Character of the Rev. Samuel Marsden* was written for the purpose of raising funds towards the building of All Saints Church, Parramatta, of which he became one of the first trustees in conjunction with H. H. Macarthur, J. B. Bettington, and Dr. Anderson. He wrote a poem on the subject of the incorporation of the foundation of the Sydney University, at the time a bill was introduced for that purpose by the late W. C. Wentworth. In 1873 Woolls was induced to take holy orders in the Church of England and was ordained by Dr. Barker, Bishop of Sydney, being appointed to the incumbency of Richmond, and subsequently on the resignation of the Rev. C. F. Garnsey to the rural deanery of the same district, since when he has applied himself to parochial duties. In his leisure hours he has continued to devote himself to literary and scientific pursuits, and has published a number of sermons, lectures, and addresses on various local, scientific, and philological subjects, including a lecture on *The Wonders of Australian Vegetation*, and another on *The Variations of Species considered in reference to the Variations of Language*. The volumes of the *Flora Australiensis* and Baron Müller's *Fragmenta Phytographiæ Australiæ* show that Dr. Woolls has furnished many specimens of Australian plants for description to Mr. Bentham and Baron Müller, and has further contributed by his knowledge to the elucidation of many points in connection with Australian vegetation.

Y.

YAN YEAN is situated 19 miles N.E. of Melbourne, at the base of the Plenty Ranges. It is the locale of the reservoir supplied by the Plenty

River, whence Melbourne derives its supply of water. The reservoir is formed by closing up the south side of the valley with an embankment 3159 feet in length, 31 feet in height, and varying in width from 170 feet at bottom to 20 feet at the top. The water thus dammed up assumes the proportion of a lake 1330 acres in area, 9 miles in circumference, $2\frac{1}{2}$ miles in diameter, and 25 feet in depth at the deepest part, with a capacity of 6,400,000,000 gallons of water. The water is conveyed to Melbourne by an open aqueduct about 7 miles long, and thence by a double service of immense pipes, safety-valves being constructed at suitable points to limit the enormous pressure. The original design contemplated a supply of 40 gallons per head per day to a population of 70,000, but since that, after mature deliberation, it was decided that the supply should be carried out on the scale of 30 gallons per head per day for 200,000 persons, or 6,000,000 gallons in 24 hours. G. Gordon characterises the Yan Yean Reservoir as the most favourable for storage of any he had seen in A. or England, containing when full a reserve of 1060 days, or nearly three years' supply. The average summer rate is about 640 days' supply. Owing to the large demand for water in summer, other mains have lately been laid down, and the city is being additionally reticulated. The total cost of the works, including maintenance, was about £1,500,000.

YARRA YARRA, a river of V. flowing into Hobson's Bay. The city of Melbourne situated five miles from its mouth is built along its banks. This river, the largest that flows into the harbour of Port Phillip is not navigable for boats far above Melbourne on account of the numerous falls. It rises near Mount Bawbaw in the district of Western Port.

YASS, an important and still growing town on the main southern road, on the banks of the River Yass, 187 miles S.W. of Sydney, with which it is connected by the Great Southern Railway. The town consists of one main street, intersected by numerous other streets which cross it at right angles, all of them the sites of respectable business and private buildings. North Yass, which forms part of the town, and divided only by a handsome iron lattice bridge of 285 feet span crossing the Yass River, is well populated and the site of numerous private residences as well as a few business places. O'Connelltown is also included within the boundaries of Yass. Both the public edifices and the places of business are substantial erections, and are tangible evidences of its growing prosperity. The population numbered in 1871 1600 persons, the district 6600. A large and handsome public school with pretty cottage residence for teachers, built at a cost of over £5000, was opened in January 1879. A court-house with necessary offices erected at a cost of over £12,000 is the most handsome edifice of the kind out of Sydney. Very fine and commodious buildings for quarters

for inspector of police and for the force were built in 1879 at a cost of £5000. The gaol buildings were also considerably enlarged in 1879. The money has been voted for by Parliament for the erection of a new post and telegraph office. One member is returned to the Assembly. There are about 2000 electors on the roll for 1880-81.

YASS PLAINS, in N.S.W., were discovered in 1828 by Hovell and Hume. They take their name from the little river that flows along their N. and N.W. boundaries, and are surrounded on every side by forests. They are from nine to twelve miles in length, and from five to seven in breadth. To the W.N.W. of Yass Plains there is a remarkable hill called Pouni. Yass Plains lie 170 miles to the S.W. of Sydney.

YORK MOUNTAIN, in N.S.W., seventy-two miles from Sydney, on the Bathurst-road; it is 3292 feet above the level of the sea, and was named in honour of the Duke of York.

YORK PENINSULA is situated at the north-easternmost extremity of the continent, between the ocean and the Gulf of Carpentaria, and is separated from New Guinea by Torres Straits, which is, at Cape York, the northern extremity of the island, 80 miles wide.

YORK SOUND is situated on the N.W. coast of the continent; it is a very spacious bay, receiving the waters of two rivers; it is bounded by precipitous rocks, from 100 to 200 feet in height.

YORKE RIVER, N.S.W., is a branch of the Turrabeile, and was named by Oxley after Sir J. Yorke.

YORKE'S PENINSULA, in S.A., is a tract of land lying between the Gulf of St. Vincent on the E. and Spencer's Gulf on the W., and running out in a S. direction in the shape of a boot. It comprises a vast extent of pastoral country, most of which is taken up as sheep runs. The entire country is almost destitute of surface water, there being no running streams worthy the name, but numerous wells have been sunk by the stock-owners, and water is obtained in the swamps, which abound during and for a time after wet seasons. The country generally comprises dry, scrubby, undulating sandy rises, and salt lagoons and swamps, with samphire, mesembryanthemum, tea-tree, and patches of rank swamp vegetation; also thinly-grassed plains, lightly timbered with oak, cherry, tea-tree, dwarf mallee, peppermint, spinifex, and black grass. Parts of this district, along the coast especially, are almost unavailable for stock, on account of the malarious exhalations which rise from the mangrove swamps, and which cause a dangerous malady known as the coast disease. The entire area of the country may be described as a scrubby flat, interspersed with open plains, covered with scanty herbage. Underneath is a crust of limestone extending over its entire area, and not a rock nor hill, not a gully nor watercourse, is to be seen for miles. By far the most important industry

connected with this part of the colony is the copper mining, which is carried on to a very large extent in its N. part at the Wallaroo, Moonta and Kadina mines. Copper was first discovered at the head of the peninsula upon a sheep run belonging to Captain Hughes in 1860 by a shepherd, who found amongst the earth and stones thrown up by a wallaby in the operation of scratching a hole in the ground a small green stone about the size of a pea, which proved to be carbonate of copper. A shaft was sunk upon the spot, and at the depth of a few feet a magnificent lode of copper was found, the workings giving rise to the celebrated Wallaroo mines, and the shaft first sunk being known as the Wombat shaft. Ore was also found near the Tipara Springs, about ten miles S. of the Wombat, and secured by Hughes, the workings being now the great Moonta mine. The ores at Wallaroo and Moonta are chiefly sulphurets, those at the latter being exceedingly rich. Railways have been erected in this part of the country from the various mines to Port Wallaroo, and smelting furnaces are erected at that place, where the ores from all the mines are smelted. The other mines on the peninsula are the Yelta, Karkarilla, Mutta, New Cornwall, and Kurilla, all in the N., although it is highly probable that copper ore exists in most parts.

YOUNG, a township in N.S.W., on the N. side of the Burrangong or Main creek, 245 miles S.W. of Sydney, with which the communication is by coach to Yass, thence rail. Gold was accidentally discovered in June 1860, and the goldfields in the immediate neighbourhood, known as the Burrangong goldfields, principally alluvial, have from time to time attracted large numbers of miners; but the promise of the early discoveries has hardly been maintained, though for many years to come the mines might be profitably worked. It has however many other resources in mineral wealth that have yet to be developed. 18,323 acres of land are under cultivation, the produce for 1879 being 230,470 bushels of wheat, 24,076 of maize, 2655 of barley, and 20,437 of oats; potatoes, 238 tons; wine, 2600 gallons, besides green crops, &c. Stock returns for 1879 were 4299 horses, 17,431 cattle, 424,845 sheep, 2637 pigs. The land in the district is fast being taken up for farming purposes, for which it is eminently suited, and surrounding Young are permanent homesteads, settled populations, and cultivated soil. The number of inhabitants in the town according to the last census was 792, with 5924 in the district; the numbers are now stated at 1500 and 8500 respectively. During the last few years the town has made considerable strides, and both it and the district are fast rising in importance. Many new buildings are going up, and brick structures on all sides are fast superseding the wooden edifices of the early time. The town is approached by three different coaches, which await the arrival of the mail train, and reach Young each morning at about nine o'clock. The local Pastoral and

Agricultural Association holds one, and sometimes two shows in the year, at which valuable prizes are largely competed for.

YOUNG, SIR HENRY EDWARD FOX (1810-1870,) was third son of the late Colonel A. W. Young, and was for some time Governor of Prince Edward Island. He held the post of Lieutenant-Governor of the Eastern Province, Cape of Good Hope, from which he was transferred in 1848 to the Governorship of S.A., where he assumed office on 2nd August of that year; held the reins of government of the colony until 20th December 1854; and was then appointed successor to Sir William Denison as Governor of T. in January 1855. Sir Henry Young remained in T. until 10th December 1861, when he retired.

YOUNG, SIR JOHN (1807—) was for many years a member of the British Parliament, formerly Secretary for Ireland, and afterwards Lord High Commissioner of the Ionian Isles, was appointed Captain-General and Governor-in-Chief of N.S.W. on 18th January 1861. He landed in the colony on 22nd March following, but as the patent for his permanent title had not arrived, he assumed the office of Administrator, and was not installed as Governor-in-Chief till the 16th May. The occasion was thought by the Imperial Government to present a favourable opportunity for cancelling the distinction primarily possessed by Governors of N.S.W. as Governor-General. There was no very good reason for retaining a title which had lost its significance, but resolutions were submitted by Cowper in the Legislative Assembly, protesting against the alteration after it was made. Sir John Young had not been long in office before what are known as the Lambing Flat riots occurred. They originated in attempts by European diggers on the Burrangong goldfields to expel the Chinese who were there in large numbers, and they proved so perplexing and formidable, that it was thought wise to send troops to the assistance of the constabulary. Those troops that were in the southern districts were the first that were ordered to the scene of disturbance, and they proving insufficient to cope with the difficulty, a party of the Royal Artillery, with field pieces and 123 men of the 12th Regiment, together with the mounted police, were dispatched to Lambing Flat. All attempts to quell the rioting by peaceful measures were ineffectual, and the troops coming into collision with the rioters one man was killed and a considerable number of others wounded. It was not alleged that there had been any provocation on the part of the Chinese, and yet ferocious outrages were committed upon them. While the troops were at Lambing Flat it became necessary to call out the Volunteer Force to do sentry duty in and about the metropolis. The Volunteers accepted the task with great cheerfulness, and performed it with exemplary patience and diligence. The circumstance is noticeable chiefly as the first instance of actual service by

Volunteers within the Australian Colonies. An intention was expressed at this time to proclaim martial law, and so to place the trial and punishment of offenders in the hands of the military, but to this course the Governor, who was a man of great constitutional knowledge, decidedly objected, and pointed out its illegality as well as danger. The outcry against the Chinese led to the passing of a law to exclude them, except on a large payment, from the colony, but the Act was afterwards repealed. During a large portion of Sir John Young's Government the colony was greatly disturbed by the combination, daring, and crimes of bushrangers; and the difficulty of coping effectually with the accumulation of violence and crime at this period led to a suggestion to pass a law more stringent than that in existence, and to bring the provisions of crime under new responsibilities. This was followed by the introduction and passing of the Felons Appropriation Bill, which materially assisted the police in the suppression of crime, and ultimately all the bushrangers were hanged, shot, or condemned to long terms of imprisonment. When Sir John Young arrived here the country was agitated by questions of great moment, embracing the reconstruction of the Upper House and a new system of disposing of public lands. The agitation with regard to the latter question ended in the passing of Sir John Robertson's Land Bill, which, with some amendment, has been ever since the land law of the colony, but several difficulties had to be overcome before the bill was finally dealt with, and among other plans to secure its passage through Parliament was the attempt by the Cowper Government to swamp the Upper House in order to compel it to accept the bill. Sir John Young, being at the time a stranger to all local parties, was naturally inclined to receive with deference the advice of his Ministers, and in consenting to the attempt at coercing the Legislative Council he departed from the course, which might have been anticipated from so experienced a politician. The result of the proceedings connected with the attempted swamping was an expression of a strong opinion on the part of the Secretary of State against the practice. While the Land Bill was under discussion, Parkes moved a resolution in the Assembly that it was desirable to send lecturers to Great Britain in order to promote immigration, and the resolution being carried, he and Dalley were appointed lecturers, and in that capacity visited Great Britain and held large meetings in various parts of England and Ireland. In August 1861 a serious disturbance in an important branch of Colonial industry occurred through the miners of Newcastle striking for increased wages, but the mischief which threatened the colony was obviated by efforts to open new mines, and by a large addition to the number of coal-miners from the general mining population. The question of State-aid to religion for a long time occupied public attention, and its settlement is regarded as one of

the happy incidents of Sir John Young's administration. Ecclesiastical affairs generally assumed, under Sir John Young's government, a more settled form, for the various Protestant communities established recognised organs for expressing their opinions on all matters affecting the relations with the State, and they acknowledged the Governor's cordial co-operation in all that affected the moral and religious well-being of the country. But the most important event during Sir John Young's tenure of office was the passing of the Public Schools Act, and the immediate success of the measure. The financial affairs of the colony proved a difficulty in the way of satisfactory government, but in this the Governor could have but little influence or control. In promoting the various benevolent institutions of the colony Sir John Young showed an unwearied activity, and led the people in the enterprise of charity with eminent success. Never was he found wanting either in personal liberality or in the cordial and hearty advocacy of the cause of the distressed. On the occasion of the death of the Prince Consort the whole colony participated in the regret and sorrow caused by the sad event, and in 1866 a statue of Albert the Good, at the cost of more than ten thousand contributors, was erected at the entrance of Hyde Park; Sir John Young delivered an oration upon the character of the Prince to an assemblage of people numbering tens of thousands. As the head of a political Government Sir John Young often had an extremely delicate part to perform, and one in which he would have been less successful but for his previous training and his knowledge of public life. The testimony on all sides seems to have been—that in the office of representative of the Queen he left to his Ministers that power which fairly belonged to them, but that he maintained with firmness the rights essential to his trust. It was to the honour of His Excellency that his example did not stimulate extravagance, or provoke the people to habits of dangerous rivalry and minor ruinous display. Expending for the most part his revenue in the maintenance of the hospitalities and dignity of his station, he sought an influence in promoting permanently the interests of the community rather than in gratifying the ephemeral vanities and love of pleasure in those who had no higher aim, and his departure from the colony left to many persons the recollections of friendship, and to thousands the more public, but not less lasting, impression of official worth.

Z.

ZAACHEN, Dutch navigator, discovered and named the land of Arnheim, from the N.W. Cape to the fifteenth parallel of south latitude, in 1618.

ZIG ZAG. One of the greatest engineering works in A., and is said to rank among the boldest and most substantial railway constructions in the world. The railway line is across the Blue Mountains, N.S.W., and commences at Penrith, thirty-four miles from Sydney. The line then ascends 155 feet, and crosses Knapsack Gully by the viaduct, which is 388 feet long, and has a maximum height of 126 feet. This crossing is 245 feet above Emu Plains, and the line reaches the lower point of the first Zig-zag at an elevation of 414 feet above sea-level, and thence an elevation of 470 feet is attained in a distance of thirty chains. After this the line continues to ascend till it reaches the summit of Lapstone Hill, and then it follows the range dividing the tributaries of the Nepean and Cox rivers from those of the Grose River, passing Springwood, Blue Mountain, Weatherboard, Pulpit Hill, Blackheath, 3494 feet, to near Shepherd's Toll-bar and Mount Victoria, 3422 feet above the sea. Here the line commences to diverge to the N. along Darling's Causeway, which divides the waters of the Lett from the sources of the Grose River to Bell's line of road, or the range dividing the Lett River and Grose River tributaries from those of the river Colo. Following this range to Dargan's Creek the line passes through Mount Clarence by a tunnel 539 yards in length, the rails at the entrance of which are 3658 feet above the sea-level. This is the summit level of the line, 88 miles from Sydney, and 52 miles from the commencement of the ascent of the Blue Mountain Ranges at Emu Plains. The line then descends on a gradient of 1 in 42 towards Lithgow Valley beyond, reaching the higher points of the Great Zig-zag, 91 miles from Sydney, at an elevation of 3362 feet. At this point the line runs nearly parallel with the main line, but in an opposite direction, for a distance of 67 chains. After passing two viaducts and through a short tunnel it reaches the lower points of the Zig-zag at an elevation of 3261 feet, and thence further descends towards Bathurst, which is situated 145 miles from Sydney, at an elevation of 2153 feet. Between Mount Clarence, 88 miles from Sydney, and Wallerawang, 105 miles, there are seven viaducts, of 2225 feet in length, averaging in height from 10 to 70 feet, and in span from 10 to 54 feet—the majority being 30 feet; also three tunnels—one at Lithgow Valley Zig-zag 77 yards in length, one at Morangaroo 267 yards in length, and one under the Mudgee Road 47 yards in length. The smallest radius of a curve in this section is 528 feet, the total length of such curves being 5 miles, including those upon the two Zig-zags. There are also 20 miles of curves ranging from 8 chains to 12 chains radius. In the whole work the number of viaducts is 8, of tunnels 4, of bridges 8, and of culverts 268. The total excavations amounted to about 3,040,000 cubic yards, of which 1,783,000 were through rock. The cost of construction alone was about £812,000.

SUPPLEMENT.

B.

BARRY, SIR REDMOND. The death of this distinguished man in November 1880, renders necessary some further particulars respecting his career. The *Argus* states that he "was the son of General Barry, of Ballyclogher, in the county of Cork, who intended his son to follow the same profession as himself. For this purpose the boy was placed, as soon as he was old enough, under the tuition of a competent preceptor at Bexley, in Kent, from whence he was to proceed to Addiscombe College. But as the old general's prospects of obtaining a commission for his son were diminished by the death of influential friends, the young man was induced to turn his attention to the study of the law, and he had for his fellow pupils in Dublin several persons like the late Isaac Butt, who afterwards distinguished themselves at the bar or in the senate. Having entered himself at the Dublin University, young Barry graduated as a B.A. in 1835, and was called to the Irish Bar in 1838. Just then, the Australian Colonies were beginning to be spoken of in the Mother Country as a land of promise to the uneasy classes; and equipped with a liberal outfit in the shape of good health, an excellent education, an adventurous spirit, and a buoyant disposition, young Barry determined to seek his fortune in a new country. Admitted to the Bar of N.S.W., of which colony Port Phillip was then an outlying settlement, Barry landed on these shores in November 1839. Melbourne then went by the name of 'Bearbrass.' It was a small, shabby, straggling township, a mere clearing in the bush; and the aspect of the place to any one coming fresh from a metropolitan city must have been depressing and discouraging in the extreme. But the young Irish barrister, having once put his hand to the plough, refused to look back. He commenced the practice of his profession, and his business naturally expanded with the growth of population in the settlement. A Court of Requests—the first legal tribunal founded here—was established, and he was appointed to the chairmanship of it. A taste for literature had to be fostered, and Barry gave lectures, and assisted to organise a Mechanics' Institute. A hospital was needed, and he was among the most

zealous of its promoters. In course of time the separation of Port Phillip from N.S.W. began to be agitated, and in this movement he took an active part, as also in the strenuous opposition offered by his fellow colonists to Earl Grey's inconsiderate proposition for the revival of transportation to the Australian Colonies. When the Colony of V. was created in 1851, Barry was appointed Solicitor-General, and in that capacity drafted many Acts with so much care and ability that, as a general rule, no subsequent amendment of them was found to be necessary. In the year following he was appointed judge, and, as he recently stated, his occupancy of a seat on the judicial bench has extended over a greater number of years than any other judge in any portion of the British Empire can lay claim to. When society was revolutionised by the gold discoveries, and people's heads were turned by the extraordinary events of 1851-2-3; when the thirst for wealth was universal, and its acquisition so easy; and when all men's thoughts were absorbed by their own selfish schemes, Barry devoted his attention to the practical execution of carefully considered schemes for the benefit of his own and of future generations. The revenue of the colony had decupled in the short space of two years, and was still increasing. What a splendid opportunity for founding two such noble institutions as the Melbourne University and the Free Public Library. He discerned it with the utmost clearness, and resolved to embrace it with a pertinacious determination which insured success. Other circumstances conspired to this end. The Government of the day was composed of educated gentlemen, who warmly sympathised with and cheerfully concurred in Barry's views. They granted forty acres of land for the purposes of a University, and sixty acres as the site for four colleges, to be erected by the principal religious denominations. They bestowed upon the former an annual endowment of £9000, and passed an act of incorporation for it. In its infancy it was the butt of trivial jesters, but its real founder lived to see it take its place among the higher educational institutions of the British Empire, and to know that its academic honours were highly prized by the fortunate recipients of them. It was only a fitting acknowledgment of the value of his services to the University that he should have been elected its

chancellor, an office which he sustained with appropriate suavity and dignity. The Public Library, Museums, and Picture Gallery are also institutions of which he might justly claim the paternity. By his untiring energy he succeeded in obtaining the large block of land, bounded by four streets, upon which this pile of buildings stands, and upon which has been expended nearly £120,000. It was in deference to his earnestly-expressed convictions that unreserved and unconditional access was permitted to the books in the Library from the very first, while his efforts have been unremittingly directed to increase its value and extend its usefulness. Differences of opinion may have arisen between himself and his co-trustees with respect to matters of detail, but there can be no question as to the singleness of purpose and the enthusiasm by which he was actuated in all he thought and did on behalf of the whole of the institutions thus grouped together. As he was their founder, so he continued to be their animating spirit; and the various officers who are engaged in them would no doubt cheerfully acknowledge that in their intercourse with him they found abundant occasion to respect the firmness of his authority, tempered as it was by the unvarying courtesy of his demeanour."

BUDD, RICHARD HALE, is a native of England, and was educated at Rugby under the celebrated Dr. Arnold. He graduated at Cambridge University in 1838. In 1840 he came to V. and was appointed Head-master of the Melbourne Diocesan Grammar School, the first public grammar school established in the colony in 1849. He was appointed Inspector under the Denominational Board in 1854, and Secretary to the Board in the following year. In 1856 he was Normal Inspector, and in 1859 the offices were joined in one. When Heales undertook the formation of a new system of education in 1862 the framing of the Act for that purpose was entrusted to Budd, who was appointed Inspector-General of Schools when the Act was passed. He retired on a pension when the present Act was passed in 1873. To him mainly is owing the organisation of the whole system of inspection, enumeration, and training established under the early boards, and which in its main principles continues in existence under the present system. Since his retirement from the public service, Budd has been actively and most efficiently engaged in the work of promoting the higher female education.

C.

CLARKE, MARCUS (1847—1881) journalist, was a native of London, and received the advantages of an excellent education. At a very early age he evinced signs of the ability which he afterwards exhibited as a writer. Related to Sir Andrew Clarke who was a member of the

first Administration under the Victorian Constitution, and to Judge Clarke, he came out to V. when a very young man, saw something of life on a squatting station, afterwards entered the Bank of Australasia, and gradually drifted into journalism, for which he seemed to feel a natural vocation. He joined the reporting staff of the *Argus*, and subsequently commenced and continued a series of pungent contributions to the *Australasian* under the signature of the "Peripatetic Philosopher." These were marked by much vivacity of expression, and by a style which, when it was at its best, resembled that of Alphonse Karr in caustic remark and epigrammatic sparkle. His first novel, entitled *Long Odds*, was published in 1868, and viewed in connection with the fact that it was the work of a man of only one-and-twenty, was a remarkable performance and full of promise. Five years later he produced *His Natural Life*, a work of fiction founded on a solid groundwork of fact, and illustrating the horrors of the old penal settlement at Port Arthur. It was republished in London, where it was most favourably reviewed by many journals of high critical repute; and it received the additional compliment of being translated into German, and of being reprinted in the United States. Clarke wrote many short stories, some of which displayed a graceful fancy in combination with stronger gifts; and most of these were afterwards issued in a collective shape. He composed or adapted three or four pantomimes and burlesques, and gave to the stage other dramatic productions with varying success. His gift of fluency and his facility of literary expression, although valuable in themselves, were probably antagonistic to him as regards his making for himself the enduring reputation which might have been secured by works demanding greater deliberation of purpose and execution, more sustained thought and steadier application. There was in his case a waste of intellectual power, owing to its distribution over a wide surface instead of its being concentrated on some important work, and strengthened and disciplined by high endeavour. But this was attributable perhaps to temperament, and in part to the stress of circumstances. In 1875 he was appointed assistant librarian to the Public Library, which he held till the time of his death.

K.

KINGSTON, SIR GEORGE, (1808-1880) was educated for the profession of surveyor and architect. He arrived in S.A. in the *Cygnat* in September 1836. With him were associated as passengers many persons whose names afterwards became familiar as household words, so intimately have they been identified with the history of the colony. When he came out in 1836 he was attached to the survey staff of Colonel Light, who

was first Surveyor-General, and who laid out the City of Adelaide. In the year 1837 he was appointed Surveyor-General of S.A., and under his supervision most of the local surveys in the early days were conducted. He resigned his position in 1838, and entered into business as a surveyor and architect. The Roman Catholic Cathedral in Wakefield-street, Adelaide, was designed by Kingston, but has never been finished in accordance with the original plans. In 1839 Kingston was made Inspector of Public Works, and about a year afterwards he accepted the post of Town Surveyor. His duties were discharged with characteristic energy and skill; and he did not neglect other matters where his services as a citizen and colonist could be useful, assisting in public movements, and lending his influence to effect social reforms in various directions. Not only in matters intimately affecting the political interests of the province did Kingston turn his mind to during his public career, but he was prominent as a Freemason, and in 1837 he opened the first Freemason's lodge established in S.A., of which he was constituted R.W.M. In 1840 he furnished an elaborate report on the subject of a railway to Port Adelaide. In 1841 Kingston was appointed member of the Statistical Society, and contributed a full and authentic account of the financial condition of the colony, its resources and prospects. In 1844 he appeared as hon. secretary to the Agricultural and Horticultural Society. Kingston was opposed to the introduction of the convict element, and took an active part in 1845 in the agitation raised against the proposed introduction of Parkhurst Reformatory boys. He was also against State-aid to religion. In 1849 he was amongst the foremost in advancing the establishment of responsible government; and in March 1851 he came out as a candidate for the Legislative Council under the new Constitution Act. He was elected member for the Burra in August of the same year, and voted against the first reading of the bill for State-aid to religion. He was elected Speaker of the House of Assembly in 1857, and held the office until 1860, when he was out of Parliament for two years. Returned for the Burra in 1863 he was re-elected Speaker, and retained the office until the prorogation when he resigned on account of failing health. Latterly he represented the district of Stanley, and the interests of that constituency had certainly not suffered in his hands. The well-merited honour of knighthood was conferred upon him in 1870, as a reward for his long and faithful public services.

M.

MACDONNELL, SIR RICHARD GRAVES.

—The death of this gentleman occurred in London on 7th February 1881.

MALAY ARCHIPELAGO.—I. GEOGRAPHICAL OUTLINE.—Of all the great island groups of the

globe, the richest in every respect is the Malay Archipelago, lying between Southern Asia and A., and made up of the fragments of two continents, although now forming a distinct geographical unit. There is every reason to believe that Asia and A. were united during the latter part of the Secondary epoch, while the processes of subsidence and upheaval resulting in the present insular formations were not fully developed till a much later period. The Australian continent was probably first broken up, as indicated by the very deep seas which now separate the several islands of the Moluccas from each other; while the Asiatic continent may have remained longer entire, and its comparative recent subsidence is equally well shown by the very shallow sea—always under fifty fathoms deep—which separates the great islands of Java, Sumatra, and Borneo from each other and from the mainland of Southern Asia. The extensive submarine plateau comes to an abrupt termination at the little island of Bali, east of Java, there being a channel of great depth, though very narrow, between it and the adjacent island of Lombok. The same deep channel is continued northwards through the straits of Macassar and the Celebes Sea, and between the islands of Mindanao and northern Celebes into the Pacific Ocean. Hence one-half only of what is sometimes called the East Indian Archipelago, and included in Asia, is really connected with that continent. The eastern half is essentially Australasian, not only as regards the history of its origin, but also in its fauna and flora. Even ethnically this extensive insular system belongs to two clearly distinct races—the Malay and the Papuan—so that the current expression, "Malay Archipelago," here adopted, is deficient in thorough accuracy. The line dividing the two typical races lies, however, considerably to the E. of that which separates the two zoological regions, the Malays extending to Celebes, Sumbawa, and to most of the islands of the Moluccas. But, while conforming to the hitherto received custom of arbitrarily including under one appellation the whole of the archipelago as far as the Moluccas and Timor, we may here still recognise several distinct groups traversed in great waves by one of the mightiest and most active volcanic systems on the globe. These groups are—in the N. the Philippines, followed to the S. by the Moluccas; further westwards, by Celebes and by the Lesser and the Greater Sunda Archipelagoes, by the latter of which are understood the three large islands of Sumatra, Java, and Borneo. All these groups—of which the Philippines, with Sumatra, Java, and Borneo, are properly Asiatic—are separated from each other by straits or passages, each bearing a distinctive name. By far the greater number belong politically to Holland, which here possesses a colonial empire with its seat in Java, rivalling in prosperity the British East Indian possessions. Besides the Dutch, we find the Portuguese established on the Australasian island of Timor, while the Spaniard

rules almost exclusively in the Philippines. Some islands or portions of islands are still independent, or subject to native sultans.

II. PHYSICAL FEATURES.—VOLCANOES.—The Malay Archipelago is traversed throughout its whole extent by one of the most extensive and continuous volcanic belts upon the globe. Commencing in the north-western part of Sumatra, beyond the equator, it extends through that island and Java, then through the Lesser Sunda Islands to the E. end of Timor. Here it turns in a north-easterly curve by Banda, Amboyna and Bouru to Gilole and Ternate. Thence turning westward to the northern extremity of Celebes it bends abruptly to the N., and passes through the entire range of the Philippines to the extreme N. of Luzon. The number of true volcanic peaks and craters in this belt is very great, and they form a continuous chain, with seldom more than an interval of a hundred miles from one to the other. A very large proportion of them are in a state of activity, and many have devastated the surrounding country within the historic era. In Sumatra there are five active volcanoes, in Java twenty, in the Lesser Sunda Isles seven, in the Banda and Molucca groups about the same number, in Northern Celebes and the adjacent islands four or five, and in the Philippines more than a dozen. Many of these are perpetually smoking, while others have been frequently in eruption since the occupation of the country by Europeans, and have often been accompanied by disastrous earthquakes. Hardly less remarkable than the extent and continuity of this belt of volcanoes is the complete absence of all volcanic vents in the surrounding districts. The great island of Borneo, and all of Celebes except the extreme northern point, are absolutely free from all signs of recent volcanic action; and the same may be said of every island which lies on either side of the band—as the Peninsula of Malacca, Madura, Sumba, Timor Laut, Ceram, Mysol, New Guinea, and Palawan. In all these countries we have ancient crystalline rocks, granite and extensive tertiary beds, but no indication of volcanic outbursts. From the acknowledged fact of the very general vicinity of active volcanoes to the ocean, we may perhaps interpret this phenomenon as pointing out to us in this great volcanic band the outer limits of very ancient continents, while the lands on either side have once formed inland portions of those continents. This agrees sufficiently well with what we know of the existing distribution of animal life, if we suppose Celebes and the other islands to the eastward as far as the volcanic belt to have been separated from Asia at a very early period, when its fauna assimilated much more with that of A. than it does now; while the islands to the W. of Celebes were only separated from the continent at a very much later epoch, after they had participated in all the more recent and higher developments of its flora and fauna. This view will explain some of the great

peculiarities of the fauna of Celebes. In this extensive chain of volcanic mountains many attain great heights, especially in Sumatra and Java. Each of these islands has one mountain about 12,300 feet high, while the former has four and the latter eight which exceed 10,000 feet. In no other part of the chain, except in Bali and Lombok, immediately E. of Java, are there any heights which approach these. The volcanoes of the Philippines and Northern Celebes do not appear to exceed 6000 or 7000 feet, and those of the Moluccas from 4000 to 5000 feet. There is only one mountain in the whole Malay Archipelago that exceeds in height the lofty peaks of Sumatra and Java, the isolated mass of Kini Balou, near the northern extremity of Borneo, which is said to be 13,698 feet high, and which is probably far higher than any other mountain in the island, or than any non-volcanic mountain in the whole Archipelago. The summit of Kini Balou is syenitic granite, and it probably represents a portion of the most ancient extension of the Asiatic continent in Tertiary or Secondary times, since it contains plants allied to some now only found in temperate A. From the position of these Malayan islands between 19° N. and 10° S. of the equator, they all enjoy that equality of climate and abundance of moisture which are so highly favourable to the growth of arboreal vegetation, and which have produced the great forest-belt everywhere girdling the earth in the equatorial zone. Hence the general condition of almost all the islands is to be covered with luxuriant tropical forests where not destroyed by man, and this forest-covering even spreads over all except the very highest summits or precipitous rocky slopes of the mountains. There is only one portion of the region where there appears to be a natural deficiency of forest, due to peculiarities of climate caused by the vicinity of the heated interior of A. From the east end of Java through all the islands to Timor Laut, the dense forests that everywhere cover the other islands are the exception rather than the rule, occurring only in valleys and on the moister slopes of the mountains. The rest consists of grassy plains, dotted with palms and thorny bushes, which latter often form dense and impenetrable thickets. During the prevalence of the S.E. monsoon, from April to October, scarcely any rain falls in this area, and towards the latter end of this dry season the drought is so great that many small streams dry up, and most of the trees lose their leaves. The heat is then intense; and were it not that the nights are cool and a breeze always blowing, the climate would approach in severity that of A. itself. As it is, the chief effect is seen in the long-continued dryness of the atmosphere being inimical to that luxuriant forest growth which elsewhere in the equatorial zones clothes the earth with perennial verdure, and affords a constant protection from the rays of the vertical sun. The only other parts of the Archipelago where any extent

of open country occurs are in Northern Borneo, in Southern Celebes, and some of the Philippine Islands, but in these cases it is probably due to human agency aided by the introduction of cattle which have become wild. The densely-peopled plains of Java and the elevated plateaus of Sumatra are highly cultivated, and have been so long the seat of an ancient civilisation that the absence of forest is clearly not to be considered a natural feature.

III. THE MALAY RACE AND LANGUAGE.—Of the two indigenous races of the Archipelago, the Malays and the Papuans, the Malays are decidedly the more highly developed, the more populous and important. They have spread their language, their domestic animals, and some of their customs, widely throughout the Pacific and Indian Oceans, in many instances to islands where they have effected no sort of change in the physical or moral characteristics of the indigenous inhabitants. This wide diffusion of Malay influence is an extraordinary phenomenon, for the Malay race itself has by no means such an extensive range, although it has been generally supposed that all the brown tribes with straight or nearly straight hair, generally termed Polynesians, which are widely scattered in the tropical and sub-tropical South Sea Islands, belong to this division of mankind. Since W. von Humboldt's studies of the old Kawi language of Java, we know that the dominant race in Madagascar and the Comoro group also belongs to the Malay linguistic family. Hence the common statement that this race has spread from the Comoros to Easter Island, lying between the 45° E. long. and 110° W. long., or more than half the circumference of the globe. But this view as to the extent of the Malayan peoples is held by many modern writers to be quite erroneous, and they accordingly give the Malays a much more restricted habitation. The editor of this volume has always maintained that the brown Polynesians are really quite distinct from the Malays, and except in colour, seem to have more affinity with the dark woolly-haired races of the Pacific; or, which now seems more probable, are equally distinct from both. This view is supported by two writers who have great knowledge of the races and languages of the Pacific. W. S. W. Vaux, in a paper on the *Probable Origin of the Maoris*, read before the Anthropological Institute in 1876, maintains that there was once a distinct Polynesian language, and that the connection of the modern languages of the brown Polynesians with the Malay is by no means so intimate as many able philologists have asserted. Still more important and weighty is the evidence of W. L. Ranken, who, in a paper on the *South Sea Islanders*, read before the same society a few months later, proposes the native term "Mahori" for the brown Polynesians, and shows that their language is totally distinct from the Malay, has a different construction, has very few Malay roots, and only a few quite recent Malay words. Though resembling

Malays both physically and mentally in some respects, the Mahoris differ greatly from them in others. They have a much greater average height, their features are much more of the European type, and their hair is typically wavy. He traces this race to Samoa as their first home in the Pacific, but primarily from some part of the Asiatic Continent. He says—"We are thus led to these conclusions; that they are of some kindred race to the Malays, of Mongolian stock; that they have separated from that stock as distinctly, and perhaps as early, as the Malays themselves, and always had a distinct language; that they dwelt some time in Papua, and perhaps in other lands of the Malay Archipelago, and there learnt some new words from Malay traders; thence they migrated to Samoa, and have since colonised the South Sea, sometimes displacing Papuan settlers. In spreading northward from Samoa they met another branch of their own family in the Kingsmill Islands, who had probably travelled along the Caroline Archipelago from the Philippines, and show another exodus of the same family about the same time." This convergence of the views of three modern writers, each starting from a different point and reasoning from a distinct set of observations, as to the radical distinctness of the Malays and brown Polynesians, will justify us in giving up the term Malayo-Polynesian as altogether misleading. We shall therefore adopt Ranken's name "Mahoris" as equivalent to that of "Brown Polynesians" used by many authors. The Malays belong then, undoubtedly, to the so-called Mongolian division of mankind, and this is well illustrated by the strong resemblance between some of the higher types of each. In the Island of Bali, A. R. Wallace was unable to distinguish them from some Chinese immigrants, who had laid aside their national dress. They are of a brown complexion and somewhat small, the men being on the average three or four inches below the mean European height. The face is of a somewhat square or rather rhomboid form, not much longer than broad, with high and prominent cheek-bones; eyes black, but rarely oblique; mouth wide and large, with thick well-cut lips; broad lower jaw, round and shapely chin, nose small and short neither flat like the Negro nor prominent like the European, nostrils very dilated, occiput flat and square, with thick coarse black hair but with weak and scanty beard, and that almost invariably plucked out by the roots. The sexes resemble each other so closely that strangers are often at first puzzled to distinguish between the two. The Malay is naturally of an easy-going, indolent character. In his intercourse with others he betrays a certain reserve, diffidence and even shyness, which has induced many to suppose that there must be some exaggeration in the current accounts of his savage and bloodthirsty nature. He never gives open expression to a sense of astonishment, surprise or fear, and is probably little affected by such

sentiments. Slow and deliberate of speech, he leads up in roundabout ways to the subject he may have come expressly to inquire into. Both women and children are timid, and shrink from the unexpected sight of a European. In the society of the male sex they are silent, and in general quiet and submissive. When alone the Malay is gloomy and taciturn, never either singing or talking to himself. But when paddling together in canoes they will occasionally chaunt a monotonous wailing song. They seldom offend each other, nor are they prone to wrangling over money matters, scarcely venturing even to claim what is lawfully their own. Coarse horse-play is especially repugnant to them, the Malay being extremely sensitive on all points of etiquette and of encroachments on his personal freedom. The upper classes are exceedingly courteous, comporting themselves with all the quiet dignity of a well-educated European. Yet this outward refinement, strange to say, co-exists in them with the most pitiless cruelty and contempt of human life, traits which belong to the dark side of their character. Herein lies the explanation of the many diametrically opposed judgments, in the various accounts given by observers of their mental characteristics. Some tell us that these dwellers by the sea are ever hospitable and trustworthy, quiet and extremely indolent, but with an insatiable passion for gambling which all prohibitive measures have failed to suppress. Other accounts describe them as impulsive, without self-control, little to be relied upon and of fickle disposition. Improvident, lazy and averse to work they would gladly assume the rôle of superior beings, whose lofty aspirations and sense of freedom are degraded by the menial occupations necessary to secure a livelihood. They are however distinguished by greater energy and acquisitiveness from the other races of the Indian Archipelago, though Islam has deprived even them of all higher aims in life, splitting up their local communes and reducing their pursuits mainly to navigation and piracy. Theft and kidnapping are thought lightly of, while insults real or imaginary are savagely avenged on the spot. They are at the same time unforgetful of wrong, false and wily, so that solemn oaths are uttered with no intention of keeping them and poisonings are very common. They are passionately fond of opium-smoking, though this is a less common vice than among the Chinese; and of betting over their cock-fights, often staking their very selves and their personal freedom on the issue. On the other hand they are very frugal; and characteristic of their contentedness is the current expression asking for a present: "Kachil presentie, tuwan, poer makan;" that is "A little present, sir, to eat." Hence the eating-houses take the place of our drinking-houses, and are their chief places of resort. Here they indulge in dry rice, capsicums, little scraps of meat or fish, cooked vegetables and sweet tibbits handed round with a cup of hot water. The Malays are nominally Moslems, but lack the fanaticism of that religion. The Javanese, especially,

consider they have done enough by observing the rite of circumcision, the prescribed ablutions, and the Ramadan fast, while at the same time retaining many of the old Hindoo ideas. Some of them are Christians, that is to say they attend the services of the Dutch Church, abstain from shaving their heads or filing down their teeth, and drink wine and spirits. The *lingua franca* of the whole East Indian Archipelago is the Low Malay, which contains no rough or harsh gutturals or other consonants difficult of utterance, but is soft and musical in its liquid sounds somewhat resembling the Italian. All Europeans in the Dutch and English possessions speak this language, which is easily and rapidly acquired. The Malays, to whom the preceding description is generally applicable, and who agree closely with those of the Malayan Peninsula, inhabit all the islands from Sumatra to Sumbawa, Celebes, the Philippines, Bouru and Ternate, with outlying settlements in Gilolo, Ceram, Amboyna, Banda, and at several points on the Papuan islands. Only a small portion of these speak the Malay language, which is found chiefly in the central plateau of Sumatra, and around the coast of Borneo. In every other part of the Malayan area other languages are spoken, some of which are dialects of Malay, others distinct but allied languages; while many, as the Bugis of Macassar, and especially the languages of the people of Ternate and Tidori, are totally unlike Malay. Again the Malays may be divided into two great groups—the savage and the semi-civilised people. The Dyaks of Borneo are the best example of the former. They have no writing or literature, no regular government or religion, and they wear only the scantiest clothing of the usual savage type. But they are by no means a low class of savages, for they build good houses, they cultivate the ground, they make pottery and canoes, they work in iron, and they even construct roads and bridges. In the same stage are some of the inland tribes of Sumatra, Celebes and Bouru. The semi-civilised people comprise all the other Malayan tribes. These possess written languages, and many of them peculiar alphabets; they have some scanty literature, established governments, and some form of religion; they wear a regular costume, they spin and weave cotton or other textile fabrics, and make use of a considerable variety of tools and weapons.—*Wallace*.

N.

NEW CALEDONIA is the most southerly of the Melanesian Islands. It lies in a N.W. and S.E. direction, its northern extremity being on the same parallel as the most southern island of the New Hebrides, Aneiteum, from which it is distant about 250 miles to the S.S.W., and it is about 700 miles from the nearest point of the coast of A. It is 250 miles long and 37 wide, with an area

of about 6000 square miles. It lies in an almost perfect straight line, and retains a width of twenty-five miles and upwards to near both extremities. It is almost entirely encircled by coral reefs, which extend along the S. side at a distance of from five to eighteen miles from the shore, but approach somewhat nearer on the N., and extend a long way beyond its two extremities, so that if they indicate the former extent of the island, it was once double its present length and width. The island is very mountainous, with fine picturesque valleys, and towards the N. a double range with an extensive valley between them. The mountains approach nearer the E. than the W. coast, with many branches and isolated peaks, and with an extensive plateau towards the centre. Several of the peaks appear to have an elevation of from 4000 to 5000 feet, but the highest point has not been ascertained. The geological formation is chiefly sedimentary, consisting of schists, limestones, serpentine, and gneiss, with ancient plutonic rocks, but no volcanoes. It is rich in gold but more so in nickel, a metal hitherto found in comparatively small quantities only, there being but few places in the world where its ores occur in sufficient abundance to allow of its being worked with profit. The most important nickel mines of New Caledonia lie on the E. coast, and the most productive are those of Kannala and Ballarod in Onailou. There is also abundance of copper ores, and a copper mine is worked near Balade. New Caledonia differs from all the other islands of Melanesia in its drier and cooler climate, due to its position between 20° and 23° 20' S. latitude. It is thus outside the equatorial belt of forests, and we find accordingly that much of its surface is bare and arid-looking, or partially clothed with bushes and mast-like pines. In the north only, and on some of the mountain sides, is there any extent of forest country. There are however many fine timber trees, one of the most valuable of which is the aromatic Niaouli. The zoology of the island is little known, but seems to be poor. Terrestrial mammals are probably wanting; while the birds exhibit a mixture of Australian and Polynesian forms, those characteristic of the New Guinea fauna being quite absent. One of the most remarkable birds is the *Rhinocetus jubatus* or Kagu, allied to the herons, but forming a distinct family. The natives of New Caledonia are a well-made race, with frizzly hair, dark skins, and pronounced features, the nose being large and greatly depressed at the root, as with the New Hebrideans. Cook described them as being intermediate between the people of Tanna and Fiji, and Erskine agrees that this accurately describes their characteristics. Cook also described them as being courteous and friendly, and not in the least addicted to pilfering—a character which subsequent writers have denied them. Like many other savages, they have probably been spoiled by association with Europeans. They differ from other Melaneseans in having circular houses, well

and strongly built, with a high conical roof surmounted with a carved post or finial. They cultivate yams, bananas, and sugar-cane, and are superior to every other race of the Pacific in their agriculture, irrigating their land with almost as much skill and care as the Balinese. Yet they use no clothing, and are said to be as thorough cannibals as the New Hebrideans. They offered a brave resistance to the French, and are far from contemptible opponents. Although possessing firearms their chief tactics consist in falling on the enemy from ingeniously devised ambuscades. Some tribes still number as many as 2000, but the native element is disappearing here no less rapidly than elsewhere in Oceania, wherever it has come into either friendly or hostile contact with the white man. Various local causes combine to accelerate the process in New Caledonia, where the natives are as quarrelsome and cruel towards each other as towards strangers. Family feuds are further fomented by polygamy, and the female births are far less numerous than the male, while the men themselves perish in large numbers by internecine warfare, intemperance, and domestic and foreign vices. New Caledonia was taken possession of by France in 1853, and is used as a penal settlement as well as a colony. The chief town is Noumea or Port de France, a place of about 5000 inhabitants; and the country around it is said to resemble some parts of the Australian colony of V. The cultivation of sugar, coffee, cotton, tobacco and indigo has been introduced. There are six sugar-mills in the colony, and the coffee and cotton plantations are said to be doing well. Cocoanut oil is also largely manufactured. Cattle, sheep and horses do well, and the wool is of superior quality, though as yet only produced in small quantities by the missionaries. Cattle however thrive best and are most profitable. Good roads, fortifications, public buildings and a lighthouse have been constructed by convict labour. Notwithstanding the alleged pacification of the island, the relations of the aborigines and the colonists continue to be unsatisfactory. They are mutually suspicious of each other, and the whites have hitherto failed to render the natives serviceable labourers by proper food, fair wages, and humane treatment.

The Isle of Pines lies thirty miles from the south-eastern extremity of New Caledonia and is about eight miles across. It is a raised coral island, the centre forming a plateau about 250 feet above the sea-level, and is remarkable for the abundance of araucarias and sandal-wood. Many massacres occurred here among the early traders, but some Englishmen have long been settled there, and found that with proper treatment it was not difficult to obtain the goodwill of the natives. It is now used by the French as the residence of those prisoners who are not condemned to labour.

The Loyalty Islands form a small chain parallel to New Caledonia, from which they are distant about seventy miles. They consist of three principal islands, Ouvéa or Uéa, Lifou, and Maré

They are all coralline and comparatively sterile, but they abound in sandal-wood, which has caused them to be much visited. Araucarias also abound here, as in the larger island. Lifou, the largest and central island of the three, is thirty-five miles long by about fifteen wide. Uea, the smallest, consists really of two islands, and is not above the sixth part the size of Lifou. Maré, to the south, is about half as large as Lifou. None of them rise more than 300 feet above the sea, and only Uea has a good harbour formed by a surrounding reef. All the islands were once thickly peopled, but they have now greatly diminished. The inhabitants closely resemble the natives of the New Hebrides, the "Chief of Maré" and "Man of Tanna" figured in Captain Erskine's book being so much alike that they might be taken for brothers. Thirty years ago they were cannibals and altogether thorough savages, though they appear to have been more moral and more kindly than the New Hebrideans. Now they are, in Maré especially, the most civilised of any Melanesians. On Maré most of the people are Christians; they build good houses, work, trade, and save money. In the other islands they are more backward. They all build double canoes, and they use neither kava nor betel. There is however a mixture of two races, and in Uea especially there is a regular colony of Polynesians who are said to have come from Wallis Island not more than two generations back. A similar immigration of the dark race seems to have occurred from Maré to Maer or Murray Island in Torres Straits, the people of which are said by Jukes to resemble those of the Loyalty Islands and New Caledonia.—Wallace.

O.

ORMOND, FRANCIS. A colonist of V. and the founder of the fine College in connection with the Presbyterian body, affiliated to the Melbourne University. Ormond contributed the sum of £20,000 to the project, and other subscriptions to the amount of about £12,000 were received, so that when the College was opened on 14th November 1880 the building was entirely free from debt.

P.

PARKER, SIR HENRY WATSON. The death of this gentleman took place in London in February 1881.

PITCAIRN ISLAND. At the extreme south-eastern limits of the Low Archipelago, and far out of sight of any other land, lies the small and mountainous Pitcairn Island, celebrated as having been colonised by the "mutineers of the *Bounty*."

It is only two miles in extreme length and three-quarters of a mile wide, with a fertile volcanic soil, but rocky and mountainous, rising to a height of 2500 feet, so that much of its surface must be too precipitous for cultivation. It is situated in 25° 3' S. latitude, or just beyond the southern tropic, and has a fine climate, producing all tropical fruits and vegetables. It was in 1790 that nine British sailors, six Tahitian men and twelve women arrived at this speck in the ocean. By discord and murder they were reduced in ten years to one man (an English sailor named Adams,) the Tahitian women and nineteen children. The story of how this ignorant English sailor suddenly rose to the responsibilities of his position, and trained up this little community to habits of industry and morality and the practice of true religion, is one of the most wonderful and encouraging episodes in the social history of mankind. The little colony was first discovered in 1808 by an American ship, the *Topaze*, which brought the news to England. They were afterwards visited by two frigates, the *Briton* and the *Tagus*, and in 1825 by Captain Beechy in the discovery ship *Blossom*, who found a community of sixty-six persons living in a state of uninterrupted peace and harmony, and in a veritable Garden of Eden. Groves of cocoanut and bread-fruit trees clothed the rocks down to the water's edge, while in the deep valleys tropical fruits and vegetables flourished luxuriantly. Their village stood on a platform of rock shaded by plantains and fig trees, and surrounded an open square covered with grass. It was encircled by palisades to keep out the hogs and goats which roamed over the island, and which, with fowls, supplied abundance of animal food. Their houses were clean and comfortable. Their clothing, entirely made from the bark of the paper-mulberry, was neat and graceful. They all lived as one united family, and crime or even dissension was unknown. Injudiciously, as we think, this intensely interesting social experiment was brought to an end by the interference of well-meaning people. The Pitcairn Islanders were removed, first to Tahiti, then back again to Pitcairn Island. Then in 1856 they were all removed to Norfolk Island, far inferior to their own in climate and soil, though somewhat larger. In 1858 some of them returned to Pitcairn, where in 1869 they were visited by Sir Charles Dilke, and were doing well. In 1873 Commander Mainwaring found seventy-six inhabitants on the island, and he remarks that epidemic or endemic diseases were unknown among them. So recently as September 1878 they had been visited by Admiral De Horsey, who found them to have increased to ninety, all in good health and quite happy; and he adds that Beechey's testimony to their good qualities, given fifty-three years ago, holds good to this day, since they still continue "to live together in perfect harmony and contentment; to be virtuous, religious, cheerful and hospitable; to be patterns of conjugal and parental affection, and

to have very few vices." De Horsey concludes by saying that no one acquainted with these islanders could fail to respect them, and that they will lose rather than gain by contact with other communities. Although the island was quite uninhabited when the mutineers of the *Bounty* arrived there, many remains show that a considerable population must once have lived on it. Burial-places, large flat paving-stones, stone spear-heads and axes, round stone balls, and even stone images, sufficiently prove that this remote speck of land had not only been visited by stray savages, but had been the settled abode of a considerable population, who yet had time to devote to the carving of stone images with tools of the same material.—*Wallace.*

R.

RESPONSIBLE GOVERNMENT IN AUSTRALIA. The Australian Colonies were founded exclusively by natural-born subjects of the English Crown. There was in them no question as to native governments or as to the rights of a foreign race. Certain Englishmen moved their residence from one portion of their Sovereign's dominions to another portion. They naturally took with them all the rights and all the duties that are personal to the subjects of the Crown. They did not cease to be Englishmen because they were colonists. So much of the law of their native island as was merely local and peculiar to the circumstances of that island they left behind. But those free customs which form the birthright of every Englishman accompanied them across the sea and governed their conduct in their new homes. Among these free customs is the right of self-government. When a new community of Englishmen is formed in any distant place, the Crown may by its prerogative organise and incorporate that community, just as it may incorporate any number of people for any lawful purpose in England, and may prescribe the form of their government and of their courts. But that government must be representative; no tax can be raised and no law can be enacted without the consent of the community as expressed by their representatives; and the courts must proceed according to the rules of the common law, and by no other method. From these principles the political organisation of the colonies naturally follows. The colonists, like their fellow-countrymen in the towns and the shires of the old country, make their own rules for their own affairs, but in all other respects remain subject to the authority of the central Government. As every municipality makes its own bye-laws, while it is subject to the general law of the land, so every colony makes its own laws for its own wants, while in all matters of extra-colonial concern it is governed by the Parliament of the empire. In other words colonists are subject to two kinds of

law—one personal, the other territorial. To the former they are subject by virtue of their allegiance; to the latter they are subject by the common law right of self-government, and by the constitution given to them by the Imperial Parliament. We do not propose here to trace the constitutional history of the Australian Colonies. It is sufficient to observe that, with the exception of W.A., they all now possess what is known as responsible government. Their Legislative Chambers are not mere Legislatures, but are true Parliaments. That is, these Chambers do not merely enact laws and impose taxes, but also superintend the administration of the Government in all its details, and advise the Crown in the exercise of its discretionary powers. The agency by which this general supervision is practically carried into effect is the institution familiarly known as the Ministry. Her Majesty, of course, controls and directs the conduct of all her servants. In this duty she is advised by her principal servants, who are at the head of the various great departments of the State. These principal servants she habitually appoints or removes as they possess, or do not possess, the general confidence and support of Parliament, or at least of the more popular House of Parliament. Such are the principles on which, in the exercise of her great discretionary powers, Her Majesty now invariably acts; and it is the duty of the Governors of her colonies sedulously to follow in these respects her Royal example. The system of responsible government in the colonies is of very recent date. It was commenced in Canada in 1840, but was not fully established in that country until several years later. In V. and N.S.W. it was introduced in 1855 simultaneously with the new constitution of the Legislatures in these colonies. The exact process of this double change was as follows:—The former Legislature which had been established by previous acts of the present reign consisted of the Governor or Lieutenant-Governor and the Legislative Council, a single Chamber composed partly of representatives and partly of nominees. These bodies prepared projects of law for constitutions for their respective colonies. Under these bills the legislative power was vested in Her Majesty with the advice and counsel of two houses, styled respectively the Legislative Council and the Legislative Assembly. But as the previous Legislatures were constituted by Imperial legislation, and as other matters, especially the control of the Crown lands over which the colonists were anxious to possess control, were also regulated by the same authority, it became necessary to invite the assistance of the mother country. In July 1855 two Acts of the Imperial Parliament were accordingly passed empowering Her Majesty to assent to the bills prepared by the colonial Legislatures, which bills were set out in schedules to the Acts and repealing the Imperial laws inconsistent with them. The colonial Legislatures in their

matured form were thus called into existence and thereupon the Crown proceeded to recognise these Parliaments as its authorised advisers not only in legislation, but in all the affairs of state. The method by which this important change was accomplished was very simple, but very effective. Since it related to the exercise of Her Majesty's discretion, it was obviously unfit for legislation; and accordingly no mention of responsible Ministers is found in the text of the Constitution Act. But an instruction was given to the Governor respecting the tenure of certain officers. Previously all Her Majesty's servants in the colony, although they technically held office during pleasure, were permitted to understand that they would not be removed except for some sufficient cause. But after the new constitution came into force, certain heads of departments were apprised that in future they must consider that political reasons would be regarded as a sufficient cause for their dismissal. This was all, and this was enough. Although the general features of the Australian Governments are thus alike, their details vary. This difference shows itself chiefly in the construction of the Upper House. In some colonies this Chamber is nominated by the Crown; in others it is elective. Of the elective Chambers, again, some are chosen from the entire colony, which is regarded as a single constituency. Others again are chosen by enlarged constituencies called provinces. But these distinctions are only superficial, and it will suffice for an acquaintance with the whole group if we describe the structure of the Parliament of V. In this colony the two Houses are elective, and as established by the Constitution Act presented a certain symmetry. The Council contained half the number of members in the Assembly, and was elected for twice as long a term. The one House was composed of thirty members elected for ten years; the latter of sixty members elected for five years. The Assembly was dissoluble by the Governor; the Council was not dissoluble, but was recruited by the retirement of its members according to a triennial rotation. The main difference of the houses was in the property qualification both of the electors and the elected. Members of the Council were required to have a property qualification in freehold estate to the value of £5000; members of the Assembly a like qualification to the value of £2000. The franchise for the Council was fixed for £100 a year, that for the Assembly at £10. Some of the earliest acts of the new Parliament were the repeal of these provisions successively, so far as they related to the Assembly. The property qualification of members was abolished. The number of members was increased until it attained its present number—eighty-six. Manhood suffrage was adopted. While these great changes were in progress the form of the Council was unchanged. At length after a bitter contest with the Assembly, a change was made in the hope of obtaining a wider and a surer basis. The

property qualification both for members and for electors was reduced one-half. A further change in the same direction is now imminent, and the Council has more than once passed a bill providing for a restoration of the lost symmetry, for a proportionate increase in the number of its members, and for the proportionate decrease in their term of office; for a reduction in the size of the provinces, and for a wide extension of the franchise. Two co-ordinate bodies are naturally liable to occasional misunderstandings. The House of Lords and the House of Commons have had in their day fierce conflicts. It is not therefore surprising that the course of Australian Legislatures has not always run smoothly; but although in all the colonies the dissensions have been sharp, none of them have had such formidable differences as those which have occurred in Victoria. With the view of giving effect to the recognised practice of the two Houses of the Imperial Parliament in financial matters, the Constitution Act provides in substance that all bills for appropriating revenue and for imposing taxation must originate in the Assembly, and must not be amended, although they may be rejected, by the Council. We cannot now enter upon the questions how far this attempt to translate into positive law a rule of practice of the Imperial Parliament, and to give effect to a portion of that practice without reference to other portions, has fulfilled the intention of its framers. We shall only observe that the Assembly made use of the special power thus given to it as an instrument for coercing the Council. It included in the Appropriation Bill provisions which it believed that the Council, if they were presented in a separate form, would not pass. The only remedy which in the circumstances the law allowed to the Council was to lay the bill aside and refuse to consider it. This course was adopted, and the result was the temporary suspension of the supplies for the public service, and great individual suffering and much public inconvenience. Four times (once in relation to the protection tariff, twice in relation to a proposed gratuity to the wife of a recalled Governor, and once in relation to the payment of members,) have deadlocks of this kind occurred during the last fifteen years. Various attempts have been made to make legal provision against their recurrence, but hitherto without success. Apart, however, from these deplorable interruptions, the Legislature of V. has not been inactive. During the three-and-twenty years that have elapsed since its first meeting in 1857, it has passed upwards of 600 Acts. Many of these, it is true, are merely formal; but many others are of the highest public importance. On some occasions too there have been grave differences between the Colonial Ministry, supported by a large majority in the Assembly, and the Imperial Government. It is, therefore, important to understand the arrangements by which both the legislation and the administration of the two countries, of the empire

and of the colony, are kept in harmony. We have seen that in every colony there are two legislative organs, namely, the local Legislature and the Imperial Parliament. Both these organs are in constant operation. The general rule is that no Imperial Act binds the colonies, except by express word or by necessary implication. There is however a large body of colonial law derived from this source. For an average of the last twenty years about eight or ten Acts which bind the colonies have been passed in England every year. It is remarkable that in these colonies the two Legislatures have so carefully observed the boundaries of their respective provinces that many persons seem not to be aware that any such double legislative power exists. If however any conflict of legislation were to take place, the rule for settling it is thoroughly ascertained. The judges have to administer the law from whatever source it is derived; and if two Acts conflict, the weaker, that is the colonial, must give way. Originally the rule ran much in the same form in which power is usually given to corporations to make bye-laws—that a colonial Act must not be repugnant to the law of England; but it is now settled that repugnancy means not mere diversity but actual conflict. We may make what laws we like provided that they do not contradict any statute which is distinctly applicable to the colony; but although the Imperial Parliament possesses this power, the exercise of that power is, in practice, vigorously limited. It is a fundamental maxim of Parliamentary practice that it is unconstitutional for the Imperial Parliament to legislate for the domestic affairs of a colony which has a legislature of its own. It is strictly legal for the Imperial Parliament to pass any such laws; and these laws, if they were enacted, would be binding upon the colonists, and it would be the duty of the courts and of the Government to enforce them; but such an exercise of power would be contrary to usage, and would not be in pursuance of a sound discretion. The Imperial Parliament therefore, while it reserves this power for use in cases of grave emergency, sedulously abstains from an unsolicited interference in matters of purely local legislation. It is only on matters of Imperial or of extra-colonial concern that it ordinarily uses its legislative rights. The principal means by which the danger of collision between the two Legislatures is practically avoided is the authority and influence of the Crown. The consent of the Governor, on behalf of Her Majesty, is necessary for all colonial legislation; but the Governor, as the servant of the Queen, is bound to obey her commands, and is removable at her pleasure. There are certain classes of bills to which, by his instructions, he is not permitted to give the Royal assent, and which he is required to reserve for her Majesty's special consideration. With such cases—and they are, of course, those in respect to which difficulties are most likely to arise—Her Majesty is thus free to deal without any

embarrassment arising out of the action of the Governor; but in all cases, even after the Governor has assented, whether rightly or wrongly, to a Bill, the Crown retains the power of disallowing it within a period of two years. This power however like that of Imperial legislation, is rarely exercised. Generally if the Colonial Office objects to a Bill on the ground of its being in excess of the colonial powers, a new Bill, amended so as to meet the objection, is passed without trouble. If the objection be not of law but of policy, the Secretary of State for the Colonies states the ground of its objection. If the colonial Parliament admit the force of his arguments, the matter is allowed to drop. If it remains unconvinced, the Home Government is usually content with having secured full discussion of the subject, and when Imperial interests are not involved, withdraws its opposition. Administrative collisions are more frequent than legislative collisions. It sometimes happens that a Ministry supported by a large majority presses, in the interest of its political party, a Governor to pursue some irregular course. A Governor is of course often compelled to sacrifice his own judgment, and if the irregularity be not actually illegal he must sooner or later give way. But his first duty is not to please his Ministers, but to maintain the law; and consequently if he is asked to do some unlawful act, he must at all hazards refuse to comply. If the colony really desire something forbidden by Imperial law—for its own laws it can of course alter at its pleasure—it must apply to the Imperial Parliament for a change in that law. When that change is made, but not before, the Governor is free to act. Thus in such a conflict he shifts the difficulty to his superior officer, and then the case comes within the limits of legislative collision. But such cases are very rare, if indeed they are not in modern times entirely unknown. In this way both in their legislation and in the administration of their own affairs, the inhabitants of the Australian Colonies have all the rights and all the powers that their countrymen at home possess in relation to purely domestic matters. The sole condition of this power is that they shall obey the laws which they have themselves made, or to which, as parts of a great complex community they are necessarily subject.—*Argus*.

T.

THOMSON, GORDON AUGUSTUS (1799—) is a native of Belfast in Ireland, and came to V. in 1836. He gives the following interesting account of Melbourne at that period:—"At the time I am now referring to, the principal residence, for so it must be called, in view of its special pretensions, which I will proceed to mention, was a small hut on Batman's Hill in which Batman himself resided. This hut had, as I remember, a brick chimney,

and I mention this particularly because the brick chimney was a conspicuous architectural feature in those days. Batman possessed not only a brick chimney, but a boarded floor in addition, an article of special luxury, as may be well imagined. Whether these things had anything to do with it, or whether it was entirely as a mark of general recognition of his comparative social standing in the new colony, he used to be generally spoken of and addressed as the Governor. A little further up the bank of the River Yarra Yarra there were a few wattle-and-daub huts, in which I remember that Dr. Thomson and his wife, Fawkner, Gellibrand, Buckley and some others lived, each man having a separate hut. As for myself I got my food from Dr. Thomson and his wife on the agreement to work for them, so that I used to call myself the hewer of wood and drawer of water to Melbourne, or rather, as we called it then, after the name of the River Yarra Yarra. Buckley, the "wild white man," who, as I have said was then living in the settlement had his hut and gun to himself, and could now speak English pretty well again—his powers of memory being re-awakened. He was at that time filling the post of interpreter between the whites and blacks, and the way an acquaintance was struck up between us was in this wise:—I was introduced to him as the bearer of a message for him from an hotelkeeper in Launceston who had been his fellow-prisoner, the purport of the message being a warm invitation to him to go over to Launceston and spend the remainder of his days (if he so pleased) in the house of his former mate in distress free of expense. From the fact perhaps of being the bearer of such an invitation and other causes combined, he and I soon made up somewhat of a bond of friendship, and often wandered out in the bush together to shoot or what not. On such occasions I used to draw him out as much as I could on the subject of his reminiscences and experiences of the native life. What he told me of his earlier days was that he and two other fellow-prisoners escaped from the ship which had brought out, as we know, the batch of convicts to these shores the evening before she set sail again from here to Hobart Town. Buckley and his two companions, who had appropriated a stock of provisions and useful articles from the ship's camp on shore, remained undiscovered—if search was made for them, but they seem rather not to have been missed, and appeared to have subsisted for some time in the bush together; but of the ultimate fate of the two companions I am ignorant. As regarded himself, Buckley told me that after being here some length of time, he was tired of life, and one day sitting down under a sheoak tree, longed for death. While thus sitting he fell off into a dose, and was awoke by the noise made by some native gins, who, during his sleep, had gathered around him, and were evincing their curiosity to one another. When they saw him awake they immediately scuttled off into the bush, and by-and-bye, while he was still lying there, a

number of their male relatives, to whom they had imparted the sight they had seen, came round him and asked him by signs where he came from. He, to make as favourable impression on them as possible, rose up from the ground, and pointing up to the sky, signified in the best pantomime that he could, that he had come down expressly from thence to visit them. They then made signs for him to follow them, and he did so, but in ignorance of their intentions towards him, although somewhat, in fact, expecting to be roasted, the more especially when he was led up to a large fire they had made. They merely, however, danced round the fire, singing their native songs, and then gave him a roasted possum to eat, which he told me was, without exception, the sweetest thing he ever ate in his life. With that same tribe he remained, becoming connected to them by marrying the daughter of a chief, and living more or less contentedly with them after their fashion, but having no descendants by his native bride. He told me that his general place of abode whilst with the natives was the trunk of a hollow tree, for house-building was not an aboriginal acquirement—the mia-mia or break-wind being the general extent of their efforts in that direction. He told me that the time thus passed by him amongst them was somewhere about thirty years, and other details which I do not now call to mind, and our intercourse remained on the same friendly footing till my departure for Hobart Town, when he came down to the vessel to say 'good-bye,' and taking a stone axe from his belt pressed it on me as a keepsake, telling me he had carried it for two-thirds of the time he had been among the natives. This was in the last week of June, and the vessel I am speaking of as the one that conveyed me in company with Gellibrand to Hobart Town was a cutter named the *Vansittart*, of about 80 tons burden, and besides us two there were only the crew on board. While referring to the aboriginal element I may as well mention here that the natives used to visit the settlement while I was staying there, and on one occasion I saw a corroboree amongst them, the women keeping time to the movements of the dance, or rather call it posturing of the men, by striking on opossum or other skins stretched across their knees. The men were covered with streaks of white paint in various patterns, and had girdles of opossum tails round their loins. The natives were very expert in the use of their spears, which they threw with much increase of power by aid of the leverage of a notched stick called by them the "Yoummaru." The target for these displays of skill was generally an old hat, and much dexterity and precision were shown in piercing its crown from sometimes considerable distances. During my stay in the settlement a rough map or plan of it was given to me, on which were marked out a number of allotments of land; the site of such allotments being on the south side of the river Yarra, but at no great distance. Some little time after this sketch

map was given to me I went down to Geelong by water in the cutter with Gellibrand, taking the map with me, and after surveying the harbour in a general manner, I added some outlines of the district to my map. To enable me to do so, in addition to my inspection of the harbour—of which, by-the-bye, I remarked at the time that it would be of no use on account of the bar there, which had then only about six feet of water on it. I made a hasty tour of the district, visiting and ascending amongst other places Station Peak. From its summit I observed to the westward a beautiful expanse of plain, which I entered on my plan as Lowwood Plains, giving it that name merely from old family association. I returned from Geelong by water to Melbourne, or rather as we used then to call the village—Yarra Yarra. There were many sales of land took place while I was here between the natives and Batman and the other whites. As far as I can remember the white purchasers were enrolled as or at all events called themselves a company. There were various documents drawn up with reference to these transfers or sales, and I remember that Gellibrand was the draftsman. I also remember being much struck at the time with the practical solution of the difficulty that presented itself as to how the natives should make their sign-manual of assent to the deed or deeds. The way it was done was this—Gellibrand having mixed up some lamp black and grease, and explained as he best could (through Buckley) the purport of his action to the native landowner, proceeded to black that native's hand with the mixture, and then placing the paper on some convenient block or tree, he guided the hand so prepared to the proper place on which to stamp its imprint; and thus did the native acknowledge that as his act and deed. My total stay in the settlement was about a month, and when about half that time had elapsed, I remember going out on an excursion with Gellibrand, the object we proposed to ourselves being to build a bridge over a river to the westward. It would be either the Saltwater or the Werribee, as I think, because it was only some two or three hours' journey to it from the settlement—as what is now Melbourne was then generally called in speaking of it. I was on horseback, and Gellibrand took charge of the bullock dray that conveyed our necessities, two ticket-of-leave men accompanying us. On the way I cantered off from the party a little, and so lost myself. I was much frightened, taking every bush for a native, or something else objectionable; but fortunately for myself, by dint of riding about, I came after a time across the tracks of the dray, and followed in the direction they were leading till I reached the banks of the river, and then came upon my party. We did not progress very far with the project we started out with, for as I am inclined to think the morning's light found our zeal frozen out of us. The excursion took place in the cold weather, in the month of June, and on

the evening of our arrival when we had chosen our camp we made our supper off damper and Irish pork washed down with water, for other liquor we had none in our canteen. At night-fall we made up a fine fire, but had nothing to lie upon but the bare ground, and very cold it was, with only a tarpaulin from the dray to cover us. The way Gellibrand and I contrived to get as much warmth as possible was to lie close together in the centre, and then flank ourselves with one of the ticket-of-leave men on either side of us. I had my saddle for a pillar, and for greater security to the flour and comfort to myself, I put the bag containing it inside the saddle. About the middle of the night my prisoner as I may call him got up—thinking as it appeared afterwards that it was much later—to make the damper for breakfast, and began looking for the flour-bag, which of course he could not find. His searching awoke me and hearing him muttering about the having no damper if there was no flour to make it with, I quickly handed over the flour-bag to him. But he then blighted my hopes about its approaching breakfast time by discovering from the face of the sky that he had miscalculated the time, and turning in again for another nap. When morning did come, on getting up we found the ground all covered with hoar frost, and as I have said somehow or other our bridge-building propensity had evaporated, and we returned as we came without putting a stroke to it. As an instance of the manner and mode of living in the settlement, I may mention that in Batman's house there was on the right hand of the hall door a small room which he called his parlour by day, but which was converted at night into a sleeping room by a feather bed being thrown down on the floor. Then there used to be a rush for tenancy, and the four or five fortunate enough to get first into the room flung themselves down in the clothes they stood upright in, and so established their claim to the dignities of civilisation while the others did without. I cannot from recollection say anything about the female part of the population, although of course some of the settlers had their families with them; but I remember Dr. Thomson's wife quite well, not only from as I have before said being their 'hewer of wood and drawer of water,' but also from the fact of a Scotch cousin relationship between us."

TRADE AND COMMERCE OF AUSTRALASIA.

The present century has been a time of rapid progress all over the world, but amongst its swiftest developments we question whether there are any to compare with the almost magical growth of Australasian commerce. Less than a hundred years ago a little fleet set out from England to found a convict settlement on the shores of New Holland. It arrived in February 1788, and after a short stay at Botany Bay moved on to Port Jackson, where the present city of Sydney was founded. Twelve years after the formation of the colony of New South Wales its population amounted to

between six and seven thousand people, but its commercial transactions were still of a very limited description, being mostly confined to the importation of the numerous articles required for the supply of the Government establishments and private wants. About that time steps were taken to establish the industry of wool-growing—an industry which, notwithstanding the great importance of other pursuits, has formed the backbone of Australasian trade. Never perhaps was the perseverance and energy of one man followed by greater results than those which sprang from Captain Macarthur's successful efforts to introduce merino sheep to southern pastures. That gentleman had the discerning eye which is genius of a certain sort. Having quitted the N.S.W. corps in disgust he turned settler, and within a very short time saw plainly that the country was admirably adapted to sheep. After some trouble he succeeded in procuring a few merinos, and his enterprise has borne the most astonishing fruit. It has been the means of showing how the greater portion of a territory almost as vast as Europe may be profitably occupied, pending the spread of population and of producing an article of commerce which adds millions annually to the wealth of the world, which keeps a considerable navy employed in its transport, and provides work for the hands and warm clothing for the backs of hundreds of thousands. In 1878 the imports of wool into Great Britain were valued at £23,128,234, and of this total Australasia contributed considerably over one-half. But while wool has been and must continue to form the staple of the Australian export trade many other articles are shipped in large quantities. The list is of a very diversified character and forms a marked contrast to the returns to be found in the official records of early days, before the discovery of gold had attracted population and given an impetus to enterprise. Amongst the products of pastoral industry we export, in addition to wool, tallow, hides, bones, horns, preserved meat, leather, butter, cheese, and artificial manures; agriculture furnishes extra-colonial markets with grain and flour, fruit, vegetables, hay, and wine; our mines and forests give gold, copper, tin, coal, kerosene shale, silver, antimony, building stone, timber, and mimosa bark; our seas produce pearl shell in abundance and *bêche de mer*; if there were only energy enough to "cast in the net," we might obtain fish in any quantity for preservation as food or reduction to oil; while our manufactures yield a variety of things which are gradually creating a moderate demand in various directions. Some idea may be formed of the extent of the Australian export trade apart from the great staple wool, from the following figures, taken from a return recently issued in Sydney. The total exports of articles the produce of N.S.W. and V. for the year 1879 is set down at £18,451,740. Of this amount wool represented £10,055,919, so that the other commodities we have mentioned were

valued at £8,396,823. In 1879 the total value of the Australasian trade (including N.Z.) was £88,655,639, the imports amounting to £47,378,783, and the exports to £41,276,856. The figures show a very considerable falling off from those of the previous year. In 1878 they were £94,742,703, £50,545,966, and £44,196,737 respectively. At first sight, and after making allowances for profits, these aggregates lead to the supposition that a balance is accumulating against us; but the excess of imports over exports is in some measure accounted for by the fact, that one or other of the provinces is a borrower every year, and the proceeds of the various loans have to be obtained from England in some shape. There is a considerable difference in the rate per head of imports and exports between the various colonies. As regards the former, N.S.W. heads the list with £19 17s. 8½d.; as regards the latter, S.A. with £18 13s. 5d. T. is the lowest in both, her imports per head being £11 7s. 11¼d., and her exports £11 13s. 11¼d. Taking imports and exports per head together, the colonies last year stood in the following order:—S.A., N.S.W., N.Z., W.A., V., Q., T. If, however, we ignore the element of population and arrange the colonies according to the total values of their trade, they stand thus:—V., £27,489,708; N.S.W., £27,285,666; N.Z., £14,117,711; S.A., £9,776,877; Q., £6,514,923; T., £2,568,572; W.A., £902,182. One of the most remarkable things about these figures is the rapid progress of N.S.W. Her population is 714,000, as against 888,000 in V., while her trade in 1879 was only £204,042 less. The parent colony, under a system of free trade, is advancing with giant strides, and it cannot be doubted that she will soon out-strip V. and all other Australasian competitors in the extent of her commercial operations. A few figures indicating the basis on which Australasian trade rests may be interesting. The total area of the seven colonies is 2,580,282 square miles, its mean population in 1879, 2,659,779; revenue, £15,927,488; trade import and export, £88,655,639; railways open, 4,338 miles, and in course of construction, 937 miles; telegraphs open, 26,841 miles, in course of erection, 1,388 miles; area under crop, 7,136,483 acres; horses, 1,064,640; cattle, 7,878,556; sheep, 65,914,236; pigs, 822,039; public debt, £77,896,183. Average rate per head of public debt, £28 13s. 8½d. According to the *Statesman's Year Book* the total imports and exports of Great Britain during 1878 were valued at £614,254,600. Of this trade, £40,428,000, or about one-fifteenth was done with the Australasian Colonies. We find that as regards imports into Great Britain these colonies were exceeded by the United States, France, British India and Germany in the order we have given them; but British India alone surpassed these colonies as a customer for British goods. The total trade with Canada was only £15,878,000, so that although the Dominion can boast a much larger population, Australasia is much more valuable to England in a commercial sense. But vast

as Australian commerce has become within a comparatively very brief space, it as yet a mere trifle to what it must grow to in time. Taking the colonies as a whole, they offer facilities for the production of every article that will grow either in tropical or temperate climes. In the northern parts of W.A., S.A. and Q. there are millions of acres that only need tillage in order to supply unlimited quantities of those articles of commerce which have hitherto been associated in the public mind with that portion of the "gorgeous East" which lies to the north of the equator. In future years, when capital and labour shall have joined hands with enterprise, the whole of the northern seaboard of this island continent will be dotted here and there with seaports, at which the merchant navies of the world will collect the tropical harvests of the back country in rich profusion—sugar and rice, and tea, coffee, indigo, fibre, and a multitude of other things which only flourish in the glowing heat of a nearly vertical sun. Sugar-growing is already carried on to a considerable extent in Q. and the northern parts of N.S.W., and we have little doubt that if some arrangement be made whereby coolie labour at moderate wages is brought within reach of the planters, A. will soon supply a considerable proportion of the sugar consumed in the world. The whole future of N.A. trade is bound up with the labour question. Although a few people of European descent can endure the climate and do a fair share of work without distress, it cannot be denied that the average temperature is above the point at which a white race can engage in field work with anything like efficiency and comfort. The question, then, is—shall tropical A. remain a mere grazing country, wholly given over to flocks and herds and the few bushmen needed to look after them, or shall it be utilised by coolie labour under English management, and made to yield its increase for the enrichment and comfort of mankind? Surely it would be selfish and short-sighted, not to say suicidal, policy for the colonies that possess the vast tropical regions alluded to, to condemn those portions of the world's surface to comparative sterility, because they cannot colonise them on exactly the same plan which answers well in more temperate climes. Under possible arrangements there would be no fear of coolie labour coming into competition with workmen of European origin or descent, and if these arrangements were once formulated in a way which effectually removed any apprehension on this point, we do not see why the development of N.A. should be long delayed. There are thousands of men in India and China fitted by Providence for tropical field work whose condition in life would be wonderfully improved could they find employment in N.A. under English planters. But though the agricultural settlement of N.A. on the only possible basis is likely to be delayed by ignorance or prejudice, it must take place at last, and within a few years of its becoming an

accomplished fact we shall see the trade of A. going forward by "leaps and bounds." Ceasing now to speak of tropical A. alone, we may say that the commercial resources of the colonies are not developed to the extent of one-thousandth part of their capacity. In years to come wine will be produced in immense quantities. Nowhere does the vine flourish more luxuriantly than with us. At present the quality of our vintages is by no means all that could be desired, but improvement will come with experience. Even now the bulk of our produce would answer admirably for mixing purposes, being far better than many of the common wines of Europe, and we believe it would long since have become an important article of commerce if enterprise in this direction had not been checked by the satisfactory nature of the profits obtainable in connection with commodities more familiar to English people. If the average value of labour should ever decline, we may look to see oil and silk also added to our exportable articles in commercial quantities, as there is an immense extent of country possessing all the natural qualities necessary for their growth. But after every acre shall have been brought into cultivation throughout the length and breadth of the land which labour and capital, placed under the most advantageous conditions by enlightened government, can possibly occupy, there will still remain for generations to come, millions of acres which the grazier alone can turn to good account. In the Australian Colonies at the present time there must be over eight millions of horned cattle and some seventy millions of sheep. These figures look large, but they will seem insignificant in a few years. There are enormous tracts of pastoral country in most of the provinces which have been taken up for speculative purposes but left untouched; while in W.A., S.A., and Q. there are whole districts of great size which can hardly be said to be settled at all. On one of his recent exploring expeditions Forrest penetrated into a region previously unknown, and added some twenty millions of acres to the available pastoral lands of the great western colony. If the process of transporting the carcasses of animals in a frozen state for long distances should prove a mercantile success, an enormous impetus will be given to the business of stock-raising and the meat trade will be one of the principal items in the Australasian commerce of the future. But it is not only what can be extracted from the earth in return for seed and cultivation which will go hereafter to swell the already goodly volume of Australian trade. There can be no doubt that every colony of the group is rich with mineral deposits of all sorts. Gold-mining is carried on profitably in the Northern Territory, Q., N.S.W., N.Z., T., and V. In 1879 N.S.W. exported £400,000 worth of the precious metal, and V. sent away £2,210,477. Neither of these sums, however, represents the quantity raised. But it is in the commoner though more useful metals that A. will find boundless

wealth, and a variety of commodities leading to an extension of interchange. Silver, copper, tin, lead and antimony are now raised and exported, but the mines from which the ores are extracted are those which have as it were forced themselves upon public notice. Hereafter we believe that A. will astonish the world by her contributions to its available mineral resources. Qualified men who have visited the northern portions of W.A. speak of them as abounding with mineral riches. In T. the first beginnings of mining enterprise have been rewarded by a large measure of success. Valuable deposits of tin have been discovered, and it is impossible to say what results may follow a systematic exploration of the mountainous country which has hitherto been neglected. In N.S.W. coal and iron abound, and copper is produced in large quantities. N.Z. also can boast possession of the two first-mentioned minerals, and others also. Q. is a country of vast potentialities in this respect. We can do no more than thus hint at the materials of commerce which in all the colonies lie hidden in the bowels of the earth. As yet they can hardly be said to have received anything like adequate attention. We have dwelt thus at length on the natural resources of these colonies, because on them of course depends the future of Australasian trade. Production lies at the root of all commerce—not that secondary production which results from the application of human labour in some form to the conversion of one article into another—but the production which adds fresh stores of raw material to the current wealth of the world, wherewith industry may busy itself in a thousand different ways. Nations at certain stages of their growth may prosper by performing the minor operation—as the manufacturing England of to-day is a proof—but we are not in a position to imitate her example, even if it were desirable that we should do so. As we cannot be a manufacturing people at present except in a minor degree, it is evident that the extent of our commercial dealings with the rest of the world must depend on the measure in which we are able to supply manufacturing countries with the raw materials of their industries. Nature, as we have seen, has endowed these colonies lavishly with natural resources, and has so done her part towards furnishing them with the primary requisites of trade. Nothing is needed to render our natural riches actually available but labour, capital, enterprise, and good government. It is within our power to command all these, and just in proportion to the use we make of our opportunities will be the growth and expansion of our commerce. We have said that the development of Australian trade as a whole has been something almost magical, and this is especially

true as regards V. The Hentys formed a whaling station at Portland in 1834, but the first attempt at regular settlement was made by Batman and Fawkner in the following year. In 1836 a census showed the white population of the Port Phillip district to be 186 males and 38 females, or 224 in all. In March 1837 Sir Richard Bourke, the Governor-General, arrived in H.M.S. *Rattlesnake*, and four months after his appearance the first land sale was held in Melbourne. In January 1839 the barque *Thomas Laurie* of 300 tons, W. B. Price master, sailed for London. She was the first vessel which left Port Phillip bound direct for a European port; and in addition to a mail she took away 400 bales of wool, valued at £6500. In the following June the barque *Midlothian*, George Morrison master, from Leith put in an appearance, being the first ship to open a direct trade with the infant settlement. On the same day the *William Bryan*, Roman master, from London *via* Circular Head and Launceston, passed up the bay; and to show how little then was known of the navigation, we may mention that both vessels grounded. In the second year of the existence of the colony 750,000lbs. of wool were exported, and we see that at the same time the estimate formed of the next clip was 15,000,000lbs.—a quantity said to be sufficient to load fifteen ships of the size then mostly employed in the trade. The customs revenue collected in the Port Phillip district in 1838 was as follows:—

Duty on spirits imported	... £876 15 8
Do. on tobacco 801 2 0
Do. ad valorem on foreign goods,	
5 per cent. 169 15 0
Wharfage 265 11 8
Fees on entry and clearance of	
vessels 136 13 6
Total ...	£2239 17 10

Passing over an interval of forty-one years we come to a very different state of affairs. In 1879 the imports were valued at £15,035,538, the duty on which amounted to £1,436,343 4s. 4d., while the exports were put down at £12,454,170. The transshipments in the same year (not included in the imports or exports) were valued at £1,914,884. The registered tonnage of the shipping inwards was 963,087; of which 176,488 tons came from the United Kingdom, 652,219 from Australian ports, and 133,380 from other countries. The outward tonnage was 977,135 tons, of which 126,481 tons were cleared for the United Kingdom, 729,631 for other Australian Colonies, and 121,023 for other ports. The pilotage paid was £21,530. —*Argus*.
